Pattern: `^([\p{L}\p{Z}\p{N}_ . : / = + \ - @] *)$`

Required: Yes

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)

- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## Tagging

Service: Amazon S3 Control

### Contents

#### TagSet

A collection for a set of tags.

Type: Array of [S3Tag](#) data types

Required: Yes

#### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## Transition

Service: Amazon S3 Control

Specifies when an object transitions to a specified storage class. For more information about Amazon S3 Lifecycle configuration rules, see [Transitioning objects using Amazon S3 Lifecycle](#) in the *Amazon S3 User Guide*.

### Contents

#### Date

Indicates when objects are transitioned to the specified storage class. The date value must be in ISO 8601 format. The time is always midnight UTC.

Type: Timestamp

Required: No

#### Days

Indicates the number of days after creation when objects are transitioned to the specified storage class. The value must be a positive integer.

Type: Integer

Required: No

#### StorageClass

The storage class to which you want the object to transition.

Type: String

Valid Values: GLACIER | STANDARD\_IA | ONEZONE\_IA | INTELLIGENT\_TIERING | DEEP\_ARCHIVE

Required: No

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## VersioningConfiguration

Service: Amazon S3 Control

Describes the versioning state of an Amazon S3 on Outposts bucket. For more information, see [PutBucketVersioning](#).

### Contents

#### MFADelete

Specifies whether MFA delete is enabled or disabled in the bucket versioning configuration for the S3 on Outposts bucket.

Type: String

Valid Values: Enabled | Disabled

Required: No

#### Status

Sets the versioning state of the S3 on Outposts bucket.

Type: String

Valid Values: Enabled | Suspended

Required: No

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## VpcConfiguration

Service: Amazon S3 Control

The virtual private cloud (VPC) configuration for an access point.

### Contents

#### VpcId

If this field is specified, this access point will only allow connections from the specified VPC ID.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

Required: Yes

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## Amazon S3 on Outposts

The following data types are supported by Amazon S3 on Outposts:

- [Endpoint](#)
- [FailedReason](#)
- [NetworkInterface](#)
- [Outpost](#)

## Endpoint

Service: Amazon S3 on Outposts

Amazon S3 on Outposts Access Points simplify managing data access at scale for shared datasets in S3 on Outposts. S3 on Outposts uses endpoints to connect to AWS Outposts buckets so that you can perform actions within your virtual private cloud (VPC). For more information, see [Accessing S3 on Outposts using VPC-only access points](#) in the *Amazon Simple Storage Service User Guide*.

### Contents

#### AccessType

The type of connectivity used to access the Amazon S3 on Outposts endpoint.

Type: String

Valid Values: `Private` | `CustomerOwnedIp`

Required: No

#### CidrBlock

The VPC CIDR committed by this endpoint.

Type: String

Required: No

#### CreationTime

The time the endpoint was created.

Type: Timestamp

Required: No

#### CustomerOwnedIpv4Pool

The ID of the customer-owned IPv4 address pool used for the endpoint.

Type: String

Pattern: `^ipv4pool-coip-([0-9a-f]{17})$`

Required: No

## EndpointArn

The Amazon Resource Name (ARN) of the endpoint.

Type: String

Pattern: `^arn:(aws|aws-cn|aws-us-gov|aws-iso|aws-iso-b):s3-outposts:[a-z\-\0-9]*:[0-9]{12}:outpost/(op-[a-f0-9]{17}|ec2)/endpoint/[a-zA-Z0-9]{19}$`

Required: No

## FailedReason

The failure reason, if any, for a create or delete endpoint operation.

Type: [FailedReason](#) object

Required: No

## NetworkInterfaces

The network interface of the endpoint.

Type: Array of [NetworkInterface](#) objects

Required: No

## OutpostsId

The ID of the AWS Outposts.

Type: String

Pattern: `^(op-[a-f0-9]{17}|\d{12}|ec2)$`

Required: No

## SecurityGroupid

The ID of the security group used for the endpoint.

Type: String

Pattern: `^sg-([0-9a-f]{8}|[0-9a-f]{17})$`

Required: No

### Status

The status of the endpoint.

Type: String

Valid Values: Pending | Available | Deleting | Create\_Failed | Delete\_Failed

Required: No

### SubnetId

The ID of the subnet used for the endpoint.

Type: String

Pattern: ^subnet-([0-9a-f]{8}|[0-9a-f]{17})\$

Required: No

### VpcId

The ID of the VPC used for the endpoint.

Type: String

Required: No

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## FailedReason

Service: Amazon S3 on Outposts

The failure reason, if any, for a create or delete endpoint operation.

### Contents

#### ErrorCode

The failure code, if any, for a create or delete endpoint operation.

Type: String

Required: No

#### Message

Additional error details describing the endpoint failure and recommended action.

Type: String

Required: No

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## NetworkInterface

Service: Amazon S3 on Outposts

The container for the network interface.

### Contents

#### NetworkInterfaceId

The ID for the network interface.

Type: String

Required: No

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## Outputpost

Service: Amazon S3 on Outposts

Contains the details for the Outputpost object.

### Contents

#### CapacityInBytes

The Amazon S3 capacity of the outpost in bytes.

Type: Long

Required: No

#### OutputpostArn

Specifies the unique Amazon Resource Name (ARN) for the outpost.

Type: String

Pattern: `^arn:(aws|aws-cn|aws-us-gov|aws-iso|aws-iso-b):outposts:[a-z\-\0-9]*:[0-9]{12}:outpost/(op-[a-f0-9]{17}|ec2)$`

Required: No

#### OutputpostId

Specifies the unique identifier for the outpost.

Type: String

Pattern: `^(op-[a-f0-9]{17}|\d{12}|ec2)$`

Required: No

#### OwnerId

Returns the AWS account ID of the outpost owner. Useful for comparing owned versus shared outposts.

Type: String

Pattern: `^\d{12}$`

Required: No

### **S3OutpostArn**

Specifies the unique S3 on Outposts ARN for use with AWS Resource Access Manager (AWS RAM).

Type: String

Pattern: `^arn:(aws|aws-cn|aws-us-gov|aws-iso|aws-iso-b):s3-outposts:[a-z\-\0-9]*:[0-9]{12}:outpost/(op-[a-f0-9]{17}|\d{12})/s3$`

Required: No

### **See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## **Amazon S3 Tables**

The following data types are supported by Amazon S3 Tables:

- [EncryptionConfiguration](#)
- [IcebergCompactionSettings](#)
- [IcebergMetadata](#)
- [IcebergSchema](#)
- [IcebergSnapshotManagementSettings](#)
- [IcebergUnreferencedFileRemovalSettings](#)
- [NamespaceSummary](#)
- [SchemaField](#)
- [TableBucketMaintenanceConfigurationValue](#)
- [TableBucketMaintenanceSettings](#)

- [TableBucketSummary](#)
- [TableMaintenanceConfigurationValue](#)
- [TableMaintenanceJobStatusValue](#)
- [TableMaintenanceSettings](#)
- [TableMetadata](#)
- [TableSummary](#)

## EncryptionConfiguration

Service: Amazon S3 Tables

Configuration specifying how data should be encrypted. This structure defines the encryption algorithm and optional KMS key to be used for server-side encryption.

### Contents

#### sseAlgorithm

The server-side encryption algorithm to use. Valid values are AES256 for S3-managed encryption keys, or `aws:kms` for AWS KMS-managed encryption keys. If you choose SSE-KMS encryption you must grant the S3 Tables maintenance principal access to your KMS key. For more information, see [Permissions requirements for S3 Tables SSE-KMS encryption](#).

Type: String

Valid Values: AES256 | `aws:kms`

Required: Yes

#### kmsKeyArn

The Amazon Resource Name (ARN) of the KMS key to use for encryption. This field is required only when `sseAlgorithm` is set to `aws:kms`.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: `(arn:aws[-a-z0-9]*:kms:[-a-z0-9]*:[0-9]{12}:key/.+)`

Required: No

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## IcebergCompactionSettings

Service: Amazon S3 Tables

Contains details about the compaction settings for an Iceberg table.

### Contents

#### targetFileSizeMB

The target file size for the table in MB.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 2147483647.

Required: No

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## IcebergMetadata

Service: Amazon S3 Tables

Contains details about the metadata for an Iceberg table.

### Contents

#### schema

The schema for an Iceberg table.

Type: [IcebergSchema](#) object

Required: Yes

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## IcebergSchema

Service: Amazon S3 Tables

Contains details about the schema for an Iceberg table.

### Contents

#### fields

The schema fields for the table

Type: Array of [SchemaField](#) objects

Required: Yes

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## IcebergSnapshotManagementSettings

Service: Amazon S3 Tables

Contains details about the snapshot management settings for an Iceberg table. The oldest snapshot expires when its age exceeds the `maxSnapshotAgeHours` and the total number of snapshots exceeds the value for the minimum number of snapshots to keep `minSnapshotsToKeep`.

### Contents

#### `maxSnapshotAgeHours`

The maximum age of a snapshot before it can be expired.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 2147483647.

Required: No

#### `minSnapshotsToKeep`

The minimum number of snapshots to keep.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 2147483647.

Required: No

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## IcebergUnreferencedFileRemovalSettings

Service: Amazon S3 Tables

Contains details about the unreferenced file removal settings for an Iceberg table bucket.

### Contents

#### **nonCurrentDays**

The number of days an object has to be non-current before it is deleted.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 2147483647.

Required: No

#### **unreferencedDays**

The number of days an object has to be unreferenced before it is marked as non-current.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 2147483647.

Required: No

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## NamespaceSummary

Service: Amazon S3 Tables

Contains details about a namespace.

### Contents

#### createdAt

The date and time the namespace was created at.

Type: Timestamp

Required: Yes

#### createdBy

The ID of the account that created the namespace.

Type: String

Length Constraints: Fixed length of 12.

Pattern: [0-9].\*

Required: Yes

#### namespace

The name of the namespace.

Type: Array of strings

Length Constraints: Minimum length of 1. Maximum length of 255.

Pattern: [0-9a-z\_]\*

Required: Yes

#### ownerAccountId

The ID of the account that owns the namespace.

Type: String

Length Constraints: Fixed length of 12.

Pattern: `[0-9].*`

Required: Yes

### **namespaceId**

The system-assigned unique identifier for the namespace.

Type: String

Required: No

### **tableBucketId**

The system-assigned unique identifier for the table bucket that contains this namespace.

Type: String

Required: No

### **See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## SchemaField

Service: Amazon S3 Tables

Contains details about a schema field.

### Contents

#### name

The name of the field.

Type: String

Required: Yes

#### type

The field type. S3 Tables supports all Apache Iceberg primitive types. For more information, see the [Apache Iceberg documentation](#).

Type: String

Required: Yes

#### required

A Boolean value that specifies whether values are required for each row in this field. By default, this is `false` and null values are allowed in the field. If this is `true` the field does not allow null values.

Type: Boolean

Required: No

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## TableBucketMaintenanceConfigurationValue

Service: Amazon S3 Tables

Details about the values that define the maintenance configuration for a table bucket.

### Contents

#### settings

Contains details about the settings of the maintenance configuration.

Type: [TableBucketMaintenanceSettings](#) object

**Note:** This object is a Union. Only one member of this object can be specified or returned.

Required: No

#### status

The status of the maintenance configuration.

Type: String

Valid Values: enabled | disabled

Required: No

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## TableBucketMaintenanceSettings

Service: Amazon S3 Tables

Contains details about the maintenance settings for the table bucket.

### Contents

#### Important

This data type is a UNION, so only one of the following members can be specified when used or returned.

### icebergUnreferencedFileRemoval

The unreferenced file removal settings for the table bucket.

Type: [IcebergUnreferencedFileRemovalSettings](#) object

Required: No

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## TableBucketSummary

Service: Amazon S3 Tables

Contains details about a table bucket.

### Contents

#### arn

The Amazon Resource Name (ARN) of the table bucket.

Type: String

Pattern: (arn:aws[-a-z0-9]\*:[a-z0-9]+:[-a-z0-9]\*:[0-9]{12}:bucket/[a-z0-9\_-]{3,63})

Required: Yes

#### createdAt

The date and time the table bucket was created at.

Type: Timestamp

Required: Yes

#### name

The name of the table bucket.

Type: String

Length Constraints: Minimum length of 3. Maximum length of 63.

Pattern: [0-9a-z-]\*

Required: Yes

#### ownerAccountId

The ID of the account that owns the table bucket.

Type: String

Length Constraints: Fixed length of 12.

Pattern: `[0-9].*`

Required: Yes

### **tableBucketId**

The system-assigned unique identifier for the table bucket.

Type: String

Required: No

### **type**

The type of the table bucket.

Type: String

Valid Values: `customer` | `aws`

Required: No

### **See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## TableMaintenanceConfigurationValue

Service: Amazon S3 Tables

Contains the values that define a maintenance configuration for a table.

### Contents

#### settings

Contains details about the settings for the maintenance configuration.

Type: [TableMaintenanceSettings](#) object

**Note:** This object is a Union. Only one member of this object can be specified or returned.

Required: No

#### status

The status of the maintenance configuration.

Type: String

Valid Values: enabled | disabled

Required: No

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## TableMaintenanceJobStatusValue

Service: Amazon S3 Tables

Details about the status of a maintenance job.

### Contents

#### status

The status of the job.

Type: String

Valid Values: Not\_Yet\_Run | Successful | Failed | Disabled

Required: Yes

#### failureMessage

The failure message of a failed job.

Type: String

Required: No

#### lastRunTimestamp

The date and time that the maintenance job was last run.

Type: Timestamp

Required: No

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## TableMaintenanceSettings

Service: Amazon S3 Tables

Contains details about maintenance settings for the table.

### Contents

#### Important

This data type is a UNION, so only one of the following members can be specified when used or returned.

### icebergCompaction

Contains details about the Iceberg compaction settings for the table.

Type: [IcebergCompactionSettings](#) object

Required: No

### icebergSnapshotManagement

Contains details about the Iceberg snapshot management settings for the table.

Type: [IcebergSnapshotManagementSettings](#) object

Required: No

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## TableMetadata

Service: Amazon S3 Tables

Contains details about the table metadata.

### Contents

#### Important

This data type is a UNION, so only one of the following members can be specified when used or returned.

### iceberg

Contains details about the metadata of an Iceberg table.

Type: [IcebergMetadata](#) object

Required: No

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## TableSummary

Service: Amazon S3 Tables

Contains details about a table.

### Contents

#### **createdAt**

The date and time the table was created at.

Type: Timestamp

Required: Yes

#### **modifiedAt**

The date and time the table was last modified at.

Type: Timestamp

Required: Yes

#### **name**

The name of the table.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 255.

Pattern: `[0-9a-z_]*`

Required: Yes

#### **namespace**

The name of the namespace.

Type: Array of strings

Length Constraints: Minimum length of 1. Maximum length of 255.

Pattern: `[0-9a-z_]*`

Required: Yes

## tableARN

The Amazon Resource Name (ARN) of the table.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: (`arn:aws[-a-z0-9]*:[a-z0-9]+:[-a-z0-9]*:[0-9]{12}:bucket/[a-z0-9_-]{3,63}/table/[a-zA-Z0-9-]{1,255}`)

Required: Yes

## type

The type of the table.

Type: String

Valid Values: `customer` | `aws`

Required: Yes

## namespaceId

The unique identifier for the namespace that contains this table.

Type: String

Required: No

## tableBucketId

The unique identifier for the table bucket that contains this table.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)

- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## Amazon S3 Vectors

The following data types are supported by Amazon S3 Vectors:

- [EncryptionConfiguration](#)
- [GetOutputVector](#)
- [Index](#)
- [IndexSummary](#)
- [ListOutputVector](#)
- [MetadataConfiguration](#)
- [PutInputVector](#)
- [QueryOutputVector](#)
- [ValidationExceptionField](#)
- [VectorBucket](#)
- [VectorBucketSummary](#)
- [VectorData](#)

# EncryptionConfiguration

Service: Amazon S3 Vectors

## Note

Amazon S3 Vectors is in preview release for Amazon S3 and is subject to change.

The encryption configuration for a vector bucket. By default, if you don't specify, all new vectors in Amazon S3 vector buckets use server-side encryption with Amazon S3 managed keys (SSE-S3), specifically AES256.

## Contents

### kmsKeyArn

AWS Key Management Service (KMS) customer managed key ID to use for the encryption configuration. This parameter is allowed if and only if `sseType` is set to `aws:kms`.

To specify the KMS key, you must use the format of the KMS key Amazon Resource Name (ARN).

For example, specify Key ARN in the following format: `arn:aws:kms:us-east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab`

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: `(arn:aws[-a-z0-9]*:kms:[-a-z0-9]*:[0-9]{12}:key/.+)`

Required: No

### sseType

The server-side encryption type to use for the encryption configuration of the vector bucket. By default, if you don't specify, all new vectors in Amazon S3 vector buckets use server-side encryption with Amazon S3 managed keys (SSE-S3), specifically AES256.

Type: String

Valid Values: `AES256` | `aws:kms`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

# GetOutputVector

Service: Amazon S3 Vectors

## Note

Amazon S3 Vectors is in preview release for Amazon S3 and is subject to change.

The attributes of a vector returned by the GetVectors operation.

## Contents

### key

The name of the vector.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

Required: Yes

### data

The vector data of the vector.

Type: [VectorData](#) object

**Note:** This object is a Union. Only one member of this object can be specified or returned.

Required: No

### metadata

Metadata about the vector.

Type: JSON value

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

# Index

Service: Amazon S3 Vectors

## Note

Amazon S3 Vectors is in preview release for Amazon S3 and is subject to change.

The attributes of a vector index.

## Contents

### **creationTime**

Date and time when the vector index was created.

Type: Timestamp

Required: Yes

### **dataType**

The data type of the vectors inserted into the vector index.

Type: String

Valid Values: float32

Required: Yes

### **dimension**

The number of values in the vectors that are inserted into the vector index.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 4096.

Required: Yes

### **distanceMetric**

The distance metric to be used for similarity search.

Type: String

Valid Values: euclidean | cosine

Required: Yes

### **indexArn**

The Amazon Resource Name (ARN) of the vector index.

Type: String

Required: Yes

### **indexName**

The name of the vector index.

Type: String

Length Constraints: Minimum length of 3. Maximum length of 63.

Required: Yes

### **vectorBucketName**

The name of the vector bucket that contains the vector index.

Type: String

Length Constraints: Minimum length of 3. Maximum length of 63.

Required: Yes

### **metadataConfiguration**

The metadata configuration for the vector index.

Type: [MetadataConfiguration](#) object

Required: No

### **See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)

- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## IndexSummary

Service: Amazon S3 Vectors

### Note

Amazon S3 Vectors is in preview release for Amazon S3 and is subject to change.

Summary information about a vector index.

### Contents

#### **creationTime**

Date and time when the vector index was created.

Type: Timestamp

Required: Yes

#### **indexArn**

The Amazon Resource Name (ARN) of the vector index.

Type: String

Required: Yes

#### **indexName**

The name of the vector index.

Type: String

Length Constraints: Minimum length of 3. Maximum length of 63.

Required: Yes

#### **vectorBucketName**

The name of the vector bucket that contains the vector index.

Type: String

Length Constraints: Minimum length of 3. Maximum length of 63.

Required: Yes

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## ListOutputVector

Service: Amazon S3 Vectors

### Note

Amazon S3 Vectors is in preview release for Amazon S3 and is subject to change.

The attributes of a vector returned by the `ListVectors` operation.

### Contents

#### key

The name of the vector.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

Required: Yes

#### data

The vector data of the vector.

Type: [VectorData](#) object

**Note:** This object is a Union. Only one member of this object can be specified or returned.

Required: No

#### metadata

Metadata about the vector.

Type: JSON value

Required: No

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## MetadataConfiguration

Service: Amazon S3 Vectors

### Note

Amazon S3 Vectors is in preview release for Amazon S3 and is subject to change.

The metadata configuration for a vector index.

### Contents

#### nonFilterableMetadataKeys

Non-filterable metadata keys allow you to enrich vectors with additional context during storage and retrieval. Unlike default metadata keys, these keys can't be used as query filters. Non-filterable metadata keys can be retrieved but can't be searched, queried, or filtered. You can access non-filterable metadata keys of your vectors after finding the vectors. For more information about non-filterable metadata keys, see [Vectors](#) and [Limitations and restrictions](#) in the *Amazon S3 User Guide*.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 10 items.

Length Constraints: Minimum length of 1. Maximum length of 63.

Required: Yes

### See Also

- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## PutInputVector

Service: Amazon S3 Vectors

### Note

Amazon S3 Vectors is in preview release for Amazon S3 and is subject to change.

The attributes of a vector to add to a vector index.

### Contents

#### data

The vector data of the vector.

Vector dimensions must match the dimension count that's configured for the vector index.

- For the `cosine` distance metric, zero vectors (vectors containing all zeros) aren't allowed.
- For both `cosine` and `euclidean` distance metrics, vector data must contain only valid floating-point values. Invalid values such as NaN (Not a Number) or Infinity aren't allowed.

Type: [VectorData](#) object

**Note:** This object is a Union. Only one member of this object can be specified or returned.

Required: Yes

#### key

The name of the vector. The key uniquely identifies the vector in a vector index.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

Required: Yes

#### metadata

Metadata about the vector. All metadata entries undergo validation to ensure they meet the format requirements for size and data types.

Type: JSON value

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## QueryOutputVector

Service: Amazon S3 Vectors

### Note

Amazon S3 Vectors is in preview release for Amazon S3 and is subject to change.

The attributes of a vector in the approximate nearest neighbor search.

### Contents

#### key

The key of the vector in the approximate nearest neighbor search.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

Required: Yes

#### data

The vector data associated with the vector, if requested.

Type: [VectorData](#) object

**Note:** This object is a Union. Only one member of this object can be specified or returned.

Required: No

#### distance

The measure of similarity between the vector in the response and the query vector.

Type: Float

Required: No

#### metadata

The metadata associated with the vector, if requested.

Type: JSON value

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## ValidationExceptionField

Service: Amazon S3 Vectors

Contains information about a validation exception.

### Contents

#### message

A message about the validation exception.

Type: String

Required: Yes

#### path

A path about the validation exception.

Type: String

Required: Yes

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## VectorBucket

Service: Amazon S3 Vectors

### Note

Amazon S3 Vectors is in preview release for Amazon S3 and is subject to change.

The attributes of a vector bucket.

### Contents

#### **creationTime**

Date and time when the vector bucket was created.

Type: Timestamp

Required: Yes

#### **vectorBucketArn**

The Amazon Resource Name (ARN) of the vector bucket.

Type: String

Required: Yes

#### **vectorBucketName**

The name of the vector bucket.

Type: String

Length Constraints: Minimum length of 3. Maximum length of 63.

Required: Yes

#### **encryptionConfiguration**

The encryption configuration for the vector bucket.

Type: [EncryptionConfiguration](#) object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)

## VectorBucketSummary

Service: Amazon S3 Vectors

### Note

Amazon S3 Vectors is in preview release for Amazon S3 and is subject to change.

Summary information about a vector bucket.

### Contents

#### **creationTime**

Date and time when the vector bucket was created.

Type: Timestamp

Required: Yes

#### **vectorBucketArn**

The Amazon Resource Name (ARN) of the vector bucket.

Type: String

Required: Yes

#### **vectorBucketName**

The name of the vector bucket.

Type: String

Length Constraints: Minimum length of 3. Maximum length of 63.

Required: Yes

### See Also

## VectorData

Service: Amazon S3 Vectors

### Note

Amazon S3 Vectors is in preview release for Amazon S3 and is subject to change.

The vector data in different formats.

## Contents

### Important

This data type is a UNION, so only one of the following members can be specified when used or returned.

## float32

The vector data as 32-bit floating point numbers. The number of elements in this array must exactly match the dimension of the vector index where the operation is being performed.

Type: Array of floats

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

# Developing with Amazon S3

This section covers developer-related topics for using Amazon S3. For more information, review the topics below.

## Topics

- [Making requests](#)
- [Developing with Amazon S3 using the AWS CLI](#)
- [Developing with Amazon S3 using the AWS SDKs](#)
- [Getting Amazon S3 request IDs for AWS Support](#)
- [Supported Amazon S3 object-level API operations for S3 Tables](#)

## Making requests

Amazon S3 is a REST service. You can send requests to Amazon S3 using the REST API or the AWS SDK (see [Sample Code and Libraries](#)) wrapper libraries that wrap the underlying Amazon S3 REST API, simplifying your programming tasks.

Every interaction with Amazon S3 is either authenticated or anonymous. Authentication is a process of verifying the identity of the requester trying to access an Amazon Web Services (AWS) product. Authenticated requests must include a signature value that authenticates the request sender. The signature value is, in part, generated from the requester's AWS access keys (access key ID and secret access key). For more information about getting access keys, see [How Do I Get Security Credentials?](#) in the *AWS General Reference*.

If you are using the AWS SDK, the libraries compute the signature from the keys you provide. However, if you make direct REST API calls in your application, you must write the code to compute the signature and add it to the request.

## Topics

- [About access keys](#)
- [Request endpoints](#)
- [Making requests to Amazon S3 over IPv6](#)
- [Making requests using the AWS SDKs](#)

- [Making requests using the REST API](#)

## About access keys

The following sections review the types of access keys that you can use to make authenticated requests.

### AWS account access keys

The account access keys provide full access to the AWS resources owned by the account. The following are examples of access keys:

- Access key ID (a 20-character, alphanumeric string). For example: AKIAIOSFODNN7EXAMPLE
- Secret access key (a 40-character string). For example: wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY

The access key ID uniquely identifies an AWS account. You can use these access keys to send authenticated requests to Amazon S3.

### IAM user access keys

You can create one AWS account for your company; however, there may be several employees in the organization who need access to your organization's AWS resources. Sharing your AWS account access keys reduces security, and creating individual AWS accounts for each employee might not be practical. Also, you cannot easily share resources such as buckets and objects because they are owned by different accounts. To share resources, you must grant permissions, which is additional work.

In such scenarios, you can use AWS Identity and Access Management (IAM) to create users under your AWS account with their own access keys and attach IAM user policies that grant appropriate resource access permissions to these users. To better manage these users, IAM enables you to create groups of users and grant group-level permissions that apply to all users in that group.

These users are referred to as IAM users that you create and manage within AWS. The parent account controls a user's ability to access AWS. Any resources an IAM user creates are under the control of and paid for by the parent AWS account. These IAM users can send authenticated requests to Amazon S3 using their own security credentials. For more information about creating and managing users under your AWS account, go to the [AWS Identity and Access Management product details page](#).

## Temporary security credentials

In addition to creating IAM users with their own access keys, IAM also enables you to grant temporary security credentials (temporary access keys and a security token) to any IAM user to enable them to access your AWS services and resources. You can also manage users in your system outside AWS. These are referred to as federated users. Additionally, users can be applications that you create to access your AWS resources.

IAM provides the AWS Security Token Service API for you to request temporary security credentials. You can use either the AWS STS API or the AWS SDK to request these credentials. The API returns temporary security credentials (access key ID and secret access key), and a security token. These credentials are valid only for the duration you specify when you request them. You use the access key ID and secret key the same way you use them when sending requests using your AWS account or IAM user access keys. In addition, you must include the token in each request you send to Amazon S3.

An IAM user can request these temporary security credentials for their own use or hand them out to federated users or applications. When requesting temporary security credentials for federated users, you must provide a user name and an IAM policy defining the permissions you want to associate with these temporary security credentials. The federated user cannot get more permissions than the parent IAM user who requested the temporary credentials.

You can use these temporary security credentials in making requests to Amazon S3. The API libraries compute the necessary signature value using those credentials to authenticate your request. If you send requests using expired credentials, Amazon S3 denies the request.

For information on signing requests using temporary security credentials in your REST API requests, see [Signing and authenticating REST requests \(AWS signature version 2\)](#). For information about sending requests using AWS SDKs, see [Making requests using the AWS SDKs](#).

For more information about IAM support for temporary security credentials, see [Temporary Security Credentials](#) in the *IAM User Guide*.

For added security, you can require multifactor authentication (MFA) when accessing your Amazon S3 resources by configuring a bucket policy. For information, see [Example bucket policies: Requiring MFA](#). After you require MFA to access your Amazon S3 resources, the only way you can access these resources is by providing temporary credentials that are created with an MFA key. For more information, see the [AWS Multi-Factor Authentication](#) detail page and [Configuring MFA-Protected API Access](#) in the *IAM User Guide*.

## Request endpoints

You send REST requests to the service's predefined endpoint. For a list of all AWS services and their corresponding endpoints, go to [Regions and Endpoints](#) in the *AWS General Reference*.

## Making requests to Amazon S3 over IPv6

Amazon Simple Storage Service (Amazon S3) supports the ability to access S3 buckets using the Internet Protocol version 6 (IPv6), in addition to the IPv4 protocol. Amazon S3 dual-stack endpoints support requests to S3 buckets over IPv6 and IPv4. There are no additional charges for accessing Amazon S3 over IPv6. For more information about pricing, see [Amazon S3 Pricing](#).

### Topics

- [Getting started making requests over IPv6](#)
- [Using IPv6 addresses in IAM policies](#)
- [Testing IP address compatibility](#)
- [Using Amazon S3 dual-stack endpoints](#)

## Getting started making requests over IPv6

To make a request to an S3 bucket over IPv6, you need to use a dual-stack endpoint. The next section describes how to make requests over IPv6 by using dual-stack endpoints.

The following are some things you should know before trying to access a bucket over IPv6:

- The client and the network accessing the bucket must be enabled to use IPv6.
- Both virtual hosted-style and path style requests are supported for IPv6 access. For more information, see [Amazon S3 dual-stack endpoints](#).
- If you use source IP address filtering in your AWS Identity and Access Management (IAM) user or bucket policies, you need to update the policies to include IPv6 address ranges. For more information, see [Using IPv6 addresses in IAM policies](#).
- When using IPv6, server access log files output IP addresses in an IPv6 format. You need to update existing tools, scripts, and software that you use to parse Amazon S3 log files so that they can parse the IPv6 formatted Remote IP addresses. For more information, see [Logging requests with server access logging](#).

**Note**

If you experience issues related to the presence of IPv6 addresses in log files, contact [AWS Support](#).

## Making requests over IPv6 by using dual-stack endpoints

You make requests with Amazon S3 API calls over IPv6 by using dual-stack endpoints. The Amazon S3 API operations work the same way whether you're accessing Amazon S3 over IPv6 or over IPv4. Performance should be the same too.

When using the REST API, you access a dual-stack endpoint directly. For more information, see [Dual-stack endpoints](#).

When using the AWS Command Line Interface (AWS CLI) and AWS SDKs, you can use a parameter or flag to change to a dual-stack endpoint. You can also specify the dual-stack endpoint directly as an override of the Amazon S3 endpoint in the config file.

You can use a dual-stack endpoint to access a bucket over IPv6 from any of the following:

- The AWS CLI, see [Using dual-stack endpoints from the AWS CLI](#).
- The AWS SDKs, see [Using dual-stack endpoints from the AWS SDKs](#).
- The REST API, see [Making requests to dual-stack endpoints by using the REST API](#).

## Features not available over IPv6

The following feature is currently not supported when accessing an S3 bucket over IPv6: Static website hosting from an S3 bucket.

## Using IPv6 addresses in IAM policies

Before trying to access a bucket using IPv6, you must ensure that any IAM user or S3 bucket policies that are used for IP address filtering are updated to include IPv6 address ranges. IP address filtering policies that are not updated to handle IPv6 addresses may result in clients incorrectly losing or gaining access to the bucket when they start using IPv6. For more information about managing access permissions with IAM, see [Identity and Access Management for Amazon S3](#).

IAM policies that filter IP addresses use [IP Address Condition Operators](#). The following bucket policy identifies the 54.240.143.\* range of allowed IPv4 addresses by using IP address condition operators. Any IP addresses outside of this range will be denied access to the bucket (examplebucket). Since all IPv6 addresses are outside of the allowed range, this policy prevents IPv6 addresses from being able to access examplebucket.

## JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "IPAllow",
      "Effect": "Allow",
      "Principal": "*",
      "Action": "s3:*",
      "Resource": "arn:aws:s3:::examplebucket/*",
      "Condition": {
        "IpAddress": {"aws:SourceIp": "54.240.143.0/24"}
      }
    }
  ]
}
```

You can modify the bucket policy's Condition element to allow both IPv4 (54.240.143.0/24) and IPv6 (2001:DB8:1234:5678::/64) address ranges as shown in the following example. You can use the same type of Condition block shown in the example to update both your IAM user and bucket policies.

```
"Condition": {
  "IpAddress": {
    "aws:SourceIp": [
      "54.240.143.0/24",
      "2001:DB8:1234:5678::/64"
    ]
  }
}
```

Before using IPv6 you must update all relevant IAM user and bucket policies that use IP address filtering. We do not recommend using IP address filtering in bucket policies.

You can review your IAM user policies using the IAM console at <https://console.aws.amazon.com/iam/>. For more information about IAM, see the [IAM User Guide](#). For information about editing S3 bucket policies, see [Adding a bucket policy](#).

## Testing IP address compatibility

If you are using Linux/Unix or Mac OS X, you can test whether you can access a dual-stack endpoint over IPv6 by using the `curl` command as shown in the following example:

### Example

```
curl -v http://s3.dualstack.us-west-2.amazonaws.com/
```

You get back information similar to the following example. If you are connected over IPv6 the connected IP address will be an IPv6 address.

```
* About to connect() to s3-us-west-2.amazonaws.com port 80 (#0)
* Trying IPv6 address... connected
* Connected to s3.dualstack.us-west-2.amazonaws.com (IPv6 address) port 80 (#0)
> GET / HTTP/1.1
> User-Agent: curl/7.18.1 (x86_64-unknown-linux-gnu) libcurl/7.18.1 OpenSSL/1.0.1t
zlib/1.2.3
> Host: s3.dualstack.us-west-2.amazonaws.com
```

If you are using Microsoft Windows 7 or Windows 10, you can test whether you can access a dual-stack endpoint over IPv6 or IPv4 by using the `ping` command as shown in the following example.

```
ping ipv6.s3.dualstack.us-west-2.amazonaws.com
```

## Using Amazon S3 dual-stack endpoints

Amazon S3 dual-stack endpoints support requests to S3 buckets over IPv6 and IPv4. This section describes how to use dual-stack endpoints.

### Topics

- [Amazon S3 dual-stack endpoints](#)
- [Using dual-stack endpoints from the AWS CLI](#)
- [Using dual-stack endpoints from the AWS SDKs](#)
- [Using dual-stack endpoints from the REST API](#)

## Amazon S3 dual-stack endpoints

When you make a request to a dual-stack endpoint, the bucket URL resolves to an IPv6 or an IPv4 address. For more information about accessing a bucket over IPv6, see [Making requests to Amazon S3 over IPv6](#).

When using the REST API, you directly access an Amazon S3 endpoint by using the endpoint name (URI). You can access an S3 bucket through a dual-stack endpoint by using a virtual hosted-style or a path-style endpoint name. Amazon S3 supports only regional dual-stack endpoint names, which means that you must specify the region as part of the name.

Use the following naming conventions for the dual-stack virtual hosted-style and path-style endpoint names:

- Virtual hosted-style dual-stack endpoint:

*bucketname*.s3.dualstack.*aws-region*.amazonaws.com

- Path-style dual-stack endpoint:

s3.dualstack.*aws-region*.amazonaws.com/*bucketname*

For more information, about endpoint name style, see [Accessing and listing an Amazon S3 bucket](#). For a list of Amazon S3 endpoints, see [Regions and Endpoints](#) in the *AWS General Reference*.

### Important

You can use transfer acceleration with dual-stack endpoints. For more information, see [Getting started with Amazon S3 Transfer Acceleration](#).

**Note**

The two types of VPC endpoints to access Amazon S3 (*Interface VPC endpoints* and *Gateway VPC endpoints*) don't have dual-stack support. For more information about VPC endpoints for Amazon S3, see [AWS PrivateLink for Amazon S3](#) .

When using the AWS Command Line Interface (AWS CLI) and AWS SDKs, you can use a parameter or flag to change to a dual-stack endpoint. You can also specify the dual-stack endpoint directly as an override of the Amazon S3 endpoint in the config file. The following sections describe how to use dual-stack endpoints from the AWS CLI and the AWS SDKs.

### Using dual-stack endpoints from the AWS CLI

This section provides examples of AWS CLI commands used to make requests to a dual-stack endpoint. For instructions on setting up the AWS CLI, see [Developing with Amazon S3 using the AWS CLI](#).

You set the configuration value `use_dualstack_endpoint` to `true` in a profile in your AWS Config file to direct all Amazon S3 requests made by the `s3` and `s3api` AWS CLI commands to the dual-stack endpoint for the specified region. You specify the region in the config file or in a command using the `--region` option.

When using dual-stack endpoints with the AWS CLI, both `path` and `virtual` addressing styles are supported. The addressing style, set in the config file, controls if the bucket name is in the hostname or part of the URL. By default, the CLI will attempt to use virtual style where possible, but will fall back to path style if necessary. For more information, see [AWS CLI Amazon S3 Configuration](#).

You can also make configuration changes by using a command, as shown in the following example, which sets `use_dualstack_endpoint` to `true` and `addressing_style` to `virtual` in the default profile.

```
$ aws configure set default.s3.use_dualstack_endpoint true
$ aws configure set default.s3.addressing_style virtual
```

If you want to use a dual-stack endpoint for specified AWS CLI commands only (not all commands), you can use either of the following methods:

- You can use the dual-stack endpoint per command by setting the `--endpoint-url` parameter to `https://s3.dualstack.aws-region.amazonaws.com` or `http://s3.dualstack.aws-region.amazonaws.com` for any `s3` or `s3api` command.

```
$ aws s3api list-objects --bucket bucketname --endpoint-url https://s3.dualstack.aws-region.amazonaws.com
```

- You can set up separate profiles in your AWS Config file. For example, create one profile that sets `use_dualstack_endpoint` to `true` and a profile that does not set `use_dualstack_endpoint`. When you run a command, specify which profile you want to use, depending upon whether or not you want to use the dual-stack endpoint.

### Note

When using the AWS CLI you currently cannot use transfer acceleration with dual-stack endpoints. However, support for the AWS CLI is coming soon. For more information, see [Enabling and using S3 Transfer Acceleration](#).

## Using dual-stack endpoints from the AWS SDKs

This section provides examples of how to access a dual-stack endpoint by using the AWS SDKs.

### AWS SDK for Java dual-stack endpoint example

The following example shows how to enable dual-stack endpoints when creating an Amazon S3 client using the AWS SDK for Java.

For instructions on creating and testing a working Java sample, see [Getting Started](#) in the AWS SDK for Java Developer Guide.

```
import com.amazonaws.AmazonServiceException;
import com.amazonaws.SdkClientException;
import com.amazonaws.auth.profile.ProfileCredentialsProvider;
import com.amazonaws.regions.Regions;
import com.amazonaws.services.s3.AmazonS3;
import com.amazonaws.services.s3.AmazonS3ClientBuilder;

public class DualStackEndpoints {
```

```
public static void main(String[] args) {
    Regions clientRegion = Regions.DEFAULT_REGION;
    String bucketName = "**** Bucket name ****";

    try {
        // Create an Amazon S3 client with dual-stack endpoints enabled.
        AmazonS3 s3Client = AmazonS3ClientBuilder.standard()
            .withCredentials(new ProfileCredentialsProvider())
            .withRegion(clientRegion)
            .withDualstackEnabled(true)
            .build();

        s3Client.listObjects(bucketName);
    } catch (AmazonServiceException e) {
        // The call was transmitted successfully, but Amazon S3 couldn't process
        // it, so it returned an error response.
        e.printStackTrace();
    } catch (SdkClientException e) {
        // Amazon S3 couldn't be contacted for a response, or the client
        // couldn't parse the response from Amazon S3.
        e.printStackTrace();
    }
}
```

If you are using the AWS SDK for Java on Windows, you might have to set the following Java virtual machine (JVM) property:

```
java.net.preferIPv6Addresses=true
```

### **AWS .NET SDK dual-stack endpoint example**

When using the AWS SDK for .NET you use the `AmazonS3Config` class to enable the use of a dual-stack endpoint as shown in the following example.

```
using Amazon;
using Amazon.S3;
using Amazon.S3.Model;
using System;
using System.Threading.Tasks;
```

```
namespace Amazon.DocSamples.S3
{
    class DualStackEndpointTest
    {
        private const string bucketName = "*** bucket name ***";
        // Specify your bucket region (an example region is shown).
        private static readonly RegionEndpoint bucketRegion = RegionEndpoint.USWest2;
        private static IAmazonS3 client;

        public static void Main()
        {
            var config = new AmazonS3Config
            {
                UseDualstackEndpoint = true,
                RegionEndpoint = bucketRegion
            };
            client = new AmazonS3Client(config);
            Console.WriteLine("Listing objects stored in a bucket");
            ListingObjectsAsync().Wait();
        }

        private static async Task ListingObjectsAsync()
        {
            try
            {
                var request = new ListObjectsV2Request
                {
                    BucketName = bucketName,
                    MaxKeys = 10
                };
                ListObjectsV2Response response;
                do
                {
                    response = await client.ListObjectsV2Async(request);

                    // Process the response.
                    foreach (S3Object entry in response.S3Objects)
                    {
                        Console.WriteLine("key = {0} size = {1}",
                            entry.Key, entry.Size);
                    }
                    Console.WriteLine("Next Continuation Token: {0}",
                        response.NextContinuationToken);
                    request.ContinuationToken = response.NextContinuationToken;
                } while (response.IsTruncated);
            }
            catch { }
        }
    }
}
```

```
        } while (response.IsTruncated == true);
    }
    catch (AmazonS3Exception amazonS3Exception)
    {
        Console.WriteLine("An AmazonS3Exception was thrown. Exception: " +
amazonS3Exception.ToString());
    }
    catch (Exception e)
    {
        Console.WriteLine("Exception: " + e.ToString());
    }
}
}
```

For information about setting up and running the code examples, see [Getting Started with the AWS SDK for .NET](#) in the *AWS SDK for .NET Developer Guide*.

### Using dual-stack endpoints from the REST API

For information about making requests to dual-stack endpoints by using the REST API, see [Making requests to dual-stack endpoints by using the REST API](#).

# Making requests using the AWS SDKs

## Topics

- [Making requests using AWS account or IAM user credentials](#)
- [Making requests using IAM user temporary credentials](#)
- [Making requests using federated user temporary credentials](#)

You can send authenticated requests to Amazon S3 using either the AWS SDK or by making the REST API calls directly in your application. The AWS SDK API uses the credentials that you provide to compute the signature for authentication. If you use the REST API directly in your applications, you must write the necessary code to compute the signature for authenticating your request. For a list of available AWS SDKs go to, [Sample Code and Libraries](#).

## Making requests using AWS account or IAM user credentials

You can use your AWS account or IAM user security credentials to send authenticated requests to Amazon S3. This section provides examples of how you can send authenticated requests using the AWS SDK for Java, AWS SDK for .NET, and AWS SDK for PHP. For a list of available AWS SDKs, go to [Sample Code and Libraries](#).

Each of these AWS SDKs uses an SDK-specific credentials provider chain to find and use credentials and perform actions on behalf of the credentials owner. What all these credentials provider chains have in common is that they all look for your local AWS credentials file.

For more information, see the topics below:

## Topics

- [To create a local AWS credentials file](#)
- [Sending authenticated requests using the AWS SDKs](#)

## To create a local AWS credentials file

The easiest way to configure credentials for your AWS SDKs is to use an AWS credentials file. If you use the AWS Command Line Interface (AWS CLI), you may already have a local AWS credentials file configured. Otherwise, use the following procedure to set up a credentials file:

1. Sign in to the AWS Management Console and open the IAM console at <https://console.aws.amazon.com/iam/>.

2. Create a new user with permissions limited to the services and actions that you want your code to have access to. For more information about creating a new user, see [Creating IAM users \(Console\)](#), and follow the instructions through step 8.
3. Choose **Download .csv** to save a local copy of your AWS credentials.
4. On your computer, navigate to your home directory, and create an `.aws` directory. On Unix-based systems, such as Linux or OS X, this is in the following location:

```
~/ .aws
```

On Windows, this is in the following location:

```
%HOMEPATH%\ .aws
```

5. In the `.aws` directory, create a new file named `credentials`.
6. Open the `credentials .csv` file that you downloaded from the IAM console, and copy its contents into the `credentials` file using the following format:

```
[default]
aws_access_key_id = your_access_key_id
aws_secret_access_key = your_secret_access_key
```

7. Save the `credentials` file, and delete the `.csv` file that you downloaded in step 3.

Your shared credentials file is now configured on your local computer, and it's ready to be used with the AWS SDKs.

## Sending authenticated requests using the AWS SDKs

Use the AWS SDKs to send authenticated requests. For more information about sending authenticated requests, see [AWS security credentials](#) or [IAM Identity Center Authentication](#).

### Java

For information about authenticating requests using the AWS SDK for Java, see [Using shared config and credentials files to globally configure AWS SDKs and tools](#) and [Authentication and access using AWS SDKs and tools](#) in the AWS SDKs and Tools Reference Guide.

### .NET

To send authenticated requests using your AWS account or IAM user credentials:

- Create an instance of the `AmazonS3Client` class.
- Run one of the `AmazonS3Client` methods to send requests to Amazon S3. The client generates the necessary signature from the credentials that you provide and includes it in the request it sends to Amazon S3.

For more information, see [Making requests using AWS account or IAM user credentials](#) >.

### Note

- You can create the `AmazonS3Client` client without providing your security credentials. Requests sent using this client are anonymous requests, without a signature. Amazon S3 returns an error if you send anonymous requests for a resource that is not publicly available.
- You can create an AWS account and create the required users. You can also manage credentials for those users. You need these credentials to perform the task in the following example. For more information, see [Configure AWS credentials](#) in the *SDK for .NET Developer Guide*.

You can then also configure your application to actively retrieve profiles and credentials, and then explicitly use those credentials when creating an AWS service client. For more information, see [Accessing credentials and profiles in an application](#) in the *SDK for .NET Developer Guide*.

The following C# example shows how to perform the preceding tasks. For information about setting up and running the code examples, see [Getting Started with the AWS SDK for .NET](#) in the *AWS SDK for .NET Developer Guide*.

### Example

```
using Amazon;
using Amazon.S3;
using Amazon.S3.Model;
using System;
using System.Threading.Tasks;

namespace Amazon.DocSamples.S3
{
```

```
class MakeS3RequestTest
{
    private const string bucketName = "**** bucket name ****";
    // Specify your bucket region (an example region is shown).
    private static readonly RegionEndpoint bucketRegion =
RegionEndpoint.USWest2;
    private static IAmazonS3 client;

    public static void Main()
    {
        using (client = new AmazonS3Client(bucketRegion))
        {
            Console.WriteLine("Listing objects stored in a bucket");
            ListingObjectsAsync().Wait();
        }
    }

    static async Task ListingObjectsAsync()
    {
        try
        {
            ListObjectsRequest request = new ListObjectsRequest
            {
                BucketName = bucketName,
                MaxKeys = 2
            };
            do
            {
                ListObjectsResponse response = await
client.ListObjectsAsync(request);
                // Process the response.
                foreach (S3Object entry in response.S3Objects)
                {
                    Console.WriteLine("key = {0} size = {1}",
                        entry.Key, entry.Size);
                }

                // If the response is truncated, set the marker to get the next
                // set of keys.
                if (response.IsTruncated)
                {
                    request.Marker = response.NextMarker;
                }
            }
            else
            {
            }
        }
    }
}
```

```
        {
            request = null;
        }
    } while (request != null);
}
catch (AmazonS3Exception e)
{
    Console.WriteLine("Error encountered on server. Message:'{0}' when
writing an object", e.Message);
}
catch (Exception e)
{
    Console.WriteLine("Unknown encountered on server. Message:'{0}' when
writing an object", e.Message);
}
}
}
```

## PHP

The following PHP example shows how the client makes a request using your security credentials to list all of the buckets for your account.

### Example

```
require 'vendor/autoload.php';

use Aws\S3\Exception\S3Exception;
use Aws\S3\S3Client;

$bucket = '*** Your Bucket Name ***';

$s3 = new S3Client([
    'region' => 'us-east-1',
    'version' => 'latest',
]);

// Retrieve the list of buckets.
$result = $s3->listBuckets();

try {
    // Retrieve a paginator for listing objects.
```

```
$objects = $s3->getPaginator('ListObjects', [
    'Bucket' => $bucket
]);

echo "Keys retrieved!" . PHP_EOL;

// Print the list of objects to the page.
foreach ($objects as $object) {
    echo $object['Key'] . PHP_EOL;
}
} catch (S3Exception $e) {
    echo $e->getMessage() . PHP_EOL;
}
```

### Note

You can create the `S3Client` client without providing your security credentials. Requests sent using this client are anonymous requests, without a signature. Amazon S3 returns an error if you send anonymous requests for a resource that is not publicly available. For more information, see [Creating Anonymous Clients](#) in the [AWS SDK for PHP Documentation](#).

## Ruby

Before you can use version 3 of the AWS SDK for Ruby to make calls to Amazon S3, you must set the AWS access credentials that the SDK uses to verify your access to your buckets and objects. If you have shared credentials set up in the AWS credentials profile on your local system, version 3 of the SDK for Ruby can use those credentials without your having to declare them in your code. For more information about setting up shared credentials, see [Making requests using AWS account or IAM user credentials](#).

The following Ruby code snippet uses the credentials in a shared AWS credentials file on a local computer to authenticate a request to get all of the object key names in a specific bucket. It does the following:

1. Creates an instance of the `Aws::S3::Client` class.
2. Makes a request to Amazon S3 by enumerating objects in a bucket using the `list_objects_v2` method of `Aws::S3::Client`. The client generates the necessary

signature value from the credentials in the AWS credentials file on your computer, and includes it in the request it sends to Amazon S3.

3. Prints the array of object key names to the terminal.

## Example

```
# Prerequisites:
# - An existing Amazon S3 bucket.

require 'aws-sdk-s3'

# @param s3_client [Aws::S3::Client] An initialized Amazon S3 client.
# @param bucket_name [String] The bucket's name.
# @return [Boolean] true if all operations succeed; otherwise, false.
# @example
#   s3_client = Aws::S3::Client.new(region: 'us-west-2')
#   exit 1 unless list_bucket_objects?(s3_client, 'amzn-s3-demo-bucket')
def list_bucket_objects?(s3_client, bucket_name)
  puts "Accessing the bucket named '#{bucket_name}'..."
  objects = s3_client.list_objects_v2(
    bucket: bucket_name,
    max_keys: 50
  )

  if objects.count.positive?
    puts 'The object keys in this bucket are (first 50 objects):'
    objects.contents.each do |object|
      puts object.key
    end
  else
    puts 'No objects found in this bucket.'
  end

  true
rescue StandardError => e
  puts "Error while accessing the bucket named '#{bucket_name}': #{e.message}"
  false
end

# Example usage:
def run_me
```

```
region = 'us-west-2'
bucket_name = 'BUCKET_NAME'
s3_client = Aws::S3::Client.new(region: region)

exit 1 unless list_bucket_objects?(s3_client, bucket_name)
end

run_me if $PROGRAM_NAME == __FILE__
```

If you don't have a local AWS credentials file, you can still create the `Aws::S3::Client` resource and run code against Amazon S3 buckets and objects. Requests that are sent using version 3 of the SDK for Ruby are anonymous, with no signature by default. Amazon S3 returns an error if you send anonymous requests for a resource that's not publicly available.

You can use and expand the previous code snippet for SDK for Ruby applications, as in the following more robust example.

```
# Prerequisites:
# - An existing Amazon S3 bucket.

require 'aws-sdk-s3'

# @param s3_client [Aws::S3::Client] An initialized Amazon S3 client.
# @param bucket_name [String] The bucket's name.
# @return [Boolean] true if all operations succeed; otherwise, false.
# @example
#   s3_client = Aws::S3::Client.new(region: 'us-west-2')
#   exit 1 unless list_bucket_objects?(s3_client, 'amzn-s3-demo-bucket')
def list_bucket_objects?(s3_client, bucket_name)
  puts "Accessing the bucket named '#{bucket_name}'..."
  objects = s3_client.list_objects_v2(
    bucket: bucket_name,
    max_keys: 50
  )

  if objects.count.positive?
    puts 'The object keys in this bucket are (first 50 objects):'
    objects.contents.each do |object|
      puts object.key
    end
  else

```

```
    puts 'No objects found in this bucket.'
  end

  true
rescue StandardError => e
  puts "Error while accessing the bucket named '#{bucket_name}': #{e.message}"
  false
end

# Example usage:
def run_me
  region = 'us-west-2'
  bucket_name = 'BUCKET_NAME'
  s3_client = Aws::S3::Client.new(region: region)

  exit 1 unless list_bucket_objects?(s3_client, bucket_name)
end

run_me if $PROGRAM_NAME == __FILE__
```

## Go

### Example

The following example uses AWS credentials automatically loaded by the SDK for Go from the shared credentials file.

```
package main

import (
    "context"
    "errors"
    "fmt"

    "github.com/aws/aws-sdk-go-v2/config"
    "github.com/aws/aws-sdk-go-v2/service/s3"
    "github.com/aws/smithy-go"
)

// main uses the AWS SDK for Go V2 to create an Amazon Simple Storage Service
// (Amazon S3) client and list up to 10 buckets in your account.
// This example uses the default settings specified in your shared credentials
```

```
// and config files.
func main() {
    ctx := context.Background()
    sdkConfig, err := config.LoadDefaultConfig(ctx)
    if err != nil {
        fmt.Println("Couldn't load default configuration. Have you set up your AWS
account?")
        fmt.Println(err)
        return
    }
    s3Client := s3.NewFromConfig(sdkConfig)
    count := 10
    fmt.Printf("Let's list up to %v buckets for your account.\n", count)
    result, err := s3Client.ListBuckets(ctx, &s3.ListBucketsInput{})
    if err != nil {
        var ae smithy.APIError
        if errors.As(err, &ae) && ae.ErrorCode() == "AccessDenied" {
            fmt.Println("You don't have permission to list buckets for this account.")
        } else {
            fmt.Printf("Couldn't list buckets for your account. Here's why: %v\n", err)
        }
        return
    }
    if len(result.Buckets) == 0 {
        fmt.Println("You don't have any buckets!")
    } else {
        if count > len(result.Buckets) {
            count = len(result.Buckets)
        }
        for _, bucket := range result.Buckets[:count] {
            fmt.Printf("\t\t%v\n", *bucket.Name)
        }
    }
}
```

## Making requests using IAM user temporary credentials

An AWS account or an IAM user can request temporary security credentials and use them to send authenticated requests to Amazon S3. This section provides examples of how to use the AWS SDK for Java, .NET, and PHP to obtain temporary security credentials and use them to authenticate your requests to Amazon S3.

### Java

An IAM user or an AWS account can request temporary security credentials (see [Making requests](#)) using the AWS SDK for Java and use them to access Amazon S3. These credentials expire after the specified session duration.

By default, the session duration is one hour. If you use IAM user credentials, you can specify the duration when requesting the temporary security credentials from 15 minutes to the maximum session duration for the role. For more information about temporary security credentials, see [Temporary Security Credentials](#) in the *IAM User Guide*. For more information about making requests, see [Making requests](#).

### To get temporary security credentials and access Amazon S3

1. Create an instance of the `AWSSecurityTokenService` class.
2. Retrieve the temporary security credentials for the desired role by calling the `assumeRole()` method of the Security Token Service (STS) client.
3. Package the temporary security credentials into a `BasicSessionCredentials` object. You use this object to provide the temporary security credentials to your Amazon S3 client.
4. Create an instance of the `AmazonS3Client` class using the temporary security credentials. You send requests to Amazon S3 using this client. If you send requests using expired credentials, Amazon S3 will return an error.

#### Note

The following example lists a set of object keys in the specified bucket. The example obtains temporary security credentials for a session and uses them to send an authenticated request to Amazon S3.

If you want to test the sample by using IAM user credentials, you must create an IAM user under your AWS account. For more information about how to create an IAM user, see [Creating Your First IAM user and Administrators Group](#) in the *IAM User Guide*.

For instructions on creating and testing a working sample, see [Getting Started](#) in the AWS SDK for Java Developer Guide.

```
import com.amazonaws.AmazonServiceException;
import com.amazonaws.SdkClientException;
import com.amazonaws.auth.AWSSStaticCredentialsProvider;
import com.amazonaws.auth.BasicSessionCredentials;
import com.amazonaws.auth.profile.ProfileCredentialsProvider;
import com.amazonaws.services.s3.AmazonS3;
import com.amazonaws.services.s3.AmazonS3ClientBuilder;
import com.amazonaws.services.s3.model.ObjectListing;
import com.amazonaws.services.securitytoken.AWSSecurityTokenService;
import com.amazonaws.services.securitytoken.AWSSecurityTokenServiceClientBuilder;
import com.amazonaws.services.securitytoken.model.AssumeRoleRequest;
import com.amazonaws.services.securitytoken.model.AssumeRoleResult;
import com.amazonaws.services.securitytoken.model.Credentials;

public class MakingRequestsWithIAMTempCredentials {
    public static void main(String[] args) {
        String clientRegion = "**** Client region ****";
        String roleARN = "**** ARN for role to be assumed ****";
        String roleSessionName = "**** Role session name ****";
        String bucketName = "**** Bucket name ****";

        try {
            // Creating the STS client is part of your trusted code. It has
            // the security credentials you use to obtain temporary security
            credentials.
            AWSSecurityTokenService stsClient =
            AWSSecurityTokenServiceClientBuilder.standard()
                .withCredentials(new ProfileCredentialsProvider())
                .withRegion(clientRegion)
                .build();

            // Obtain credentials for the IAM role. Note that you cannot assume the
            role of
            // an AWS root account;
```

```
or an // Amazon S3 will deny access. You must use credentials for an IAM user
// IAM role.
AssumeRoleRequest roleRequest = new AssumeRoleRequest()
    .withRoleArn(roleARN)
    .withRoleSessionName(roleSessionName);
AssumeRoleResult roleResponse = stsClient.assumeRole(roleRequest);
Credentials sessionCredentials = roleResponse.getCredentials();

you // Create a BasicSessionCredentials object that contains the credentials
// just retrieved.
BasicSessionCredentials awsCredentials = new BasicSessionCredentials(
    sessionCredentials.getAccessKeyId(),
    sessionCredentials.getSecretAccessKey(),
    sessionCredentials.getSessionToken());

// Provide temporary security credentials so that the Amazon S3 client
// can send authenticated requests to Amazon S3. You create the client
// using the sessionCredentials object.
AmazonS3 s3Client = AmazonS3ClientBuilder.standard()
    .withCredentials(new
AWSStaticCredentialsProvider(awsCredentials))
    .withRegion(clientRegion)
    .build();

correctly // Verify that assuming the role worked and the permissions are set
// by getting a set of object keys from the bucket.
ObjectListing objects = s3Client.listObjects(bucketName);
System.out.println("No. of Objects: " +
objects.getObjectSummaries().size());
    } catch (AmazonServiceException e) {
        // The call was transmitted successfully, but Amazon S3 couldn't process
        // it, so it returned an error response.
        e.printStackTrace();
    } catch (SdkClientException e) {
        // Amazon S3 couldn't be contacted for a response, or the client
        // couldn't parse the response from Amazon S3.
        e.printStackTrace();
    }
}
}
```

## .NET

An IAM user or an AWS account can request temporary security credentials using the AWS SDK for .NET and use them to access Amazon S3. These credentials expire after the session duration.

By default, the session duration is one hour. If you use IAM user credentials, you can specify the duration when requesting the temporary security credentials from 15 minutes to the maximum session duration for the role. For more information about temporary security credentials, see [Temporary Security Credentials](#) in the *IAM User Guide*. For more information about making requests, see [Making requests](#).

### To get temporary security credentials and access Amazon S3

1. Create an instance of the AWS Security Token Service client, `AmazonSecurityTokenServiceClient`.
2. Start a session by calling the `GetSessionToken` method of the STS client you created in the preceding step. You provide session information to this method using a `GetSessionTokenRequest` object.

The method returns your temporary security credentials.

3. Package the temporary security credentials in an instance of the `SessionAWSCredentials` object. You use this object to provide the temporary security credentials to your Amazon S3 client.
4. Create an instance of the `AmazonS3Client` class by passing in the temporary security credentials. You send requests to Amazon S3 using this client. If you send requests using expired credentials, Amazon S3 returns an error.

#### Note

The following C# example lists object keys in the specified bucket. For illustration, the example obtains temporary security credentials for a default one-hour session and uses them to send authenticated request to Amazon S3.

If you want to test the sample by using IAM user credentials, you must create an IAM user under your AWS account. For more information about how to create an IAM user, see [Creating Your First IAM user and Administrators Group](#) in the *IAM User Guide*. For more information about making requests, see [Making requests](#).

For information about setting up and running the code examples, see [Getting Started with the AWS SDK for .NET](#) in the *AWS SDK for .NET Developer Guide*.

```
using Amazon;
using Amazon.Runtime;
using Amazon.S3;
using Amazon.S3.Model;
using Amazon.SecurityToken;
using Amazon.SecurityToken.Model;
using System;
using System.Collections.Generic;
using System.Threading.Tasks;

namespace Amazon.DocSamples.S3
{
    class TempCredExplicitSessionStartTest
    {
        private const string bucketName = "*** bucket name ***";
        // Specify your bucket region (an example region is shown).
        private static readonly RegionEndpoint bucketRegion =
RegionEndpoint.USWest2;
        private static IAmazonS3 s3Client;
        public static void Main()
        {
            ListObjectsAsync().Wait();
        }

        private static async Task ListObjectsAsync()
        {
            try
            {
                // Credentials use the default AWS SDK for .NET credential search
chain.
                // On local development machines, this is your default profile.
                Console.WriteLine("Listing objects stored in a bucket");
                SessionAWSCredentials tempCredentials = await
GetTemporaryCredentialsAsync();
```

```
// Create a client by providing temporary security credentials.
using (s3Client = new AmazonS3Client(tempCredentials, bucketRegion))
{
    var listObjectRequest = new ListObjectsRequest
    {
        BucketName = bucketName
    };
    // Send request to Amazon S3.
    ListObjectsResponse response = await
s3Client.ListObjectsAsync(listObjectRequest);
    List<S3Object> objects = response.S3Objects;
    Console.WriteLine("Object count = {0}", objects.Count);
}
}
catch (AmazonS3Exception s3Exception)
{
    Console.WriteLine(s3Exception.Message, s3Exception.InnerException);
}
catch (AmazonSecurityTokenServiceException stsException)
{
    Console.WriteLine(stsException.Message,
stsException.InnerException);
}
}

    {
        var getSessionTokenRequest = new GetSessionTokenRequest
        {
            DurationSeconds = 7200 // seconds
        };

        GetSessionTokenResponse sessionTokenResponse =
            await
stsClient.GetSessionTokenAsync(getSessionTokenRequest);

        Credentials credentials = sessionTokenResponse.Credentials;

        var sessionCredentials =
            new SessionAWSCredentials(credentials.AccessKeyId,
                credentials.SecretAccessKey,
```

```
        credentials.SessionToken);  
    }  
    return sessionCredentials;  
}  
}  
}
```

## PHP

For more information about the AWS SDK for Ruby API, go to [AWS SDK for Ruby - Version 2](#).

An IAM user or an AWS account can request temporary security credentials using version 3 of the AWS SDK for PHP. It can then use the temporary credentials to access Amazon S3. The credentials expire when the session duration expires.

By default, the session duration is one hour. If you use IAM user credentials, you can specify the duration when requesting the temporary security credentials from 15 minutes to the maximum session duration for the role. For more information about temporary security credentials, see [Temporary Security Credentials](#) in the *IAM User Guide*. For more information about making requests, see [Making requests](#).

### Note

## Example

The following PHP example lists object keys in the specified bucket using temporary security credentials. The example obtains temporary security credentials for a default one-hour session, and uses them to send authenticated request to Amazon S3. For more information about the AWS SDK for Ruby API, go to [AWS SDK for Ruby - Version 2](#).

If you want to test the example by using IAM user credentials, you must create an IAM user under your AWS account. For information about how to create an IAM user, see [Creating Your First IAM user and Administrators Group](#) in the *IAM User Guide*. For examples of setting the session duration when using IAM user credentials to request a session, see [Making requests using IAM user temporary credentials](#).

```
require 'vendor/autoload.php';  
  
use Aws\S3\Exception\S3Exception;
```

```
use Aws\S3\S3Client;
use Aws\Sts\StsClient;

$bucket = '*** Your Bucket Name ***';

$sts = new StsClient([
    'version' => 'latest',
    'region' => 'us-east-1'
]);

$sessionToken = $sts->getSessionToken();

$s3 = new S3Client([
    'region' => 'us-east-1',
    'version' => 'latest',
    'credentials' => [
        'key' => $sessionToken['Credentials']['AccessKeyId'],
        'secret' => $sessionToken['Credentials']['SecretAccessKey'],
        'token' => $sessionToken['Credentials']['SessionToken']
    ]
]);

$result = $s3->listBuckets();

try {
    // Retrieve a paginator for listing objects.
    $objects = $s3->getPaginator('ListObjects', [
        'Bucket' => $bucket
    ]);

    echo "Keys retrieved!" . PHP_EOL;

    // List objects
    foreach ($objects as $object) {
        echo $object['Key'] . PHP_EOL;
    }
} catch (S3Exception $e) {
    echo $e->getMessage() . PHP_EOL;
}
```

## Ruby

An IAM user or an AWS account can request temporary security credentials using AWS SDK for Ruby and use them to access Amazon S3. These credentials expire after the session duration.

By default, the session duration is one hour. If you use IAM user credentials, you can specify the duration when requesting the temporary security credentials from 15 minutes to the maximum session duration for the role. For more information about temporary security credentials, see [Temporary Security Credentials](#) in the *IAM User Guide*. For more information about making requests, see [Making requests](#).

### Note

The following Ruby example creates a temporary user to list the items in a specified bucket for one hour. To use this example, you must have AWS credentials that have the necessary permissions to create new AWS Security Token Service (AWS STS) clients, and list Amazon S3 buckets.

```
# Prerequisites:
# - A user in AWS Identity and Access Management (IAM). This user must
#   be able to assume the following IAM role. You must run this code example
#   within the context of this user.
# - An existing role in IAM that allows all of the Amazon S3 actions for all of the
#   resources in this code example. This role must also trust the preceding IAM
#   user.
# - An existing S3 bucket.

  puts "Error while accessing the bucket named '#{bucket_name}': #{e.message}"
end

```

## Making requests using federated user temporary credentials

You can request temporary security credentials and provide them to your federated users or applications who need to access your AWS resources. This section provides examples of how you can use the AWS SDK to obtain temporary security credentials for your federated users or applications and send authenticated requests to Amazon S3 using those credentials. For a list of available AWS SDKs, see [Sample Code and Libraries](#).

### Note

Both the AWS account and an IAM user can request temporary security credentials for federated users. However, for added security, only an IAM user with the necessary permissions should request these temporary credentials to ensure that the federated user gets at most the permissions of the requesting IAM user. In some applications, you might find it suitable to create an IAM user with specific permissions for the sole purpose of granting temporary security credentials to your federated users and applications.

### Java

You can provide temporary security credentials for your federated users and applications so that they can send authenticated requests to access your AWS resources. When requesting these temporary credentials, you must provide a user name and an IAM policy that describes the resource permissions that you want to grant. By default, the session duration is one hour. You can explicitly set a different duration value when requesting the temporary security credentials for federated users and applications.

### Note

For added security when requesting temporary security credentials for federated users and applications, we recommend that you use a dedicated IAM user with only the necessary access permissions. The temporary user you create can never get more permissions than the IAM user who requested the temporary security credentials. For more information, see [AWS Identity and Access Management FAQs](#).

To provide security credentials and send authenticated request to access resources, do the following:

- Create an instance of the `AWSecurityTokenServiceClient` class.
- Start a session by calling the `getFederationToken()` method of the Security Token Service (STS) client. Provide session information, including the user name and an IAM policy, that you want to attach to the temporary credentials. You can provide an optional session duration. This method returns your temporary security credentials.
- Package the temporary security credentials in an instance of the `BasicSessionCredentials` object. You use this object to provide the temporary security credentials to your Amazon S3 client.
- Create an instance of the `AmazonS3Client` class using the temporary security credentials. You send requests to Amazon S3 using this client. If you send requests using expired credentials, Amazon S3 returns an error.

## Example

The example lists keys in the specified S3 bucket. In the example, you obtain temporary security credentials for a two-hour session for your federated user and use the credentials to send authenticated requests to Amazon S3. To run the example, you need to create an IAM user with an attached policy that allows the user to request temporary security credentials and list your AWS resources. The following policy accomplishes this:

```
{
  "Statement": [{
    "Action": ["s3:ListBucket",
      "sts:GetFederationToken*"],
    "Effect": "Allow",
    "Resource": "*"
  }]
}
```

For more information about how to create an IAM user, see [Creating Your First IAM user and Administrators Group](#) in the *IAM User Guide*.

After creating an IAM user and attaching the preceding policy, you can run the following example. For instructions on creating and testing a working sample, see [Getting Started](#) in the *AWS SDK for Java Developer Guide*.

```
import com.amazonaws.AmazonServiceException;
import com.amazonaws.SdkClientException;
import com.amazonaws.auth.AWSStaticCredentialsProvider;
import com.amazonaws.auth.BasicSessionCredentials;
import com.amazonaws.auth.policy.Policy;
import com.amazonaws.auth.policy.Resource;
import com.amazonaws.auth.policy.Statement;
import com.amazonaws.auth.policy.Statement.Effect;
import com.amazonaws.auth.policy.actions.S3Actions;
import com.amazonaws.auth.profile.ProfileCredentialsProvider;
import com.amazonaws.regions.Regions;
import com.amazonaws.services.s3.AmazonS3;
import com.amazonaws.services.s3.AmazonS3ClientBuilder;
import com.amazonaws.services.s3.model.ObjectListing;
import com.amazonaws.services.securitytoken.AWSSecurityTokenService;
import com.amazonaws.services.securitytoken.AWSSecurityTokenServiceClientBuilder;
import com.amazonaws.services.securitytoken.model.Credentials;
import com.amazonaws.services.securitytoken.model.GetFederationTokenRequest;
import com.amazonaws.services.securitytoken.model.GetFederationTokenResult;

import java.io.IOException;

public class MakingRequestsWithFederatedTempCredentials {

    public static void main(String[] args) throws IOException {
        Regions clientRegion = Regions.DEFAULT_REGION;
        String bucketName = "*** Specify bucket name ***";
        String federatedUser = "*** Federated user name ***";
        String resourceARN = "arn:aws:s3:::" + bucketName;

        try {
            AWSSecurityTokenService stsClient = AWSSecurityTokenServiceClientBuilder
                .standard()
                .withCredentials(new ProfileCredentialsProvider())
                .withRegion(clientRegion)
                .build();

            GetFederationTokenRequest getFederationTokenRequest = new
            GetFederationTokenRequest();
            getFederationTokenRequest.setDurationSeconds(7200);
            getFederationTokenRequest.setName(federatedUser);
```

```
// Define the policy and add it to the request.
Policy policy = new Policy();
policy.withStatements(new Statement(Effect.Allow)
    .withActions(S3Actions.ListObjects)
    .withResources(new Resource(resourceARN)));
getFederationTokenRequest.setPolicy(policy.toJson());

// Get the temporary security credentials.
GetFederationTokenResult federationTokenResult =
stsClient.getFederationToken(getFederationTokenRequest);
Credentials sessionCredentials = federationTokenResult.getCredentials();

// Package the session credentials as a BasicSessionCredentials
// object for an Amazon S3 client object to use.
BasicSessionCredentials basicSessionCredentials = new
BasicSessionCredentials(
    sessionCredentials.getAccessKeyId(),
    sessionCredentials.getSecretAccessKey(),
    sessionCredentials.getSessionToken());
AmazonS3 s3Client = AmazonS3ClientBuilder.standard()
    .withCredentials(new
AWSStaticCredentialsProvider(basicSessionCredentials))
    .withRegion(clientRegion)
    .build();

// To verify that the client works, send a listObjects request using
// the temporary security credentials.
ObjectListing objects = s3Client.listObjects(bucketName);
System.out.println("No. of Objects = " +
objects.getObjectSummaries().size());
} catch (AmazonServiceException e) {
    // The call was transmitted successfully, but Amazon S3 couldn't process
    // it, so it returned an error response.
    e.printStackTrace();
} catch (SdkClientException e) {
    // Amazon S3 couldn't be contacted for a response, or the client
    // couldn't parse the response from Amazon S3.
    e.printStackTrace();
}
}
}
```

## .NET

You can provide temporary security credentials for your federated users and applications so that they can send authenticated requests to access your AWS resources. When requesting these temporary credentials, you must provide a user name and an IAM policy that describes the resource permissions that you want to grant. By default, the duration of a session is one hour. You can explicitly set a different duration value when requesting the temporary security credentials for federated users and applications. For information about sending authenticated requests, see [Making requests](#).

### Note

When requesting temporary security credentials for federated users and applications, for added security, we suggest that you use a dedicated IAM user with only the necessary access permissions. The temporary user you create can never get more permissions than the IAM user who requested the temporary security credentials. For more information, see [AWS Identity and Access Management FAQs](#).

You do the following:

- Create an instance of the AWS Security Token Service client, `AmazonSecurityTokenServiceClient` class.
- Start a session by calling the `GetFederationToken` method of the STS client. You need to provide session information, including the user name and an IAM policy that you want to attach to the temporary credentials. Optionally, you can provide a session duration. This method returns your temporary security credentials.
- Package the temporary security credentials in an instance of the `SessionAWSCredentials` object. You use this object to provide the temporary security credentials to your Amazon S3 client.
- Create an instance of the `AmazonS3Client` class by passing the temporary security credentials. You use this client to send requests to Amazon S3. If you send requests using expired credentials, Amazon S3 returns an error.

## Example

The following C# example lists the keys in the specified bucket. In the example, you obtain temporary security credentials for a two-hour session for your federated user (User1), and use the credentials to send authenticated requests to Amazon S3.

- For this exercise, you create an IAM user with minimal permissions. Using the credentials of this IAM user, you request temporary credentials for others. This example lists only the objects in a specific bucket. Create an IAM user with the following policy attached:

```
{
  "Statement": [{
    "Action": ["s3:ListBucket",
      "sts:GetFederationToken*"],
    "Effect": "Allow",
    "Resource": "*"
  }
]
```

The policy allows the IAM user to request temporary security credentials and access permission only to list your AWS resources. For more information about how to create an IAM user, see [Creating Your IAM user User and Administrators Group](#) in the *IAM User Guide*.

- Use the IAM user security credentials to test the following example. The example sends authenticated request to Amazon S3 using temporary security credentials. The example specifies the following policy when requesting temporary security credentials for the federated user (User1), which restricts access to listing objects in a specific bucket (YourBucketName). You must update the policy and provide your own existing bucket name.

```
{
  "Statement": [
    {
      "Sid": "1",
      "Action": ["s3:ListBucket"],
      "Effect": "Allow",
      "Resource": "arn:aws:s3:::YourBucketName"
    }
  ]
}
```

- **Example**

Update the following sample and provide the bucket name that you specified in the preceding federated user access policy. For information about setting up and running the code examples, see [Getting Started with the AWS SDK for .NET](#) in the *AWS SDK for .NET Developer Guide*.

```
using Amazon;
using Amazon.Runtime;
using Amazon.S3;
using Amazon.S3.Model;
using Amazon.SecurityToken;
using Amazon.SecurityToken.Model;
using System;
using System.Collections.Generic;
using System.Threading.Tasks;

namespace Amazon.DocSamples.S3
{
    class TempFederatedCredentialsTest
    {
        private const string bucketName = "**** bucket name ****";
        // Specify your bucket region (an example region is shown).
        private static readonly RegionEndpoint bucketRegion =
RegionEndpoint.USWest2;
        private static IAmazonS3 client;

        public static void Main()
        {
            ListObjectsAsync().Wait();
        }

        private static async Task ListObjectsAsync()
        {
            try
            {
                Console.WriteLine("Listing objects stored in a bucket");
                // Credentials use the default AWS SDK for .NET credential search
chain.

                // On local development machines, this is your default profile.
                SessionAWSCredentials tempCredentials =
                    await GetTemporaryFederatedCredentialsAsync();
            }
            catch { }
        }
    }
}
```

```
        // Create a client by providing temporary security credentials.
        using (client = new AmazonS3Client(bucketRegion))
        {
            ListObjectsRequest listObjectRequest = new
ListObjectsRequest();
            listObjectRequest.BucketName = bucketName;

            ListObjectsResponse response = await
client.ListObjectsAsync(listObjectRequest);
            List<S3Object> objects = response.S3Objects;
            Console.WriteLine("Object count = {0}", objects.Count);

            Console.WriteLine("Press any key to continue...");
            Console.ReadKey();
        }
    }
    catch (AmazonS3Exception e)
    {
        Console.WriteLine("Error encountered ***. Message:'{0}' when
writing an object", e.Message);
    }
    catch (Exception e)
    {
        Console.WriteLine("Unknown encountered on server. Message:'{0}'
when writing an object", e.Message);
    }
}

private static async Task<SessionAWSCredentials>
GetTemporaryFederatedCredentialsAsync()
{
    AmazonSecurityTokenServiceConfig config = new
AmazonSecurityTokenServiceConfig();
    AmazonSecurityTokenServiceClient stsClient =
        new AmazonSecurityTokenServiceClient(
            config);

    GetFederationTokenRequest federationTokenRequest =
        new GetFederationTokenRequest();
    federationTokenRequest.DurationSeconds = 7200;
    federationTokenRequest.Name = "User1";
    federationTokenRequest.Policy = @"{
        ""Statement"":
        [
```

```
        {
            "Sid": "Stmt1311212314284",
            "Action": ["s3:ListBucket"],
            "Effect": "Allow",
            "Resource": "arn:aws:s3::" + bucketName + @"*"
        }
    ]
}
";

GetFederationTokenResponse federationTokenResponse =
    await
stsClient.GetFederationTokenAsync(federationTokenRequest);
Credentials credentials = federationTokenResponse.Credentials;

SessionAWSCredentials sessionCredentials =
    new SessionAWSCredentials(credentials.AccessKeyId,
                              credentials.SecretAccessKey,
                              credentials.SessionToken);

return sessionCredentials;
}
}
}
```

## PHP

This topic explains how to use classes from version 3 of the AWS SDK for PHP to request temporary security credentials for federated users and applications and use them to access resources stored in Amazon S3. For more information about the AWS SDK for Ruby API, go to [AWS SDK for Ruby - Version 2](#).

You can provide temporary security credentials to your federated users and applications so they can send authenticated requests to access your AWS resources. When requesting these temporary credentials, you must provide a user name and an IAM policy that describes the resource permissions that you want to grant. These credentials expire when the session duration expires. By default, the session duration is one hour. You can explicitly set a different value for the duration when requesting the temporary security credentials for federated users and applications. For more information about temporary security credentials, see [Temporary Security Credentials](#) in the *IAM User Guide*. For information about providing temporary security credentials to your federated users and applications, see [Making requests](#).

For added security when requesting temporary security credentials for federated users and applications, we recommend using a dedicated IAM user with only the necessary access permissions. The temporary user you create can never get more permissions than the IAM user who requested the temporary security credentials. For information about identity federation, see [AWS Identity and Access Management FAQs](#).

For more information about the AWS SDK for Ruby API, go to [AWS SDK for Ruby - Version 2](#).

## Example

The following PHP example lists keys in the specified bucket. In the example, you obtain temporary security credentials for an hour session for your federated user (User1). Then you use the temporary security credentials to send authenticated requests to Amazon S3.

For added security when requesting temporary credentials for others, you use the security credentials of an IAM user who has permissions to request temporary security credentials. To ensure that the IAM user grants only the minimum application-specific permissions to the federated user, you can also limit the access permissions of this IAM user. This example lists only objects in a specific bucket. Create an IAM user with the following policy attached:

```
{
  "Statement": [{
    "Action": ["s3:ListBucket",
      "sts:GetFederationToken*"],
    "Effect": "Allow",
    "Resource": "*"
  }
]
```

The policy allows the IAM user to request temporary security credentials and access permission only to list your AWS resources. For more information about how to create an IAM user, see [Creating Your First IAM user and Administrators Group](#) in the *IAM User Guide*.

You can now use the IAM user security credentials to test the following example. The example sends an authenticated request to Amazon S3 using temporary security credentials. When requesting temporary security credentials for the federated user (User1), the example specifies the following policy, which restricts access to list objects in a specific bucket. Update the policy with your bucket name.

```
{
  "Statement": [
    {
      "Sid": "1",
      "Action": ["s3:ListBucket"],
      "Effect": "Allow",
      "Resource": "arn:aws:s3:::YourBucketName"
    }
  ]
}
```

In the following example, when specifying the policy resource, replace `YourBucketName` with the name of your bucket.:

```
require 'vendor/autoload.php';

use Aws\S3\Exception\S3Exception;
use Aws\S3\S3Client;
use Aws\Sts\StsClient;

$bucket = '*** Your Bucket Name ***';

// In real applications, the following code is part of your trusted code. It has
// the security credentials that you use to obtain temporary security credentials.
$sts = new StsClient([
  'version' => 'latest',
  'region' => 'us-east-1'
]);

// Fetch the federated credentials.
$sessionToken = $sts->getFederationToken([
  'Name' => 'User1',
  'DurationSeconds' => '3600',
  'Policy' => json_encode([
    'Statement' => [
      'Sid' => 'randomstatementid' . time(),
      'Action' => ['s3:ListBucket'],
      'Effect' => 'Allow',
      'Resource' => 'arn:aws:s3:::' . $bucket
    ]
  ])
]);
```

```
// The following will be part of your less trusted code. You provide temporary
// security credentials so the code can send authenticated requests to Amazon S3.

$s3 = new S3Client([
    'region' => 'us-east-1',
    'version' => 'latest',
    'credentials' => [
        'key' => $sessionToken['Credentials']['AccessKeyId'],
        'secret' => $sessionToken['Credentials']['SecretAccessKey'],
        'token' => $sessionToken['Credentials']['SessionToken']
    ]
]);

try {
    $result = $s3->listObjects([
        'Bucket' => $bucket
    ]);
} catch (S3Exception $e) {
    echo $e->getMessage() . PHP_EOL;
}
```

## Ruby

You can provide temporary security credentials for your federated users and applications so that they can send authenticated requests to access your AWS resources. When requesting temporary credentials from the IAM service, you must provide a user name and an IAM policy that describes the resource permissions that you want to grant. By default, the session duration is one hour. However, if you are requesting temporary credentials using IAM user credentials, you can explicitly set a different duration value when requesting the temporary security credentials for federated users and applications. For information about temporary security credentials for your federated users and applications, see [Making requests](#).

### Note

For added security when you request temporary security credentials for federated users and applications, you might want to use a dedicated IAM user with only the necessary access permissions. The temporary user you create can never get more permissions than the IAM user who requested the temporary security credentials. For more information, see [AWS Identity and Access Management FAQs](#).

## Example

The following Ruby code example allows a federated user with a limited set of permissions to lists keys in the specified bucket.

```
# Prerequisites:
# - An existing Amazon S3 bucket.

require 'aws-sdk-s3'
require 'aws-sdk-iam'
require 'json'

# Checks to see whether a user exists in IAM; otherwise,
# creates the user.
#
# @param iam [Aws::IAM::Client] An initialized IAM client.
# @param user_name [String] The user's name.
# @return [Aws::IAM::Types::User] The existing or new user.
# @example
#   iam = Aws::IAM::Client.new(region: 'us-west-2')
#   user = get_user(iam, 'my-user')
#   exit 1 unless user.user_name
#   puts "User's name: #{user.user_name}"
def get_user(iam, user_name)
  puts "Checking for a user with the name '#{user_name}'..."
  response = iam.get_user(user_name: user_name)
  puts "A user with the name '#{user_name}' already exists."
  response.user
# If the user doesn't exist, create them.
rescue Aws::IAM::Errors::NoSuchEntity
  puts "A user with the name '#{user_name}' doesn't exist. Creating this user..."
  response = iam.create_user(user_name: user_name)
  iam.wait_until(:user_exists, user_name: user_name)
  puts "Created user with the name '#{user_name}'."
  response.user
rescue StandardError => e
  puts "Error while accessing or creating the user named '#{user_name}':
#{e.message}"
end

# Gets temporary AWS credentials for an IAM user with the specified permissions.
#
# @param sts [Aws::STS::Client] An initialized AWS STS client.
# @param duration_seconds [Integer] The number of seconds for valid credentials.
```

```
# @param user_name [String] The user's name.
# @param policy [Hash] The access policy.
# @return [Aws::STS::Types::Credentials] AWS credentials for API authentication.
# @example
#   sts = Aws::STS::Client.new(region: 'us-west-2')
#   credentials = get_temporary_credentials(sts, duration_seconds, user_name,
#     {
#       'Version' => '2012-10-17',
#       'Statement' => [
#         'Sid' => 'Stmt1',
#         'Effect' => 'Allow',
#         'Action' => 's3:ListBucket',
#         'Resource' => 'arn:aws:s3:::amzn-s3-demo-bucket'
#       ]
#     }
#   )
#   exit 1 unless credentials.access_key_id
#   puts "Access key ID: #{credentials.access_key_id}"
def get_temporary_credentials(sts, duration_seconds, user_name, policy)
  response = sts.get_federation_token(
    duration_seconds: duration_seconds,
    name: user_name,
    policy: policy.to_json
  )
  response.credentials
rescue StandardError => e
  puts "Error while getting federation token: #{e.message}"
end

# Lists the keys and ETags for the objects in an Amazon S3 bucket.
#
# @param s3_client [Aws::S3::Client] An initialized Amazon S3 client.
# @param bucket_name [String] The bucket's name.
# @return [Boolean] true if the objects were listed; otherwise, false.
# @example
#   s3_client = Aws::S3::Client.new(region: 'us-west-2')
#   exit 1 unless list_objects_in_bucket?(s3_client, 'amzn-s3-demo-bucket')
def list_objects_in_bucket?(s3_client, bucket_name)
  puts "Accessing the contents of the bucket named '#{bucket_name}'..."

# Example usage:
def run_me
  region = "us-west-2"
  user_name = "my-user"
  bucket_name = "amzn-s3-demo-bucket"

  iam = Aws::IAM::Client.new(region: region)
  user = get_user(iam, user_name)

  exit 1 unless user.user_name

  puts "User's name: #{user.user_name}"
  sts = Aws::STS::Client.new(region: region)
  credentials = get_temporary_credentials(sts, 3600, user_name,
    {
      'Version' => '2012-10-17',
      'Statement' => [
        'Sid' => 'Stmnt1',
        'Effect' => 'Allow',
        'Action' => 's3:ListBucket',
        'Resource' =>
"arn:aws:s3:::#{bucket_name}"
      ]
    })

  exit 1 unless credentials.access_key_id

  puts "Access key ID: #{credentials.access_key_id}"
  s3_client = Aws::S3::Client.new(region: region, credentials: credentials)
```

```
    exit 1 unless list_objects_in_bucket?(s3_client, bucket_name)
  end

  run_me if $PROGRAM_NAME == __FILE__
```

## Making requests using the REST API

This section contains information on how to make requests to Amazon S3 endpoints by using the REST API. For a list of Amazon S3 endpoints, see [Regions and Endpoints](#) in the *AWS General Reference*.

### Constructing S3 hostnames for REST API requests

Amazon S3 endpoints follow the structure shown below:

```
s3.Region.amazonaws.com
```

Amazon S3 access points endpoints and dual-stack endpoints also follow the standard structure:

- **Amazon S3 access points** -s3-accesspoint.*Region*.amazonaws.com
- **Dual-stack** - s3.dualstack.*Region*.amazonaws.com

For a complete list of Amazon S3 Regions and endpoints, see [Amazon S3 endpoints and quotas](#) in the *Amazon Web Services General Reference*.

### Virtual hosted-style and path-style requests

When making requests by using the REST API, you can use virtual hosted-style or path-style URIs for the Amazon S3 endpoints. For more information, see [Path-style requests](#).

#### Example Virtual hosted-Style request

Following is an example of a virtual hosted-style request to delete the puppy.jpg file from the bucket named examplebucket in the US West (Oregon) Region. For more information about virtual hosted-style requests, see [Path-style requests](#).

```
DELETE /puppy.jpg HTTP/1.1
Host: examplebucket.s3.us-west-2.amazonaws.com
Date: Mon, 11 Apr 2016 12:00:00 GMT
x-amz-date: Mon, 11 Apr 2016 12:00:00 GMT
```

```
Authorization: authorization string
```

## Example Path-style request

Following is an example of a path-style version of the same request.

```
DELETE /examplebucket/puppy.jpg HTTP/1.1
Host: s3.us-west-2.amazonaws.com
Date: Mon, 11 Apr 2016 12:00:00 GMT
x-amz-date: Mon, 11 Apr 2016 12:00:00 GMT
Authorization: authorization string
```

You will receive an HTTP response code 307 Temporary Redirect error and a message indicating what the correct URI is for your resource if you try to access a bucket outside the US East (N. Virginia) region with path-style syntax that uses either of the following:

For more information about path-style requests, see [Path-style requests](#).

### Important

Update (September 23, 2020) – To make sure that customers have the time that they need to transition to virtual-hosted-style URLs, we have decided to delay the deprecation of path-style URLs. For more information, see [Amazon S3 Path Deprecation Plan – The Rest of the Story](#) in the *AWS News Blog*.

## Making requests to dual-stack endpoints by using the REST API

When using the REST API, you can directly access a dual-stack endpoint by using a virtual hosted-style or a path style endpoint name (URI). All Amazon S3 dual-stack endpoint names include the region in the name. Unlike the standard IPv4-only endpoints, both virtual hosted-style and a path-style endpoints use region-specific endpoint names.

### Example Virtual hosted-Style dual-stack endpoint request

You can use a virtual hosted-style endpoint in your REST request as shown in the following example that retrieves the `puppy.jpg` object from the bucket named `examplebucket` in the US West (Oregon) Region.

```
GET /puppy.jpg HTTP/1.1
```

```
Host: examplebucket.s3.dualstack.us-west-2.amazonaws.com
Date: Mon, 11 Apr 2016 12:00:00 GMT
x-amz-date: Mon, 11 Apr 2016 12:00:00 GMT
Authorization: authorization string
```

## Example Path-style dual-stack endpoint request

Or you can use a path-style endpoint in your request as shown in the following example.

```
GET /examplebucket/puppy.jpg HTTP/1.1
Host: s3.dualstack.us-west-2.amazonaws.com
Date: Mon, 11 Apr 2016 12:00:00 GMT
x-amz-date: Mon, 11 Apr 2016 12:00:00 GMT
Authorization: authorization string
```

For more information about dual-stack endpoints, see [Using Amazon S3 dual-stack endpoints](#).

For more information about making requests using the REST API, see the topics below.

### Topics

- [Request routing](#)

## Request redirection and the REST API

### Topics

- [Redirects and HTTP user-agents](#)
- [Redirects and 100-Continue](#)
- [Redirect example](#)

This section describes how to handle HTTP redirects by using the Amazon S3 REST API. For general information about Amazon S3 redirects, see [Making requests](#) in the Amazon Simple Storage Service API Reference.

### Redirects and HTTP user-agents

Programs that use the Amazon S3 REST API should handle redirects either at the application layer or the HTTP layer. Many HTTP client libraries and user agents can be configured to correctly

handle redirects automatically; however, many others have incorrect or incomplete redirect implementations.

Before you rely on a library to fulfill the redirect requirement, test the following cases:

- Verify all HTTP request headers are correctly included in the redirected request (the second request after receiving a redirect) including HTTP standards such as Authorization and Date.
- Verify non-GET redirects, such as PUT and DELETE, work correctly.
- Verify large PUT requests follow redirects correctly.
- Verify PUT requests follow redirects correctly if the 100-continue response takes a long time to arrive.

HTTP user-agents that strictly conform to RFC 2616 might require explicit confirmation before following a redirect when the HTTP request method is not GET or HEAD. It is generally safe to follow redirects generated by Amazon S3 automatically, as the system will issue redirects only to hosts within the amazonaws.com domain and the effect of the redirected request will be the same as that of the original request.

## Redirects and 100-Continue

To simplify redirect handling, improve efficiencies, and avoid the costs associated with sending a redirected request body twice, configure your application to use 100-continues for PUT operations. When your application uses 100-continue, it does not send the request body until it receives an acknowledgement. If the message is rejected based on the headers, the body of the message is not sent. For more information about 100-continue, go to [RFC 2616 Section 8.2.3](#)

### Note

According to RFC 2616, when using `Expect: Continue` with an unknown HTTP server, you should not wait an indefinite period before sending the request body. This is because some HTTP servers do not recognize 100-continue. However, Amazon S3 does recognize if your request contains an `Expect: Continue` and will respond with a provisional 100-continue status or a final status code. Additionally, no redirect error will occur after receiving the provisional 100 continue go-ahead. This will help you avoid receiving a redirect response while you are still writing the request body.

## Redirect example

This section provides an example of client-server interaction using HTTP redirects and 100-continue.

Following is a sample PUT to the `quotes.s3.amazonaws.com` bucket.

```
PUT /nelson.txt HTTP/1.1
Host: quotes.s3.amazonaws.com
Date: Mon, 15 Oct 2007 22:18:46 +0000
```

```
Content-Length: 6
Expect: 100-continue
```

Amazon S3 returns the following:

```
HTTP/1.1 307 Temporary Redirect
Location: http://quotes.s3-4c25d83b.amazonaws.com/nelson.txt?rk=8d47490b
Content-Type: application/xml
Transfer-Encoding: chunked
Date: Mon, 15 Oct 2007 22:18:46 GMT
```

```
Server: AmazonS3
```

```
<?xml version="1.0" encoding="UTF-8"?>
<Error>
  <Code>TemporaryRedirect</Code>
  <Message>Please re-send this request to the
  specified temporary endpoint. Continue to use the
  original request endpoint for future requests.
</Message>
  <Endpoint>quotes.s3-4c25d83b.amazonaws.com</Endpoint>
  <Bucket>quotes</Bucket>
</Error>
```

The client follows the redirect response and issues a new request to the `quotes.s3-4c25d83b.amazonaws.com` temporary endpoint.

```
PUT /nelson.txt?rk=8d47490b HTTP/1.1
Host: quotes.s3-4c25d83b.amazonaws.com
```

```
Date: Mon, 15 Oct 2007 22:18:46 +0000
```

```
Content-Length: 6
```

```
Expect: 100-continue
```

Amazon S3 returns a 100-continue indicating the client should proceed with sending the request body.

```
HTTP/1.1 100 Continue
```

The client sends the request body.

```
ha ha\n
```

Amazon S3 returns the final response.

```
HTTP/1.1 200 OK
```

```
Date: Mon, 15 Oct 2007 22:18:48 GMT
```

```
ETag: "a2c8d6b872054293afd41061e93bc289"
```

```
Content-Length: 0
```

```
Server: AmazonS3
```

## Request routing

Programs that make requests against buckets created using the [CreateBucket](#) API that include a [CreateBucketConfiguration](#) must support redirects. Additionally, some clients that do not respect DNS TTLs might encounter issues.

This section describes routing and DNS issues to consider when designing your service or application for use with Amazon S3.

### Request redirection and the REST API

Amazon S3 uses the Domain Name System (DNS) to route requests to facilities that can process them. This system works effectively, but temporary routing errors can occur. If a request arrives at the wrong Amazon S3 location, Amazon S3 responds with a temporary redirect that tells the requester to resend the request to a new endpoint. If a request is incorrectly formed, Amazon S3 uses permanent redirects to provide direction on how to perform the request correctly.

**⚠ Important**

To use this feature, you must have an application that can handle Amazon S3 redirect responses. The only exception is for applications that work exclusively with buckets that were created without `<CreateBucketConfiguration>`. For more information about location constraints, see [Accessing and listing an Amazon S3 bucket](#).

For all Regions that launched after March 20, 2019, if a request arrives at the wrong Amazon S3 location, Amazon S3 returns an HTTP 400 Bad Request error.

For more information about enabling or disabling an AWS Region, see [AWS Regions and Endpoints](#) in the *AWS General Reference*.

**Topics**

- [DNS routing](#)
- [Temporary request redirection](#)
- [Permanent request redirection](#)
- [Request redirection examples](#)

**DNS routing**

DNS routing routes requests to appropriate Amazon S3 facilities. The following figure and procedure show an example of DNS routing.

### DNS routing request steps

1. The client makes a DNS request to get an object stored on Amazon S3.

2. The client receives one or more IP addresses for facilities that can process the request. In this example, the IP address is for Facility B.
3. The client makes a request to Amazon S3 Facility B.
4. Facility B returns a copy of the object to the client.

## Temporary request redirection

A temporary redirect is a type of error response that signals to the requester that they should resend the request to a different endpoint. Due to the distributed nature of Amazon S3, requests can be temporarily routed to the wrong facility. This is most likely to occur immediately after buckets are created or deleted.

For example, if you create a new bucket and immediately make a request to the bucket, you might receive a temporary redirect, depending on the location constraint of the bucket. If you created the bucket in the US East (N. Virginia) AWS Region, you will not see the redirect because this is also the default Amazon S3 endpoint.

However, if the bucket is created in any other Region, any requests for the bucket go to the default endpoint while the bucket's DNS entry is propagated. The default endpoint redirects the request to the correct endpoint with an HTTP 302 response. Temporary redirects contain a URI to the correct facility, which you can use to immediately resend the request.

### Important

Don't reuse an endpoint provided by a previous redirect response. It might appear to work (even for long periods of time), but it might provide unpredictable results and will eventually fail without notice.

The following figure and procedure shows an example of a temporary redirect.

### Temporary request redirection steps

1. The client makes a DNS request to get an object stored on Amazon S3.
2. The client receives one or more IP addresses for facilities that can process the request.

3. The client makes a request to Amazon S3 Facility B.
4. Facility B returns a redirect indicating the object is available from Location C.
5. The client resends the request to Facility C.
6. Facility C returns a copy of the object.

## Permanent request redirection

A permanent redirect indicates that your request addressed a resource inappropriately. For example, permanent redirects occur if you use a path-style request to access a bucket that was created using `<CreateBucketConfiguration>`. For more information, see [Accessing and listing an Amazon S3 bucket](#).

To help you find these errors during development, this type of redirect does not contain a Location HTTP header that allows you to automatically follow the request to the correct location. Consult the resulting XML error document for help using the correct Amazon S3 endpoint.

## Request redirection examples

The following are examples of temporary request redirection responses.

### REST API temporary redirect response

```
HTTP/1.1 307 Temporary Redirect
Location: http://awsexamplebucket1.s3-gztb4pa9sq.amazonaws.com/photos/puppy.jpg?
rk=e2c69a31
Content-Type: application/xml
Transfer-Encoding: chunked
Date: Fri, 12 Oct 2007 01:12:56 GMT
Server: AmazonS3

<?xml version="1.0" encoding="UTF-8"?>
<Error>
  <Code>TemporaryRedirect</Code>
  <Message>Please re-send this request to the specified temporary endpoint.
  Continue to use the original request endpoint for future requests.</Message>
  <Endpoint>awsexamplebucket1.s3-gztb4pa9sq.amazonaws.com</Endpoint>
</Error>
```

## SOAP API temporary redirect response

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

```
<soapenv:Body>
  <soapenv:Fault>
    <Faultcode>soapenv:Client.TemporaryRedirect</Faultcode>
    <Faultstring>Please re-send this request to the specified temporary endpoint.
    Continue to use the original request endpoint for future requests.</Faultstring>
    <Detail>
      <Bucket>images</Bucket>
      <Endpoint>s3-gztb4pa9sq.amazonaws.com</Endpoint>
    </Detail>
  </soapenv:Fault>
</soapenv:Body>
```

## DNS considerations

One of the design requirements of Amazon S3 is extremely high availability. One of the ways we meet this requirement is by updating the IP addresses associated with the Amazon S3 endpoint in DNS as needed. These changes are automatically reflected in short-lived clients, but not in some long-lived clients. Long-lived clients will need to take special action to re-resolve the Amazon S3 endpoint periodically to benefit from these changes. For more information about virtual machines (VMs), refer to the following:

- For Java, Sun's JVM caches DNS lookups forever by default; go to the "InetAddress Caching" section of [the InetAddress documentation](#) for information on how to change this behavior.
- For PHP, the persistent PHP VM that runs in the most popular deployment configurations caches DNS lookups until the VM is restarted. Go to [the getHostByName PHP docs](#).

# Developing with Amazon S3 using the AWS CLI

The Amazon S3 AWS CLI commands are organized into different sets in AWS CLI Command Reference and each has its own available commands. If you don't find the command that you're looking for in one set, check one of the other sets. The different sets are as follows:

- `s3` – Describes high-level commands for working with objects and buckets. These include copy, list and move actions. For a complete list of commands in this set, see [s3](#) in the AWS CLI Command Reference.
- `s3api` – Describes low-level commands that manage S3 resources such as buckets, objects, sessions and multipart uploads. These commands correspond to the [Amazon S3 API](#) operations. For a complete list of CLI commands in this set, see [s3api](#) in the AWS CLI Command Reference.
- `s3control` – Describes low-level commands that manage all other S3 resources such as Access Grants, Storage Lens groups, and Amazon S3 on Outposts buckets. These commands correspond to the [Amazon S3 Control](#) API operations. For a complete list of CLI commands in this set, see [s3control](#) in the AWS CLI Command Reference.

If you are having issues setting up the AWS CLI, see [see How do I resolve the "Unable to locate credentials" error in Amazon S3](#) in the AWS re:Post Knowledge Center.

## Note

Services in AWS, such as Amazon S3, require that you provide credentials when you access them. The service can then determine whether you have permissions to access the resources that it owns. The console requires your password. You can create access keys for your AWS account to access the AWS CLI or API. However, we don't recommend that you access AWS using the credentials for your AWS account. Instead, we recommend that you use AWS Identity and Access Management (IAM). Create an IAM user, add the user to an IAM group with administrative permissions, and then grant administrative permissions to the IAM user that you created. You can then access AWS using a special URL and the credentials of that IAM user. For instructions, go to [Creating Your First IAM user and Administrators Group](#) in the *IAM User Guide*.

## Learn more about the AWS CLI

To learn more about the AWS, see the following resources:

- [AWS Command Line Interface](#)
- [AWS Command Line Interface User Guide for Version 2](#)

## Developing with Amazon S3 using the AWS SDKs

AWS software development kits (SDKs) are available for many popular programming languages. Each SDK provides an API, code examples, and documentation that make it easier for developers to build applications in their preferred language.

### Note

You can use AWS Amplify for end-to-end fullstack development of web and mobile apps. Amplify Storage seamlessly integrates file storage and management capabilities into frontend web and mobile apps, built on top of Amazon S3. For more information, see [Storage](#) in the Amplify user guide.

SDK documentation	Code examples

<a href="#">AWS Tools for PowerShell</a>	<a href="#">Tools for PowerShell code examples</a>
<a href="#">AWS SDK for Python (Boto3)</a>	<a href="#">AWS SDK for Python (Boto3) code examples</a>

SDK documentation	Code examples
<a href="#">AWS SDK for Ruby</a>	<a href="#">AWS SDK for Ruby code examples</a>
<a href="#">AWS SDK for Rust</a>	<a href="#">AWS SDK for Rust code examples</a>
<a href="#">AWS SDK for SAP ABAP</a>	<a href="#">AWS SDK for SAP ABAP code examples</a>
<a href="#">AWS SDK for Swift</a>	<a href="#">AWS SDK for Swift code examples</a>

For specific examples, see [Code examples for Amazon S3 using AWS SDKs](#).

## SDK Programming interfaces

Each AWS SDK provides one or more programmatic interfaces for working with Amazon S3. Each SDK provides a low-level interface for Amazon S3, with methods that closely resemble API operations. Some SDKs provide high-level interfaces for Amazon S3, that are abstractions intended to simplify common use cases.

For example, when you perform a multipart upload by using the low-level API operations, you use an operation to initiate the upload, another operation to upload parts, and a final operation to complete the upload. A high-level multipart upload API operation lets you to do all of the operations required for upload in a single API call. For examples, see [Uploading an object using multipart upload](#) in the *Amazon S3 User Guide*.

Low-level API operations allow greater control over the upload. We recommend that you use the low-level API operations if you need to pause and resume uploads, vary part sizes during the upload, or begin uploads when you don't know the size of the data in advance.

## Specifying the Signature Version in request authentication

Amazon S3 supports only AWS Signature Version 4 in most AWS Regions. In some of the older AWS Regions, Amazon S3 supports both Signature Version 4 and Signature Version 2. However, Signature Version 2 is being turned off (deprecated). For more information about the end of support for Signature Version 2, see [AWS Signature Version 2 turned off \(deprecated\) for Amazon S3](#).

For a list of all the Amazon S3 Regions and the signature versions they support, see [Regions and Endpoints](#) in the *AWS General Reference*.

For all AWS Regions, AWS SDKs use Signature Version 4 by default to authenticate requests. When using AWS SDKs that were released before May 2016, you might be required to request Signature Version 4, as shown in the following table.

SDK	Requesting Signature Version 4 for Request Authentication
AWS CLI	<p>For the default profile, run the following command:</p> <pre data-bbox="597 499 1507 619">\$ aws configure set default.s3.signature_version s3v4</pre> <p>For a custom profile, run the following command:</p> <pre data-bbox="597 730 1507 850">\$ aws configure set profile.your_profile_name.s3.signature_version s3v4</pre>
Java SDK	<p>Add the following in your code:</p> <pre data-bbox="597 961 1507 1081">System.setProperty(SDKGlobalConfiguration.ENABLE_S3_SIGV4_SYSTEM_PROPERTY, "true");</pre> <p>Or, on the command line, specify the following:</p> <pre data-bbox="597 1192 1507 1270">-Dcom.amazonaws.services.s3.enableV4</pre>
JavaScript SDK	<p>Set the <code>signatureVersion</code> parameter to <code>v4</code> when constructing the client:</p> <pre data-bbox="597 1432 1507 1507">var s3 = new AWS.S3({signatureVersion: 'v4'});</pre>
PHP SDK	<p>Set the <code>signature</code> parameter to <code>v4</code> when constructing the Amazon S3 service client for PHP SDK v2:</p> <pre data-bbox="597 1675 1507 1877">&lt;?php \$client = S3Client::factory([     'region' =&gt; 'YOUR-REGION',     'version' =&gt; 'latest',     'signature' =&gt; 'v4'</pre>

SDK	Requesting Signature Version 4 for Request Authentication
	<pre data-bbox="597 205 1502 268">]);</pre> <p data-bbox="597 304 1502 436">When using the PHP SDK v3, set the <code>signature_version</code> parameter to <code>v4</code> during construction of the Amazon S3 service client:</p> <pre data-bbox="597 472 1502 751">&lt;?php \$s3 = new Aws\S3\S3Client([     'version' =&gt; '2006-03-01',     'region' =&gt; 'YOUR-REGION',     'signature_version' =&gt; 'v4' ]);</pre>
Python-Boto SDK	<p data-bbox="597 787 1502 829">Specify the following in the boto default config file:</p> <pre data-bbox="597 861 1502 940">[s3] use-sigv4 = True</pre>
Ruby SDK	<p data-bbox="597 982 1502 1066">Ruby SDK - Version 1: Set the <code>:s3_signature_version</code> parameter to <code>v4</code> when constructing the client:</p> <pre data-bbox="597 1102 1502 1222">s3 = AWS::S3::Client.new(:s3_signature_version =&gt; :v4)</pre> <p data-bbox="597 1260 1502 1344">Ruby SDK - Version 3: Set the <code>signature_version</code> parameter to <code>v4</code> when constructing the client:</p> <pre data-bbox="597 1375 1502 1459">s3 = Aws::S3::Client.new(signature_version: 'v4')</pre>

SDK	Requesting Signature Version 4 for Request Authentication
.NET SDK	<p>Add the following to the code before creating the Amazon S3 client:</p> <pre data-bbox="597 348 1507 428">AWSConfigsS3.UseSignatureVersion4 = true;</pre> <p>Or, add the following to the config file:</p> <pre data-bbox="597 537 1507 735">&lt;appSettings&gt;   &lt;add key="AWS.S3.UseSignatureVersion4" value="true" /&gt; &lt;/appSettings&gt;</pre>

## AWS Signature Version 2 turned off (deprecated) for Amazon S3

Signature Version 2 is being turned off (deprecated) in Amazon S3. Amazon S3 will then only accept API requests that are signed using Signature Version 4.

This section provides answers to common questions regarding the end of support for Signature Version 2.

### What is Signature Version 2/4, and What Does It Mean to Sign Requests?

The Signature Version 2 or Signature Version 4 signing process is used to authenticate your Amazon S3 API requests. Signing requests enables Amazon S3 to identify who is sending the request and protects your requests from bad actors.

For more information about signing AWS requests, see [Signing AWS API Requests](#) in the *AWS General Reference*.

### What Update Are You Making?

We currently support Amazon S3 API requests that are signed using Signature Version 2 and Signature Version 4 processes. After that, Amazon S3 will only accept requests that are signed using Signature Version 4.

For more information about signing AWS requests, see [Changes in Signature Version 4](#) in the *AWS General Reference*.

## Why Are You Making the Update?

Signature Version 4 provides improved security by using a signing key instead of your secret access key. Signature Version 4 is currently supported in all AWS Regions, whereas Signature Version 2 is only supported in Regions that were launched before January 2014. This update allows us to provide a more consistent experience across all Regions.

## How Do I Ensure That I'm Using Signature Version 4, and What Updates Do I Need?

The signature version that is used to sign your requests is usually set by the tool or the SDK on the client side. By default, the latest versions of our AWS SDKs use Signature Version 4. For third-party software, contact the appropriate support team for your software to confirm what version you need. If you are sending direct REST calls to Amazon S3, you must modify your application to use the Signature Version 4 signing process.

For information about which version of the AWS SDKs to use when moving to Signature Version 4, see [Moving from Signature Version 2 to Signature Version 4](#).

For information about using Signature Version 4 with the Amazon S3 REST API, see [Authenticating Requests \(AWS Signature Version 4\)](#) in the *Amazon Simple Storage Service API Reference*.

## What Happens if I Don't Make Updates?

Requests signed with Signature Version 2 that are made after that will fail to authenticate with Amazon S3. Requesters will see errors stating that the request must be signed with Signature Version 4.

## Should I Make Changes Even if I'm Using a Presigned URL That Requires Me to Sign for More than 7 Days?

If you are using a presigned URL that requires you to sign for more than 7 days, no action is currently needed. You can continue to use AWS Signature Version 2 to sign and authenticate the presigned URL. We will follow up and provide more details on how to migrate to Signature Version 4 for a presigned URL scenario.

## More Info

- For more information about using Signature Version 4, see [Signing AWS API Requests](#).

- View the list of changes between Signature Version 2 and Signature Version 4 in [Changes in Signature Version 4](#).
- View the post [AWS Signature Version 4 to replace AWS Signature Version 2 for signing Amazon S3 API requests](#) in the AWS forums.
- If you have any questions or concerns, contact [Support](#).

## Moving from Signature Version 2 to Signature Version 4

If you currently use Signature Version 2 for Amazon S3 API request authentication, you should move to using Signature Version 4. Support is ending for Signature Version 2, as described in [AWS Signature Version 2 turned off \(deprecated\) for Amazon S3](#).

For information about using Signature Version 4 with the Amazon S3 REST API, see [Authenticating Requests \(AWS Signature Version 4\)](#) in the *Amazon Simple Storage Service API Reference*.

The following table lists the SDKs with the necessary minimum version to use Signature Version 4 (SigV4). If you are using presigned URLs with the AWS Java, JavaScript (Node.js), or Python (Boto/CLI) SDKs, you must set the correct AWS Region and set Signature Version 4 in the client configuration. For information about setting SigV4 in the client configuration, see [Specifying the Signature Version in request authentication](#).

If you use this SDK/ Product	Upgrade to this SDK version	Code change needed to the client to use Sigv4?	Link to SDK documentation
AWS SDK for Java v1	Upgrade to Java 1.11.201+ or v2.	Yes	<a href="#">Specifying the Signature Version in request authentication</a>
AWS SDK for Java v2	No SDK upgrade is needed.	No	<a href="#">AWS SDK for Java</a>

<b>If you use this SDK/Product</b>	<b>Upgrade to this SDK version</b>	<b>Code change needed to the client to use Sigv4?</b>	<b>Link to SDK documentation</b>
AWS SDK for .NET v1	Upgrade to 3.1.10 or later.	Yes	<a href="#">AWS SDK for .NET</a>
AWS SDK for .NET v2	Upgrade to 3.1.10 or later.	No	<a href="#">AWS SDK for .NET v2</a>
AWS SDK for .NET v3	Upgrade to 3.3.0.0 or later.	Yes	<a href="#">AWS SDK for .NET v3</a>
AWS SDK for JavaScript v1	Upgrade to 2.68.0 or later.	Yes	<a href="#">AWS SDK for JavaScript</a>
AWS SDK for JavaScript v2	Upgrade to 2.68.0 or later.	Yes	<a href="#">AWS SDK for JavaScript</a>
AWS SDK for JavaScript v3	No action is currently needed. Upgrade to major version V3 in Q3 2019.	No	<a href="#">AWS SDK for JavaScript</a>

<b>If you use this SDK/Product</b>	<b>Upgrade to this SDK version</b>	<b>Code change needed to the client to use Sigv4?</b>	<b>Link to SDK documentation</b>
AWS SDK for PHP v1	Recommend to upgrade to the most recent version of PHP or, at least to v2.7.4 with the signature parameter set to v4 in the S3 client's configuration.	Yes	<a href="#">AWS SDK for PHP</a>
AWS SDK for PHP v2	Recommend to upgrade to the most recent version of PHP or, at least to v2.7.4 with the signature parameter set to v4 in the S3 client's configuration.	No	<a href="#">AWS SDK for PHP</a>

If you use this SDK/Product	Upgrade to this SDK version	Code change needed to the client to use Sigv4?	Link to SDK documentation
AWS SDK for PHP v3	No SDK upgrade is needed.	No	<a href="#">AWS SDK for PHP</a>
Boto2	Upgrade to Boto2 v2.49.0.	Yes	<a href="#">Boto 2 Upgrade</a>
Boto3	Upgrade to 1.5.71 (Botocore), 1.4.6 (Boto3).	Yes	<a href="#">Boto 3 - AWS SDK for Python</a>
AWS CLI	Upgrade to 1.11.108.	Yes	<a href="#">AWS Command Line Interface</a>
AWS CLI v2 (preview)	No SDK upgrade is needed.	No	<a href="#">AWS Command Line Interface version 2</a>
AWS SDK for Ruby v1	Upgrade to Ruby V3.	Yes	<a href="#">Ruby V3 for AWS</a>
AWS SDK for Ruby v2	Upgrade to Ruby V3.	Yes	<a href="#">Ruby V3 for AWS</a>
AWS SDK for Ruby v3	No SDK upgrade is needed.	No	<a href="#">Ruby V3 for AWS</a>
Go	No SDK upgrade is needed.	No	<a href="#">AWS SDK for Go</a>

If you use this SDK/Product	Upgrade to this SDK version	Code change needed to the client to use Sigv4?	Link to SDK documentation
C++	No SDK upgrade is needed.	No	<a href="#">AWS SDK for C++</a>

## AWS Tools for Windows PowerShell or AWS Tools for PowerShell Core

If you are using module versions *earlier* than 3.3.0.0, you must upgrade to 3.3.0.0.

To get the version information, use the `Get-Module` cmdlet:

```
Get-Module -Name AWSPowershell
Get-Module -Name AWSPowershell.NetCore
```

To update the 3.3.0.0 version, use the `Update-Module` cmdlet:

```
Update-Module -Name AWSPowershell
Update-Module -Name AWSPowershell.NetCore
```

You can use presigned URLs that are valid for more than 7 days that you will send Signature Version 2 traffic on.

## Getting Amazon S3 request IDs for AWS Support

Whenever you contact AWS Support because you've encountered errors or unexpected behavior in Amazon S3, you must provide the request IDs associated with the failed action. AWS Support uses these request IDs to help resolve the problems that you're experiencing.

Request IDs come in pairs, are returned in every response that Amazon S3 processes (even the erroneous ones), and can be accessed through verbose logs. There are a number of common

methods for getting your request IDs, including S3 server access logs and AWS CloudTrail events or data events.

After you've recovered these logs, copy and retain those two values, because you'll need them when you contact AWS Support. For information about contacting AWS Support, see [Contact AWS](#) or the [AWS Support Documentation](#).

## Topics

- [Using the AWS CLI to obtain request IDs](#)
- [Using Windows PowerShell to obtain request IDs](#)
- [Using AWS CloudTrail data events to obtain request IDs](#)
- [Using S3 server access logging to obtain request IDs](#)
- [Using HTTP to obtain request IDs](#)
- [Using a web browser to obtain request IDs](#)
- [Using the AWS SDKs to obtain request IDs](#)

## Using the AWS CLI to obtain request IDs

To get your request IDs when using the AWS Command Line Interface (AWS CLI), add `--debug` to your command. For example you should see `x-amz-request-id` and `x-amz-id-2` in the debug log as shown below:

```
...
2025-04-30 14:35:28,572 - MainThread - botocore.parsers - DEBUG - Response headers:
{'x-amz-id-2': 'a+zm50vDJH3LLmCiXvwEo0u0PtPS/qCJaBvB2ZMH9dzyzTiJhiLZkBFFoRfsPf0KztUKT/
garCI=', 'x-amz-request-id': 'N4NMN0MJ4VDFZMX9', 'Date': 'Wed, 30 Apr 2025 21:35:29
GMT', 'Content-Type': 'application/xml', 'Transfer-Encoding': 'chunked', 'Server':
'AmazonS3'}
...
```

## Using Windows PowerShell to obtain request IDs

For information on recovering logs with Windows PowerShell, see the [Response Logging in AWS Tools for Windows PowerShell](#) in the *AWS Developer Tools Blog*.

## Using AWS CloudTrail data events to obtain request IDs

An Amazon S3 bucket that is configured with CloudTrail data events to log S3 object-level API operations provides detailed information about actions that are taken by a user, role, or an AWS service in Amazon S3. You can identify S3 request IDs by querying CloudTrail events with Athena.

For more information, see [Identifying Amazon S3 requests using CloudTrail](#) in the *Amazon Simple Storage Service User Guide*.

## Using S3 server access logging to obtain request IDs

An Amazon S3 bucket configured for S3 server access logging provides detailed records for each request that is made to the bucket. You can identify S3 request IDs by querying the server access logs using Athena.

For more information, see [Querying access logs for requests by using Amazon Athena](#) in the *Amazon Simple Storage Service User Guide*.

## Using HTTP to obtain request IDs

You can obtain your request IDs, `x-amz-request-id` and `x-amz-id-2` by logging the bits of an HTTP request before it reaches the target application. There are a variety of third-party tools that can be used to recover verbose logs for HTTP requests. Choose one that you trust, and then run the tool to listen on the port that your Amazon S3 traffic travels on, as you send out another Amazon S3 HTTP request.

For HTTP requests, the pair of request IDs will look like the following:

```
x-amz-request-id: 79104EXAMPLEB723
x-amz-id-2: IOWQ4fDEXAMPLEQM+ey7N9WgVhSnQ6JEXAMPLEZb7hSQDASK+Jd1vEXAMPLEa3Km
```

### Note

HTTPS requests are encrypted and hidden in most packet captures.

## Using a web browser to obtain request IDs

Most web browsers have developer tools that you can use to view request headers.

For web browser-based requests that return an error, the pair of request IDs will look like the following examples.

```
<Error><Code>AccessDenied</Code><Message>Access Denied</Message>
<RequestId>79104EXAMPLEB723</RequestId><HostId>IOWQ4fDEXAMPLEQM
+ey7N9WgVhSnQ6JEXAMPLEZb7hSQDASK+Jd1vEXAMPLEa3Km</HostId></Error>
```

To obtain the request ID pair from successful requests, use your browser's developer tools to look at the HTTP response headers.

## Using the AWS SDKs to obtain request IDs

The following sections include information for configuring logging by using different AWS SDKs.

### Note

Although you can enable verbose logging on every request and response, we don't recommend enabling logging in production systems, because large requests or responses can significantly slow down an application.

For AWS SDK requests, the pair of request IDs will look like the following:

```
Status Code: 403, AWS Service: Amazon S3, AWS Request ID: 79104EXAMPLEB723
AWS Error Code: AccessDenied AWS Error Message: Access Denied
S3 Extended Request ID: IOWQ4fDEXAMPLEQM+ey7N9WgVhSnQ6JEXAMPLEZb7hSQDASK
+Jd1vEXAMPLEa3Km
```

### C++

The type of logger and the verbosity are specified during the SDK initialization in the `SDKOptions` argument. The following example specifies the verbosity level as `LogLevel::Debug`.

The default logger will write to the filesystem and the file is named using the following convention `aws_sdk_YYYY-MM-DD-HH.log`. The logger creates a new file on the hour.

```
Aws::SDKOptions options;
options.loggingOptions.logLevel = Aws::Utils::Logging::LogLevel::Debug;
Aws::InitAPI(options);
```

```
// ...  
Aws::ShutdownAPI(options);
```

For more information, see [How do I turn on logging?](#) in the *AWS SDK for C++ wiki on GitHub*.

## Go

You can configure logging by using SDK for Go. For more information, see [Logging](#) in the *AWS SDK for Go v2 Developer Guide*.

## Java

You can enable logging for specific requests or responses to catch and return only relevant headers. To do this, import the `com.amazonaws.services.s3.S3ResponseMetadata` class. Afterward, you can store the request in a variable before performing the actual request. To get the logged request or response, call `getCachedResponseMetadata(AmazonWebServiceRequest request).getRequestID()`.

```
PutObjectRequest req = new PutObjectRequest(bucketName, key, createSampleFile());  
s3.putObject(req);  
S3ResponseMetadata md = s3.getCachedResponseMetadata(req);  
System.out.println("Host ID: " + md.getHostId() + " RequestID: " +  
md.getRequestId());
```

Alternatively, you can use verbose logging of every Java request and response. For more information, see [Verbose Wire Logging](#) in the *AWS SDK for Java Developer Guide*.

## JavaScript

The AWS SDK for JavaScript has a built-in logger so you can log API calls you make with it. To turn on the logger and print log entries in the console, add the following statement to your code:

```
AWS.config.logger = console;
```

For more information, see [Logging AWS SDK for JavaScript Calls](#) in the *AWS SDK for JavaScript Developer Guide*.

## Kotlin

With the AWS SDK for Kotlin, you can specify log mode for wire-level messages using code or environment settings. You can set log mode for HTTP requests and HTTP responses.

To opt into additional logging, set the `LogMode` property when you construct a service client:

```
import aws.smithy.kotlin.runtime.client.LogMode

// ...

val client = DynamoDbClient {
    // ...
    logMode = LogMode.LogRequestWithBody + LogMode.LogResponse
}
```

Alternatively, you can set log mode using an environment variable:

```
export SDK_LOG_MODE=LogRequestWithBody|LogResponse
```

For more information, see [Logging](#) in the *AWS SDK for Kotlin Developer Guide*.

## .NET

You can configure logging with the SDK for .NET by using the built-in `System.Diagnostics` logging tool. For more information, see the [Logging with the SDK for .NET](#) *AWS Developer Blog* post.

### Note

By default, the returned log contains only error information. To get the request IDs, the config file must have `AWSLogMetrics` (and optionally, `AWSResponseLogging`) added.

## PHP

You can get debug information, including the data sent over the wire, by setting the debug option to `true` in a client constructor.

```
$s3Client = new Aws\S3\S3Client([
    'region' => 'us-standard',
    'version' => '2006-03-01',
    'debug'   => true
]);
```

For more information, see [How can I see what data is sent over the wire?](#) in the *AWS SDK for PHP Developer Guide*.

## Python (Boto3)

With the AWS SDK for Python (Boto3), you can log specific responses. You can use this feature to capture only the relevant headers. The following code shows how to log parts of the response to a file:

```
import logging
import boto3
logging.basicConfig(filename='logfile.txt', level=logging.INFO)
logger = logging.getLogger(__name__)
s3 = boto3.resource('s3')
response = s3.Bucket(bucket_name).Object(object_key).put()
logger.info("HTTPStatusCode: %s", response['ResponseMetadata']['HTTPStatusCode'])
logger.info("RequestId: %s", response['ResponseMetadata']['RequestId'])
logger.info("HostId: %s", response['ResponseMetadata']['HostId'])
logger.info("Date: %s", response['ResponseMetadata']['HTTPHeaders']['date'])
```

You can also catch exceptions and log relevant information when an exception is raised. For more information, see [Discerning useful information from error responses](#) in the *AWS SDK for Python (Boto) API Reference*.

Additionally, you can configure Boto3 to output verbose debugging logs by using the following code:

```
import logging
import boto3
boto3.set_stream_logger('', logging.DEBUG)
```

For more information, see [set\\_stream\\_logger](#) in the *AWS SDK for Python (Boto) API Reference*.

## Ruby

You can get your request IDs using the SDK for Ruby Version 3. You can enable HTTP wire logging in your client using the following code:

```
s3 = Aws::S3::Client.new(http_wire_trace: true)
```

**Note**

Wire logging can include sensitive information, such as your access key ID. Sensitive information should be sanitized before sharing it with AWS Support.

You can also find the request ID of the request context object in the request response or error:

```
# Finding the request ID from an error:
begin
  s3.put_object(bucket: 'bucket', key: 'key', body: 'test')
rescue Aws::S3::Errors::ServiceError => e
  puts e.context[:request_id]
  puts e.context[:s3_host_id]
end

# Finding the request ID from a successful call:
resp = s3.put_object(bucket: 'bucket', key: 'key', body: 'test')
puts resp.context[:request_id]
puts resp.context[:s3_host_id]
```

For more information, see [Debugging using wire trace information from an AWS SDK for Ruby client](#) in the *AWS SDK for Ruby Developer Guide*.

## Rust

To enable logging, add the `tracing-subscriber` crate and initialize it in your Rust application.

Add the tracing library to your `Cargo.toml` file:

```
tracing-subscriber = { version = "0.3", features = ["env-filter"] }
```

Then, in your Rust code, initialize the logger in the main function before you call any SDK operation:

```
tracing_subscriber::fmt::init();
```

For more information, see [Configuring and using logging in the AWS SDK for Rust](#) in the *AWS SDK for Rust Developer Guide*.

## Supported Amazon S3 object-level API operations for S3 Tables

The following table includes supported S3 object-level API operations and corresponding headers for S3 Tables. For a list of Amazon S3 Tables APIs, see [Amazon S3 Tables](#). For more information about Amazon S3 Tables, see [Working with Amazon S3 Tables and table buckets](#) in the *Amazon S3 User Guide*.

Object-level API	Supported headers	Notes
<a href="#">AbortMultipartUpload</a>	x-amz-expected-bucket-owner	None
<a href="#">CompleteMultipartUpload</a>	x-amz-checksum-crc32	None
	x-amz-checksum-crc32c	None

## Code examples for Amazon S3 using AWS SDKs

The following code examples show how to use Amazon S3 with an AWS software development kit (SDK).

*Basics* are code examples that show you how to perform the essential operations within a service.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

*Scenarios* are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

### Get started

#### Hello Amazon S3

The following code examples show how to get started using Amazon S3.

C++

#### SDK for C++

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Code for the CMakeLists.txt CMake file.

```
# Set the minimum required version of CMake for this project.
cmake_minimum_required(VERSION 3.13)

# Set the AWS service components used by this project.
set(SERVICE_COMPONENTS s3)

# Set this project's name.
project("hello_s3")

# Set the C++ standard to use to build this target.
# At least C++ 11 is required for the AWS SDK for C++.
set(CMAKE_CXX_STANDARD 11)

# Use the MSVC variable to determine if this is a Windows build.
set(WINDOWS_BUILD ${MSVC})

if (WINDOWS_BUILD) # Set the location where CMake can find the installed
  libraries for the AWS SDK.
  string(REPLACE ";" "/aws-cpp-sdk-all;" SYSTEM_MODULE_PATH
    "${CMAKE_SYSTEM_PREFIX_PATH}/aws-cpp-sdk-all")
  list(APPEND CMAKE_PREFIX_PATH ${SYSTEM_MODULE_PATH})
endif ()

# Find the AWS SDK for C++ package.
find_package(AWSSDK REQUIRED COMPONENTS ${SERVICE_COMPONENTS})

if (WINDOWS_BUILD AND AWSSDK_INSTALL_AS_SHARED_LIBS)
  # Copy relevant AWS SDK for C++ libraries into the current binary directory
  for running and debugging.

  # set(BIN_SUB_DIR "/Debug") # if you are building from the command line you
  may need to uncomment this
  # and set the proper subdirectory to the executables' location.

  AWSSDK_CPY_DYN_LIBS(SERVICE_COMPONENTS ""
    ${CMAKE_CURRENT_BINARY_DIR}${BIN_SUB_DIR})
endif ()

add_executable(${PROJECT_NAME}
  hello_s3.cpp)

target_link_libraries(${PROJECT_NAME}
  ${AWSSDK_LINK_LIBRARIES})
```

## Code for the hello\_s3.cpp source file.

```
#include <aws/core/Aws.h>
#include <aws/s3/S3Client.h>
#include <iostream>
#include <aws/core/auth/AWSCredentialsProviderChain.h>
using namespace Aws;
using namespace Aws::Auth;

/*
 * A "Hello S3" starter application which initializes an Amazon Simple Storage
 * Service (Amazon S3) client
 * and lists the Amazon S3 buckets in the selected region.
 *
 * main function
 *
 * Usage: 'hello_s3'
 *
 */

int main(int argc, char **argv) {
    Aws::SDKOptions options;
    // Optionally change the log level for debugging.
    // options.loggingOptions.logLevel = Utils::Logging::LogLevel::Debug;
    Aws::InitAPI(options); // Should only be called once.
    int result = 0;
    {
        Aws::Client::ClientConfiguration clientConfig;
        // Optional: Set to the AWS Region (overrides config file).
        // clientConfig.region = "us-east-1";

        // You don't normally have to test that you are authenticated. But the
        // S3 service permits anonymous requests, thus the s3Client will return "success"
        // and 0 buckets even if you are unauthenticated, which can be confusing to a new
        // user.

        auto provider =
        Aws::MakeShared<DefaultAWSCredentialsProviderChain>("alloc-tag");
        auto creds = provider->GetAWSCredentials();
        if (creds.IsEmpty()) {
            std::cerr << "Failed authentication" << std::endl;
        }
    }
}
```

```
Aws::S3::S3Client s3Client(clientConfig);
auto outcome = s3Client.ListBuckets();

if (!outcome.IsSuccess()) {
    std::cerr << "Failed with error: " << outcome.GetError() <<
std::endl;
    result = 1;
} else {
    std::cout << "Found " << outcome.GetResult().GetBuckets().size()
        << " buckets\n";
    for (auto &bucket: outcome.GetResult().GetBuckets()) {
        std::cout << bucket.GetName() << std::endl;
    }
}

Aws::ShutdownAPI(options); // Should only be called once.
return result;
}
```

- For API details, see [ListBuckets](#) in *AWS SDK for C++ API Reference*.

Go

## SDK for Go V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
package main

import (
    "context"
    "errors"
    "fmt"
```

```
"github.com/aws/aws-sdk-go-v2/config"
"github.com/aws/aws-sdk-go-v2/service/s3"
"github.com/aws/smithy-go"
)

// main uses the AWS SDK for Go V2 to create an Amazon Simple Storage Service
// (Amazon S3) client and list up to 10 buckets in your account.
// This example uses the default settings specified in your shared credentials
// and config files.
func main() {
    ctx := context.Background()
    sdkConfig, err := config.LoadDefaultConfig(ctx)
    if err != nil {
        fmt.Println("Couldn't load default configuration. Have you set up your AWS
account?")
        fmt.Println(err)
        return
    }
    s3Client := s3.NewFromConfig(sdkConfig)
    count := 10
    fmt.Printf("Let's list up to %v buckets for your account.\n", count)
    result, err := s3Client.ListBuckets(ctx, &s3.ListBucketsInput{})
    if err != nil {
        var ae smithy.APIError
        if errors.As(err, &ae) && ae.ErrorCode() == "AccessDenied" {
            fmt.Println("You don't have permission to list buckets for this account.")
        } else {
            fmt.Printf("Couldn't list buckets for your account. Here's why: %v\n", err)
        }
        return
    }
    if len(result.Buckets) == 0 {
        fmt.Println("You don't have any buckets!")
    } else {
        if count > len(result.Buckets) {
            count = len(result.Buckets)
        }
        for _, bucket := range result.Buckets[:count] {
            fmt.Printf("\t\t%v\n", *bucket.Name)
        }
    }
}
```

- For API details, see [ListBuckets](#) in *AWS SDK for Go API Reference*.

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```

## Hello Amazon S3

The following code examples show how to get started using Amazon S3.

C++

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Code for the CMakeLists.txt CMake file.

```
# Set the minimum required version of CMake for this project.
cmake_minimum_required(VERSION 3.13)

# Set the AWS service components used by this project.
set(SERVICE_COMPONENTS s3)

# Set this project's name.
project("hello_s3")

# Set the C++ standard to use to build this target.
# At least C++ 11 is required for the AWS SDK for C++.
set(CMAKE_CXX_STANDARD 11)

# Use the MSVC variable to determine if this is a Windows build.
set(WINDOWS_BUILD ${MSVC})

if (WINDOWS_BUILD) # Set the location where CMake can find the installed
  libraries for the AWS SDK.
  string(REPLACE ";" "/aws-cpp-sdk-all;" SYSTEM_MODULE_PATH
    "${CMAKE_SYSTEM_PREFIX_PATH}/aws-cpp-sdk-all")
  list(APPEND CMAKE_PREFIX_PATH ${SYSTEM_MODULE_PATH})
endif ()

# Find the AWS SDK for C++ package.
```

```
find_package(AWSSDK REQUIRED COMPONENTS ${SERVICE_COMPONENTS})

if (WINDOWS_BUILD AND AWSSDK_INSTALL_AS_SHARED_LIBS)
    # Copy relevant AWS SDK for C++ libraries into the current binary directory
    for running and debugging.

    # set(BIN_SUB_DIR "/Debug") # if you are building from the command line you
    may need to uncomment this
    # and set the proper subdirectory to the executables' location.

    AWSSDK_COPY_DYN_LIBS(SERVICE_COMPONENTS ""
        ${CMAKE_CURRENT_BINARY_DIR}${BIN_SUB_DIR})
endif ()

add_executable(${PROJECT_NAME}
    hello_s3.cpp)

target_link_libraries(${PROJECT_NAME}
    ${AWSSDK_LINK_LIBRARIES})
```

### Code for the hello\_s3.cpp source file.

```
#include <aws/core/Aws.h>
#include <aws/s3/S3Client.h>
#include <iostream>
#include <aws/core/auth/AWSCredentialsProviderChain.h>
using namespace Aws;
using namespace Aws::Auth;

/*
 * A "Hello S3" starter application which initializes an Amazon Simple Storage
 * Service (Amazon S3) client
 * and lists the Amazon S3 buckets in the selected region.
 *
 * main function
 *
 * Usage: 'hello_s3'
 *
 */

int main(int argc, char **argv) {
    Aws::SDKOptions options;
```

```
// Optionally change the log level for debugging.
// options.loggingOptions.logLevel = Utils::Logging::LogLevel::Debug;
Aws::InitAPI(options); // Should only be called once.
int result = 0;
{
    Aws::Client::ClientConfiguration clientConfig;
    // Optional: Set to the AWS Region (overrides config file).
    // clientConfig.region = "us-east-1";

    // You don't normally have to test that you are authenticated. But the
    S3 service permits anonymous requests, thus the s3Client will return "success"
    and 0 buckets even if you are unauthenticated, which can be confusing to a new
    user.

    auto provider =
    Aws::MakeShared<DefaultAWSCredentialsProviderChain>("alloc-tag");
    auto creds = provider->GetAWSCredentials();
    if (creds.IsEmpty()) {
        std::cerr << "Failed authentication" << std::endl;
    }

    Aws::S3::S3Client s3Client(clientConfig);
    auto outcome = s3Client.ListBuckets();

    if (!outcome.IsSuccess()) {
        std::cerr << "Failed with error: " << outcome.GetError() <<
        std::endl;
        result = 1;
    } else {
        std::cout << "Found " << outcome.GetResult().GetBuckets().size()
        << " buckets\n";
        for (auto &bucket: outcome.GetResult().GetBuckets()) {
            std::cout << bucket.GetName() << std::endl;
        }
    }
}

Aws::ShutdownAPI(options); // Should only be called once.
return result;
}
```

## Rust

### SDK for Rust

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// S3 Hello World Example using the AWS SDK for Rust.
///
/// This example lists the objects in a bucket, uploads an object to that bucket,
/// and then retrieves the object and prints some S3 information about the
/// object.
/// This shows a number of S3 features, including how to use built-in paginators
/// for large data sets.
///
/// # Arguments
///
/// * `client` - an S3 client configured appropriately for the environment.
/// * `bucket` - the bucket name that the object will be uploaded to. Must be
///   present in the region the `client` is configured to use.
/// * `filename` - a reference to a path that will be read and uploaded to S3.
/// * `key` - the string key that the object will be uploaded as inside the
///   bucket.
async fn list_bucket_and_upload_object(
    client: &aws_sdk_s3::Client,
    bucket: &str,
    filepath: &Path,
    key: &str,

## Learn the basics of Amazon S3 with an AWS SDK

The following code examples show how to:

- Create a bucket and upload a file to it.
- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the bucket objects and the bucket.

.NET

### SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public class S3_Basics
{
    public static async Task Main()
    {
```

```
// Create an Amazon S3 client object. The constructor uses the
// default user installed on the system. To work with Amazon S3
// features in a different AWS Region, pass the AWS Region as a
// parameter to the client constructor.
IAmazonS3 client = new AmazonS3Client();
string bucketName = string.Empty;

/**
 * Before running this Java V2 code example, set up your development
 * environment, including your credentials.
 *
 * For more information, see the following documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-
 * started.html
 *
 * This Java code example performs the following tasks:
 *
 * 1. Creates an Amazon S3 bucket.
```

- \* 2. Uploads an object to the bucket.
  - \* 3. Downloads the object to another local file.
  - \* 4. Uploads an object using multipart upload.
  - \* 5. List all objects located in the Amazon S3 bucket.
  - \* 6. Copies the object to another Amazon S3 bucket.
  - \* 7. Copy the object to another Amazon S3 bucket using multi copy.
  - \* 8. Deletes the object from the Amazon S3 bucket.
  - \* 9. Deletes the Amazon S3 bucket.
- \*/

    Amazon S3 is a highly scalable and durable object storage
    service provided by Amazon Web Services (AWS). It is designed to
store and retrieve
    any amount of data, from anywhere on the web, at any time.

    The `S3AsyncClient` interface in the AWS SDK for Java 2.x provides a
set of methods to
    programmatically interact with the Amazon S3 (Simple Storage Service)
service. This allows
    developers to automate the management and manipulation of S3 buckets
and objects as
    part of their application deployment pipelines. With S3, teams can
focus on building
    and deploying their applications without having to worry about the
underlying storage
    infrastructure required to host and manage large amounts of data.

    This scenario walks you through how to perform key operations for
this service.

    Let's get started...

## JavaScript

### SDK for JavaScript (v3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

First, import all the necessary modules.

```
// Used to check if currently running file is this file.
import { fileURLToPath } from "node:url";
import { readdirSync, readFileSync, writeFileSync } from "node:fs";

// Local helper utils.
import { dirnameFromMetaUrl } from "@aws-doc-sdk-examples/lib/utils/util-fs.js";
import { Prompter } from "@aws-doc-sdk-examples/lib/prompter.js";
import { wrapText } from "@aws-doc-sdk-examples/lib/utils/util-string.js";

import {
    S3Client,
    CreateBucketCommand,
```

```
PutObjectCommand,  
ListObjectsCommand,  
CopyObjectCommand,  
GetObjectCommand,  
DeleteObjectsCommand,  
DeleteBucketCommand,  
} from "@aws-sdk/client-s3";
```

The preceding imports reference some helper utilities. These utilities are local to the GitHub repository linked at the start of this section. For your reference, see the following implementations of those utilities.

```
export const dirnameFromMetaUrl = (metaUrl) =>  
  fileURLToPath(new URL(".", metaUrl));  
  
import { select, input, confirm, checkbox, password } from "@inquirer/prompts";  
  
export class Prompter {  
  /**  
   * @param {{ message: string, choices: { name: string, value: string }[] }}  
   options  
   */  
  select(options) {  
    return select(options);  
  }  
  
  /**  
   * @param {{ message: string }} options  
   */  
  input(options) {  
    return input(options);  
  }  
  
  /**  
   * @param {{ message: string }} options  
   */  
  password(options) {  
    return password({ ...options, mask: true });  
  }  
  
  /**  
   * @param {string} prompt
```

```

    */
    checkContinue = async (prompt = "") => {
      const prefix = prompt && `${prompt} `;
      const ok = await this.confirm({
        message: `${prefix}Continue?`,
      });
      if (!ok) throw new Error("Exiting...");
    };

    /**
     * @param {{ message: string }} options
     */
    confirm(options) {
      return confirm(options);
    }

    /**
     * @param {{ message: string, choices: { name: string, value: string }[] }}
    options
     */
    checkbox(options) {
      return checkbox(options);
    }
  }

  export const wrapText = (text, char = "=") => {
    const rule = char.repeat(80);
    return `${rule}\n  ${text}\n${rule}\n`;
  };

```

Objects in S3 are stored in 'buckets'. Let's define a function for creating a new bucket.

```

export const createBucket = async () => {
  const bucketName = await prompter.input({
    message: "Enter a bucket name. Bucket names must be globally unique:",
  });
  const command = new CreateBucketCommand({ Bucket: bucketName });
  await s3Client.send(command);
  console.log("Bucket created successfully.\n");
  return bucketName;
};

```

Buckets contain 'objects'. This function uploads the contents of a directory to your bucket as objects.

```
export const uploadFilesToBucket = async ({ bucketName, folderPath }) => {
  console.log(`Uploading files from ${folderPath}\n`);
  const keys = readdirSync(folderPath);
  const files = keys.map((key) => {
    const filePath = `${folderPath}/${key}`;
    const fileContent = readFileSync(filePath);
    return {
      Key: key,
      Body: fileContent,
    };
  });

  for (const file of files) {
    await s3Client.send(
      new PutObjectCommand({
        Bucket: bucketName,
        Body: file.Body,
        Key: file.Key,
      }),
    );
    console.log(`${file.Key} uploaded successfully.`);
  }
};
```

After uploading objects, check to confirm that they were uploaded correctly. You can use `ListObjects` for that. You'll be using the 'Key' property, but there are other useful properties in the response also.

```
export const listFilesInBucket = async ({ bucketName }) => {
  const command = new ListObjectsCommand({ Bucket: bucketName });
  const { Contents } = await s3Client.send(command);
  const contentsList = Contents.map((c) => ` • ${c.Key}`).join("\n");
  console.log("\nHere's a list of files in the bucket:");
  console.log(`${contentsList}\n`);
};
```

Sometimes you might want to copy an object from one bucket to another. Use the `CopyObject` command for that.

```
export const copyFileFromBucket = async ({ destinationBucket }) => {
  const proceed = await prompter.confirm({
    message: "Would you like to copy an object from another bucket?",
  });

  if (!proceed) {
    return;
  }

  const copy = async () => {
    try {
      const sourceBucket = await prompter.input({
        message: "Enter source bucket name:",
      });
      const sourceKey = await prompter.input({
        message: "Enter source key:",
      });
      const destinationKey = await prompter.input({
        message: "Enter destination key:",
      });

      const command = new CopyObjectCommand({
        Bucket: destinationBucket,
        CopySource: `${sourceBucket}/${sourceKey}`,
        Key: destinationKey,
      });
      await s3Client.send(command);
      await copyFileFromBucket({ destinationBucket });
    } catch (err) {
      console.error("Copy error.");
      console.error(err);
      const retryAnswer = await prompter.confirm({ message: "Try again?" });
      if (retryAnswer) {
        await copy();
      }
    }
  };
  await copy();
};
```

There's no SDK method for getting multiple objects from a bucket. Instead, you'll create a list of objects to download and iterate over them.

```
export const downloadFilesFromBucket = async ({ bucketName }) => {
  const { Contents } = await s3Client.send(
    new ListObjectsCommand({ Bucket: bucketName }),
  );
  const path = await prompter.input({
    message: "Enter destination path for files:",
  });

  for (const content of Contents) {
    const obj = await s3Client.send(
      new GetObjectCommand({ Bucket: bucketName, Key: content.Key }),
    );
    writeFileSync(
      `${path}/${content.Key}`,
      await obj.Body.transformToByteArray(),
    );
  }
  console.log("Files downloaded successfully.\n");
};
```

It's time to clean up your resources. A bucket must be empty before it can be deleted. These two functions empty and delete the bucket.

```
export const emptyBucket = async ({ bucketName }) => {
  const listObjectsCommand = new ListObjectsCommand({ Bucket: bucketName });
  const { Contents } = await s3Client.send(listObjectsCommand);
  const keys = Contents.map((c) => c.Key);

  const deleteObjectsCommand = new DeleteObjectsCommand({
    Bucket: bucketName,
    Delete: { Objects: keys.map((key) => ({ Key: key })) },
  });
  await s3Client.send(deleteObjectsCommand);
  console.log(`${bucketName} emptied successfully.\n`);
};

export const deleteBucket = async ({ bucketName }) => {
  const command = new DeleteBucketCommand({ Bucket: bucketName });
  await s3Client.send(command);
};
```

```
console.log(`${bucketName} deleted successfully.\n`);  
};
```

The 'main' function pulls everything together. If you run this file directly the main function will be called.

```
const main = async () => {  
  const OBJECT_DIRECTORY = `${dirnameFromMetaUrl(  
    import.meta.url,  
  )}../../../../resources/sample_files/.sample_media`;  
  
  try {  
    console.log(wrapText("Welcome to the Amazon S3 getting started example."));  
    console.log("Let's create a bucket.");  
    const bucketName = await createBucket();  
    await prompter.confirm({ message: continueMessage });  
  
    console.log(wrapText("File upload."));  
    console.log(  
      "I have some default files ready to go. You can edit the source code to  
provide your own.",  
    );  
    await uploadFilesToBucket({  
      bucketName,  
      folderPath: OBJECT_DIRECTORY,  
    });  
  
    await listFilesInBucket({ bucketName });  
    await prompter.confirm({ message: continueMessage });  
  
    console.log(wrapText("Copy files."));  
    await copyFileFromBucket({ destinationBucket: bucketName });  
    await listFilesInBucket({ bucketName });  
    await prompter.confirm({ message: continueMessage });  
  
    console.log(wrapText("Download files."));  
    await downloadFilesFromBucket({ bucketName });  
  
    console.log(wrapText("Clean up."));  
    await emptyBucket({ bucketName });  
    await deleteBucket({ bucketName });  
  } catch (err) {
```

```
    console.error(err);
  }
};
```

## Actions for Amazon S3 using AWS SDKs

The following code examples demonstrate how to perform individual Amazon S3 actions with AWS SDKs. Each example includes a link to GitHub, where you can find instructions for setting up and running the code.

These excerpts call the Amazon S3 API and are code excerpts from larger programs that must be run in context. You can see actions in context in [Scenarios for Amazon S3 using AWS SDKs](#).

The following examples include only the most commonly used actions. For a complete list, see the [Amazon Simple Storage Service API Reference](#).

### Examples

- [Use AbortMultipartUpload with an AWS SDK or CLI](#)
- [Use CompleteMultipartUpload with an AWS SDK or CLI](#)
- [Use CopyObject with an AWS SDK or CLI](#)
- [Use CreateBucket with an AWS SDK or CLI](#)
- [Use CreateMultiRegionAccessPoint with an AWS SDK](#)
- [Use CreateMultipartUpload with an AWS SDK or CLI](#)
- [Use CreatePresignedPost with an AWS SDK](#)
- [Use DeleteBucket with an AWS SDK or CLI](#)
- [Use DeleteBucketAnalyticsConfiguration with a CLI](#)
- [Use DeleteBucketCors with an AWS SDK or CLI](#)
- [Use DeleteBucketEncryption with a CLI](#)
- [Use DeleteBucketInventoryConfiguration with a CLI](#)
- [Use DeleteBucketLifecycle with an AWS SDK or CLI](#)

- [Use DeleteBucketMetricsConfiguration with a CLI](#)
- [Use DeleteBucketPolicy with an AWS SDK or CLI](#)
- [Use DeleteBucketReplication with a CLI](#)
- [Use DeleteBucketTagging with a CLI](#)
- [Use DeleteBucketWebsite with an AWS SDK or CLI](#)
- [Use DeleteObject with an AWS SDK or CLI](#)
- [Use DeleteObjectTagging with a CLI](#)
- [Use DeleteObjects with an AWS SDK or CLI](#)
- [Use DeletePublicAccessBlock with a CLI](#)
- [Use GetBucketAccelerateConfiguration with a CLI](#)
- [Use GetBucketAcl with an AWS SDK or CLI](#)
- [Use GetBucketAnalyticsConfiguration with a CLI](#)
- [Use GetBucketCors with an AWS SDK or CLI](#)
- [Use GetBucketEncryption with an AWS SDK or CLI](#)
- [Use GetBucketInventoryConfiguration with a CLI](#)
- [Use GetBucketLifecycleConfiguration with an AWS SDK or CLI](#)
- [Use GetBucketLocation with an AWS SDK or CLI](#)
- [Use GetBucketLogging with a CLI](#)
- [Use GetBucketMetricsConfiguration with a CLI](#)
- [Use GetBucketNotification with a CLI](#)
- [Use GetBucketPolicy with an AWS SDK or CLI](#)
- [Use GetBucketPolicyStatus with a CLI](#)
- [Use GetBucketReplication with an AWS SDK or CLI](#)
- [Use GetBucketRequestPayment with a CLI](#)
- [Use GetBucketTagging with a CLI](#)
- [Use GetBucketVersioning with a CLI](#)
- [Use GetBucketWebsite with an AWS SDK or CLI](#)
- [Use GetObject with an AWS SDK or CLI](#)
- [Use GetObjectAcl with an AWS SDK or CLI](#)
- [Use GetObjectAttributes with an AWS SDK or CLI](#)

- [Use `GetObjectLegalHold` with an AWS SDK or CLI](#)
- [Use `GetObjectLockConfiguration` with an AWS SDK or CLI](#)
- [Use `GetObjectRetention` with an AWS SDK or CLI](#)
- [Use `GetObjectTagging` with a CLI](#)
- [Use `GetPublicAccessBlock` with a CLI](#)
- [Use `HeadBucket` with an AWS SDK or CLI](#)
- [Use `HeadObject` with an AWS SDK or CLI](#)
- [Use `ListBucketAnalyticsConfigurations` with a CLI](#)
- [Use `ListBucketInventoryConfigurations` with a CLI](#)

- [Use UploadPart with an AWS SDK or CLI](#)
- [Use UploadPartCopy with an AWS SDK or CLI](#)

## Use AbortMultipartUpload with an AWS SDK or CLI

The following code examples show how to use AbortMultipartUpload.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- [Delete incomplete multipart uploads](#)
- [Work with Amazon S3 object integrity](#)

C++

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
#!/ Abort a multipart upload to an S3 bucket.
/*!
    \param bucket: The name of the S3 bucket where the object will be uploaded.
    \param key: The unique identifier (key) for the object within the S3 bucket.
    \param uploadID: An upload ID string.
    \param client: The S3 client instance used to perform the upload operation.
    \return bool: Function succeeded.
*/

bool AwsDoc::S3::abortMultipartUpload(const Aws::String &bucket,
```

```

        const Aws::String &key,
        const Aws::String &uploadID,
        const Aws::S3::S3Client &client) {
    Aws::S3::Model::AbortMultipartUploadRequest request;
    request.SetBucket(bucket);
    request.SetKey(key);
    request.SetUploadId(uploadID);

    Aws::S3::Model::AbortMultipartUploadOutcome outcome =
        client.AbortMultipartUpload(request);

    if (outcome.IsSuccess()) {
        std::cout << "Multipart upload aborted." << std::endl;
    } else {
        std::cerr << "Error aborting multipart upload: " <<
outcome.GetError().GetMessage() << std::endl;
    }

    return outcome.IsSuccess();
}

```

- For API details, see [AbortMultipartUpload](#) in *AWS SDK for C++ API Reference*.

## CLI

### AWS CLI

#### To abort the specified multipart upload

The following `abort-multipart-upload` command aborts a multipart upload for the key `multipart/01` in the bucket `amzn-s3-demo-bucket`.

```

aws s3api abort-multipart-upload \
  --bucket amzn-s3-demo-bucket \
  --key multipart/01 \
  --upload-
id dfRtDYU0WWCCcH43C3WFbkR0NycyCpTJJvxu2i5GYkZLjF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8F

```

The upload ID required by this command is output by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`.

- For API details, see [AbortMultipartUpload](#) in *AWS CLI Command Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1: This command aborts multipart uploads created earlier than 5 days ago.**

```
Remove-S3MultipartUpload -BucketName amzn-s3-demo-bucket -DaysBefore 5
```

**Example 2: This command aborts multipart uploads created earlier than January 2nd, 2014.**

```
Remove-S3MultipartUpload -BucketName amzn-s3-demo-bucket -InitiatedDate  
"Thursday, January 02, 2014"
```

**Example 3: This command aborts multipart uploads created earlier than January 2nd, 2014, 10:45:37.**

```
Remove-S3MultipartUpload -BucketName amzn-s3-demo-bucket -InitiatedDate  
"2014/01/02 10:45:37"
```

- For API details, see [AbortMultipartUpload](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

### Tools for PowerShell V5

**Example 1: This command aborts multipart uploads created earlier than 5 days ago.**

```
Remove-S3MultipartUpload -BucketName amzn-s3-demo-bucket -DaysBefore 5
```

**Example 2: This command aborts multipart uploads created earlier than January 2nd, 2014.**

```
Remove-S3MultipartUpload -BucketName amzn-s3-demo-bucket -InitiatedDate  
"Thursday, January 02, 2014"
```

**Example 3: This command aborts multipart uploads created earlier than January 2nd, 2014, 10:45:37.**

```
Remove-S3MultipartUpload -BucketName amzn-s3-demo-bucket -InitiatedDate  
"2014/01/02 10:45:37"
```

- For API details, see [AbortMultipartUpload](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

## Use CompleteMultipartUpload with an AWS SDK or CLI

The following code examples show how to use CompleteMultipartUpload.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- [Perform a multipart copy](#)
- [Use checksums](#)
- [Work with Amazon S3 object integrity](#)

C++

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
//! Complete a multipart upload to an S3 bucket.
```

```

/ * !
  \param bucket: The name of the S3 bucket where the object will be uploaded.
  \param key: The unique identifier (key) for the object within the S3 bucket.
  \param uploadID: An upload ID string.
  \param parts: A vector of CompleteParts.
  \param client: The S3 client instance used to perform the upload operation.
  \return CompleteMultipartUploadOutcome: The request outcome.
*/
Aws::S3::Model::CompleteMultipartUploadOutcome
AwsDoc::S3::completeMultipartUpload(const Aws::String &bucket,

const Aws::String &key,

const Aws::String &uploadID,

const Aws::Vector<Aws::S3::Model::CompletedPart> &parts,

const Aws::S3::S3Client &client) {
    Aws::S3::Model::CompletedMultipartUpload completedMultipartUpload;
    completedMultipartUpload.SetParts(parts);

    Aws::S3::Model::CompleteMultipartUploadRequest request;
    request.SetBucket(bucket);
    request.SetKey(key);
    request.SetUploadId(uploadID);
    request.SetMultipartUpload(completedMultipartUpload);

    Aws::S3::Model::CompleteMultipartUploadOutcome outcome =
        client.CompleteMultipartUpload(request);

    if (!outcome.IsSuccess()) {
        std::cerr << "Error completing multipart upload: " <<
outcome.GetError().GetMessage() << std::endl;
    }
    return outcome;
}

```

- For API details, see [CompleteMultipartUpload](#) in *AWS SDK for C++ API Reference*.

## CLI

## AWS CLI

The following command completes a multipart upload for the key `multipart/01` in the bucket `amzn-s3-demo-bucket`:

```
aws s3api complete-multipart-upload --multipart-upload file://  
mpustruct --bucket amzn-s3-demo-bucket --key 'multipart/01' --upload-  
id dfRtDYU0WwCCcH43C3WfbkR0NycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6YjLx.cph0gtNBtJ8P
```

The upload ID required by this command is output by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`.

The multipart upload option in the above command takes a JSON structure that describes the parts of the multipart upload that should be reassembled into the complete file. In this example, the `file://` prefix is used to load the JSON structure from a file in the local folder named `mpustruct`.

`mpustruct`:

```
{  
  "Parts": [  
    {  
      "ETag": "e868e0f4719e394144ef36531ee6824c",  
      "PartNumber": 1  
    },  
    {  
      "ETag": "6bb2b12753d66fe86da4998aa33fffb0",  
      "PartNumber": 2  
    },  
    {  
      "ETag": "d0a0112e841abec9c9ec83406f0159c8",  
      "PartNumber": 3  
    }  
  ]  
}
```

The ETag value for each part is output each time you upload a part using the `upload-part` command and can also be retrieved by calling `list-parts` or calculated by taking the MD5 checksum of each part.

## Output:

```
{
  "ETag": "\"3944a9f7a4faab7f78788ff6210f63f0-3\"",
  "Bucket": "amzn-s3-demo-bucket",
  "Location": "https://amzn-s3-demo-bucket.s3.amazonaws.com/multipart%2F01",
  "Key": "multipart/01"
}
```

- For API details, see [CompleteMultipartUpload](#) in *AWS CLI Command Reference*.

## Rust

Simple copy of an object.

```
$s3client = new Aws\S3\S3Client(['region' => 'us-west-2']);
```

```
try {
    $folder = "copied-folder";
    $this->s3client->copyObject([
        'Bucket' => $this->bucketName,
        'CopySource' => "$this->bucketName/$fileName",
        'Key' => "$folder/$fileName-copy",
    ]);
    echo "Copied $fileName to $folder/$fileName-copy.\n";
} catch (Exception $exception) {
    echo "Failed to copy $fileName with error: " . $exception-
>getMessage();
    exit("Please fix error with object copying before continuing.");
}
```

## PowerShell

### Tools for PowerShell V4

**Example 1: This command copies the object "sample.txt" from bucket "test-files" to the same bucket but with a new key of "sample-copy.txt".**

```
Copy-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt -DestinationKey
sample-copy.txt
```

**Example 2: This command copies the object "sample.txt" from bucket "test-files" to the bucket "backup-files" with a key of "sample-copy.txt".**

```
Copy-S3Object -BucketName amzn-s3-demo-source-bucket -Key sample.txt -
DestinationKey sample-copy.txt -DestinationBucket amzn-s3-demo-destination-bucket
```

**Example 3: This command downloads the object "sample.txt" from bucket "test-files" to a local file with name "local-sample.txt".**

```
Copy-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt -LocalFile local-
sample.txt
```

**Example 4: Downloads the single object to the specified file. The downloaded file will be found at c:\downloads\data\archive.zip**

```
Copy-S3Object -BucketName amzn-s3-demo-bucket -Key data/archive.zip -LocalFolder
c:\downloads
```

**Example 5: Downloads all objects that match the specified key prefix to the local folder. The relative key hierarchy will be preserved as subfolders in the overall download location.**

```
Copy-S3Object -BucketName amzn-s3-demo-bucket -KeyPrefix data -LocalFolder c:
\downloads
```

- For API details, see [CopyObject](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1: This command copies the object "sample.txt" from bucket "test-files" to the same bucket but with a new key of "sample-copy.txt".**

```
Copy-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt -DestinationKey
sample-copy.txt
```

**Example 2: This command copies the object "sample.txt" from bucket "test-files" to the bucket "backup-files" with a key of "sample-copy.txt".**

```
Copy-S3Object -BucketName amzn-s3-demo-source-bucket -Key sample.txt -
DestinationKey sample-copy.txt -DestinationBucket amzn-s3-demo-destination-bucket
```

**Example 3: This command downloads the object "sample.txt" from bucket "test-files" to a local file with name "local-sample.txt".**

```
Copy-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt -LocalFile local-
sample.txt
```

**Example 4: Downloads the single object to the specified file. The downloaded file will be found at c:\downloads\data\archive.zip**

```
Copy-S3Object -BucketName amzn-s3-demo-bucket -Key data/archive.zip -LocalFolder
c:\downloads
```

**Example 5: Downloads all objects that match the specified key prefix to the local folder. The relative key hierarchy will be preserved as subfolders in the overall download location.**

```
Copy-S3Object -BucketName amzn-s3-demo-bucket -KeyPrefix data -LocalFolder c:\downloads
```

- For API details, see [CopyObject](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

## Ruby

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

#### Copy an object.

```
require 'aws-sdk-s3'

# Wraps Amazon S3 object actions.
class ObjectCopyWrapper
  attr_reader :source_object

  # @param source_object [Aws::S3::Object] An existing Amazon S3 object. This is
  # used as the source object for
  #                                     copy actions.
  def initialize(source_object)
    @source_object = source_object
  end

  # Copy the source object to the specified target bucket and rename it with the
  # target key.
  #
  # @param target_bucket [Aws::S3::Bucket] An existing Amazon S3 bucket where the
  # object is copied.
  # @param target_object_key [String] The key to give the copy of the object.
  # @return [Aws::S3::Object, nil] The copied object when successful; otherwise,
  # nil.
  def copy_object(target_bucket, target_object_key)
    @source_object.copy_to(bucket: target_bucket.name, key: target_object_key)
    target_bucket.object(target_object_key)
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't copy #{@source_object.key} to #{target_object_key}. Here's
    why: #{e.message}"
  end
end

# Example usage:
```

```

def run_demo
  source_bucket_name = "amzn-s3-demo-bucket1"
  source_key = "my-source-file.txt"
  target_bucket_name = "amzn-s3-demo-bucket2"
  target_key = "my-target-file.txt"

  source_bucket = Aws::S3::Bucket.new(source_bucket_name)
  wrapper = ObjectCopyWrapper.new(source_bucket.object(source_key))
  target_bucket = Aws::S3::Bucket.new(target_bucket_name)
  target_object = wrapper.copy_object(target_bucket, target_key)
  return unless target_object

  puts "Copied #{source_key} from #{source_bucket_name} to
  #{target_object.bucket_name}:#{target_object.key}."
end

run_demo if $PROGRAM_NAME == __FILE__

```

Copy an object and add server-side encryption to the destination object.

```

require 'aws-sdk-s3'

# Wraps Amazon S3 object actions.
class ObjectCopyEncryptWrapper
  attr_reader :source_object

  # @param source_object [Aws::S3::Object] An existing Amazon S3 object. This is
  # used as the source object for
  #                                     copy actions.
  def initialize(source_object)
    @source_object = source_object
  end

  # Copy the source object to the specified target bucket, rename it with the
  # target key, and encrypt it.
  #
  # @param target_bucket [Aws::S3::Bucket] An existing Amazon S3 bucket where the
  # object is copied.
  # @param target_object_key [String] The key to give the copy of the object.
  # @return [Aws::S3::Object, nil] The copied object when successful; otherwise,
  # nil.
  def copy_object(target_bucket, target_object_key, encryption)

```

```
@source_object.copy_to(bucket: target_bucket.name, key: target_object_key,
server_side_encryption: encryption)
  target_bucket.object(target_object_key)
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't copy #{@source_object.key} to #{target_object_key}. Here's
why: #{e.message}"
  end
end
end

# Example usage:
def run_demo
  source_bucket_name = "amzn-s3-demo-bucket1"
  source_key = "my-source-file.txt"

```

bool AwsDoc::S3::createBucket(const Aws::String &bucketName,
                              const Aws::S3::S3ClientConfiguration &clientConfig)
{
    Aws::S3::S3Client client(clientConfig);
    Aws::S3::Model::CreateBucketRequest request;
    request.SetBucket(bucketName);

    if (clientConfig.region != "us-east-1") {
        Aws::S3::Model::CreateBucketConfiguration createBucketConfig;
        createBucketConfig.SetLocationConstraint(
            Aws::S3::Model::BucketLocationConstraintMapper::GetBucketLocationConstraintForName(
                clientConfig.region));
        request.SetCreateBucketConfiguration(createBucketConfig);
    }

    Aws::S3::Model::CreateBucketOutcome outcome = client.CreateBucket(request);
    if (!outcome.IsSuccess()) {
        auto err = outcome.GetError();
        std::cerr << "Error: createBucket: " <<
            err.GetExceptionName() << ": " << err.GetMessage() <<
            std::endl;
    } else {
        std::cout << "Created bucket " << bucketName <<
            " in the specified AWS Region." << std::endl;
    }

    return outcome.IsSuccess();
}

```

- For API details, see [CreateBucket](#) in *AWS SDK for C++ API Reference*.

## CLI

### AWS CLI

#### Example 1: To create a bucket

The following create-bucket example creates a bucket named amzn-s3-demo-bucket:

```
aws s3api create-bucket \
```

```
--bucket amzn-s3-demo-bucket \  
--region us-east-1
```

Output:

```
{  
  "Location": "/amzn-s3-demo-bucket"  
}
```

For more information, see [Creating a bucket](#) in the *Amazon S3 User Guide*.

### Example 2: To create a bucket with owner enforced

The following create-bucket example creates a bucket named amzn-s3-demo-bucket that uses the bucket owner enforced setting for S3 Object Ownership.

```
aws s3api create-bucket \  
  --bucket amzn-s3-demo-bucket \  
  --region us-east-1 \  
  --object-ownership BucketOwnerEnforced
```

Output:

```
{  
  "Location": "/amzn-s3-demo-bucket"  
}
```

For more information, see [Controlling ownership of objects and disabling ACLs](#) in the *Amazon S3 User Guide*.

### Example 3: To create a bucket outside of the ``us-east-1`` region

The following create-bucket example creates a bucket named amzn-s3-demo-bucket in the eu-west-1 region. Regions outside of us-east-1 require the appropriate LocationConstraint to be specified in order to create the bucket in the desired region.

```
aws s3api create-bucket \  
  --bucket amzn-s3-demo-bucket \  
  --region eu-west-1 \  
  --create-bucket-configuration LocationConstraint=eu-west-1
```

**Output:**

```
{
  "Location": "http://amzn-s3-demo-bucket.s3.amazonaws.com/"
}
```

For more information, see [Creating a bucket](#) in the *Amazon S3 User Guide*.

- For API details, see [CreateBucket](#) in *AWS CLI Command Reference*.

## Use CreateMultiRegionAccessPoint with an AWS SDK

The following code example shows how to use CreateMultiRegionAccessPoint.

Kotlin

### SDK for Kotlin

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Configure the S3 control client to send request to the us-west-2 Region.

```
suspend fun createS3ControlClient(): S3ControlClient {
    // Configure your S3ControlClient to send requests to US West
    (Oregon).
    val s3Control = S3ControlClient.fromEnvironment {
        region = "us-west-2"
    }
    return s3Control
}
```

Create the Multi-Region Access Point.

```
suspend fun createMrap(
    s3Control: S3ControlClient,
```

```
    accountIdParam: String,
    bucketName1: String,
    bucketName2: String,
    mrapName: String,
): String {
    println("Creating MRAP ...")
    val createMrapResponse: CreateMultiRegionAccessPointResponse =
        s3Control.createMultiRegionAccessPoint {
            accountId = accountIdParam
            clientToken = UUID.randomUUID().toString()
            details {
                name = mrapName
                regions = listOf(
                    Region {
                        bucket = bucketName1
                    },
                    Region {
                        bucket = bucketName2
                    },
                )
            }
        }
    val requestToken: String? = createMrapResponse.requestTokenArn

    // Use the request token to check for the status of the
    CreateMultiRegionAccessPoint operation.
    if (requestToken != null) {
        waitForSucceededStatus(s3Control, requestToken, accountIdParam)
        println("MRAP created")
    }

    val getMrapResponse =
        s3Control.getMultiRegionAccessPoint(
            input = GetMultiRegionAccessPointRequest {
                accountId = accountIdParam
                name = mrapName
            },
        )
    val mrapAlias = getMrapResponse.accessPoint?.alias
    return "arn:aws:s3:::$accountIdParam:accesspoint/$mrapAlias"
}
```

## Wait for the Multi-Region Access Point to become available.

```
suspend fun waitForSucceededStatus(
    s3Control: S3ControlClient,
    requestToken: String,
    accountIdParam: String,
    timeBetweenChecks: Duration = 1.minutes,
) {
    var describeResponse: DescribeMultiRegionAccessPointOperationResponse
    describeResponse = s3Control.describeMultiRegionAccessPointOperation(
        input = DescribeMultiRegionAccessPointOperationRequest {
            accountId = accountIdParam
            requestTokenArn = requestToken
        },
    )

    var status: String? = describeResponse.asyncOperation?.requestStatus
    while (status != "SUCCEEDED") {
        delay(timeBetweenChecks)
        describeResponse =
s3Control.describeMultiRegionAccessPointOperation(
            input = DescribeMultiRegionAccessPointOperationRequest {
                accountId = accountIdParam
                requestTokenArn = requestToken
            },
        )
        status = describeResponse.asyncOperation?.requestStatus
        println(status)
    }
}
```

- For more information, see [AWS SDK for Kotlin developer guide](#).
- For API details, see [CreateMultiRegionAccessPoint](#) in *AWS SDK for Kotlin API reference*.

## Use CreateMultipartUpload with an AWS SDK or CLI

The following code examples show how to use CreateMultipartUpload.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- [Perform a multipart copy](#)
- [Use checksums](#)
- [Work with Amazon S3 object integrity](#)

C++

## SDK for C++

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
#!/ Create a multipart upload.
/#!
  \param bucket: The name of the S3 bucket where the object will be uploaded.
  \param key: The unique identifier (key) for the object within the S3 bucket.
  \param client: The S3 client instance used to perform the upload operation.
  \return Aws::String: Upload ID or empty string if failed.
*/
Aws::String
AwsDoc::S3::createMultipartUpload(const Aws::String &bucket, const Aws::String
&key,
                                Aws::S3::Model::ChecksumAlgorithm
checksumAlgorithm,
                                const Aws::S3::S3Client &client) {
  Aws::S3::Model::CreateMultipartUploadRequest request;
  request.SetBucket(bucket);
  request.SetKey(key);

  if (checksumAlgorithm != Aws::S3::Model::ChecksumAlgorithm::NOT_SET) {
    request.SetChecksumAlgorithm(checksumAlgorithm);
  }

  Aws::S3::Model::CreateMultipartUploadOutcome outcome =
    client.CreateMultipartUpload(request);
```

```
Aws::String uploadID;
if (outcome.IsSuccess()) {
    uploadID = outcome.GetResult().GetUploadId();
} else {
    std::cerr << "Error creating multipart upload: " <<
outcome.GetError().GetMessage() << std::endl;
}

return uploadID;
}
```

- For API details, see [CreateMultipartUpload](#) in *AWS SDK for C++ API Reference*.

## CLI

### AWS CLI

The following command creates a multipart upload in the bucket `amzn-s3-demo-bucket` with the key `multipart/01`:

```
aws s3api create-multipart-upload --bucket amzn-s3-demo-bucket --key
'multipart/01'
```

Output:

```
{
  "Bucket": "amzn-s3-demo-bucket",
  "UploadId":
"dfRtDYU0WCCcH43C3WFbkR0NycyCpTJJvxu2i5GYkZ1jF.Yxwh6XG7WfS2vC4to6HiV6Yj1x.cph0gtNBtJ8P3
  "Key": "multipart/01"
}
```

The completed file will be named `01` in a folder called `multipart` in the bucket `amzn-s3-demo-bucket`. Save the upload ID, key and bucket name for use with the `upload-part` command.

- For API details, see [CreateMultipartUpload](#) in *AWS CLI Command Reference*.

## Rust

## SDK for Rust

Delete an empty bucket.

```
$s3client = new Aws\S3\S3Client(['region' => 'us-west-2']);  
  
try {  
    $this->s3client->deleteBucket([  
        'Bucket' => $this->bucketName,  
    ]);  
    echo "Deleted bucket $this->bucketName.\n";  
} catch (Exception $exception) {  
    echo "Failed to delete $this->bucketName with error: " . $exception-  
>getMessage();  
    exit("Please fix error with bucket deletion before continuing.");  
}
```

- For API details, see [DeleteBucket](#) in *AWS SDK for PHP API Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1:** This command removes all objects and object versions from the bucket 'test-files' and then deletes the bucket. The command will prompt for confirmation before proceeding. Add the `-Force` switch to suppress confirmation. Note that buckets that are not empty cannot be deleted.

```
Remove-S3Bucket -BucketName amzn-s3-demo-bucket -DeleteBucketContent
```

- For API details, see [DeleteBucket](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

### Tools for PowerShell V5

**Example 1:** This command removes all objects and object versions from the bucket 'test-files' and then deletes the bucket. The command will prompt for confirmation before proceeding. Add the `-Force` switch to suppress confirmation. Note that buckets that are not empty cannot be deleted.

```
Remove-S3Bucket -BucketName amzn-s3-demo-bucket -DeleteBucketContent
```

- For API details, see [DeleteBucket](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

## Use DeleteBucketAnalyticsConfiguration with a CLI

The following code examples show how to use DeleteBucketAnalyticsConfiguration.

### CLI

#### AWS CLI

##### To delete an analytics configuration for a bucket

The following delete-bucket-analytics-configuration example removes the analytics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-analytics-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 1
```

This command produces no output.

- For API details, see [DeleteBucketAnalyticsConfiguration](#) in *AWS CLI Command Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1: The command removes the analytics filter with name 'testfilter' in the given S3 bucket.**

```
Remove-S3BucketAnalyticsConfiguration -BucketName 'amzn-s3-demo-bucket' -
AnalyticsId 'testfilter'
```

- For API details, see [DeleteBucketAnalyticsConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

### Tools for PowerShell V5

**Example 1: The command removes the analytics filter with name 'testfilter' in the given S3 bucket.**

```
Remove-S3BucketAnalyticsConfiguration -BucketName 'amzn-s3-demo-bucket' -
AnalyticsId 'testfilter'
```

- For API details, see [DeleteBucketAnalyticsConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

### Use DeleteBucketCors with an AWS SDK or CLI

The following code examples show how to use DeleteBucketCors.

.NET

#### SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
    /// <summary>
    /// Deletes a CORS configuration from an Amazon S3 bucket.
    /// </summary>
    /// <param name="client">The initialized Amazon S3 client object used
    /// to delete the CORS configuration from the bucket.</param>
    private static async Task DeleteCORSConfigurationAsync(AmazonS3Client
client)
    {
        DeleteCORSConfigurationRequest request = new
DeleteCORSConfigurationRequest()
        {
            BucketName = BucketName,
        };
        await client.DeleteCORSConfigurationAsync(request);
    }
}
```

- For API details, see [DeleteBucketCors](#) in *AWS SDK for .NET API Reference*.

## CLI

### AWS CLI

The following command deletes a Cross-Origin Resource Sharing configuration from a bucket named `amzn-s3-demo-bucket`:

```
aws s3api delete-bucket-cors --bucket amzn-s3-demo-bucket
```

- For API details, see [DeleteBucketCors](#) in *AWS CLI Command Reference*.

## Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class BucketWrapper:
    """Encapsulates S3 bucket actions."""

    def __init__(self, bucket):
        """
        :param bucket: A Boto3 Bucket resource. This is a high-level resource in
        Boto3
            that wraps bucket actions in a class-like structure.
        """
        self.bucket = bucket
        self.name = bucket.name

    def delete_cors(self):
        """
        Delete the CORS rules from the bucket.

        :param bucket_name: The name of the bucket to update.
        """
        try:
            self.bucket.Cors().delete()
            logger.info("Deleted CORS from bucket '%s'.", self.bucket.name)
        except ClientError:
            logger.exception("Couldn't delete CORS from bucket '%s'.",
self.bucket.name)
            raise
```

## Ruby

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require 'aws-sdk-s3'

# Wraps Amazon S3 bucket CORS configuration.
class BucketCorsWrapper
  attr_reader :bucket_cors

  # @param bucket_cors [Aws::S3::BucketCors] A bucket CORS object configured with
  # an existing bucket.
  def initialize(bucket_cors)
    @bucket_cors = bucket_cors
  end

  # Deletes the CORS configuration of a bucket.
  #
  # @return [Boolean] True if the CORS rules were deleted; otherwise, false.
  def delete_cors
    @bucket_cors.delete
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't delete CORS rules for #{@bucket_cors.bucket.name}. Here's why:
  #{e.message}"
    false
  end
end

end
```

- For API details, see [DeleteBucketCors](#) in *AWS SDK for Ruby API Reference*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use DeleteBucketEncryption with a CLI

The following code examples show how to use DeleteBucketEncryption.

### CLI

#### AWS CLI

#### To delete the server-side encryption configuration of a bucket

The following `delete-bucket-encryption` example deletes the server-side encryption configuration of the specified bucket.

```
aws s3api delete-bucket-encryption \  
  --bucket amzn-s3-demo-bucket
```

This command produces no output.

- For API details, see [DeleteBucketEncryption](#) in *AWS CLI Command Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1: This disables the encryption enabled for the S3 bucket provided.**

```
Remove-S3BucketEncryption -BucketName 'amzn-s3-demo-bucket'
```

#### Output:

```
Confirm  
Are you sure you want to perform this action?  
Performing the operation "Remove-S3BucketEncryption (DeleteBucketEncryption)" on  
target "s3casetestbucket".  
[Y] Yes [A] Yes to All [N] No [L] No to All [S] Suspend [?] Help (default is  
"Y"): Y
```

- For API details, see [DeleteBucketEncryption](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

### Tools for PowerShell V5

**Example 1: This disables the encryption enabled for the S3 bucket provided.**

```
Remove-S3BucketEncryption -BucketName 'amzn-s3-demo-bucket'
```

#### Output:

```
Confirm  
Are you sure you want to perform this action?  
Performing the operation "Remove-S3BucketEncryption (DeleteBucketEncryption)" on  
target "s3casetestbucket".
```

```
[Y] Yes [A] Yes to All [N] No [L] No to All [S] Suspend [?] Help (default is "Y"): Y
```

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use DeleteBucketInventoryConfiguration with a CLI

The following code examples show how to use DeleteBucketInventoryConfiguration.

### CLI

#### AWS CLI

##### To delete the inventory configuration of a bucket

The following delete-bucket-inventory-configuration example deletes the inventory configuration with ID 1 for the specified bucket.

```
aws s3api delete-bucket-inventory-configuration \
  --bucket amzn-s3-demo-bucket \
  --id 1
```

This command produces no output.

- For API details, see [DeleteBucketInventoryConfiguration](#) in *AWS CLI Command Reference*.

### PowerShell

#### Tools for PowerShell V4

**Example 1: This command removes the inventory named 'testInventoryName' corresponding to the given S3 bucket.**

```
Remove-S3BucketInventoryConfiguration -BucketName 'amzn-s3-demo-bucket' -
InventoryId 'testInventoryName'
```

**Output:**

```
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3BucketInventoryConfiguration
(DeleteBucketInventoryConfiguration)" on target "amzn-s3-demo-bucket".
[Y] Yes [A] Yes to All [N] No [L] No to All [S] Suspend [?] Help (default is
"Y"): Y
```

- For API details, see [DeleteBucketInventoryConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

**Tools for PowerShell V5**

**Example 1: This command removes the inventory named 'testInventoryName' corresponding to the given S3 bucket.**

```
Remove-S3BucketInventoryConfiguration -BucketName 'amzn-s3-demo-bucket' -
InventoryId 'testInventoryName'
```

**Output:**

```
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3BucketInventoryConfiguration
(DeleteBucketInventoryConfiguration)" on target "amzn-s3-demo-bucket".
[Y] Yes [A] Yes to All [N] No [L] No to All [S] Suspend [?] Help (default is
"Y"): Y
```

- For API details, see [DeleteBucketInventoryConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

**Use DeleteBucketLifecycle with an AWS SDK or CLI**

The following code examples show how to use DeleteBucketLifecycle.

## .NET

### SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// This method removes the Lifecycle configuration from the named
/// S3 bucket.
/// </summary>
/// <param name="client">The S3 client object used to call
/// the RemoveLifecycleConfigAsync method.</param>
/// <param name="bucketName">A string representing the name of the
/// S3 bucket from which the configuration will be removed.</param>
public static async Task RemoveLifecycleConfigAsync(IAmazonS3 client,
string bucketName)
{
    var request = new DeleteLifecycleConfigurationRequest()
    {
        BucketName = bucketName,
    };
    await client.DeleteLifecycleConfigurationAsync(request);
}
```

- For API details, see [DeleteBucketLifecycle](#) in *AWS SDK for .NET API Reference*.

## CLI

### AWS CLI

The following command deletes a lifecycle configuration from a bucket named `amzn-s3-demo-bucket`:

```
aws s3api delete-bucket-lifecycle --bucket amzn-s3-demo-bucket
```

- For API details, see [DeleteBucketLifecycle](#) in *AWS CLI Command Reference*.

## Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class BucketWrapper:
    """Encapsulates S3 bucket actions."""

    def __init__(self, bucket):
        """
        :param bucket: A Boto3 Bucket resource. This is a high-level resource in
        Boto3
                        that wraps bucket actions in a class-like structure.
        """
        self.bucket = bucket
        self.name = bucket.name

    def delete_lifecycle_configuration(self):
        """
        Remove the lifecycle configuration from the specified bucket.
        """
        try:
            self.bucket.LifecycleConfiguration().delete()
            logger.info(
                "Deleted lifecycle configuration for bucket '%s'.",
                self.bucket.name
            )
        except ClientError:
            logger.exception(
                "Couldn't delete lifecycle configuration for bucket '%s'.",
                self.bucket.name,
            )
            raise
```

- For API details, see [DeleteBucketLifecycle](#) in *AWS SDK for Python (Boto3) API Reference*.

## Use DeleteBucketMetricsConfiguration with a CLI

The following code examples show how to use DeleteBucketMetricsConfiguration.

### CLI

#### AWS CLI

##### To delete a metrics configuration for a bucket

The following delete-bucket-metrics-configuration example removes the metrics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-metrics-configuration \  
  --bucket amzn-s3-demo-bucket \  
  --id 123
```

This command produces no output.

- For API details, see [DeleteBucketMetricsConfiguration](#) in *AWS CLI Command Reference*.

### PowerShell

#### Tools for PowerShell V4

**Example 1: The command removes the metrics filter with name 'testmetrics' in the given S3 bucket.**

```
Remove-S3BucketMetricsConfiguration -BucketName 'amzn-s3-demo-bucket' -MetricsId  
'testmetrics'
```

- For API details, see [DeleteBucketMetricsConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1: The command removes the metrics filter with name 'testmetrics' in the given S3 bucket.**

```
Remove-S3BucketMetricsConfiguration -BucketName 'amzn-s3-demo-bucket' -MetricsId  
'testmetrics'
```

- For API details, see [DeleteBucketMetricsConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

### Use DeleteBucketPolicy with an AWS SDK or CLI

The following code examples show how to use DeleteBucketPolicy.

C++

#### SDK for C++

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
bool AwsDoc::S3::deleteBucketPolicy(const Aws::String &bucketName,  
                                     const Aws::S3::S3ClientConfiguration  
&clientConfig) {  
    Aws::S3::S3Client client(clientConfig);  
  
    Aws::S3::Model::DeleteBucketPolicyRequest request;  
    request.SetBucket(bucketName);  
  
    Aws::S3::Model::DeleteBucketPolicyOutcome outcome =  
    client.DeleteBucketPolicy(request);  
  
    if (!outcome.IsSuccess()) {
```

```
const Aws::S3::S3Error &err = outcome.GetError();
std::cerr << "Error: deleteBucketPolicy: " <<
    err.GetExceptionName() << ": " << err.GetMessage() <<

### Delete the bucket policy.

```
import {
    DeleteBucketPolicyCommand,
    S3Client,
    S3ServiceException,
} from "@aws-sdk/client-s3";

/**
 * Remove the policy from an Amazon S3 bucket.
```

```
* @param {{ bucketName: string }}
*/
export const main = async ({ bucketName }) => {
  const client = new S3Client({});

  try {
    await client.send(
      new DeleteBucketPolicyCommand({
        Bucket: bucketName,
      }),
    );
    console.log(`Bucket policy deleted from "${bucketName}".`);
  } catch (caught) {
    if (
      caught instanceof S3ServiceException &&
      caught.name === "NoSuchBucket"
    ) {
      console.error(
        `Error from S3 while deleting policy from ${bucketName}. The bucket
        doesn't exist.`,
      );
    } else if (caught instanceof S3ServiceException) {
      console.error(
        `Error from S3 while deleting policy from ${bucketName}. ${caught.name}:
        ${caught.message}`,
      );
    } else {
      throw caught;
    }
  }
};
```

## Use DeleteBucketTagging with a CLI

The following code examples show how to use DeleteBucketTagging.

### CLI

#### AWS CLI

The following command deletes a tagging configuration from a bucket named amzn-s3-demo-bucket:

```
aws s3api delete-bucket-tagging --bucket amzn-s3-demo-bucket
```

- For API details, see [DeleteBucketTagging](#) in *AWS CLI Command Reference*.

### PowerShell

#### Tools for PowerShell V4

**Example 1: This command removes all the tags associated with the given S3 bucket.**

```
Remove-S3BucketTagging -BucketName 'amzn-s3-demo-bucket'
```

#### Output:

```
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3BucketTagging (DeleteBucketTagging)" on target
"amzn-s3-demo-bucket".
[Y] Yes [A] Yes to All [N] No [L] No to All [S] Suspend [?] Help (default is
"Y"): Y
```

- For API details, see [DeleteBucketTagging](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

#### Tools for PowerShell V5

**Example 1: This command removes all the tags associated with the given S3 bucket.**

```
Remove-S3BucketTagging -BucketName 'amzn-s3-demo-bucket'
```

#### Output:

**Confirm**

Are you sure you want to perform this action?

Performing the operation "Remove-S3BucketTagging (DeleteBucketTagging)" on target "amzn-s3-demo-bucket".

[Y] Yes [A] Yes to All [N] No [L] No to All [S] Suspend [?] Help (default is "Y"): Y

- For API details, see [DeleteBucketTagging](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

## CLI

### AWS CLI

The following command deletes an object named `test.txt` from a bucket named `amzn-s3-demo-bucket`:

```
aws s3api delete-object --bucket amzn-s3-demo-bucket --key test.txt
```

If bucket versioning is enabled, the output will contain the version ID of the delete marker:

```
{
  "VersionId": "9_gKg5vG56F.TTEUdwkxGpJ3tND1WlGq",
  "DeleteMarker": true
}
```

For more information about deleting objects, see *Deleting Objects* in the *Amazon S3 Developer Guide*.

- For API details, see [DeleteObject](#) in *AWS CLI Command Reference*.

## Swift

### SDK for Swift

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
import AWSS3

public func deleteFile(bucket: String, key: String) async throws {
    let input = DeleteObjectInput(
        bucket: bucket,
        key: key
    )

    do {
        _ = try await client.deleteObject(input: input)
    }
    catch {
        print("ERROR: ", dump(error, name: "Deleting a file. "))
        throw error
    }
}
```

- For API details, see [DeleteObject](#) in *AWS SDK for Swift API reference*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

### Use DeleteObjectTagging with a CLI

The following code examples show how to use DeleteObjectTagging.

## CLI

## AWS CLI

**To delete the tag sets of an object**

The following `delete-object-tagging` example deletes the tag with the specified key from the object `doc1.rtf`.

```
aws s3api delete-object-tagging \  
  --bucket amzn-s3-demo-bucket \  
  --key doc1.rtf
```

This command produces no output.

- For API details, see [DeleteObjectTagging](#) in *AWS CLI Command Reference*.

## PowerShell

**Tools for PowerShell V4**

**Example 1: This command removes all the tags associated with the object with key 'testfile.txt' in the given S3 Bucket.**

```
Remove-S3ObjectTagSet -Key 'testfile.txt' -BucketName 'amzn-s3-demo-bucket' -  
Select '^Key'
```

**Output:**

```
Confirm  
Are you sure you want to perform this action?  
Performing the operation "Remove-S3ObjectTagSet (DeleteObjectTagging)" on target  
"testfile.txt".  
[Y] Yes [A] Yes to All [N] No [L] No to All [S] Suspend [?] Help (default is  
"Y"): Y  
testfile.txt
```

- For API details, see [DeleteObjectTagging](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1: This command removes all the tags associated with the object with key 'testfile.txt' in the given S3 Bucket.**

```
Remove-S3ObjectTagSet -Key 'testfile.txt' -BucketName 'amzn-s3-demo-bucket' -  
Select '^Key'
```

### Output:

```
Confirm  
Are you sure you want to perform this action?  
Performing the operation "Remove-S3ObjectTagSet (DeleteObjectTagging)" on target  
"testfile.txt".  
[Y] Yes [A] Yes to All [N] No [L] No to All [S] Suspend [?] Help (default is  
"Y"): Y  
testfile.txt
```

- For API details, see [DeleteObjectTagging](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use DeleteObjects with an AWS SDK or CLI

The following code examples show how to use DeleteObjects.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- [Learn the basics](#)
- [Delete all objects in a bucket](#)
- [Get started with S3](#)

## .NET

### SDK for .NET

#### Note

Delete all objects in an S3 bucket.

```
/// <summary>
/// Delete all of the objects stored in an existing Amazon S3 bucket.
/// </summary>
/// <param name="client">An initialized Amazon S3 client object.</param>
/// <param name="bucketName">The name of the bucket from which the
/// contents will be deleted.</param>
/// <returns>A boolean value that represents the success or failure of
/// deleting all of the objects in the bucket.</returns>
public static async Task<bool> DeleteBucketContentsAsync(IAmazonS3
client, string bucketName)
{
    // Iterate over the contents of the bucket and delete all objects.
    var request = new ListObjectsV2Request
    {
        BucketName = bucketName,
    };

    try
    {
        ListObjectsV2Response response;

        do
        {
            response = await client.ListObjectsV2Async(request);
            response.S3Objects
                .ForEach(async obj => await
client.DeleteObjectAsync(bucketName, obj.Key));

            // If the response is truncated, set the request
ContinuationToken
```

```
        // from the NextContinuationToken property of the response.
        request.ContinuationToken = response.NextContinuationToken;
    }
    while (response.IsTruncated);

    return true;
}
catch (AmazonS3Exception ex)
{
    Console.WriteLine($"Error deleting objects: {ex.Message}");
    return false;
}
}
```

### Delete multiple objects in a non-versioned S3 bucket.

```
using System;
using System.Collections.Generic;
using System.Threading.Tasks;
using Amazon.S3;
using Amazon.S3.Model;

/// <summary>
/// This example shows how to delete multiple objects from an Amazon Simple
/// Storage Service (Amazon S3) bucket.
/// </summary>
public class DeleteMultipleObjects
{
    /// <summary>
    /// The Main method initializes the Amazon S3 client and the name of
    /// the bucket and then passes those values to MultiObjectDeleteAsync.
    /// </summary>
    public static async Task Main()
    {
        const string bucketName = "amzn-s3-demo-bucket";

        // If the Amazon S3 bucket from which you wish to delete objects is
not
        // located in the same AWS Region as the default user, define the
        // AWS Region for the Amazon S3 bucket as a parameter to the client
        // constructor.
```

```
        IAmazonS3 s3Client = new AmazonS3Client();

        await MultiObjectDeleteAsync(s3Client, bucketName);
    }

    /// <summary>
    /// This method uses the passed Amazon S3 client to first create and then
    /// delete three files from the named bucket.
    /// </summary>
    /// <param name="client">The initialized Amazon S3 client object used to
call
    /// Amazon S3 methods.</param>
    /// <param name="bucketName">The name of the Amazon S3 bucket where
objects
    /// will be created and then deleted.</param>

## CLI

### AWS CLI

The following command deletes an object from a bucket named `amzn-s3-demo-bucket`:

```
aws s3api delete-objects --bucket amzn-s3-demo-bucket --delete file://delete.json
```

`delete.json` is a JSON document in the current directory that specifies the object to delete:

```
{
  "Objects": [
    {
      "Key": "test1.txt"
    }
  ],
  "Quiet": false
}
```

Output:

```
{
  "Deleted": [
    {
      "DeleteMarkerVersionId": "mYAT5Mc6F7aeUL8SS7FAAqUP01koHwzU",
      "Key": "test1.txt",
      "DeleteMarker": true
    }
  ]
}
```

- For API details, see [DeleteObjects](#) in *AWS CLI Command Reference*.

Delete a set of objects from a list of keys.

```
$s3client = new Aws\S3\S3Client(['region' => 'us-west-2']);

try {
    $objects = [];
    foreach ($contents['Contents'] as $content) {
        $objects[] = [
            'Key' => $content['Key'],
        ];
    }
    $this->s3client->deleteObjects([
        'Bucket' => $this->bucketName,
        'Delete' => [
            'Objects' => $objects,
        ],
    ]);
    $check = $this->s3client->listObjectsV2([
        'Bucket' => $this->bucketName,
    ]);
    if (isset($check['Contents']) && count($check['Contents']) > 0) {
        throw new Exception("Bucket wasn't empty.");
    }
    echo "Deleted all objects and folders from $this->bucketName.\n";
} catch (Exception $exception) {
```

```
        echo "Failed to delete $fileName from $this->bucketName with error:  
" . $exception->getMessage();  
        exit("Please fix error with object deletion before continuing.");  
    }
```

- For API details, see [DeleteObjects](#) in *AWS SDK for PHP API Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1:** This command removes the object "sample.txt" from bucket "test-files". You are prompted for confirmation before the command executes; to suppress the prompt use the `-Force` switch.

```
Remove-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt
```

**Example 2:** This command removes the specified version of object "sample.txt" from bucket "test-files", assuming the bucket has been configured to enable object versions.

```
Remove-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt -VersionId  
HLbxnx6V9omT6AQYVpks8mmFKQcejpqt
```

**Example 3:** This command removes objects "sample1.txt", "sample2.txt" and "sample3.txt" from bucket "test-files" as a single batch operation. The service response will list all keys processed, regardless of the success or error status of the deletion. To obtain only errors for keys that were not able to be processed by the service add the `-ReportErrorsOnly` parameter (this parameter can also be specified with the alias `-Quiet`).

```
Remove-S3Object -BucketName amzn-s3-demo-bucket -KeyCollection @( "sample1.txt",  
"sample2.txt", "sample3.txt" )
```

**Example 4:** This example uses an inline expression with the `-KeyCollection` parameter to obtain the keys of the objects to delete. `Get-S3Object` returns a collection of `Amazon.S3.Model.S3Object` instances, each of which has a `Key` member of type string identifying the object.

```
Remove-S3Object -bucketname "amzn-s3-demo-bucket" -KeyCollection (Get-S3Object
"test-files" -KeyPrefix "prefix/subprefix" | select -ExpandProperty Key)
```

**Example 5:** This example obtains all objects that have a key prefix "prefix/subprefix" in the bucket and deletes them. Note that the incoming objects are processed one at a time. For large collections consider passing the collection to the cmdlet's `-InputObject` (alias `-S3ObjectCollection`) parameter to enable the deletion to occur as a batch with a single call to the service.

```
Get-S3Object -BucketName "amzn-s3-demo-bucket" -KeyPrefix "prefix/subprefix" |
Remove-S3Object -Force
```

**Example 6:** This example pipes a collection of `Amazon.S3.Model.S3ObjectVersion` instances that represent delete markers to the cmdlet for deletion. Note that the incoming objects are processed one at a time. For large collections consider passing the collection to the cmdlet's `-InputObject` (alias `-S3ObjectCollection`) parameter to enable the deletion to occur as a batch with a single call to the service.

```
(Get-S3Version -BucketName "amzn-s3-demo-bucket").Versions | Where
{$_ .IsDeleteMarker -eq "True"} | Remove-S3Object -Force
```

**Example 7:** This script shows how to perform a batch delete of a set of objects (in this case delete markers) by constructing an array of objects to be used with the `-KeyAndVersionCollection` parameter.

```
$keyVersions = @()
$markers = (Get-S3Version -BucketName $BucketName).Versions | Where
{$_ .IsDeleteMarker -eq "True"}
foreach ($marker in $markers) { $keyVersions += @{ Key = $marker.Key; VersionId =
$marker.VersionId } }
Remove-S3Object -BucketName $BucketName -KeyAndVersionCollection $keyVersions -
Force
```

- For API details, see [DeleteObjects](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1:** This command removes the object "sample.txt" from bucket "test-files". You are prompted for confirmation before the command executes; to suppress the prompt use the `-Force` switch.

```
Remove-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt
```

**Example 2:** This command removes the specified version of object "sample.txt" from bucket "test-files", assuming the bucket has been configured to enable object versions.

```
Remove-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt -VersionId  
HLbxnx6V9omT6AQYVpks8mmFKQcejpqt
```

**Example 3:** This command removes objects "sample1.txt", "sample2.txt" and "sample3.txt" from bucket "test-files" as a single batch operation. The service response will list all keys processed, regardless of the success or error status of the deletion. To obtain only errors for keys that were not able to be processed by the service add the -ReportErrorsOnly parameter (this parameter can also be specified with the alias -Quiet).

```
Remove-S3Object -BucketName amzn-s3-demo-bucket -KeyCollection @( "sample1.txt",  
"sample2.txt", "sample3.txt" )
```

**Example 4:** This example uses an inline expression with the -KeyCollection parameter to obtain the keys of the objects to delete. Get-S3Object returns a collection of Amazon.S3.Model.S3Object instances, each of which has a Key member of type string identifying the object.

```
Remove-S3Object -bucketname "amzn-s3-demo-bucket" -KeyCollection (Get-S3Object  
"test-files" -KeyPrefix "prefix/subprefix" | select -ExpandProperty Key)
```

**Example 5:** This example obtains all objects that have a key prefix "prefix/subprefix" in the bucket and deletes them. Note that the incoming objects are processed one at a time. For large collections consider passing the collection to the cmdlet's -InputObject (alias -S3ObjectCollection) parameter to enable the deletion to occur as a batch with a single call to the service.

```
Get-S3Object -BucketName "amzn-s3-demo-bucket" -KeyPrefix "prefix/subprefix" |  
Remove-S3Object -Force
```

**Example 6:** This example pipes a collection of Amazon.S3.Model.S3ObjectVersion instances that represent delete markers to the cmdlet for deletion. Note that the incoming objects are processed one at a time. For large collections consider passing the

**collection to the cmdlet's `-InputObject` (alias `-S3ObjectCollection`) parameter to enable the deletion to occur as a batch with a single call to the service.**

```
(Get-S3Version -BucketName "amzn-s3-demo-bucket").Versions | Where
{$_ .IsDeleteMarker -eq "True"} | Remove-S3Object -Force
```

**Example 7: This script shows how to perform a batch delete of a set of objects (in this case delete markers) by constructing an array of objects to be used with the `-KeyAndVersionCollection` parameter.**

```
$keyVersions = @()
$markers = (Get-S3Version -BucketName $BucketName).Versions | Where
{$_ .IsDeleteMarker -eq "True"}
foreach ($marker in $markers) { $keyVersions += @{ Key = $marker.Key; VersionId =
$marker.VersionId } }
Remove-S3Object -BucketName $BucketName -KeyAndVersionCollection $keyVersions -
Force
```

- For API details, see [DeleteObjects](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

        .delete_objects()
        .bucket(bucket_name)
        .delete(
            aws_sdk_s3::types::Delete::builder()
                .set_objects(Some(delete_object_ids))
                .build()
                .map_err(|err| {
```

```
                S3ExampleError::new(format!("Failed to build delete_object
input {err:?}"))
                ))?,
            )
            .send()
            .await?;
        Ok(())
    }
}
```

- For API details, see [DeleteObjects](#) in *AWS SDK for Rust API reference*.

## Swift

### SDK for Swift

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
import AWSS3

public func deleteObjects(bucket: String, keys: [String]) async throws {
    let input = DeleteObjectsInput(
        bucket: bucket,
        delete: S3ClientTypes.Delete(
            objects: keys.map { S3ClientTypes.ObjectIdentifier(key: $0) },
            quiet: true
        )
    )

    do {
        _ = try await client.deleteObjects(input: input)
    } catch {
        print("ERROR: deleteObjects:", dump(error))
        throw error
    }
}
```

- For API details, see [DeleteObjects](#) in *AWS SDK for Swift API reference*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use DeletePublicAccessBlock with a CLI

The following code examples show how to use DeletePublicAccessBlock.

### CLI

#### AWS CLI

##### To delete the block public access configuration for a bucket

The following delete-public-access-block example removes the block public access configuration on the specified bucket.

```
aws s3api delete-public-access-block \  
  --bucket amzn-s3-demo-bucket
```

This command produces no output.

- For API details, see [DeletePublicAccessBlock](#) in *AWS CLI Command Reference*.

### PowerShell

#### Tools for PowerShell V4

**Example 1: This command turns off the block public access setting for the given bucket.**

```
Remove-S3PublicAccessBlock -BucketName 'amzn-s3-demo-bucket' -Force -Select  
'^BucketName'
```

#### Output:

```
amzn-s3-demo-bucket
```

- For API details, see [DeletePublicAccessBlock](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1: This command turns off the block public access setting for the given bucket.**

```
Remove-S3PublicAccessBlock -BucketName 'amzn-s3-demo-bucket' -Force -Select  
'^BucketName'
```

### Output:

```
amzn-s3-demo-bucket
```

- For API details, see [DeletePublicAccessBlock](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use GetBucketAccelerateConfiguration with a CLI

The following code examples show how to use GetBucketAccelerateConfiguration.

### CLI

#### AWS CLI

#### To retrieve the accelerate configuration of a bucket

The following `get-bucket-accelerate-configuration` example retrieves the accelerate configuration for the specified bucket.

```
aws s3api get-bucket-accelerate-configuration \  
--bucket amzn-s3-demo-bucket
```

### Output:

```
{  
  "Status": "Enabled"  
}
```

- For API details, see [GetBucketAccelerateConfiguration](#) in *AWS CLI Command Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1: This command returns the value Enabled, if the transfer acceleration settings is enabled for the bucket specified.**

```
Get-S3BucketAccelerateConfiguration -BucketName 'amzn-s3-demo-bucket'
```

#### Output:

```
Value
-----
Enabled
```

- For API details, see [GetBucketAccelerateConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

### Tools for PowerShell V5

**Example 1: This command returns the value Enabled, if the transfer acceleration settings is enabled for the bucket specified.**

```
Get-S3BucketAccelerateConfiguration -BucketName 'amzn-s3-demo-bucket'
```

#### Output:

```
Value
-----
Enabled
```

- For API details, see [GetBucketAccelerateConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use GetBucketAcl with an AWS SDK or CLI

The following code examples show how to use GetBucketAcl.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- [Check if a bucket exists](#)
- [Manage access control lists \(ACLs\)](#)

.NET

### SDK for .NET

#### Note

## Use GetBucketAnalyticsConfiguration with a CLI

The following code examples show how to use GetBucketAnalyticsConfiguration.

### CLI

#### AWS CLI

##### To retrieve the analytics configuration for a bucket with a specific ID

The following `get-bucket-analytics-configuration` example displays the analytics configuration for the specified bucket and ID.

```
aws s3api get-bucket-analytics-configuration \
  --bucket amzn-s3-demo-bucket \
  --id 1
```

Output:

```
{
  "AnalyticsConfiguration": {
    "StorageClassAnalysis": {},
    "Id": "1"
  }
}
```

- For API details, see [GetBucketAnalyticsConfiguration](#) in *AWS CLI Command Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1: This command returns the details of the analytics filter with the name 'testfilter' in the given S3 bucket.**

```
Get-S3BucketAnalyticsConfiguration -BucketName 'amzn-s3-demo-bucket' -AnalyticsId 'testfilter'
```

- For API details, see [GetBucketAnalyticsConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

### Tools for PowerShell V5

**Example 1: This command returns the details of the analytics filter with the name 'testfilter' in the given S3 bucket.**

```
Get-S3BucketAnalyticsConfiguration -BucketName 'amzn-s3-demo-bucket' -AnalyticsId 'testfilter'
```

- For API details, see [GetBucketAnalyticsConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

### Use GetBucketCors with an AWS SDK or CLI

The following code examples show how to use GetBucketCors.

.NET

#### SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```

    /// <summary>
    /// Retrieve the CORS configuration applied to the Amazon S3 bucket.
    /// </summary>
    /// <param name="client">The initialized Amazon S3 client object used
    /// to retrieve the CORS configuration.</param>
    /// <returns>The created CORS configuration object.</returns>
    private static async Task<CORSConfiguration>
    RetrieveCORSConfigurationAsync(AmazonS3Client client)
    {
        GetCORSConfigurationRequest request = new
    GetCORSConfigurationRequest()
        {
            BucketName = BucketName,
        };
        var response = await client.GetCORSConfigurationAsync(request);
        var configuration = response.Configuration;
        PrintCORSRules(configuration);
        return configuration;
    }

```

- For API details, see [GetBucketCors](#) in *AWS SDK for .NET API Reference*.

## CLI

### AWS CLI

The following command retrieves the Cross-Origin Resource Sharing configuration for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-cors --bucket amzn-s3-demo-bucket
```

Output:

```
{
  "CORSRules": [
    {
      "AllowedHeaders": [
        "*"
      ],
    },
  ],
}
```

```
    "ExposeHeaders": [
      "x-amz-server-side-encryption"
    ],
    "AllowedMethods": [
      "PUT",
      "POST",
      "DELETE"
    ],
    "MaxAgeSeconds": 3000,
    "AllowedOrigins": [
      "http://www.example.com"
    ]
  },
  {
    "AllowedHeaders": [
      "Authorization"
    ],
    "MaxAgeSeconds": 3000,
    "AllowedMethods": [
      "GET"
    ],
    "AllowedOrigins": [
      "*"
    ]
  }
]
```

- For API details, see [GetBucketCors](#) in *AWS CLI Command Reference*.

## JavaScript

### SDK for JavaScript (v3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Get the CORS policy for the bucket.

```
import {
  GetBucketCorsCommand,
  S3Client,
  S3ServiceException,
} from "@aws-sdk/client-s3";

/**
 * Log the Cross-Origin Resource Sharing (CORS) configuration information
 * set for the bucket.
 * @param {{ bucketName: string }}
 */
export const main = async ({ bucketName }) => {
  const client = new S3Client({});
  const command = new GetBucketCorsCommand({
    Bucket: bucketName,
  });

  try {
    const { CORSRules } = await client.send(command);
    console.log(JSON.stringify(CORSRules));
    CORSRules.forEach((cr, i) => {
      console.log(
        `\\nCORSRule ${i + 1}`,
        `\\n${"-".repeat(10)}`,
        `\\nAllowedHeaders: ${cr.AllowedHeaders}`,

## Use GetBucketEncryption with an AWS SDK or CLI

The following code examples show how to use GetBucketEncryption.

.NET

### SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Get and print the encryption settings of a bucket.
/// </summary>
/// <param name="bucketName">Name of the bucket.</param>
/// <returns>Async task.</returns>
public static async Task GetEncryptionSettings(string bucketName)
{
    // Check and print the bucket encryption settings.
```

```
        Console.WriteLine($"Getting encryption settings for bucket
{bucketName}.");

        try
        {
            var settings =
                await _s3Client.GetBucketEncryptionAsync(
                    new GetBucketEncryptionRequest() { BucketName =
bucketName });

            foreach (var encryptionSettings in
settings?.ServerSideEncryptionConfiguration?.ServerSideEncryptionRules!)
            {
                Console.WriteLine(
                    $"\\tAlgorithm:
{encryptionSettings.ServerSideEncryptionByDefault.ServerSideEncryptionAlgorithm}");
                Console.WriteLine(
                    $"\\tKey:
{encryptionSettings.ServerSideEncryptionByDefault.ServerSideEncryptionKeyManagementService
}
}
            catch (AmazonS3Exception ex)
            {
                Console.WriteLine(ex.ErrorCode == "InvalidBucketName"
? $"Bucket {bucketName} was not found."
: $"Unable to get bucket encryption for bucket {bucketName},
{ex.Message}");
            }
        }
    }
```

- For API details, see [GetBucketEncryption](#) in *AWS SDK for .NET API Reference*.

## CLI

### AWS CLI

#### To retrieve the server-side encryption configuration for a bucket

The following `get-bucket-encryption` example retrieves the server-side encryption configuration for the bucket `amzn-s3-demo-bucket`.

```
aws s3api get-bucket-encryption \
```

```
--bucket amzn-s3-demo-bucket
```

Output:

```
{
  "ServerSideEncryptionConfiguration": {
    "Rules": [
      {
        "ApplyServerSideEncryptionByDefault": {
          "SSEAlgorithm": "AES256"
        }
      }
    ]
  }
}
```

- For API details, see [GetBucketEncryption](#) in *AWS CLI Command Reference*.

PowerShell

### Tools for PowerShell V4

**Example 1: This command returns all the server side encryption rules associated with the given bucket.**

```
Get-S3BucketEncryption -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see [GetBucketEncryption](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

### Tools for PowerShell V5

**Example 1: This command returns all the server side encryption rules associated with the given bucket.**

```
Get-S3BucketEncryption -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see [GetBucketEncryption](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use `GetBucketInventoryConfiguration` with a CLI

The following code examples show how to use `GetBucketInventoryConfiguration`.

CLI

### AWS CLI

#### To retrieve the inventory configuration for a bucket

The following `get-bucket-inventory-configuration` example retrieves the inventory configuration for the specified bucket with ID 1.

```
aws s3api get-bucket-inventory-configuration \
  --bucket amzn-s3-demo-bucket \
  --id 1
```

Output:

```
{
  "InventoryConfiguration": {
    "IsEnabled": true,
    "Destination": {
      "S3BucketDestination": {
        "Format": "ORC",
        "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket",
        "AccountId": "123456789012"
      }
    },
    "IncludedObjectVersions": "Current",
    "Id": "1",
    "Schedule": {
      "Frequency": "Weekly"
    }
  }
}
```

- For API details, see [GetBucketInventoryConfiguration](#) in *AWS CLI Command Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1: This command returns the details of the inventory named 'testinventory' for the given S3 bucket.**

```
Get-S3BucketInventoryConfiguration -BucketName 'amzn-s3-demo-bucket' -InventoryId 'testinventory'
```

- For API details, see [GetBucketInventoryConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

### Tools for PowerShell V5

**Example 1: This command returns the details of the inventory named 'testinventory' for the given S3 bucket.**

```
Get-S3BucketInventoryConfiguration -BucketName 'amzn-s3-demo-bucket' -InventoryId 'testinventory'
```

- For API details, see [GetBucketInventoryConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

### Use GetBucketLifecycleConfiguration with an AWS SDK or CLI

The following code examples show how to use `GetBucketLifecycleConfiguration`.

.NET

#### SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
    /// <summary>
    /// Returns a configuration object for the supplied bucket name.
    /// </summary>
    /// <param name="client">The S3 client object used to call
    /// the GetLifecycleConfigurationAsync method.</param>
    /// <param name="bucketName">The name of the S3 bucket for which a
    /// configuration will be created.</param>
    /// <returns>Returns a new LifecycleConfiguration object.</returns>
    public static async Task<LifecycleConfiguration>
    RetrieveLifecycleConfigAsync(IAmazonS3 client, string bucketName)
    {
        var request = new GetLifecycleConfigurationRequest()
        {
            BucketName = bucketName,
        };
        var response = await client.GetLifecycleConfigurationAsync(request);
        var configuration = response.Configuration;
        return configuration;
    }
}
```

- For API details, see [GetBucketLifecycleConfiguration](#) in *AWS SDK for .NET API Reference*.

## CLI

### AWS CLI

The following command retrieves the lifecycle configuration for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-lifecycle-configuration --bucket amzn-s3-demo-bucket
```

Output:

```
{
  "Rules": [
    {
      "ID": "Move rotated logs to Glacier",
      "Prefix": "rotated/",
    }
  ]
}
```

```

        "Status": "Enabled",
        "Transitions": [
            {
                "Date": "2015-11-10T00:00:00.000Z",
                "StorageClass": "GLACIER"
            }
        ]
    },
    {
        "Status": "Enabled",
        "Prefix": "",
        "NoncurrentVersionTransitions": [
            {
                "NoncurrentDays": 0,
                "StorageClass": "GLACIER"
            }
        ],
        "ID": "Move old versions to Glacier"
    }
]
}

```

- For API details, see [GetBucketLifecycleConfiguration](#) in *AWS CLI Command Reference*.

## Python

### SDK for Python (Boto3)

#### Note

## Use `GetBucketLocation` with an AWS SDK or CLI

The following code examples show how to use `GetBucketLocation`.

## CLI

### AWS CLI

The following command retrieves the location constraint for a bucket named `amzn-s3-demo-bucket`, if a constraint exists:

```
aws s3api get-bucket-location --bucket amzn-s3-demo-bucket
```

Output:

```
{  
  "LocationConstraint": "us-west-2"  
}
```

- For API details, see [GetBucketLocation](#) in *AWS CLI Command Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1: This command returns the location constraint for the bucket 'amzn-s3-demo-bucket', if a constraint exists.**

```
Get-S3BucketLocation -BucketName 'amzn-s3-demo-bucket'
```

**Output:**

```
Value  
-----  
ap-south-1
```

- For API details, see [GetBucketLocation](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

### Tools for PowerShell V5

**Example 1: This command returns the location constraint for the bucket 'amzn-s3-demo-bucket', if a constraint exists.**

```
Get-S3BucketLocation -BucketName 'amzn-s3-demo-bucket'
```

## Output:

```
Value
-----
ap-south-1
```

- For API details, see [GetBucketLocation](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

## Rust

### SDK for Rust

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn show_buckets(
    strict: bool,
    client: &Client,
    region: BucketLocationConstraint,
) -> Result<(), S3ExampleError> {
    let mut buckets = client.list_buckets().into_paginator().send();

    let mut num_buckets = 0;
    let mut in_region = 0;

    while let Some(Ok(output)) = buckets.next().await {
        for bucket in output.buckets() {
            num_buckets += 1;
            if strict {
                let r = client
                    .get_bucket_location()
                    .bucket(bucket.name().unwrap_or_default())
                    .send()
                    .await?;

                if r.location_constraint() == Some(&region) {
                    println!("{}", bucket.name().unwrap_or_default());
                    in_region += 1;
                }
            }
        }
    }
}
```

```
        }
    } else {
        println!("{}", bucket.name().unwrap_or_default());
    }
}

println!();
if strict {
    println!(
        "Found {} buckets in the {} region out of a total of {} buckets.",
        in_region, region, num_buckets
    );
} else {
    println!("Found {} buckets in all regions.", num_buckets);
}

Ok(())
}
```

- For API details, see [GetBucketLocation](#) in *AWS SDK for Rust API reference*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use GetBucketLogging with a CLI

The following code examples show how to use GetBucketLogging.

### CLI

#### AWS CLI

##### To retrieve the logging status for a bucket

The following `get-bucket-logging` example retrieves the logging status for the specified bucket.

```
aws s3api get-bucket-logging \  
  --bucket amzn-s3-demo-bucket
```

**Output:**

```
{
  "LoggingEnabled": {
    "TargetPrefix": "",
    "TargetBucket": "amzn-s3-demo-bucket-logs"
  }
}
```

- For API details, see [GetBucketLogging](#) in *AWS CLI Command Reference*.

**PowerShell****Tools for PowerShell V4**

**Example 1: This command returns the logging status for the specified bucket.**

```
Get-S3BucketLogging -BucketName 'amzn-s3-demo-bucket'
```

**Output:**

TargetBucketName	Grants	TargetPrefix
-----	-----	-----
testbucket1	{}	testprefix

- For API details, see [GetBucketLogging](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

**Tools for PowerShell V5**

**Example 1: This command returns the logging status for the specified bucket.**

```
Get-S3BucketLogging -BucketName 'amzn-s3-demo-bucket'
```

**Output:**

TargetBucketName	Grants	TargetPrefix
-----	-----	-----
testbucket1	{}	testprefix

- For API details, see [GetBucketLogging](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use `GetBucketMetricsConfiguration` with a CLI

The following code examples show how to use `GetBucketMetricsConfiguration`.

### CLI

#### AWS CLI

##### To retrieve the metrics configuration for a bucket with a specific ID

The following `get-bucket-metrics-configuration` example displays the metrics configuration for the specified bucket and ID.

```
aws s3api get-bucket-metrics-configuration \
  --bucket amzn-s3-demo-bucket \
  --id 123
```

Output:

```
{
  "MetricsConfiguration": {
    "Filter": {
      "Prefix": "logs"
    },
    "Id": "123"
  }
}
```

- For API details, see [GetBucketMetricsConfiguration](#) in *AWS CLI Command Reference*.

### PowerShell

#### Tools for PowerShell V4

**Example 1:** This command returns the details about the metrics filter named 'testfilter' for the given S3 bucket.

```
Get-S3BucketMetricsConfiguration -BucketName 'amzn-s3-demo-bucket' -MetricsId  
'testfilter'
```

- For API details, see [GetBucketMetricsConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1: This command returns the details about the metrics filter named 'testfilter' for the given S3 bucket.**

```
Get-S3BucketMetricsConfiguration -BucketName 'amzn-s3-demo-bucket' -MetricsId  
'testfilter'
```

- For API details, see [GetBucketMetricsConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use GetBucketNotification with a CLI

The following code examples show how to use GetBucketNotification.

### CLI

#### AWS CLI

The following command retrieves the notification configuration for a bucket named amzn-s3-demo-bucket:

```
aws s3api get-bucket-notification --bucket amzn-s3-demo-bucket
```

Output:

```
{  
  "TopicConfiguration": {  
    "Topic": "arn:aws:sns:us-west-2:123456789012:my-notification-topic",
```

```
    "Id": "YmQzMmEwM2EjZWVlI0NGItNzVtZjI1MC00ZjgyLWZDBiZWw1",
    "Event": "s3:ObjectCreated:*",
    "Events": [
      "s3:ObjectCreated:*"
    ]
  }
}
```

- For API details, see [GetBucketNotification](#) in *AWS CLI Command Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1: This example retrieves notification configuration of the given bucket**

```
Get-S3BucketNotification -BucketName amzn-s3-demo-bucket | select -ExpandProperty
  TopicConfigurations
```

#### Output:

```
Id    Topic
--    -
mimo  arn:aws:sns:eu-west-1:123456789012:topic-1
```

- For API details, see [GetBucketNotification](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

### Tools for PowerShell V5

**Example 1: This example retrieves notification configuration of the given bucket**

```
Get-S3BucketNotification -BucketName amzn-s3-demo-bucket | select -ExpandProperty
  TopicConfigurations
```

#### Output:

```
Id    Topic
--    -
mimo  arn:aws:sns:eu-west-1:123456789012:topic-1
```

- For API details, see [GetBucketNotification](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use GetBucketPolicy with an AWS SDK or CLI

The following code examples show how to use GetBucketPolicy.

C++

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
bool AwsDoc::S3::getBucketPolicy(const Aws::String &bucketName,
                                const Aws::S3::S3ClientConfiguration
                                &clientConfig) {
    Aws::S3::S3Client s3Client(clientConfig);

    Aws::S3::Model::GetBucketPolicyRequest request;
    request.SetBucket(bucketName);

    Aws::S3::Model::GetBucketPolicyOutcome outcome =
        s3Client.GetBucketPolicy(request);

    if (!outcome.IsSuccess()) {
        const Aws::S3::S3Error &err = outcome.GetError();
        std::cerr << "Error: getBucketPolicy: "
                  << err.GetExceptionName() << ": " << err.GetMessage() <<
std::endl;
    } else {
        Aws::StringStream policy_stream;
        Aws::String line;
```

```

        outcome.GetResult().GetPolicy() >> line;
        policy_stream << line;

        std::cout << "Retrieve the policy for bucket '" << bucketName << "':\n\n"
<<
            policy_stream.str() << std::endl;
    }

    return outcome.IsSuccess();
}

```

- For API details, see [GetBucketPolicy](#) in *AWS SDK for C++ API Reference*.

## CLI

### AWS CLI

The following command retrieves the bucket policy for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-policy --bucket amzn-s3-demo-bucket
```

Output:

```
{
  "Policy": "{\"Version\":\"2008-10-17\",\"Statement\":[{\"Sid\":\"\",\"Effect\":\"Allow\",\"Principal\":\"*\",\"Action\":\"s3:GetObject\",\"Resource\":\"arn:aws:s3:::amzn-s3-demo-bucket/*\"},{\"Sid\":\"\",\"Effect\":\"Deny\",\"Principal\":\"*\",\"Action\":\"s3:GetObject\",\"Resource\":\"arn:aws:s3:::amzn-s3-demo-bucket/secret/*\"}]}"
}
```

Get and put a bucket policyThe following example shows how you can download an Amazon S3 bucket policy, make modifications to the file, and then use `put-bucket-policy` to apply the modified bucket policy. To download the bucket policy to a file, you can run:

```
aws s3api get-bucket-policy --bucket amzn-s3-demo-bucket --query Policy --output text > policy.json
```

You can then modify the `policy.json` file as needed. Finally you can apply this modified policy back to the S3 bucket by running:

`policy.json` file as needed. Finally you can apply this modified policy back to the S3 bucket by running:

file as needed. Finally you can apply this modified policy back to the S3 bucket by running:

```
aws s3api put-bucket-policy --bucket amzn-s3-demo-bucket --policy file://  
policy.json
```

- For API details, see [GetBucketPolicy](#) in *AWS CLI Command Reference*.

### Get the bucket policy.

```
import {
    GetBucketPolicyCommand,
    S3Client,
    S3ServiceException,
} from "@aws-sdk/client-s3";

/**
 * Logs the policy for a specified bucket.
 * @param {{ bucketName: string }}
 */
export const main = async ({ bucketName }) => {
    const client = new S3Client({});

    try {
```

```
const { Policy } = await client.send(
  new GetBucketPolicyCommand({
    Bucket: bucketName,
  })),
);
console.log(`Policy for "${bucketName}":\n${Policy}`);
} catch (caught) {
  if (
    caught instanceof S3ServiceException &&
    caught.name === "NoSuchBucket"
  ) {
    console.error(
      `Error from S3 while getting policy from ${bucketName}. The bucket
doesn't exist.`,
    );
  } else if (caught instanceof S3ServiceException) {
    console.error(
      `Error from S3 while getting policy from ${bucketName}. ${caught.name}:
${caught.message}`,
    );
  } else {
    throw caught;
  }
}
};
```

## Use `GetBucketPolicyStatus` with a CLI

The following code examples show how to use `GetBucketPolicyStatus`.

### CLI

#### AWS CLI

##### To retrieve the policy status for a bucket indicating whether the bucket is public

The following `get-bucket-policy-status` example retrieves the policy status for the bucket `amzn-s3-demo-bucket`.

```
aws s3api get-bucket-policy-status \  
  --bucket amzn-s3-demo-bucket
```

Output:

```
{  
  "PolicyStatus": {  
    "IsPublic": false  
  }  
}
```

- For API details, see [GetBucketPolicyStatus](#) in *AWS CLI Command Reference*.

### PowerShell

#### Tools for PowerShell V4

**Example 1: This command returns policy status for the given S3 bucket, indicating whether the bucket is public.**

```
Get-S3BucketPolicyStatus -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see [GetBucketPolicyStatus](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1: This command returns policy status for the given S3 bucket, indicating whether the bucket is public.**

```
Get-S3BucketPolicyStatus -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see [GetBucketPolicyStatus](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use GetBucketReplication with an AWS SDK or CLI

The following code examples show how to use GetBucketReplication.

### CLI

#### AWS CLI

The following command retrieves the replication configuration for a bucket named amzn-s3-demo-bucket:

```
aws s3api get-bucket-replication --bucket amzn-s3-demo-bucket
```

Output:

```
{
  "ReplicationConfiguration": {
    "Rules": [
      {
        "Status": "Enabled",
        "Prefix": "",
        "Destination": {
          "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket-backup",
          "StorageClass": "STANDARD"
        },
        "ID": "ZmUwNzE4ZmQ4tMjVhOS00MTlkLOGI4NDkzZTIWJjNTUtYTA1"
      }
    ]
  }
}
```

```
    ],  
    "Role": "arn:aws:iam::123456789012:role/s3-replication-role"  
  }  
}
```

- For API details, see [GetBucketReplication](#) in *AWS CLI Command Reference*.

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**  
 * Retrieves the replication details for the specified S3 bucket.  
 *  
 * @param s3Client          the S3 client used to interact with the S3  
service  
 * @param sourceBucketName the name of the S3 bucket to retrieve the  
replication details for  
 *  
 * @throws S3Exception if there is an error retrieving the replication  
details  
 */  
public static void getReplicationDetails(S3Client s3Client, String  
sourceBucketName) {  
    GetBucketReplicationRequest getRequest =  
GetBucketReplicationRequest.builder()  
        .bucket(sourceBucketName)  
        .build();  
  
    try {  
        ReplicationConfiguration replicationConfig =  
s3Client.getBucketReplication(getRequest).replicationConfiguration();  
        ReplicationRule rule = replicationConfig.rules().get(0);  
        System.out.println("Retrieved destination bucket: " +  
rule.destination().bucket());  
        System.out.println("Retrieved priority: " + rule.priority());  
    }  
}
```

```
        System.out.println("Retrieved source-bucket replication rule status:
" + rule.status());

    } catch (S3Exception e) {
        System.err.println("Failed to retrieve replication details: " +
e.awsErrorDetails().errorMessage());
    }
}
```

- For API details, see [GetBucketReplication](#) in *AWS SDK for Java 2.x API Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1: Returns the replication configuration information set on the bucket named 'amzn-s3-demo-bucket'.**

```
Get-S3BucketReplication -BucketName amzn-s3-demo-bucket
```

- For API details, see [GetBucketReplication](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

### Tools for PowerShell V5

**Example 1: Returns the replication configuration information set on the bucket named 'amzn-s3-demo-bucket'.**

```
Get-S3BucketReplication -BucketName amzn-s3-demo-bucket
```

- For API details, see [GetBucketReplication](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use GetBucketRequestPayment with a CLI

The following code examples show how to use GetBucketRequestPayment.

## CLI

## AWS CLI

**To retrieve the request payment configuration for a bucket**

The following `get-bucket-request-payment` example retrieves the requester pays configuration for the specified bucket.

```
aws s3api get-bucket-request-payment \  
  --bucket amzn-s3-demo-bucket
```

Output:

```
{  
  "Payer": "BucketOwner"  
}
```

- For API details, see [GetBucketRequestPayment](#) in *AWS CLI Command Reference*.

## PowerShell

## Tools for PowerShell V4

**Example 1:** Returns the request payment configuration for the bucket named 'amzn-s3-demo-bucket'. By default, the bucket owner pays for downloads from the bucket.

```
Get-S3BucketRequestPayment -BucketName amzn-s3-demo-bucket
```

- For API details, see [GetBucketRequestPayment](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1:** Returns the request payment configuration for the bucket named 'amzn-s3-demo-bucket'. By default, the bucket owner pays for downloads from the bucket.

```
Get-S3BucketRequestPayment -BucketName amzn-s3-demo-bucket
```

- For API details, see [GetBucketRequestPayment](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use GetBucketTagging with a CLI

The following code examples show how to use GetBucketTagging.

### CLI

#### AWS CLI

The following command retrieves the tagging configuration for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-tagging --bucket amzn-s3-demo-bucket
```

Output:

```
{
  "TagSet": [
    {
      "Value": "marketing",
      "Key": "organization"
    }
  ]
}
```

- For API details, see [GetBucketTagging](#) in *AWS CLI Command Reference*.

### PowerShell

#### Tools for PowerShell V4

**Example 1:** This command returns all the tags associated with the given bucket.

```
Get-S3BucketTagging -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see [GetBucketTagging](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1: This command returns all the tags associated with the given bucket.**

```
Get-S3BucketTagging -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see [GetBucketTagging](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use GetBucketVersioning with a CLI

The following code examples show how to use GetBucketVersioning.

### CLI

#### AWS CLI

The following command retrieves the versioning configuration for a bucket named amzn-s3-demo-bucket:

```
aws s3api get-bucket-versioning --bucket amzn-s3-demo-bucket
```

Output:

```
{  
  "Status": "Enabled"  
}
```

- For API details, see [GetBucketVersioning](#) in *AWS CLI Command Reference*.

### PowerShell

#### Tools for PowerShell V4

**Example 1: This command returns the status of versioning with respect to the given bucket.**

```
Get-S3BucketVersioning -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see [GetBucketVersioning](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1: This command returns the status of versioning with respect to the given bucket.**

```
Get-S3BucketVersioning -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see [GetBucketVersioning](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use GetBucketWebsite with an AWS SDK or CLI

The following code examples show how to use `GetBucketWebsite`.

.NET

### SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get the website configuration.
GetBucketWebsiteRequest getRequest = new
GetBucketWebsiteRequest()
{
    BucketName = bucketName,
};
```

```
        GetBucketWebsiteResponse getResponse = await
client.GetBucketWebsiteAsync(getRequest);
        Console.WriteLine($"Index document:
{getResponse.WebsiteConfiguration.IndexDocumentSuffix}");
        Console.WriteLine($"Error document:
{getResponse.WebsiteConfiguration.ErrorDocument}");
```

- For API details, see [GetBucketWebsite](#) in *AWS SDK for .NET API Reference*.

## C++

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
bool AwsDoc::S3::getWebsiteConfig(const Aws::String &bucketName,
                                  const Aws::S3::S3ClientConfiguration
&clientConfig) {
    Aws::S3::S3Client s3Client(clientConfig);

    Aws::S3::Model::GetBucketWebsiteRequest request;
    request.SetBucket(bucketName);

    Aws::S3::Model::GetBucketWebsiteOutcome outcome =
        s3Client.GetBucketWebsite(request);

    if (!outcome.IsSuccess()) {
        const Aws::S3::S3Error &err = outcome.GetError();

        std::cerr << "Error: GetBucketWebsite: "
                  << err.GetMessage() << std::endl;
    } else {
        Aws::S3::Model::GetBucketWebsiteResult websiteResult =
outcome.GetResult();

        std::cout << "Success: GetBucketWebsite: "
```

```
        << std::endl << std::endl
        << "For bucket '" << bucketName << "':"
        << std::endl
        << "Index page : "
        << websiteResult.GetIndexDocument().GetSuffix()
        << std::endl
        << "Error page: "
        << websiteResult.GetErrorDocument().GetKey()
        << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see [GetBucketWebsite](#) in *AWS SDK for C++ API Reference*.

## CLI

### AWS CLI

The following command retrieves the static website configuration for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-website --bucket amzn-s3-demo-bucket
```

Output:

```
{
  "IndexDocument": {
    "Suffix": "index.html"
  },
  "ErrorDocument": {
    "Key": "error.html"
  }
}
```

- For API details, see [GetBucketWebsite](#) in *AWS CLI Command Reference*.

## JavaScript

### SDK for JavaScript (v3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Get the website configuration.

```
import {
  GetBucketWebsiteCommand,
  S3Client,
  S3ServiceException,
} from "@aws-sdk/client-s3";

/**
 * Log the website configuration for a bucket.
 * @param {{ bucketName }}
 */
export const main = async ({ bucketName }) => {
  const client = new S3Client({});

  try {
    const response = await client.send(
      new GetBucketWebsiteCommand({
        Bucket: bucketName,
      }),
    );
    console.log(
      `Your bucket is set up to host a website with the following configuration:
\n${JSON.stringify(response, null, 2)}`,
    );
  } catch (caught) {
    if (
      caught instanceof S3ServiceException &&
      caught.name === "NoSuchWebsiteConfiguration"
    ) {
      console.error(
        `Error from S3 while getting website configuration for ${bucketName}. The
bucket isn't configured as a website.`
      );
    }
  }
}
```

```
    );
  } else if (caught instanceof S3ServiceException) {
    console.error(
      `Error from S3 while getting website configuration for ${bucketName}.
      ${caught.name}: ${caught.message}`,
    );
  } else {
    throw caught;
  }
}
};
```

- For API details, see [GetBucketWebsite](#) in *AWS SDK for JavaScript API Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1: This command returns the details of the static website configurations of the given S3 bucket.**

```
Get-S3BucketWebsite -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see [GetBucketWebsite](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

### Tools for PowerShell V5

**Example 1: This command returns the details of the static website configurations of the given S3 bucket.**

```
Get-S3BucketWebsite -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see [GetBucketWebsite](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

```
bool AwsDoc::S3::getObject(const Aws::String &objectKey,
                           const Aws::String &fromBucket,
                           const Aws::S3::S3ClientConfiguration &clientConfig) {
    Aws::S3::S3Client client(clientConfig);

    Aws::S3::Model::GetObjectRequest request;
    request.SetBucket(fromBucket);
    request.SetKey(objectKey);

    Aws::S3::Model::GetObjectOutcome outcome =
        client.GetObject(request);

    if (!outcome.IsSuccess()) {
        const Aws::S3::S3Error &err = outcome.GetError();
        std::cerr << "Error: getObject: " <<
            err.GetExceptionName() << ": " << err.GetMessage() <<
std::endl;
    } else {
        std::cout << "Successfully retrieved '" << objectKey << "' from '"
            << fromBucket << "'." << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see [GetObject](#) in *AWS SDK for C++ API Reference*.

## CLI

### AWS CLI

The following example uses the `get-object` command to download an object from Amazon S3:

```
aws s3api get-object --bucket text-content --key dir/  
my_images.tar.bz2 my_images.tar.bz2
```

Note that the outfile parameter is specified without an option name such as "`--outfile`". The name of the output file must be the last parameter in the command.

The example below demonstrates the use of `--range` to download a specific byte range from an object. Note the byte ranges needs to be prefixed with "bytes=":

```
aws s3api get-object --bucket text-content --key dir/my_data --  
range bytes=8888-9999 my_data_range
```

For more information about retrieving objects, see *Getting Objects in the Amazon S3 Developer Guide*.

- For API details, see [GetObject](#) in *AWS CLI Command Reference*.

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Read data as a byte array using an [S3Client](#).

```
/**
 * Asynchronously retrieves the bytes of an object from an Amazon S3 bucket
 * and writes them to a local file.
 *
 * @param bucketName the name of the S3 bucket containing the object
 * @param keyName    the key (or name) of the S3 object to retrieve
 * @param path       the local file path where the object's bytes will be
 * written
 * @return a {@link CompletableFuture} that completes when the object bytes
 * have been written to the local file
 */
public CompletableFuture<Void> getObjectBytesAsync(String bucketName, String
keyName, String path) {
    GetObjectRequest objectRequest = GetObjectRequest.builder()
        .key(keyName)
        .bucket(bucketName)
        .build();

    CompletableFuture<ResponseBytes<GetObjectResponse>> response =
getAsyncClient().getObject(objectRequest, AsyncResponseTransformer.toBytes());
    return response.thenAccept(objectBytes -> {
        try {
            byte[] data = objectBytes.asByteArray();
            Path filePath = Paths.get(path);
```

```
        Files.write(filePath, data);
        logger.info("Successfully obtained bytes from an S3 object");
    } catch (IOException ex) {
        throw new RuntimeException("Failed to write data to file", ex);
    }
}).whenComplete((resp, ex) -> {
    if (ex != null) {
        throw new RuntimeException("Failed to get object bytes from S3",
ex);
    }
});
}
```

Use an [S3TransferManager](#) to [download an object](#) in an S3 bucket to a local file. View the [complete file](#) and [test](#).

## JavaScript

### SDK for JavaScript (v3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

### Download the object.

```
import {
  GetObjectCommand,
  NoSuchKey,
  S3Client,
  S3ServiceException,
} from "@aws-sdk/client-s3";

/**
 * Get a single object from a specified S3 bucket.
 * @param {{ bucketName: string, key: string }}
 */
export const main = async ({ bucketName, key }) => {
  const client = new S3Client({});

  try {
    const response = await client.send(
      new GetObjectCommand({
        Bucket: bucketName,
        Key: key,
      }),
    );
    // The Body object also has 'transformToArray' and 'transformToWebStream'
    methods.
    const str = await response.Body.transformToString();
    console.log(str);
  } catch (caught) {
    if (caught instanceof NoSuchKey) {
      console.error(
```

```
    `Error from S3 while getting object "${key}" from "${bucketName}". No
such key exists.` ,
    );
  } else if (caught instanceof S3ServiceException) {
    console.error(
      `Error from S3 while getting object from ${bucketName}. ${caught.name}:
${caught.message}` ,
    );
  } else {
    throw caught;
  }
}
};
```

Download the object on condition its ETag matches the one provided.

```
import {
  GetObjectCommand,

## PHP

## SDK for PHP

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Get an object.

```
$s3client = new Aws\S3\S3Client(['region' => 'us-west-2']);

try {
    $file = $this->s3client->getObject([
        'Bucket' => $this->bucketName,
        'Key' => $fileName,
    ]);
    $body = $file->get('Body');
    $body->rewind();
    echo "Downloaded the file and it begins with: {$body->read(26)}.\n";
} catch (Exception $exception) {
    echo "Failed to download $fileName from $this->bucketName with error:
" . $exception->getMessage();
    exit("Please fix error with file downloading before continuing.");
}
```

- For API details, see [GetObject](#) in *AWS SDK for PHP API Reference*.

## PowerShell

## Tools for PowerShell V4

**Example 1:** This command retrieves item "sample.txt" from bucket "test-files" and saves it to a file named "local-sample.txt" in the current location. The file "local-sample.txt" does not have to exist before this command is called.

```
Read-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt -File local-
sample.txt
```

**Example 2: This command retrieves virtual directory "DIR" from bucket "test-files" and saves it to a folder named "Local-DIR" in the current location. The folder "Local-DIR" does not have to exist before this command is called.**

```
Read-S3Object -BucketName amzn-s3-demo-bucket -KeyPrefix DIR -Folder Local-DIR
```

**Example 3: Downloads all objects with keys ending in '.json' from buckets with 'config' in the bucket name to files in the specified folder. The object keys are used to set the filenames.**

```
Get-S3Bucket | ? { $_.BucketName -like '*config*' } | Get-S3Object | ? { $_.Key -like '*.json' } | Read-S3Object -Folder C:\ConfigObjects
```

- For API details, see [GetObject](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1: This command retrieves item "sample.txt" from bucket "test-files" and saves it to a file named "local-sample.txt" in the current location. The file "local-sample.txt" does not have to exist before this command is called.**

```
Read-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt -File local-sample.txt
```

**Example 2: This command retrieves virtual directory "DIR" from bucket "test-files" and saves it to a folder named "Local-DIR" in the current location. The folder "Local-DIR" does not have to exist before this command is called.**

```
Read-S3Object -BucketName amzn-s3-demo-bucket -KeyPrefix DIR -Folder Local-DIR
```

**Example 3: Downloads all objects with keys ending in '.json' from buckets with 'config' in the bucket name to files in the specified folder. The object keys are used to set the filenames.**

```
Get-S3Bucket | ? { $_.BucketName -like '*config*' } | Get-S3Object | ? { $_.Key -like '*.json' } | Read-S3Object -Folder C:\ConfigObjects
```

- For API details, see [GetObject](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

## Python

## SDK for Python (Boto3)

 **Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```

## Ruby

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

### Get an object.

```
require 'aws-sdk-s3'

# Wraps Amazon S3 object actions.
class ObjectGetWrapper
  attr_reader :object

  # @param object [Aws::S3::Object] An existing Amazon S3 object.
```

```

def initialize(object)
  @object = object
end

# Gets the object directly to a file.
#
# @param target_path [String] The path to the file where the object is
downloaded.
# @return [Aws::S3::Types::GetObjectOutput, nil] The retrieved object data if
successful; otherwise nil.
def get_object(target_path)
  @object.get(response_target: target_path)
rescue Aws::Errors::ServiceError => e
  puts "Couldn't get object #{@object.key}. Here's why: #{e.message}"
end
end

# Example usage:
def run_demo
  bucket_name = "amzn-s3-demo-bucket"
  object_key = "my-object.txt"
  target_path = "my-object-as-file.txt"

  wrapper = ObjectGetWrapper.new(Aws::S3::Object.new(bucket_name, object_key))
  obj_data = wrapper.get_object(target_path)
  return unless obj_data

  puts "Object #{object_key} (#{obj_data.content_length} bytes) downloaded to
#{target_path}."
end

run_demo if $PROGRAM_NAME == __FILE__

```

Get an object and report its server-side encryption state.

```

require 'aws-sdk-s3'

# Wraps Amazon S3 object actions.
class ObjectGetEncryptionWrapper
  attr_reader :object

  # @param object [Aws::S3::Object] An existing Amazon S3 object.

```

```
def initialize(object)
  @object = object
end

# Gets the object into memory.
#
# @return [Aws::S3::Types::GetObjectOutput, nil] The retrieved object data if
successful; otherwise nil.
def object
  @object.get
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't get object #{@object.key}. Here's why: #{e.message}"
  end
end

# Example usage:
def run_demo
  bucket_name = "amzn-s3-demo-bucket"
  object_key = "my-object.txt"

  wrapper = ObjectGetEncryptionWrapper.new(Aws::S3::Object.new(bucket_name,
object_key))
  obj_data = wrapper.get_object
  return unless obj_data

  encryption = obj_data.server_side_encryption.nil? ? 'no' :
obj_data.server_side_encryption
  puts "Object #{object_key} uses #{encryption} encryption."
end

run_demo if $PROGRAM_NAME == __FILE__
```

- For API details, see [GetObject](#) in *AWS SDK for Ruby API Reference*.

## CLI

## AWS CLI

The following command retrieves the access control list for an object in a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-object-acl --bucket amzn-s3-demo-bucket --key index.html
```

Output:

```
{
  "Owner": {
    "DisplayName": "my-username",
    "ID": "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"
  },
  "Grants": [
    {
      "Grantee": {
        "DisplayName": "my-username",
        "ID": "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"
      },
      "Permission": "FULL_CONTROL"
    },
    {
      "Grantee": {
        "URI": "http://acs.amazonaws.com/groups/global/AllUsers"
      },
      "Permission": "READ"
    }
  ]
}
```

## CLI

### AWS CLI

**To retrieves metadata from an object without returning the object itself**

The following `get-object-attributes` example retrieves metadata from the object `doc1.rtf`.

```
aws s3api get-object-attributes \  
  --bucket amzn-s3-demo-bucket \  
  --key doc1.rtf \  
  --object-attributes "StorageClass" "ETag" "ObjectSize"
```

Output:

```
{  
  "LastModified": "2022-03-15T19:37:31+00:00",  
  "VersionId": "IuCPjXTDzHNfldAuitVBIKJpF2p1fg4P",  
  "ETag": "b662d79adeb7c8d787ea7eafb9ef6207",  
  "StorageClass": "STANDARD",  
  "ObjectSize": 405  
}
```

For more information, see [GetObjectAttributes](#) in the Amazon S3 API Reference.

- For API details, see [GetObjectAttributes](#) in *AWS CLI Command Reference*.

## CLI

### AWS CLI

#### To retrieve an object lock configuration for a bucket

The following `get-object-lock-configuration` example retrieves the object lock configuration for the specified bucket.

```
aws s3api get-object-lock-configuration \  
  --bucket amzn-s3-demo-bucket-with-object-lock
```

### Output:

```
{  
  "ObjectLockConfiguration": {  
    "ObjectLockEnabled": "Enabled",  
    "Rule": {  
      "DefaultRetention": {  
        "Mode": "COMPLIANCE",  
        "Days": 50  
      }  
    }  
  }  
}
```

- For API details, see [GetObjectLockConfiguration](#) in *AWS CLI Command Reference*.

## CLI

## AWS CLI

**To retrieve the tags attached to an object**

The following `get-object-tagging` example retrieves the values for the specified key from the specified object.

```
aws s3api get-object-tagging \  
  --bucket amzn-s3-demo-bucket \  
  --key doc1.rtf
```

Output:

```
{  
  "TagSet": [  
    {  
      "Value": "confidential",  
      "Key": "designation"  
    }  
  ]  
}
```

The following `get-object-tagging` example tries to retrieve the tag sets of the object `doc2.rtf`, which has no tags.

```
aws s3api get-object-tagging \  
  --bucket amzn-s3-demo-bucket \  
  --key doc2.rtf
```

Output:

```
{  
  "TagSet": []  
}
```

The following `get-object-tagging` example retrieves the tag sets of the object `doc3.rtf`, which has multiple tags.

```
aws s3api get-object-tagging \  
  --bucket amzn-s3-demo-bucket \  
  --key doc3.rtf
```

```
--bucket amzn-s3-demo-bucket \  
--key doc3.rtf
```

### Output:

```
{  
  "TagSet": [  
    {  
      "Value": "confidential",  
      "Key": "designation"  
    },  
    {  
      "Value": "finance",  
      "Key": "department"  
    },  
    {  
      "Value": "payroll",  
      "Key": "team"  
    }  
  ]  
}
```

- For API details, see [GetObjectTagging](#) in *AWS CLI Command Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1: The sample returns the tags associated with the object present on the given S3 bucket.**

```
Get-S3ObjectTagSet -Key 'testfile.txt' -BucketName 'amzn-s3-demo-bucket'
```

### Output:

```
Key  Value  
---  -  
test value
```

- For API details, see [GetObjectTagging](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1: The sample returns the tags associated with the object present on the given S3 bucket.**

```
Get-S3ObjectTagSet -Key 'testfile.txt' -BucketName 'amzn-s3-demo-bucket'
```

### Output:

```
Key  Value
---  -
test value
```

- For API details, see [GetObjectTagging](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use GetPublicAccessBlock with a CLI

The following code examples show how to use GetPublicAccessBlock.

### CLI

#### AWS CLI

### To set or modify the block public access configuration for a bucket

The following `get-public-access-block` example displays the block public access configuration for the specified bucket.

```
aws s3api get-public-access-block \  
  --bucket amzn-s3-demo-bucket
```

### Output:

```
{  
  "PublicAccessBlockConfiguration": {
```

```
    "IgnorePublicAcls": true,  
    "BlockPublicPolicy": true,  
    "BlockPublicAcls": true,  
    "RestrictPublicBuckets": true  
  }  
}
```

- For API details, see [GetPublicAccessBlock](#) in *AWS CLI Command Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1: The command returns the public access block configuration of the given S3 bucket.**

```
Get-S3PublicAccessBlock -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see [GetPublicAccessBlock](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

### Tools for PowerShell V5

**Example 1: The command returns the public access block configuration of the given S3 bucket.**

```
Get-S3PublicAccessBlock -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see [GetPublicAccessBlock](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use HeadBucket with an AWS SDK or CLI

The following code examples show how to use HeadBucket.

## Bash

### AWS CLI with Bash script

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
#####  
# function bucket_exists  
#  
# This function checks to see if the specified bucket already exists.  
#  
# Parameters:  
#     $1 - The name of the bucket to check.  
#  
# Returns:  
#     0 - If the bucket already exists.  
#     1 - If the bucket doesn't exist.  
#####  
function bucket_exists() {  
    local bucket_name  
    bucket_name=$1  
  
    # Check whether the bucket already exists.  
    # We suppress all output - we're interested only in the return code.  
  
    if aws s3api head-bucket \  
        --bucket "$bucket_name" \  
        >/dev/null 2>&1; then  
        return 0 # 0 in Bash script means true.  
    else  
        return 1 # 1 in Bash script means false.  
    fi  
}
```

- For API details, see [HeadBucket](#) in *AWS CLI Command Reference*.

## CLI

### AWS CLI

The following command verifies access to a bucket named `amzn-s3-demo-bucket`:

```
aws s3api head-bucket --bucket amzn-s3-demo-bucket
```

If the bucket exists and you have access to it, no output is returned. Otherwise, an error message will be shown. For example:

```
A client error (404) occurred when calling the HeadBucket operation: Not Found
```

- For API details, see [HeadBucket](#) in *AWS CLI Command Reference*.

## Go

### SDK for Go V2

#### Note

    }

    return exists, err
}
```

- For API details, see [HeadBucket](#) in *AWS SDK for Go API Reference*.

## PowerShell

### Tools for PowerShell V5

**Example 1: This command returns the output with HTTP status code 200 OK for existing bucket when user has permission to access it. BucketArn parameter is only supported for S3 directory buckets.**

```
Get-S3HeadBucket -BucketName amzn-s3-demo-bucket
```

#### Output:

```
AccessPointAlias      : False
BucketArn             :
BucketLocationName   :
BucketLocationType   :
BucketRegion         : us-east-2
ResponseMetadata     : Amazon.Runtime.ResponseMetadata
ContentLength        : 0
HttpStatusCode       : OK
```

**Example 2: This command throws error with HTTP status code NotFound for non-existent bucket.**

```
Get-S3HeadBucket -BucketName amzn-s3-non-existing-bucket
```

#### Output:

```
Get-S3HeadBucket: Error making request with Error Code NotFound and Http Status Code NotFound. No further error information was returned by the service.
```

**Example 3: This command throws error with HTTP status code Forbidden for existing bucket where user does not have permission to access it.**

```
Get-S3HeadBucket -BucketName amzn-s3-no-access-bucket
```

#### Output:

Get-S3HeadBucket: Error making request with Error Code Forbidden and Http Status Code Forbidden. No further error information was returned by the service.

- For API details, see [HeadBucket](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

## Python

## Use HeadObject with an AWS SDK or CLI

The following code examples show how to use HeadObject.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- [Get started with S3](#)

## CLI

### AWS CLI

The following command retrieves metadata for an object in a bucket named `amzn-s3-demo-bucket`:

```
aws s3api head-object --bucket amzn-s3-demo-bucket --key index.html
```

Output:

```
{  
  "AcceptRanges": "bytes",  
  "ContentType": "text/html",  
  "LastModified": "Thu, 16 Apr 2015 18:19:14 GMT",  
  "ContentLength": 77,  
  "VersionId": "null",  
  "ETag": "\"30a6ec7e1a9ad79c203d05a589c8b400\"",  
  "Metadata": {}
```

```
}
```

- For API details, see [HeadObject](#) in *AWS CLI Command Reference*.

## Java

### SDK for Java 2.x

#### Note

## Use ListBucketAnalyticsConfigurations with a CLI

The following code examples show how to use ListBucketAnalyticsConfigurations.

### CLI

#### AWS CLI

##### To retrieve a list of analytics configurations for a bucket

The following list-bucket-analytics-configurations retrieves a list of analytics configurations for the specified bucket.

```
aws s3api list-bucket-analytics-configurations \  
  --bucket amzn-s3-demo-bucket
```

Output:

```
{  
  "AnalyticsConfigurationList": [  
    {  
      "StorageClassAnalysis": {},  
      "Id": "1"  
    }  
  ],  
  "IsTruncated": false  
}
```

- For API details, see [ListBucketAnalyticsConfigurations](#) in *AWS CLI Command Reference*.

### PowerShell

#### Tools for PowerShell V4

**Example 1: This command returns the first 100 analytics configurations of the given S3 bucket.**

```
Get-S3BucketAnalyticsConfigurationList -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see [ListBucketAnalyticsConfigurations](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1: This command returns the first 100 analytics configurations of the given S3 bucket.**

```
Get-S3BucketAnalyticsConfigurationList -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see [ListBucketAnalyticsConfigurations](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use ListBucketInventoryConfigurations with a CLI

The following code examples show how to use ListBucketInventoryConfigurations.

### CLI

#### AWS CLI

#### To retrieve a list of inventory configurations for a bucket

The following list-bucket-inventory-configurations example lists the inventory configurations for the specified bucket.

```
aws s3api list-bucket-inventory-configurations \  
  --bucket amzn-s3-demo-bucket
```

Output:

```
{  
  "InventoryConfigurationList": [  
    {  
      "IsEnabled": true,  
      "Destination": {  
        "S3BucketDestination": {  
          "Format": "ORC",  
          "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket",
```

```

        "AccountId": "123456789012"
      }
    },
    "IncludedObjectVersions": "Current",
    "Id": "1",
    "Schedule": {
      "Frequency": "Weekly"
    }
  },
  {
    "IsEnabled": true,
    "Destination": {
      "S3BucketDestination": {
        "Format": "CSV",
        "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket",
        "AccountId": "123456789012"
      }
    },
    "IncludedObjectVersions": "Current",
    "Id": "2",
    "Schedule": {
      "Frequency": "Daily"
    }
  }
],
"IsTruncated": false
}

```

- For API details, see [ListBucketInventoryConfigurations](#) in *AWS CLI Command Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1: This command returns the first 100 inventory configurations of the given S3 bucket.**

```
Get-S3BucketInventoryConfigurationList -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see [ListBucketInventoryConfigurations](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1: This command returns the first 100 inventory configurations of the given S3 bucket.**

```
Get-S3BucketInventoryConfigurationList -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see [ListBucketInventoryConfigurations](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

### Use ListBuckets with an AWS SDK or CLI

The following code examples show how to use ListBuckets.

.NET

#### SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
namespace ListBucketsExample
{
    using System;
    using System.Collections.Generic;
    using System.Threading.Tasks;
    using Amazon.S3;
    using Amazon.S3.Model;

    /// <summary>
    /// This example uses the AWS SDK for .NET to list the Amazon Simple Storage
    /// Service (Amazon S3) buckets belonging to the default account.
    /// </summary>
```

```
public class ListBuckets
{
    private static IAmazonS3 _s3Client;

    /// <summary>
    /// Get a list of the buckets owned by the default user.
    /// </summary>
    /// <param name="client">An initialized Amazon S3 client object.</param>
    /// <returns>The response from the ListingBuckets call that contains a
    /// list of the buckets owned by the default user.</returns>
    public static async Task<ListBucketsResponse> GetBuckets(IAmazonS3
client)
    {
        return await client.ListBucketsAsync();
    }

    /// <summary>
    /// This method lists the name and creation date for the buckets in
    /// the passed List of S3 buckets.
    /// </summary>
    /// <param name="bucketList">A List of S3 bucket objects.</param>
    public static void DisplayBucketList(List<S3Bucket> bucketList)
    {
        bucketList
            .ForEach(b => Console.WriteLine($"Bucket name: {b.BucketName},
created on: {b.CreationDate}"));
    }

    public static async Task Main()
    {
        // The client uses the AWS Region of the default user.
        // If the Region where the buckets were created is different,
        // pass the Region to the client constructor. For example:
        // _s3Client = new AmazonS3Client(RegionEndpoint.USEast1);
        _s3Client = new AmazonS3Client();
        var response = await GetBuckets(_s3Client);
        DisplayBucketList(response.Buckets);
    }
}
}
```

## C++

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
bool AwsDoc::S3::listBuckets(const Aws::S3::S3ClientConfiguration &clientConfig)
{
    Aws::S3::S3Client client(clientConfig);

    auto outcome = client.ListBuckets();

    bool result = true;
    if (!outcome.IsSuccess()) {
        std::cerr << "Failed with error: " << outcome.GetError() << std::endl;
        result = false;
    } else {
        std::cout << "Found " << outcome.GetResult().GetBuckets().size() << "
buckets\n";
        for (auto &&b: outcome.GetResult().GetBuckets()) {
            std::cout << b.GetName() << std::endl;
        }
    }

    return result;
}
```

- For API details, see [ListBuckets](#) in *AWS SDK for C++ API Reference*.

## CLI

### AWS CLI

The following command uses the `list-buckets` command to display the names of all your Amazon S3 buckets (across all regions):

```
aws s3api list-buckets --query "Buckets[].Name"
```

The query option filters the output of `list-buckets` down to only the bucket names.

For more information about buckets, see [Working with Amazon S3 Buckets](#) in the *Amazon S3 Developer Guide*.

- For API details, see [ListBuckets](#) in *AWS CLI Command Reference*.

### Use ListMultipartUploads with an AWS SDK or CLI

The following code examples show how to use ListMultipartUploads.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- [Delete incomplete multipart uploads](#)

## CLI

## AWS CLI

The following command lists all of the active multipart uploads for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api list-multipart-uploads --bucket amzn-s3-demo-bucket
```

Output:

```
{
  "Uploads": [
    {
      "Initiator": {
        "DisplayName": "username",
        "ID": "arn:aws:iam::0123456789012:user/username"
      },
      "Initiated": "2015-06-02T18:01:30.000Z",
      "UploadId":
"dfRtDYU0WwCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZ1jF.Yxwh6XG7WfS2vC4to6HiV6Yj1x.cph0gtNBtJ8P3",
      "StorageClass": "STANDARD",
      "Key": "multipart/01",
      "Owner": {
        "DisplayName": "aws-account-name",
        "ID":
"100719349fc3b6dcd7c820a124bf7aec408092c3d7b51b38494939801fc248b"
      }
    }
  ],
  "CommonPrefixes": []
}
```

In progress multipart uploads incur storage costs in Amazon S3. Complete or abort an active multipart upload to remove its parts from your account.

- For API details, see [ListMultipartUploads](#) in *AWS CLI Command Reference*.

```
async fn show_versions(client: &Client, bucket: &str) -> Result<(), Error> {
    let resp = client.list_object_versions().bucket(bucket).send().await?;

    for version in resp.versions() {
        println!("{}", version.key().unwrap_or_default());
        println!(" version ID: {}", version.version_id().unwrap_or_default());
        println!();
    }

    Ok(())
}
```

- For API details, see [ListObjectVersions](#) in *AWS SDK for Rust API reference*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

### Use ListObjects with a CLI

The following code examples show how to use ListObjects.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- [Create a web page that lists Amazon S3 objects](#)

## CLI

### AWS CLI

The following example uses the `list-objects` command to display the names of all the objects in the specified bucket:

```
aws s3api list-objects --bucket text-content --query 'Contents[].{Key: Key, Size: Size}'
```

The example uses the `--query` argument to filter the output of `list-objects` down to the key value and size for each object

For more information about objects, see *Working with Amazon S3 Objects* in the *Amazon S3 Developer Guide*.

- For API details, see [ListObjects](#) in *AWS CLI Command Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1: This command retrieves the information about all of the items in the bucket "test-files".**

```
Get-S3Object -BucketName amzn-s3-demo-bucket
```

**Example 2: This command retrieves the information about the item "sample.txt" from bucket "test-files".**

```
Get-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt
```

**Example 3: This command retrieves the information about all items with the prefix "sample" from bucket "test-files".**

```
Get-S3Object -BucketName amzn-s3-demo-bucket -KeyPrefix sample
```

- For API details, see [ListObjects](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1: This command retrieves the information about all of the items in the bucket "test-files".**

```
Get-S3Object -BucketName amzn-s3-demo-bucket
```

**Example 2: This command retrieves the information about the item "sample.txt" from bucket "test-files".**

```
Get-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt
```

**Example 3: This command retrieves the information about all items with the prefix "sample" from bucket "test-files".**

```
Get-S3Object -BucketName amzn-s3-demo-bucket -KeyPrefix sample
```

- For API details, see [ListObjects](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use ListObjectsV2 with an AWS SDK or CLI

The following code examples show how to use ListObjectsV2.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- [Learn the basics](#)
- [Delete all objects in a bucket](#)
- [Get started with S3](#)

## .NET

```
using System;
using System.Threading.Tasks;
using Amazon.S3;
using Amazon.S3.Model;

/// <summary>
/// Amazon Simple Storage Service (Amazon S3) Transfer Acceleration is a
/// bucket-level feature that enables you to perform faster data transfers
/// to Amazon S3. This example shows how to configure Transfer
/// Acceleration.
/// </summary>
public class TransferAcceleration
```

```
{
    /// <summary>
    /// The main method initializes the client object and sets the
    /// Amazon Simple Storage Service (Amazon S3) bucket name before
    /// calling EnableAccelerationAsync.
    /// </summary>
    public static async Task Main()
    {
        var s3Client = new AmazonS3Client();
        const string bucketName = "amzn-s3-demo-bucket";

        await EnableAccelerationAsync(s3Client, bucketName);
    }

    /// <summary>
    /// This method sets the configuration to enable transfer acceleration
    /// for the bucket referred to in the bucketName parameter.
    /// </summary>
    /// <param name="client">An Amazon S3 client used to enable the
    /// acceleration on an Amazon S3 bucket.</param>
    /// <param name="bucketName">The name of the Amazon S3 bucket for which
the
    /// method will be enabling acceleration.</param>
    private static async Task EnableAccelerationAsync(AmazonS3Client client,
string bucketName)
    {
        try
        {
            var putRequest = new PutBucketAccelerateConfigurationRequest
            {
                BucketName = bucketName,
                AccelerateConfiguration = new AccelerateConfiguration
                {
                    Status = BucketAccelerateStatus.Enabled,
                },
            };
            await client.PutBucketAccelerateConfigurationAsync(putRequest);

            var getRequest = new GetBucketAccelerateConfigurationRequest
            {
                BucketName = bucketName,
            };
            var response = await
client.GetBucketAccelerateConfigurationAsync(getRequest);
```

```
        Console.WriteLine($"Acceleration state = '{response.Status}' ");
    }
    catch (AmazonS3Exception ex)
    {
        Console.WriteLine($"Error occurred. Message: '{ex.Message}' when
setting transfer acceleration");
    }
}
}
```

- For API details, see [PutBucketAccelerateConfiguration](#) in *AWS SDK for .NET API Reference*.

## CLI

### AWS CLI

#### To set the accelerate configuration of a bucket

The following `put-bucket-accelerate-configuration` example enables the accelerate configuration for the specified bucket.

```
aws s3api put-bucket-accelerate-configuration \  
  --bucket amzn-s3-demo-bucket \  
  --accelerate-configuration Status=Enabled
```

This command produces no output.

- For API details, see [PutBucketAccelerateConfiguration](#) in *AWS CLI Command Reference*.

## PowerShell

### Tools for PowerShell V4

#### Example 1: This command enables the transfer acceleration for the given S3 bucket.

```
$statusVal = New-Object Amazon.S3.BucketAccelerateStatus('Enabled')  
Write-S3BucketAccelerateConfiguration -BucketName 'amzn-s3-demo-bucket' -  
AccelerateConfiguration_Status $statusVal
```

- For API details, see [PutBucketAccelerateConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1: This command enables the transfer acceleration for the given S3 bucket.**

```
$statusVal = New-Object Amazon.S3.BucketAccelerateStatus('Enabled')
Write-S3BucketAccelerateConfiguration -BucketName 'amzn-s3-demo-bucket' -
AccelerateConfiguration_Status $statusVal
```

- For API details, see [PutBucketAccelerateConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use PutBucketAc1 with an AWS SDK or CLI

The following code examples show how to use PutBucketAc1.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

```

- For API details, see [PutBucketAcl](#) in *AWS SDK for C++ API Reference*.

## CLI

### AWS CLI

This example grants `full control` to two AWS users (`user1@example.com` and `user2@example.com`) and read permission to everyone:

```
aws s3api put-bucket-acl --bucket amzn-s3-demo-bucket --grant-full-
control emailaddress=user1@example.com,emailaddress=user2@example.com --grant-
read uri=http://acs.amazonaws.com/groups/global/AllUsers
```

See <http://docs.aws.amazon.com/AmazonS3/latest/API/RESTBucketPUTacl.html> for details on custom ACLs (the `s3api` ACL commands, such as `put-bucket-acl`, use the same shorthand argument notation).

- For API details, see [PutBucketAcl](#) in *AWS CLI Command Reference*.

## Use PutBucketCors with an AWS SDK or CLI

The following code examples show how to use PutBucketCors.

.NET

### SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Add CORS configuration to the Amazon S3 bucket.
/// </summary>
/// <param name="client">The initialized Amazon S3 client object used
/// to apply the CORS configuration to an Amazon S3 bucket.</param>
/// <param name="configuration">The CORS configuration to apply.</param>
private static async Task PutCORSConfigurationAsync(AmazonS3Client
client, CORSConfiguration configuration)
```

```
{
    PutCORSConfigurationRequest request = new
PutCORSConfigurationRequest()
    {
        BucketName = BucketName,
        Configuration = configuration,
    };

    _ = await client.PutCORSConfigurationAsync(request);
}
```

- For API details, see [PutBucketCors](#) in *AWS SDK for .NET API Reference*.

## CLI

### AWS CLI

The following example enables PUT, POST, and DELETE requests from *www.example.com*, and enables GET requests from any domain:

```
aws s3api put-bucket-cors --bucket amzn-s3-demo-bucket --cors-configuration file://cors.json
```

*cors.json*:

```
{
  "CORSRules": [
    {
      "AllowedOrigins": ["http://www.example.com"],
      "AllowedHeaders": ["*"],
      "AllowedMethods": ["PUT", "POST", "DELETE"],
      "MaxAgeSeconds": 3000,
      "ExposeHeaders": ["x-amz-server-side-encryption"]
    },
    {
      "AllowedOrigins": ["*"],
      "AllowedHeaders": ["Authorization"],
      "AllowedMethods": ["GET"],
      "MaxAgeSeconds": 3000
    }
  ]
}
```

```
]
}
```

- For API details, see [PutBucketCors](#) in *AWS CLI Command Reference*.

## Use PutBucketEncryption with an AWS SDK or CLI

The following code examples show how to use PutBucketEncryption.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- [Get started with S3](#)

.NET

### SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Set the bucket server side encryption to use AWSKMS with a customer-
managed key id.
/// </summary>
/// <param name="bucketName">Name of the bucket.</param>
/// <param name="kmsKeyId">The Id of the KMS Key.</param>
/// <returns>True if successful.</returns>
public static async Task<bool> SetBucketServerSideEncryption(string
bucketName, string kmsKeyId)
{
    var serverSideEncryptionByDefault = new ServerSideEncryptionConfiguration
    {
        ServerSideEncryptionRules = new List<ServerSideEncryptionRule>
        {
            new ServerSideEncryptionRule
            {
                ServerSideEncryptionByDefault = new
ServerSideEncryptionByDefault
                {
                    ServerSideEncryptionAlgorithm =
ServerSideEncryptionMethod.AWSKMS,
                    ServerSideEncryptionKeyManagementServiceKeyId = kmsKeyId
                }
            }
        }
    };
    try
    {
        var encryptionResponse = await _s3Client.PutBucketEncryptionAsync(new
PutBucketEncryptionRequest
        {
            BucketName = bucketName,
            ServerSideEncryptionConfiguration =
serverSideEncryptionByDefault,
        });

        return encryptionResponse.HttpStatusCode == HttpStatusCode.OK;
    }
    catch (AmazonS3Exception ex)
    {
        Console.WriteLine(ex.ErrorCode == "AccessDenied"
            ? $"This account does not have permission to set encryption on
{bucketName}, please try again."
            : null);
    }
}
```

```
        : $"Unable to set bucket encryption for bucket {bucketName},  
{ex.Message}");  
    }  
    return false;  
}
```

- For API details, see [PutBucketEncryption](#) in *AWS SDK for .NET API Reference*.

## CLI

### AWS CLI

#### To configure server-side encryption for a bucket

The following `put-bucket-encryption` example sets AES256 encryption as the default for the specified bucket.

```
aws s3api put-bucket-encryption \  
  --bucket amzn-s3-demo-bucket \  
  --server-side-encryption-configuration '{"Rules":  
  [{"ApplyServerSideEncryptionByDefault": {"SSEAlgorithm": "AES256"}}]}'
```

This command produces no output.

- For API details, see [PutBucketEncryption](#) in *AWS CLI Command Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1: This command enables default AES256 server side encryption with Amazon S3 Managed Keys(SSE-S3) on the given bucket.**

```
$Encryptionconfig = @{ServerSideEncryptionByDefault =  
  @{ServerSideEncryptionAlgorithm = "AES256"}}  
Set-S3BucketEncryption -BucketName 'amzn-s3-demo-bucket' -  
ServerSideEncryptionConfiguration_ServerSideEncryptionRule $Encryptionconfig
```

- For API details, see [PutBucketEncryption](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1: This command enables default AES256 server side encryption with Amazon S3 Managed Keys(SSE-S3) on the given bucket.**

```
$Encryptionconfig = @{ServerSideEncryptionByDefault =  
    @{ServerSideEncryptionAlgorithm = "AES256"}}  
Set-S3BucketEncryption -BucketName 'amzn-s3-demo-bucket' -  
ServerSideEncryptionConfiguration_ServerSideEncryptionRule $Encryptionconfig
```

- For API details, see [PutBucketEncryption](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

### Use PutBucketLifecycleConfiguration with an AWS SDK or CLI

The following code examples show how to use PutBucketLifecycleConfiguration.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- [Delete incomplete multipart uploads](#)
- [Manage large messages using S3](#)
- [Work with versioned objects](#)

.NET

### SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Adds lifecycle configuration information to the S3 bucket named in
/// the bucketName parameter.
/// </summary>
/// <param name="client">The S3 client used to call the
/// PutLifecycleConfigurationAsync method.</param>
/// <param name="bucketName">A string representing the S3 bucket to
/// which configuration information will be added.</param>
/// <param name="configuration">A LifecycleConfiguration object that
/// will be applied to the S3 bucket.</param>
public static async Task AddExampleLifecycleConfigAsync(IAmazonS3 client,
string bucketName, LifecycleConfiguration configuration)
{
    var request = new PutLifecycleConfigurationRequest()
    {
        BucketName = bucketName,
        Configuration = configuration,
    };
    var response = await client.PutLifecycleConfigurationAsync(request);
}
```

- For API details, see [PutBucketLifecycleConfiguration](#) in *AWS SDK for .NET API Reference*.

## CLI

### AWS CLI

The following command applies a lifecycle configuration to a bucket named `amzn-s3-demo-bucket`:

```
aws s3api put-bucket-lifecycle-configuration --bucket amzn-s3-demo-bucket --
lifecycle-configuration file://lifecycle.json
```

The file `lifecycle.json` is a JSON document in the current folder that specifies two rules:

```
{
  "Rules": [
    {
      "ID": "Move rotated logs to Glacier",
      "Prefix": "rotated/",
```

```
    "Status": "Enabled",
    "Transitions": [
      {
        "Date": "2015-11-10T00:00:00.000Z",
        "StorageClass": "GLACIER"
      }
    ],
  },
  {
    "Status": "Enabled",
    "Prefix": "",
    "NoncurrentVersionTransitions": [
      {
        "NoncurrentDays": 2,
        "StorageClass": "GLACIER"
      }
    ],
    "ID": "Move old versions to Glacier"
  }
]
```

The first rule moves files with the prefix `rotated` to Glacier on the specified date. The second rule moves old object versions to Glacier when they are no longer current. For information on acceptable timestamp formats, see *Specifying Parameter Values* in the *AWS CLI User Guide*.

- For API details, see [PutBucketLifecycleConfiguration](#) in *AWS CLI Command Reference*.

local settings.
            .Build();
    }
}
```

```
    }  
  }  
}
```

- For API details, see [PutBucketLogging](#) in *AWS SDK for .NET API Reference*.

## CLI

### AWS CLI

#### Example 1: To set bucket policy logging

The following `put-bucket-logging` example sets the logging policy for `amzn-s3-demo-bucket`. First, grant the logging service principal permission in your bucket policy using the `put-bucket-policy` command.

```
aws s3api put-bucket-policy \  
  --bucket amzn-s3-demo-bucket \  
  --policy file://policy.json
```

Contents of `policy.json`:

```
{  
  "Version": "2012-10-17",  
  "Statement": [  
    {  
      "Sid": "S3ServerAccessLogsPolicy",  
      "Effect": "Allow",  
      "Principal": {"Service": "logging.s3.amazonaws.com"},  
      "Action": "s3:PutObject",  
      "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/Logs/*",  
      "Condition": {  
        "ArnLike": {"aws:SourceARN": "arn:aws:s3:::SOURCE-BUCKET-NAME"},  
        "StringEquals": {"aws:SourceAccount": "SOURCE-AWS-ACCOUNT-ID"}  
      }  
    }  
  ]  
}
```

To apply the logging policy, use `put-bucket-logging`.

```
aws s3api put-bucket-logging \  
  --bucket amzn-s3-demo-bucket \  
  --bucket-logging-status file://logging.json
```

Contents of logging.json:

```
{  
  "LoggingEnabled": {  
    "TargetBucket": "amzn-s3-demo-bucket",  
    "TargetPrefix": "Logs/"  
  }  
}
```

The `put-bucket-policy` command is required to grant `s3:PutObject` permissions to the logging service principal.

For more information, see [Amazon S3 Server Access Logging](#) in the *Amazon S3 User Guide*.

### Example 2: To set a bucket policy for logging access to only a single user

The following `put-bucket-logging` example sets the logging policy for `amzn-s3-demo-bucket`. The AWS user `bob@example.com` will have full control over the log files, and no one else has any access. First, grant S3 permission with `put-bucket-acl`.

```
aws s3api put-bucket-acl \  
  --bucket amzn-s3-demo-bucket \  
  --grant-write URI=http://acs.amazonaws.com/groups/s3/LogDelivery \  
  --grant-read-acp URI=http://acs.amazonaws.com/groups/s3/LogDelivery
```

Then apply the logging policy using `put-bucket-logging`.

```
aws s3api put-bucket-logging \  
  --bucket amzn-s3-demo-bucket \  
  --bucket-logging-status file://logging.json
```

Contents of logging.json:

```
{  
  "LoggingEnabled": {
```

```
"TargetBucket": "amzn-s3-demo-bucket",
"TargetPrefix": "amzn-s3-demo-bucket-logs/",
"TargetGrants": [
  {
    "Grantee": {
      "Type": "AmazonCustomerByEmail",
      "EmailAddress": "bob@example.com"
    },
    "Permission": "FULL_CONTROL"
  }
]
```

the `put-bucket-acl` command is required to grant S3's log delivery system the necessary permissions (write and read-acp permissions).

For more information, see [Amazon S3 Server Access Logging](#) in the *Amazon S3 Developer Guide*.

- For API details, see [PutBucketLogging](#) in *AWS CLI Command Reference*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use PutBucketNotification with a CLI

The following code examples show how to use PutBucketNotification.

### CLI

#### AWS CLI

The applies a notification configuration to a bucket named `amzn-s3-demo-bucket`:

```
aws s3api put-bucket-notification --bucket amzn-s3-demo-bucket --notification-configuration file://notification.json
```

The file `notification.json` is a JSON document in the current folder that specifies an SNS topic and an event type to monitor:

```
{
  "TopicConfiguration": {
    "Event": "s3:ObjectCreated:*",
    "Topic": "arn:aws:sns:us-west-2:123456789012:s3-notification-topic"
  }
}
```

The SNS topic must have an IAM policy attached to it that allows Amazon S3 to publish to it:

```
{
  "Version": "2008-10-17",
  "Id": "example-ID",
  "Statement": [
    {
      "Sid": "example-statement-ID",
      "Effect": "Allow",
      "Principal": {
        "Service": "s3.amazonaws.com"
      },
      "Action": [
        "SNS:Publish"
      ],
      "Resource": "arn:aws:sns:us-west-2:123456789012:amzn-s3-demo-bucket",
      "Condition": {
        "ArnLike": {
          "aws:SourceArn": "arn:aws:s3:*:*:amzn-s3-demo-bucket"
        }
      }
    }
  ]
}
```

- For API details, see [PutBucketNotification](#) in *AWS CLI Command Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1: This example configures the SNS topic configuration for the S3 event `ObjectRemovedDelete` and enables notification for the given s3 bucket**

```
$topic = [Amazon.S3.Model.TopicConfiguration] @{
```

```

    Id = "delete-event"
    Topic = "arn:aws:sns:eu-west-1:123456789012:topic-1"
    Event = [Amazon.S3.EventType]::ObjectRemovedDelete
  }

```

```

Write-S3BucketNotification -BucketName amzn-s3-demo-bucket -TopicConfiguration
  $topic

```

**Example 2: This example enables notifications of ObjectCreatedAll for the given bucket sending it to Lambda function.**

```

$lambdaConfig = [Amazon.S3.Model.LambdaFunctionConfiguration] @{
    Events = "s3:ObjectCreated:*"
    FunctionArn = "arn:aws:lambda:eu-west-1:123456789012:function:rdplock"
    Id = "ObjectCreated-Lambda"
    Filter = @{
        S3KeyFilter = @{
            FilterRules = @(
                @{Name="Prefix";Value="dada"}
                @{Name="Suffix";Value=".pem"}
            )
        }
    }
}

```

```

Write-S3BucketNotification -BucketName amzn-s3-demo-bucket -
LambdaFunctionConfiguration $lambdaConfig

```

**Example 3: This example creates 2 different Lambda configuration on the basis of different key-suffix and configured both in a single command.**

```

#Lambda Config 1

```

```

$firstLambdaConfig = [Amazon.S3.Model.LambdaFunctionConfiguration] @{
    Events = "s3:ObjectCreated:*"
    FunctionArn = "arn:aws:lambda:eu-west-1:123456789012:function:verifynet"
    Id = "ObjectCreated-dada-ps1"
    Filter = @{
        S3KeyFilter = @{
            FilterRules = @(
                @{Name="Prefix";Value="dada"}
                @{Name="Suffix";Value=".ps1"}
            )
        }
    }
}

```

```

    )
  }
}

#Lambda Config 2

$secondlambdaConfig = [Amazon.S3.Model.LambdaFunctionConfiguration] @{
  Events = [Amazon.S3.EventType]::ObjectCreatedAll
  FunctionArn = "arn:aws:lambda:eu-west-1:123456789012:function:verifyssm"
  Id = "ObjectCreated-dada-json"
  Filter = @{
    S3KeyFilter = @{
      FilterRules = @(
        @{Name="Prefix";Value="dada"}
        @{Name="Suffix";Value=".json"}
      )
    }
  }
}

Write-S3BucketNotification -BucketName amzn-s3-demo-bucket -
LambdaFunctionConfiguration $firstLambdaConfig,$secondlambdaConfig

```

- For API details, see [PutBucketNotification](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1: This example configures the SNS topic configuration for the S3 event ObjectRemovedDelete and enables notification for the given s3 bucket**

```

$topic = [Amazon.S3.Model.TopicConfiguration] @{
  Id = "delete-event"
  Topic = "arn:aws:sns:eu-west-1:123456789012:topic-1"
  Event = [Amazon.S3.EventType]::ObjectRemovedDelete
}

Write-S3BucketNotification -BucketName amzn-s3-demo-bucket -TopicConfiguration
$topic

```

**Example 2: This example enables notifications of ObjectCreatedAll for the given bucket sending it to Lambda function.**

```

$lambdaConfig = [Amazon.S3.Model.LambdaFunctionConfiguration] @{
    Events = "s3:ObjectCreated:*"
    FunctionArn = "arn:aws:lambda:eu-west-1:123456789012:function:rdplock"
    Id = "ObjectCreated-Lambda"
    Filter = @{
        S3KeyFilter = @{
            FilterRules = @(
                @{Name="Prefix";Value="dada"}
                @{Name="Suffix";Value=".pem"}
            )
        }
    }
}

```

```

Write-S3BucketNotification -BucketName amzn-s3-demo-bucket -
LambdaFunctionConfiguration $lambdaConfig

```

**Example 3: This example creates 2 different Lambda configuration on the basis of different key-suffix and configured both in a single command.**

```

#Lambda Config 1

$firstLambdaConfig = [Amazon.S3.Model.LambdaFunctionConfiguration] @{
    Events = "s3:ObjectCreated:*"
    FunctionArn = "arn:aws:lambda:eu-west-1:123456789012:function:verifynet"
    Id = "ObjectCreated-dada-ps1"
    Filter = @{
        S3KeyFilter = @{
            FilterRules = @(
                @{Name="Prefix";Value="dada"}
                @{Name="Suffix";Value=".ps1"}
            )
        }
    }
}

#Lambda Config 2

$secondLambdaConfig = [Amazon.S3.Model.LambdaFunctionConfiguration] @{
    Events = [Amazon.S3.EventType]::ObjectCreatedAll
    FunctionArn = "arn:aws:lambda:eu-west-1:123456789012:function:verifyssm"
    Id = "ObjectCreated-dada-json"
    Filter = @{

```

```
S3KeyFilter = @{
    FilterRules = @(
        @{Name="Prefix";Value="dada"}
        @{Name="Suffix";Value=".json"}
    )
}
}
```

```
Write-S3BucketNotification -BucketName amzn-s3-demo-bucket -
LambdaFunctionConfiguration $firstLambdaConfig,$secondLambdaConfig
```

## CLI

## AWS CLI

**To enable the specified notifications to a bucket**

The following `put-bucket-notification-configuration` example applies a notification configuration to a bucket named `amzn-s3-demo-bucket`. The file `notification.json` is a JSON document in the current folder that specifies an SNS topic and an event type to monitor.

```
aws s3api put-bucket-notification-configuration \  
  --bucket amzn-s3-demo-bucket \  
  --notification-configuration file://notification.json
```

Contents of `notification.json`:

```
{  
  "TopicConfigurations": [  
    {  
      "TopicArn": "arn:aws:sns:us-west-2:123456789012:s3-notification-  
topic",  
      "Events": [  
        "s3:ObjectCreated:*"  
      ]  
    }  
  ]  
}
```

The SNS topic must have an IAM policy attached to it that allows Amazon S3 to publish to it.

```
{  
  "Version": "2008-10-17",  
  "Id": "example-ID",  
  "Statement": [  
    {  
      "Sid": "example-statement-ID",  
      "Effect": "Allow",  
      "Principal": {  
        "Service": "s3.amazonaws.com"  
      },  
      "Action": [  

```

```

        "SNS:Publish"
    ],
    "Resource": "arn:aws:sns:us-west-2:123456789012::s3-notification-
topic",
    "Condition": {
        "ArnLike": {
            "aws:SourceArn": "arn:aws:s3:*:*:amzn-s3-demo-bucket"
        }
    }
}
]
}

```

- For API details, see [PutBucketNotificationConfiguration](#) in *AWS CLI Command Reference*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use PutBucketPolicy with an AWS SDK or CLI

The following code examples show how to use PutBucketPolicy.

C++

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```

bool AwsDoc::S3::putBucketPolicy(const Aws::String &bucketName,
                                const Aws::String &policyBody,
                                const Aws::S3::S3ClientConfiguration
&clientConfig) {
    Aws::S3::S3Client s3Client(clientConfig);

    std::shared_ptr<Aws::StringStream> request_body =
        Aws::MakeShared<Aws::StringStream>("");
}

```

```

    *request_body << policyBody;

    Aws::S3::Model::PutBucketPolicyRequest request;
    request.SetBucket(bucketName);
    request.SetBody(request_body);

    Aws::S3::Model::PutBucketPolicyOutcome outcome =
        s3Client.PutBucketPolicy(request);

    if (!outcome.IsSuccess()) {
        std::cerr << "Error: putBucketPolicy: "
                  << outcome.GetError().GetMessage() << std::endl;
    } else {
        std::cout << "Set the following policy body for the bucket '" <<
                  bucketName << "':" << std::endl << std::endl;
        std::cout << policyBody << std::endl;
    }

    return outcome.IsSuccess();
}

//! Build a policy JSON string.
/*!
    \param userArn: Aws user Amazon Resource Name (ARN).
        For more information, see https://docs.aws.amazon.com/IAM/latest/UserGuide/reference\_identifiers.html#identifiers-arns.
    \param bucketName: Name of a bucket.
    \return String: Policy as JSON string.
*/

Aws::String getPolicyString(const Aws::String &userArn,
                           const Aws::String &bucketName) {
    return
        "{\n"
        "  \"Version\": \"2012-10-17\", \n"
        "  \"Statement\": [\n"
        "    {\n"
        "      \"Sid\": \"1\", \n"
        "      \"Effect\": \"Allow\", \n"
        "      \"Principal\": {\n"
        "        \"AWS\": \""
        + userArn +
        "\"\n"
        "      }, \n"

```

```

    "      \"Action\": [ \"s3:getObject\" ],\n"
    "      \"Resource\": [ \"arn:aws:s3::\"
+ bucketName +
    \"/*\"]\n"
    "    ]\n"
    "  ]\n"
    "};
}

```

- For API details, see [PutBucketPolicy](#) in *AWS SDK for C++ API Reference*.

## CLI

### AWS CLI

This example allows all users to retrieve any object in *amzn-s3-demo-bucket* except those in the *MySecretFolder*. It also grants put and delete permission to the root user of the AWS account 1234-5678-9012:

```
aws s3api put-bucket-policy --bucket amzn-s3-demo-bucket --policy file://policy.json
```

*policy.json*:

```

{
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": "*",
      "Action": "s3:GetObject",
      "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/*"
    },
    {
      "Effect": "Deny",
      "Principal": "*",
      "Action": "s3:GetObject",
      "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/MySecretFolder/*"
    },
    {
      "Effect": "Allow",
      "Principal": {
        "AWS": "arn:aws:iam::123456789012:root"

```

```
    },
    "Action": [
      "s3:DeleteObject",
      "s3:PutObject"
    ],
    "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/*"
  }
]
}
```

- For API details, see [PutBucketPolicy](#) in *AWS CLI Command Reference*.

  configured with an existing bucket.
  def initialize(bucket_policy)
    @bucket_policy = bucket_policy
  end

  # Sets a policy on a bucket.
  #
  def policy(policy)
    @bucket_policy.put(policy: policy)
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't set the policy for #{@bucket_policy.bucket.name}. Here's why:
#{e.message}"
    false
  end
end

end
```

- For API details, see [PutBucketPolicy](#) in *AWS SDK for Ruby API Reference*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use PutBucketReplication with an AWS SDK or CLI

The following code examples show how to use PutBucketReplication.

### CLI

#### AWS CLI

#### To configure replication for an S3 bucket

The following `put-bucket-replication` example applies a replication configuration to the specified S3 bucket.

```
aws s3api put-bucket-replication \  
  --bucket amzn-s3-demo-bucket1 \  
  --replication-configuration file://replication.json
```

Contents of `replication.json`:

```
{  
  "Role": "arn:aws:iam::123456789012:role/s3-replication-role",  
  "Rules": [  
    {  
      "Status": "Enabled",  
      "Priority": 1,  
      "DeleteMarkerReplication": { "Status": "Disabled" },  
      "Filter" : { "Prefix": ""},  
      "Destination": {  
        "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket2"  
      }  
    }  
  ]  
}
```

The destination bucket must have versioning enabled. The specified role must have permission to write to the destination bucket and have a trust relationship that allows Amazon S3 to assume the role.

Example role permission policy:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "s3:GetReplicationConfiguration",
        "s3:ListBucket"
      ],
      "Resource": [
        "arn:aws:s3:::amzn-s3-demo-bucket1"
      ]
    },
    {
      "Effect": "Allow",
      "Action": [
        "s3:GetObjectVersion",
        "s3:GetObjectVersionAcl",
        "s3:GetObjectVersionTagging"
      ],
      "Resource": [
        "arn:aws:s3:::amzn-s3-demo-bucket1/*"
      ]
    },
    {
      "Effect": "Allow",
      "Action": [
        "s3:ReplicateObject",
        "s3:ReplicateDelete",
        "s3:ReplicateTags"
      ],
      "Resource": "arn:aws:s3:::amzn-s3-demo-bucket2/*"
    }
  ]
}
```

Example trust relationship policy:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "s3.amazonaws.com"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

This command produces no output.

For more information, see [This is the topic title](#) in the *Amazon Simple Storage Service Console User Guide*.

- For API details, see [PutBucketReplication](#) in *AWS CLI Command Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1:** This example sets a replication configuration with a single rule enabling replication to the 'amzn-s3-demo-bucket' bucket any new objects created with the key name prefix "TaxDocs" in the bucket 'amzn-s3-demo-bucket'.

```
$rule1 = New-Object Amazon.S3.Model.ReplicationRule
$rule1.ID = "Rule-1"
$rule1.Status = "Enabled"
$rule1.Prefix = "TaxDocs"
$rule1.Destination = @{ BucketArn = "arn:aws:s3:::amzn-s3-demo-destination-
bucket" }

$params = @{
    BucketName = "amzn-s3-demo-bucket"
    Configuration_Role = "arn:aws:iam::35667example:role/
CrossRegionReplicationRoleForS3"
    Configuration_Rule = $rule1
}
```

```
Write-S3BucketReplication @params
```

**Example 2: This example sets a replication configuration with multiple rules enabling replication to the 'amzn-s3-demo-bucket' bucket any new objects created with either the key name prefix "TaxDocs" or "OtherDocs". The key prefixes must not overlap.**

```
$rule1 = New-Object Amazon.S3.Model.ReplicationRule
$rule1.ID = "Rule-1"
$rule1.Status = "Enabled"
$rule1.Prefix = "TaxDocs"
$rule1.Destination = @{ BucketArn = "arn:aws:s3:::amzn-s3-demo-destination-
bucket" }

$rule2 = New-Object Amazon.S3.Model.ReplicationRule
$rule2.ID = "Rule-2"
$rule2.Status = "Enabled"
$rule2.Prefix = "OtherDocs"
$rule2.Destination = @{ BucketArn = "arn:aws:s3:::amzn-s3-demo-destination-
bucket" }

$params = @{
    BucketName = "amzn-s3-demo-bucket"
    Configuration_Role = "arn:aws:iam::35667example:role/
CrossRegionReplicationRoleForS3"
    Configuration_Rule = $rule1,$rule2
}

Write-S3BucketReplication @params
```

**Example 3: This example updates the replication configuration on the specified bucket to disable the rule controlling replication of objects with the key name prefix "TaxDocs" to the bucket 'amzn-s3-demo-bucket'.**

```
$rule1 = New-Object Amazon.S3.Model.ReplicationRule
$rule1.ID = "Rule-1"
$rule1.Status = "Disabled"
$rule1.Prefix = "TaxDocs"
$rule1.Destination = @{ BucketArn = "arn:aws:s3:::amzn-s3-demo-destination-
bucket" }

$params = @{
```

```

    BucketName = "amzn-s3-demo-bucket"

## Use PutBucketRequestPayment with a CLI

The following code examples show how to use PutBucketRequestPayment.

### CLI

#### AWS CLI

##### Example 1: To enable `requester pays` configuration for a bucket

The following `put-bucket-request-payment` example enables `requester pays` for the specified bucket.

```
aws s3api put-bucket-request-payment \  
  --bucket amzn-s3-demo-bucket \  
  --request-payment-configuration '{"Payer":"Requester"}
```

This command produces no output.

##### Example 2: To disable `requester pays` configuration for a bucket

The following `put-bucket-request-payment` example disables `requester pays` for the specified bucket.

```
aws s3api put-bucket-request-payment \  
  --bucket amzn-s3-demo-bucket \  
  --request-payment-configuration '{"Payer":"BucketOwner"}
```

This command produces no output.

- For API details, see [PutBucketRequestPayment](#) in *AWS CLI Command Reference*.

### PowerShell

#### Tools for PowerShell V4

**Example 1: Updates the request payment configuration for the bucket named 'amzn-s3-demo-bucket' so that the person requesting downloads from the**

**bucket will be charged for the download. By default the bucket owner pays for downloads. To set the request payment back to the default use 'BucketOwner' for the RequestPaymentConfiguration\_Payer parameter.**

```
Write-S3BucketRequestPayment -BucketName amzn-s3-demo-bucket -  
RequestPaymentConfiguration_Payer Requester
```

- For API details, see [PutBucketRequestPayment](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1: Updates the request payment configuration for the bucket named 'amzn-s3-demo-bucket' so that the person requesting downloads from the bucket will be charged for the download. By default the bucket owner pays for downloads. To set the request payment back to the default use 'BucketOwner' for the RequestPaymentConfiguration\_Payer parameter.**

```
Write-S3BucketRequestPayment -BucketName amzn-s3-demo-bucket -  
RequestPaymentConfiguration_Payer Requester
```

- For API details, see [PutBucketRequestPayment](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use PutBucketTagging with a CLI

The following code examples show how to use PutBucketTagging.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- [Get started with S3](#)

## CLI

## AWS CLI

The following command applies a tagging configuration to a bucket named `amzn-s3-demo-bucket`:

```
aws s3api put-bucket-tagging --bucket amzn-s3-demo-bucket --tagging file://tagging.json
```

The file `tagging.json` is a JSON document in the current folder that specifies tags:

```
{
  "TagSet": [
    {
      "Key": "organization",
      "Value": "marketing"
    }
  ]
}
```

Or apply a tagging configuration to `amzn-s3-demo-bucket` directly from the command line:

```
aws s3api put-bucket-tagging --bucket amzn-s3-demo-bucket --tagging 'TagSet=[{Key=organization, Value=marketing}]'
```

- For API details, see [PutBucketTagging](#) in *AWS CLI Command Reference*.

## PowerShell

## Tools for PowerShell V4

**Example 1:** This command applies two tags to a bucket named `cloudtrail-test-2018`: a tag with a key of `Stage` and a value of `Test`, and a tag with a key of `Environment` and a value of `Alpha`. To verify that the tags were added to the bucket, run `Get-S3BucketTagging -BucketName bucket_name`. The results should show the tags that you applied to the bucket in the first command. Note that `Write-S3BucketTagging` overwrites the entire existing tag set on a bucket. To add or delete individual tags, run

the Resource Groups and Tagging API cmdlets, `Add-RGTResourceTag` and `Remove-RGTResourceTag`. Alternatively, use Tag Editor in the AWS Management Console to manage S3 bucket tags.

```
Write-S3BucketTagging -BucketName amzn-s3-demo-bucket -TagSet @( @{ Key="Stage"; Value="Test" }, @{ Key="Environment"; Value="Alpha" } )
```

**Example 2:** This command pipes a bucket named `cloudtrail-test-2018` into the `Write-S3BucketTagging` cmdlet. It applies tags `Stage:Production` and `Department:Finance` to the bucket. Note that `Write-S3BucketTagging` overwrites the entire existing tag set on a bucket.

```
Get-S3Bucket -BucketName amzn-s3-demo-bucket | Write-S3BucketTagging -TagSet @( @{ Key="Stage"; Value="Production" }, @{ Key="Department"; Value="Finance" } )
```

- For API details, see [PutBucketTagging](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1:** This command applies two tags to a bucket named `cloudtrail-test-2018`: a tag with a key of `Stage` and a value of `Test`, and a tag with a key of `Environment` and a value of `Alpha`. To verify that the tags were added to the bucket, run `Get-S3BucketTagging -BucketName bucket_name`. The results should show the tags that you applied to the bucket in the first command. Note that `Write-S3BucketTagging` overwrites the entire existing tag set on a bucket. To add or delete individual tags, run the Resource Groups and Tagging API cmdlets, `Add-RGTResourceTag` and `Remove-RGTResourceTag`. Alternatively, use Tag Editor in the AWS Management Console to manage S3 bucket tags.

```
Write-S3BucketTagging -BucketName amzn-s3-demo-bucket -TagSet @( @{ Key="Stage"; Value="Test" }, @{ Key="Environment"; Value="Alpha" } )
```

**Example 2:** This command pipes a bucket named `cloudtrail-test-2018` into the `Write-S3BucketTagging` cmdlet. It applies tags `Stage:Production` and `Department:Finance` to the bucket. Note that `Write-S3BucketTagging` overwrites the entire existing tag set on a bucket.

```
Get-S3Bucket -BucketName amzn-s3-demo-bucket | Write-S3BucketTagging
-TagSet @( @{ Key="Stage"; Value="Production" }, @{ Key="Department";
Value="Finance" } )
```

- For API details, see [PutBucketTagging](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use PutBucketVersioning with an AWS SDK or CLI

The following code examples show how to use PutBucketVersioning.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- [Get started with S3](#)

### CLI

#### AWS CLI

The following command enables versioning on a bucket named amzn-s3-demo-bucket:

```
aws s3api put-bucket-versioning --bucket amzn-s3-demo-bucket --versioning-
configuration Status=Enabled
```

The following command enables versioning, and uses an mfa code

```
aws s3api put-bucket-versioning --bucket amzn-s3-demo-bucket --versioning-
configuration Status=Enabled --mfa "SERIAL 123456"
```

- For API details, see [PutBucketVersioning](#) in *AWS CLI Command Reference*.

## Java

### SDK for Java 2.x

#### Note

```
/**
 * Enables bucket versioning for the specified S3 bucket.
 *
 * @param s3Client the S3 client to use for the operation
 * @param bucketName the name of the S3 bucket to enable versioning for
 */
public static void enableBucketVersioning(S3Client s3Client, String
bucketName){
    VersioningConfiguration versioningConfiguration =
VersioningConfiguration.builder()
        .status(BucketVersioningStatus.ENABLED)
        .build();

    PutBucketVersioningRequest versioningRequest =
PutBucketVersioningRequest.builder()
        .bucket(bucketName)
        .versioningConfiguration(versioningConfiguration)
        .build();

    s3Client.putBucketVersioning(versioningRequest);
    System.out.println("Bucket versioning has been enabled for "+bucketName);
}
```

- For API details, see [PutBucketVersioning](#) in *AWS SDK for Java 2.x API Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1: The command enables versioning for the given S3 bucket.**

```
Write-S3BucketVersioning -BucketName 'amzn-s3-demo-bucket' -  
VersioningConfig_Status Enabled
```

- For API details, see [PutBucketVersioning](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

### Example 1: The command enables versioning for the given S3 bucket.

```
Write-S3BucketVersioning -BucketName 'amzn-s3-demo-bucket' -  
VersioningConfig_Status Enabled
```

- For API details, see [PutBucketVersioning](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use PutBucketWebsite with an AWS SDK or CLI

The following code examples show how to use PutBucketWebsite.

.NET

### SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Put the website configuration.  
PutBucketWebsiteRequest putRequest = new  
PutBucketWebsiteRequest()  
{  
    BucketName = bucketName,
```

```
        WebsiteConfiguration = new WebsiteConfiguration()
        {
            IndexDocumentSuffix = indexDocumentSuffix,
            ErrorDocument = errorDocument,
        },
    };
    PutBucketWebsiteResponse response = await
client.PutBucketWebsiteAsync(putRequest);
```

- For API details, see [PutBucketWebsite](#) in *AWS SDK for .NET API Reference*.

## C++

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
bool AwsDoc::S3::putWebsiteConfig(const Aws::String &bucketName,
                                  const Aws::String &indexPath, const Aws::String
&errorPage,
                                  const Aws::S3::S3ClientConfiguration
&clientConfig) {
    Aws::S3::S3Client client(clientConfig);

    Aws::S3::Model::IndexDocument indexDocument;
    indexDocument.SetSuffix(indexPath);

    Aws::S3::Model::ErrorDocument errorDocument;
    errorDocument.SetKey(errorPage);

    Aws::S3::Model::WebsiteConfiguration websiteConfiguration;
    websiteConfiguration.SetIndexDocument(indexDocument);
    websiteConfiguration.SetErrorDocument(errorDocument);

    Aws::S3::Model::PutBucketWebsiteRequest request;
    request.SetBucket(bucketName);
```

```
request.SetWebsiteConfiguration(websiteConfiguration);

Aws::S3::Model::PutBucketWebsiteOutcome outcome =
    client.PutBucketWebsite(request);

if (!outcome.IsSuccess()) {
    std::cerr << "Error: PutBucketWebsite: "
              << outcome.GetError().GetMessage() << std::endl;
} else {
    std::cout << "Success: Set website configuration for bucket '"
              << bucketName << "'." << std::endl;
}

return outcome.IsSuccess();
}
```

- For API details, see [PutBucketWebsite](#) in *AWS SDK for C++ API Reference*.

## CLI

### AWS CLI

The applies a static website configuration to a bucket named `amzn-s3-demo-bucket`:

```
aws s3api put-bucket-website --bucket amzn-s3-demo-bucket --website-configuration file://website.json
```

The file `website.json` is a JSON document in the current folder that specifies index and error pages for the website:

```
{
  "IndexDocument": {
    "Suffix": "index.html"
  },
  "ErrorDocument": {
    "Key": "error.html"
  }
}
```

- For API details, see [PutBucketWebsite](#) in *AWS CLI Command Reference*.

/// bucket.
/// </summary>
/// <param name="client">An initialized Amazon S3 client object.</param>
/// <param name="bucketName">The Amazon S3 bucket to which the object
/// will be uploaded.</param>
/// <param name="objectName">The object to upload.</param>
/// <param name="filePath">The path, including file name, of the object
/// on the local computer to upload.</param>
/// <returns>A boolean value indicating the success or failure of the
/// upload procedure.</returns>
public static async Task<bool> UploadFileAsync(
    IAmazonS3 client,
    string bucketName,
    string objectName,
```

```
        string filePath)
    {
        try
        {
            var request = new PutObjectRequest
            {
                BucketName = bucketName,
                Key = objectName,
                FilePath = filePath,
            };

            await client.PutObjectAsync(request);
            Console.WriteLine($"Successfully uploaded {objectName} to
{bucketName}.");
            return true;
        }
        catch (AmazonS3Exception ex)
        {
            Console.WriteLine($"Could not upload {objectName} to
{bucketName}: '{ex.Message}'");
            return false;
        }
    }
}
```

### Upload an object with server-side encryption.

```
using System;
using System.Threading.Tasks;
using Amazon.S3;
using Amazon.S3.Model;

/// <summary>
/// This example shows how to upload an object to an Amazon Simple Storage
/// Service (Amazon S3) bucket with server-side encryption enabled.
/// </summary>
public class ServerSideEncryption
{
    public static async Task Main()
    {
        string bucketName = "amzn-s3-demo-bucket";
        string keyName = "samplefile.txt";
```

```
    // If the AWS Region defined for your default user is different
    // from the Region where your Amazon S3 bucket is located,
    // pass the Region name to the Amazon S3 client object's constructor.
    // For example: RegionEndpoint.USWest2.
    IAmazonS3 client = new AmazonS3Client();

    await WritingAnObjectAsync(client, bucketName, keyName);
}

/// <summary>
/// Upload a sample object include a setting for encryption.
/// </summary>
/// <param name="client">The initialized Amazon S3 client object used to
/// to upload a file and apply server-side encryption.</param>
/// <param name="bucketName">The name of the Amazon S3 bucket where the
/// encrypted object will reside.</param>
/// <param name="keyName">The name for the object that you want to
/// create in the supplied bucket.</param>
public static async Task WritingAnObjectAsync(IAmazonS3 client, string
bucketName, string keyName)
{
    try
    {
        var putRequest = new PutObjectRequest
        {
            BucketName = bucketName,
            Key = keyName,
            ContentBody = "sample text",
            ServerSideEncryptionMethod =
ServerSideEncryptionMethod.AES256,
        };

        var putResponse = await client.PutObjectAsync(putRequest);

        // Determine the encryption state of an object.
        GetObjectMetadataRequest metadataRequest = new
GetObjectMetadataRequest
        {
            BucketName = bucketName,
            Key = keyName,
        };
        GetObjectMetadataResponse response = await
client.GetObjectMetadataAsync(metadataRequest);
```

```
        ServerSideEncryptionMethod objectEncryption =
response.ServerSideEncryptionMethod;

```

### Put an object using a conditional request.

```
/// <summary>
/// Uploads an object to Amazon S3 with a conditional request. Prevents
overwrite using an IfNoneMatch condition for the object key.
/// </summary>
/// <param name="objectKey">The key of the object to upload.</param>
/// <param name="bucket">The source bucket of the object.</param>
/// <param name="content">The content to upload as a string.</param>
/// <returns>The ETag if the conditional write is successful, empty
otherwise.</returns>
public async Task<string> PutObjectConditional(string objectKey, string
bucket, string content)
{
    try
    {
        var putObjectRequest = new PutObjectRequest
        {
            BucketName = bucket,
            Key = objectKey,
            ContentBody = content,
            IfNoneMatch = "*"
        };

        var putResult = await _amazonS3.PutObjectAsync(putObjectRequest);
        _logger.LogInformation($"Conditional write successful for key
{objectKey} in bucket {bucket}.");
    }
}
```

```

        return putResult.ETag;
    }
    catch (AmazonS3Exception e)
    {
        if (e.ErrorCode == "PreconditionFailed")
        {
            _logger.LogError("Conditional write failed: Precondition
failed");
        }
        else
        {
            _logger.LogError($"Unexpected error: {e.ErrorCode}");
            throw;
        }
        return string.Empty;
    }
}

```

## CLI

## AWS CLI

**Example 1: Upload an object to Amazon S3**

The following `put-object` command example uploads an object to Amazon S3.

```
aws s3api put-object \  
  --bucket amzn-s3-demo-bucket \  
  --key my-dir/MySampleImage.png \  
  --body MySampleImage.png
```

For more information about uploading objects, see [Uploading Objects < http://docs.aws.amazon.com/AmazonS3/latest/dev/UploadingObjects.html >](http://docs.aws.amazon.com/AmazonS3/latest/dev/UploadingObjects.html) in the *Amazon S3 Developer Guide*.

**Example 2: Upload a video file to Amazon S3**

The following `put-object` command example uploads a video file.

```
aws s3api put-object \  
  --bucket amzn-s3-demo-bucket \  
  --key my-dir/big-video-file.mp4 \  
  --body /media/videos/f-sharp-3-data-services.mp4
```

For more information about uploading objects, see [Uploading Objects < http://docs.aws.amazon.com/AmazonS3/latest/dev/UploadingObjects.html >](http://docs.aws.amazon.com/AmazonS3/latest/dev/UploadingObjects.html) in the *Amazon S3 Developer Guide*.

- For API details, see [PutObject](#) in *AWS CLI Command Reference*.

Upload an object to a bucket.

```
$s3client = new Aws\S3\S3Client(['region' => 'us-west-2']);

$file_name = __DIR__ . "/local-file-" . uniqid();
try {
```

```
$this->s3client->putObject([
    'Bucket' => $this->bucketName,
    'Key' => $fileName,
    'SourceFile' => __DIR__ . '/testfile.txt'
]);
echo "Uploaded $fileName to $this->bucketName.\n";
} catch (Exception $exception) {
    echo "Failed to upload $fileName with error: " . $exception-
>getMessage();
    exit("Please fix error with file upload before continuing.");
}
```

- For API details, see [PutObject](#) in *AWS SDK for PHP API Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1:** This command uploads the single file "local-sample.txt" to Amazon S3, creating an object with key "sample.txt" in bucket "test-files".

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Key "sample.txt" -File .\local-
sample.txt
```

**Example 2:** This command uploads the single file "sample.txt" to Amazon S3, creating an object with key "sample.txt" in bucket "test-files". If the -Key parameter is not supplied, the filename is used as the S3 object key.

```
Write-S3Object -BucketName amzn-s3-demo-bucket -File .\sample.txt
```

**Example 3:** This command uploads the single file "local-sample.txt" to Amazon S3, creating an object with key "prefix/to/sample.txt" in bucket "test-files".

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Key "prefix/to/sample.txt" -
File .\local-sample.txt
```

**Example 4:** This command uploads all files in the subdirectory "Scripts" to the bucket "test-files" and applies the common key prefix "SampleScripts" to each object. Each uploaded file will have a key of "SampleScripts/filename" where 'filename' varies.

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Folder .\Scripts -KeyPrefix
SampleScripts\
```

**Example 5: This command uploads all \*.ps1 files in the local director "Scripts" to bucket "test-files" and applies the common key prefix "SampleScripts" to each object. Each uploaded file will have a key of "SampleScripts/filename.ps1" where 'filename' varies.**

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Folder .\Scripts -KeyPrefix
SampleScripts\ -SearchPattern *.ps1
```

**Example 6: This command creates a new S3 object containing the specified content string with key 'sample.txt'.**

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Key "sample.txt" -Content "object
contents"
```

**Example 7: This command uploads the specified file (the filename is used as the key) and applies the specified tags to the new object.**

```
Write-S3Object -BucketName amzn-s3-demo-bucket -File "sample.txt" -TagSet
@{Key="key1";Value="value1"},@{Key="key2";Value="value2"}
```

**Example 8: This command recursively uploads the specified folder and applies the specified tags to all the new objects.**

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Folder . -KeyPrefix "TaggedFiles"
-Recurse -TagSet @{Key="key1";Value="value1"},@{Key="key2";Value="value2"}
```

- For API details, see [PutObject](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

## Tools for PowerShell V5

**Example 1: This command uploads the single file "local-sample.txt" to Amazon S3, creating an object with key "sample.txt" in bucket "test-files".**

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Key "sample.txt" -File .\local-
sample.txt
```

**Example 2:** This command uploads the single file "sample.txt" to Amazon S3, creating an object with key "sample.txt" in bucket "test-files". If the -Key parameter is not supplied, the filename is used as the S3 object key.

```
Write-S3Object -BucketName amzn-s3-demo-bucket -File .\sample.txt
```

**Example 3:** This command uploads the single file "local-sample.txt" to Amazon S3, creating an object with key "prefix/to/sample.txt" in bucket "test-files".

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Key "prefix/to/sample.txt" -  
File .\local-sample.txt
```

**Example 4:** This command uploads all files in the subdirectory "Scripts" to the bucket "test-files" and applies the common key prefix "SampleScripts" to each object. Each uploaded file will have a key of "SampleScripts/filename" where 'filename' varies.

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Folder .\Scripts -KeyPrefix  
SampleScripts\
```

**Example 5:** This command uploads all \*.ps1 files in the local director "Scripts" to bucket "test-files" and applies the common key prefix "SampleScripts" to each object. Each uploaded file will have a key of "SampleScripts/filename.ps1" where 'filename' varies.

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Folder .\Scripts -KeyPrefix  
SampleScripts\ -SearchPattern *.ps1
```

**Example 6:** This command creates a new S3 object containing the specified content string with key 'sample.txt'.

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Key "sample.txt" -Content "object  
contents"
```

**Example 7:** This command uploads the specified file (the filename is used as the key) and applies the specified tags to the new object.

```
Write-S3Object -BucketName amzn-s3-demo-bucket -File "sample.txt" -TagSet  
@{Key="key1";Value="value1"},@{Key="key2";Value="value2"}
```

**Example 8: This command recursively uploads the specified folder and applies the specified tags to all the new objects.**

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Folder . -KeyPrefix "TaggedFiles"
-Recurse -TagSet @{Key="key1";Value="value1"},@{Key="key2";Value="value2"}
```

- For API details, see [PutObject](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

#### Upload a file using a managed uploader (Object.upload\_file).

```
require 'aws-sdk-s3'

# Wraps Amazon S3 object actions.
class ObjectUploadFileWrapper
  attr_reader :object

  # @param object [Aws::S3::Object] An existing Amazon S3 object.
  def initialize(object)
    @object = object
  end

  # Uploads a file to an Amazon S3 object by using a managed uploader.
  #
  # @param file_path [String] The path to the file to upload.
  # @return [Boolean] True when the file is uploaded; otherwise false.
  def upload_file(file_path)
    @object.upload_file(file_path)
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't upload file #{file_path} to #{@object.key}. Here's why:
#{e.message}"
    false
  end
end

# Example usage:
def run_demo
  bucket_name = "amzn-s3-demo-bucket"
  object_key = "my-uploaded-file"
  file_path = "object_upload_file.rb"
```

```
wrapper = ObjectUploadFileWrapper.new(Aws::S3::Object.new(bucket_name,
object_key))

## Use PutObjectLegalHold with an AWS SDK or CLI

The following code examples show how to use PutObjectLegalHold.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- [Lock Amazon S3 objects](#)

## .NET

### SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Set or modify a legal hold on an object in an S3 bucket.
/// </summary>
/// <param name="bucketName">The bucket of the object.</param>
/// <param name="objectKey">The key of the object.</param>
/// <param name="holdStatus">The On or Off status for the legal hold.</param>
/// <returns>True if successful.</returns>
public async Task<bool> ModifyObjectLegalHold(string bucketName,
    string objectKey, ObjectLockLegalHoldStatus holdStatus)
{
    try
    {
        var request = new PutObjectLegalHoldRequest()
        {
            BucketName = bucketName,
            Key = objectKey,
            LegalHold = new ObjectLockLegalHold()
            {
                Status = holdStatus
            }
        };

        var response = await _amazonS3.PutObjectLegalHoldAsync(request);
        Console.WriteLine($"\\tModified legal hold for {objectKey} in
{bucketName}.");
        return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
    }
    catch (AmazonS3Exception ex)
    {
        Console.WriteLine($"\\tError modifying legal hold: '{ex.Message}'");
        return false;
    }
}
```

```
}
```

- For API details, see [PutObjectLegalHold](#) in *AWS SDK for .NET API Reference*.

## CLI

### AWS CLI

#### To apply a Legal Hold to an object

The following `put-object-legal-hold` example sets a Legal Hold on the object `doc1.rtf`.

```
aws s3api put-object-legal-hold \  
  --bucket amzn-s3-demo-bucket-with-object-lock \  
  --key doc1.rtf \  
  --legal-hold Status=ON
```

This command produces no output.

- For API details, see [PutObjectLegalHold](#) in *AWS CLI Command Reference*.

## CLI

### AWS CLI

#### To set an object lock configuration on a bucket

The following `put-object-lock-configuration` example sets a 50-day object lock on the specified bucket.

```
aws s3api put-object-lock-configuration \
```

```
--bucket amzn-s3-demo-bucket-with-object-lock \  
--object-lock-configuration '{ "ObjectLockEnabled": "Enabled", "Rule":  
{ "DefaultRetention": { "Mode": "COMPLIANCE", "Days": 50 } } }'
```

This command produces no output.

- For API details, see [PutObjectLockConfiguration](#) in *AWS CLI Command Reference*.

## PowerShell

### Tools for PowerShell V4

**Example 1: The command enables governance retention mode until the date '31st Dec 2019 00:00:00' for 'testfile.txt' object in the given S3 bucket.**

```
Write-S3ObjectRetention -BucketName 'amzn-s3-demo-bucket' -Key 'testfile.txt' -
Retention_Mode GOVERNANCE -Retention_RetainUntilDate "2019-12-31T00:00:00"
```

- For API details, see [PutObjectRetention](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

### Tools for PowerShell V5

**Example 1: The command enables governance retention mode until the date '31st Dec 2019 00:00:00' for 'testfile.txt' object in the given S3 bucket.**

```
Write-S3ObjectRetention -BucketName 'amzn-s3-demo-bucket' -Key 'testfile.txt' -
Retention_Mode GOVERNANCE -Retention_RetainUntilDate "2019-12-31T00:00:00"
```

- For API details, see [PutObjectRetention](#) in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

## Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Put an object retention.

```
s3_client.put_object_retention(
    Bucket=bucket,
    Key=key,
    VersionId=version_id,
    Retention={"Mode": "GOVERNANCE", "RetainUntilDate":
far_future_date},
    BypassGovernanceRetention=True,
)
```

- For API details, see [PutObjectRetention](#) in *AWS SDK for Python (Boto3) API Reference*.

        };
    }
```

```
        GetObjectMetadataResponse response = await
client.GetObjectMetadataAsync(metadataRequest);

        var restStatus = response.RestoreInProgress ? "in-progress" :
"finished or failed";
        Console.WriteLine($"Restoration status: {restStatus}");
    }
}
```

- For API details, see [RestoreObject](#) in *AWS SDK for .NET API Reference*.

## CLI

### AWS CLI

#### To create a restore request for an object

The following `restore-object` example restores the specified Amazon S3 Glacier object for the bucket `my-glacier-bucket` for 10 days.

```
aws s3api restore-object \  
  --bucket my-glacier-bucket \  
  --key doc1.rtf \  
  --restore-request Days=10
```

This command produces no output.

- For API details, see [RestoreObject](#) in *AWS CLI Command Reference*.

## Use SelectObjectContent with an AWS SDK or CLI

The following code examples show how to use `SelectObjectContent`.

### CLI

#### AWS CLI

#### To filter the contents of an Amazon S3 object based on an SQL statement

The following `select-object-content` example filters the object `my-data-file.csv` with the specified SQL statement and sends output to a file.

```
aws s3api select-object-content \  
  --bucket amzn-s3-demo-bucket \  
  --key my-data-file.csv \  
  --expression "select * from s3object limit 100" \  
  --expression-type 'SQL' \  
  --input-serialization '{"CSV": {}, "CompressionType": "NONE"}' \  
  --output-serialization '{"CSV": {}}' "output.csv"
```

This command produces no output.

- For API details, see [SelectObjectContent](#) in *AWS CLI Command Reference*.

            break;
    }
}

return client.UploadPart(request);
}
```

- For API details, see [UploadPart](#) in *AWS SDK for C++ API Reference*.

## CLI

### AWS CLI

The following command uploads the first part in a multipart upload initiated with the `create-multipart-upload` command:

```
aws s3api upload-part --bucket amzn-s3-demo-bucket --key
'multipart/01' --part-number 1 --body part01 --upload-id
'dfRtDYU0WMCCcH43C3WFbkR0NycyCpTJJvxu2i5GYkZLjF.Yxwh6XG7WfS2vC4to6HiV6YjLx.cph0gtNBtJ8P'
```

The body option takes the name or path of a local file for upload (do not use the file:// prefix). The minimum part size is 5 MB. Upload ID is returned by create-multipart-upload and can also be retrieved with list-multipart-uploads. Bucket and key are specified when you create the multipart upload.

Output:

```
{
  "ETag": "\"e868e0f4719e394144ef36531ee6824c\""
}
```

Save the ETag value of each part for later. They are required to complete the multipart upload.

- For API details, see [UploadPart](#) in *AWS CLI Command Reference*.

## Use UploadPartCopy with an AWS SDK or CLI

The following code examples show how to use UploadPartCopy.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- [Perform a multipart copy](#)

### CLI

#### AWS CLI

#### To upload part of an object by copying data from an existing object as the data source

The following upload-part-copy example uploads a part by copying data from an existing object as a data source.

```

aws s3api upload-part-copy \
    --bucket amzn-s3-demo-bucket \
    --key "Map_Data_June.mp4" \

```

```
--copy-source "amzn-s3-demo-bucket/copy_of_Map_Data_June.mp4" \  
--part-number 1 \  
--upload-  
id "bq0tdE1CDpWQYRPLHuNG50xAT6pA5D.m_RiBy0gg0H6b13pVRY7QjvLlf75iFdJqp_2wztk5hvpUM2SesXgrz"
```

Output:

```
{  
  "CopyPartResult": {  
    "LastModified": "2019-12-13T23:16:03.000Z",  
    "ETag": "\"711470fc377698c393d94aed6305e245\""  
  }  
}
```

- For API details, see [UploadPartCopy](#) in *AWS CLI Command Reference*.

## Scenarios for Amazon S3 using AWS SDKs

The following code examples show you how to implement common scenarios in Amazon S3 with AWS SDKs. These scenarios show you how to accomplish specific tasks by calling multiple functions within Amazon S3 or combined with other AWS services. Each scenario includes a link to the complete source code, where you can find instructions on how to set up and run the code.

Scenarios target an intermediate level of experience to help you understand service actions in context.

## Examples

- [Check if a bucket exists](#)
- [Convert text to speech and back to text using an AWS SDK](#)
- [Create a presigned URL for Amazon S3 using an AWS SDK](#)
- [Create a photo asset management application that lets users manage photos using labels](#)
- [A web page that lists Amazon S3 objects using an AWS SDK](#)
- [Create an Amazon Textract explorer application](#)
- [Delete all objects in a given Amazon S3 bucket using an AWS SDK](#)
- [Delete incomplete multipart uploads to Amazon S3 using an AWS SDK](#)
- [Detect PPE in images with Amazon Rekognition using an AWS SDK](#)
- [Detect entities in text extracted from an image using an AWS SDK](#)
- [Detect faces in an image using an AWS SDK](#)
- [Detect objects in images with Amazon Rekognition using an AWS SDK](#)
- [Detect people and objects in a video with Amazon Rekognition using an AWS SDK](#)
- [Download S3 'directories' from an Amazon Simple Storage Service \(Amazon S3\) bucket](#)
- [Download all objects in an Amazon Simple Storage Service \(Amazon S3\) bucket to a local directory](#)
- [Download a stream of unknown size from an Amazon S3 object using an AWS SDK](#)
- [Get an Amazon S3 object from a Multi-Region Access Point by using an AWS SDK](#)
- [Get an object from an Amazon S3 bucket using an AWS SDK, specifying an If-Modified-Since header](#)

## Check if a bucket exists

The following code example shows how to check if a bucket exists.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

You can use the following `doesBucketExists` method as a replacement for the the SDK for Java V1 [AmazonS3Client#doesBucketExistV2\(String\)](#) method.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.awscore.exception.AwsServiceException;
import software.amazon.awssdk.http.HttpStatusCode;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.utils.Validate;
```

```
public class DoesBucketExist {
    private static final Logger logger =
        LoggerFactory.getLogger(DoesBucketExist.class);

    public static void main(String[] args) {
        DoesBucketExist doesBucketExist = new DoesBucketExist();

        final S3Client s3SyncClient = S3Client.builder().build();
        final String bucketName = "amzn-s3-demo-bucket"; // Change to the bucket
        name that you want to check.

        boolean exists = doesBucketExist.doesBucketExist(bucketName,
            s3SyncClient);
        logger.info("Bucket exists: {}", exists);
    }

    /**
     * Checks if the specified bucket exists. Amazon S3 buckets are named in a
     * global namespace; use this method to
     * determine if a specified bucket name already exists, and therefore can't
     * be used to create a new bucket.
     * <p>
     * Internally this method uses the <a
     * href="https://sdk.amazonaws.com/java/api/latest/software.amazon.awssdk/
     services/s3/
     S3Client.html#getBucketAcl(java.util.function.Consumer)">S3Client.getBucketAcl(String)</
     a>
     * operation to determine whether the bucket exists.
     * <p>
     * This method is equivalent to the AWS SDK for Java V1's <a
     * href="https://docs.aws.amazon.com/AWSJavaSDK/latest/javadoc/
     com/amazonaws/services/s3/AmazonS3Client.html#doesBucketExistV2-
     java.lang.String-">AmazonS3Client#doesBucketExistV2(String)</a>.
     *
     * @param bucketName The name of the bucket to check.
     * @param s3SyncClient An <code>S3Client</code> instance. The method checks
     for the bucket in the AWS Region
     * configured on the instance.
     * @return The value true if the specified bucket exists in Amazon S3; the
     value false if there is no bucket in
     * Amazon S3 with that name.
     */
    public boolean doesBucketExist(String bucketName, S3Client s3SyncClient) {
```

```
        try {
            Validate.notEmpty(bucketName, "The bucket name must not be null or an
empty string.", "");
            s3SyncClient.getBucketAcl(r -> r.bucket(bucketName));
            return true;
        } catch (AwsServiceException ase) {
            // A redirect error or an AccessDenied exception means the bucket
exists but it's not in this region
            // or we don't have permissions to it.
            if ((ase.getStatusCode() == HttpStatusCode.MOVED_PERMANENTLY) ||
"AccessDenied".equals(ase.awsErrorDetails().errorCode())) {
                return true;
            }
            if (ase.getStatusCode() == HttpStatusCode.NOT_FOUND) {
                return false;
            }
            throw ase;
        }
    }
}
```

- For API details, see [GetBucketAcl](#) in *AWS SDK for Java 2.x API Reference*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Convert text to speech and back to text using an AWS SDK

The following code example shows how to:

- Use Amazon Polly to synthesize a plain text (UTF-8) input file to an audio file.
- Upload the audio file to an Amazon S3 bucket.
- Use Amazon Transcribe to convert the audio file to text.
- Display the text.

## Rust

### SDK for Rust

Use Amazon Polly to synthesize a plain text (UTF-8) input file to an audio file, upload the audio file to an Amazon S3 bucket, use Amazon Transcribe to convert that audio file to text, and display the text.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Polly
- Amazon S3
- Amazon Transcribe

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

### Create a presigned URL for Amazon S3 using an AWS SDK

The following code examples show how to create a presigned URL for Amazon S3 and upload an object.

.NET

#### SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Generate a presigned URL that can perform an Amazon S3 action for a limited time.

```
using System;  
using Amazon;  
using Amazon.S3;
```

```
using Amazon.S3.Model;

public class GenPresignedUrl
{
    public static void Main()
    {
        const string bucketName = "amzn-s3-demo-bucket";
        const string objectKey = "sample.txt";

        // Specify how long the presigned URL lasts, in hours
        const double timeoutDuration = 12;

        // Specify the AWS Region of your Amazon S3 bucket. If it is
        // different from the Region defined for the default user,
        // pass the Region to the constructor for the client. For
        // example: new AmazonS3Client(RegionEndpoint.USEast1);

        // If using the Region us-east-1, and server-side encryption with AWS
        KMS, you must specify Signature Version 4.
        // Region us-east-1 defaults to Signature Version 2 unless explicitly
        set to Version 4 as shown below.
        // For more details, see https://docs.aws.amazon.com/AmazonS3/latest/userguide/UsingAWSSDK.html#specify-signature-version
        // and https://docs.aws.amazon.com/sdkfornet/v3/apidocs/items/Amazon/TAWSConfigsS3.html
        AWSConfigsS3.UseSignatureVersion4 = true;
        IAmazonS3 s3Client = new AmazonS3Client(RegionEndpoint.USEast1);

        string urlString = GeneratePresignedURL(s3Client, bucketName,
        objectKey, timeoutDuration);
        Console.WriteLine($"The generated URL is: {urlString}.");
    }

    /// <summary>
    /// Generate a presigned URL that can be used to access the file named
    /// in the objectKey parameter for the amount of time specified in the
    /// duration parameter.
    /// </summary>
    /// <param name="client">An initialized S3 client object used to call
    /// the GetPresignedUrl method.</param>
    /// <param name="bucketName">The name of the S3 bucket containing the
    /// object for which to create the presigned URL.</param>
    /// <param name="objectKey">The name of the object to access with the
    /// presigned URL.</param>
}
```

```
    /// <param name="duration">The length of time for which the presigned
    /// URL will be valid.</param>
    /// <returns>A string representing the generated presigned URL.</returns>
    public static string GeneratePresignedURL(IAmazonS3 client, string
bucketName, string objectKey, double duration)
    {
        string urlString = string.Empty;
        try
        {
            var request = new GetPreSignedUrlRequest()
            {
                BucketName = bucketName,
                Key = objectKey,
                Expires = DateTime.UtcNow.AddHours(duration),
            };
            urlString = client.GetPreSignedURL(request);
        }
        catch (AmazonS3Exception ex)
        {
            Console.WriteLine($"Error: '{ex.Message}'");
        }

        return urlString;
    }
}
```

Generate a presigned URL and perform an upload using that URL.

```
using System;
using System.IO;
using System.Net.Http;
using System.Threading.Tasks;
using Amazon;
using Amazon.S3;
using Amazon.S3.Model;

/// <summary>
/// This example shows how to upload an object to an Amazon Simple Storage
/// Service (Amazon S3) bucket using a presigned URL. The code first
/// creates a presigned URL and then uses it to upload an object to an
/// Amazon S3 bucket using that URL.
```

```
/// </summary>

"github.com/awsdocs/aws-doc-sdk-examples/gov2/demotools"
"github.com/awsdocs/aws-doc-sdk-examples/gov2/s3/actions"
)

// RunPresigningScenario is an interactive example that shows you how to get
// presigned
// HTTP requests that you can use to move data into and out of Amazon Simple
// Storage
// Service (Amazon S3). The presigned requests contain temporary credentials and
// can
// be used by an HTTP client.
//
// 1. Get a presigned request to put an object in a bucket.
// 2. Use the net/http package to use the presigned request to upload a local
// file to the bucket.
// 3. Get a presigned request to get an object from a bucket.
// 4. Use the net/http package to use the presigned request to download the
// object to a local file.
// 5. Get a presigned request to delete an object from a bucket.
// 6. Use the net/http package to use the presigned request to delete the object.
//
// This example creates an Amazon S3 presign client from the specified sdkConfig
// so that
// you can replace it with a mocked or stubbed config for unit testing.
//
// It uses a questioner from the `demotools` package to get input during the
// example.
// This package can be found in the ..\..\demotools folder of this repo.
//
// It uses an IHttpRequester interface to abstract HTTP requests so they can be
// mocked
// during testing.

Define an HTTP request wrapper used by the example to make HTTP requests.

```

// IHttpRequester abstracts HTTP requests into an interface so it can be mocked
// during
// unit testing.
type IHttpRequester interface {
    Get(url string) (resp *http.Response, err error)
    Post(url, contentType string, body io.Reader) (resp *http.Response, err error)
    Put(url string, contentLength int64, body io.Reader) (resp *http.Response, err
    error)
    Delete(url string) (resp *http.Response, err error)
}

// HttpRequester uses the net/http package to make HTTP requests during the
// scenario.
type HttpRequester struct{}

func (httpReq HttpRequester) Get(url string) (resp *http.Response, err error) {
    return http.Get(url)
}

func (httpReq HttpRequester) Post(url, contentType string, body io.Reader) (resp
    *http.Response, err error) {
    postRequest, err := http.NewRequest("POST", url, body)
    if err != nil {
        return nil, err
    }
    postRequest.Header.Set("Content-Type", contentType)
    return http.DefaultClient.Do(postRequest)
}

```

```
func (httpReq HttpRequester) Put(url string, contentType int64, body io.Reader)
(resp *http.Response, err error) {
    putRequest, err := http.NewRequest("PUT", url, body)
    if err != nil {
        return nil, err
    }
    putRequest.ContentLength = contentType
    return http.DefaultClient.Do(putRequest)
}
func (httpReq HttpRequester) Delete(url string) (resp *http.Response, err error)
{
    delRequest, err := http.NewRequest("DELETE", url, nil)
    if err != nil {
        return nil, err
    }
    return http.DefaultClient.Do(delRequest)
}
```

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

The following shows three example of how to create presigned URLs and use the URLs with HTTP client libraries:

- An HTTP GET request that uses the URL with three HTTP client libraries
- An HTTP PUT request with metadata in headers that uses the URL with three HTTP client libraries
- An HTTP PUT request with query parameters that uses the URL with one HTTP client library

Generate a pre-signed URL for an object, then download it (GET request).

## Imports.

```
import com.example.s3.util.PresignUrlUtils;
import org.slf4j.Logger;
import software.amazon.awssdk.http.HttpExecuteRequest;
import software.amazon.awssdk.http.HttpExecuteResponse;
import software.amazon.awssdk.http.SdkHttpClient;
import software.amazon.awssdk.http.SdkHttpMethod;
import software.amazon.awssdk.http.SdkHttpRequest;
import software.amazon.awssdk.http.apache.ApacheHttpClient;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.services.s3.model.GetObjectRequest;
import software.amazon.awssdk.services.s3.model.S3Exception;
import software.amazon.awssdk.services.s3.presigner.S3Presigner;
import
    software.amazon.awssdk.services.s3.presigner.model.GetObjectPresignRequest;
import
    software.amazon.awssdk.services.s3.presigner.model.PresignedGetObjectRequest;
import software.amazon.awssdk.utils.IoUtils;

import java.io.ByteArrayOutputStream;
import java.io.File;
import java.io.IOException;
import java.io.InputStream;
import java.net.HttpURLConnection;
import java.net.URISyntaxException;
import java.net.URL;
import java.net.http.HttpClient;
import java.net.http.HttpRequest;
import java.net.http.HttpResponse;
import java.nio.file.Paths;
import java.time.Duration;
import java.util.UUID;
```

## Generate the URL.

```
    /* Create a pre-signed URL to download an object in a subsequent GET request.
    */
    public String createPresignedGetUrl(String bucketName, String keyName) {
        try (S3Presigner presigner = S3Presigner.create()) {

            GetObjectRequest objectRequest = GetObjectRequest.builder()
```

```

        .bucket(bucketName)
        .key(keyName)
        .build();

        GetObjectPresignRequest presignRequest =
GetObjectPresignRequest.builder()
        .signatureDuration(Duration.ofMinutes(10)) // The URL will
expire in 10 minutes.
        .getObjectRequest(objectRequest)
        .build();

        PresignedGetObjectRequest presignedRequest =
presigner.presignGetObject(presignRequest);
        logger.info("Presigned URL: [{}]",
presignedRequest.url().toString());
        logger.info("HTTP method: [{}]",
presignedRequest.httpRequest().method());

        return presignedRequest.url().toExternalForm();
    }
}

```

Download the object by using any one of the following three approaches.

Use JDK `URLConnection` (since v1.1) class to do the download.

```

/* Use the JDK HttpURLConnection (since v1.1) class to do the download. */
public byte[] useURLConnectionToGet(String presignedUrlString) {
    ByteArrayOutputStream byteArrayOutputStream = new
ByteArrayOutputStream(); // Capture the response body to a byte array.

    try {
        URL presignedUrl = new URL(presignedUrlString);
        HttpURLConnection connection = (HttpURLConnection)
presignedUrl.openConnection();
        connection.setRequestMethod("GET");
        // Download the result of executing the request.
        try (InputStream content = connection.getInputStream()) {
            IoUtils.copy(content, byteArrayOutputStream);
        }
        logger.info("HTTP response code is " + connection.getResponseCode());
    } catch (S3Exception | IOException e) {

```

```
        logger.error(e.getMessage(), e);
    }
    return byteArrayOutputStream.toByteArray();
}
```

Use JDK `HttpClient` (since v11) class to do the download.

```
/* Use the JDK HttpClient (since v11) class to do the download. */
public byte[] useHttpClientToGet(String presignedUrlString) {
    ByteArrayOutputStream byteArrayOutputStream = new
ByteArrayOutputStream(); // Capture the response body to a byte array.

    HttpRequest.Builder requestBuilder = HttpRequest.newBuilder();
    HttpClient httpClient = HttpClient.newHttpClient();
    try {
        URL presignedUrl = new URL(presignedUrlString);
        HttpResponse<InputStream> response = httpClient.send(requestBuilder
            .uri(presignedUrl.toURI())
            .GET()
            .build(),
            HttpResponse.BodyHandlers.ofInputStream());

        IoUtils.copy(response.body(), byteArrayOutputStream);

        logger.info("HTTP response code is " + response.statusCode());
    } catch (URISyntaxException | InterruptedException | IOException e) {
        logger.error(e.getMessage(), e);
    }
    return byteArrayOutputStream.toByteArray();
}
```

Use the AWS SDK for Java `SdkHttpClient` class to do the download.

```
/* Use the AWS SDK for Java SdkHttpClient class to do the download. */
public byte[] useSdkHttpClientToGet(String presignedUrlString) {

    ByteArrayOutputStream byteArrayOutputStream = new
ByteArrayOutputStream(); // Capture the response body to a byte array.
    try {
        URL presignedUrl = new URL(presignedUrlString);
```

```

        SdkHttpRequest request = SdkHttpRequest.builder()
            .method(SdkHttpMethod.GET)
            .uri(presignedUrl.toURI())
            .build();

        HttpExecuteRequest executeRequest = HttpExecuteRequest.builder()
            .request(request)
            .build();

        try (SdkHttpClient sdkHttpClient = ApacheHttpClient.create()) {
            HttpExecuteResponse response =
sdkHttpClient.prepareRequest(executeRequest).call();
            response.responseBody().ifPresentOrElse(
                abortableInputStream -> {
                    try {
                        IoUtils.copy(abortableInputStream,
byteArrayOutputStream);
                    } catch (IOException e) {
                        throw new RuntimeException(e);
                    }
                },
                () -> logger.error("No response body."));

            logger.info("HTTP Response code is {}",
response.httpResponse().statusCode());
        }
        } catch (URISyntaxException | IOException e) {
            logger.error(e.getMessage(), e);
        }
        return byteArrayOutputStream.toByteArray();
    }

```

Generate a pre-signed URL with metadata in headers for an upload, then upload a file (PUT request).

### Imports.

```

import com.example.s3.util.PresignUrlUtils;
import org.slf4j.Logger;
import software.amazon.awssdk.core.internal.sync.FileContentStreamProvider;

import java.nio.file.Path;
import java.nio.file.Paths;
import java.time.Duration;
import java.util.Map;
import java.util.UUID;
```

## Generate the URL.

```
/* Create a presigned URL to use in a subsequent PUT request */
public String createPresignedUrl(String bucketName, String keyName,
    Map<String, String> metadata) {
    try (S3Presigner presigner = S3Presigner.create()) {

        PutObjectRequest objectRequest = PutObjectRequest.builder()
            .bucket(bucketName)
            .key(keyName)
            .metadata(metadata)
```

```

        .build();

        PutObjectPresignRequest presignRequest =
PutObjectPresignRequest.builder()
            .signatureDuration(Duration.ofMinutes(10)) // The URL
expires in 10 minutes.
            .putObjectRequest(objectRequest)
            .build();

        PresignedPutObjectRequest presignedRequest =
presigner.presignPutObject(presignRequest);
        String myURL = presignedRequest.url().toString();
        logger.info("Presigned URL to upload a file to: [{}]", myURL);
        logger.info("HTTP method: [{}]",
presignedRequest.httpRequest().method());

        return presignedRequest.url().toExternalForm();
    }
}

```

Upload a file object by using any one of the following three approaches.

Use the JDK `URLConnection` (since v1.1) class to do the upload.

```

/* Use the JDK HttpURLConnection (since v1.1) class to do the upload. */
public void useURLConnectionToPut(String presignedUrlString, File
fileToPut, Map<String, String> metadata) {
    logger.info("Begin [{}] upload", fileToPut.toString());
    try {
        URL presignedUrl = new URL(presignedUrlString);
        HttpURLConnection connection = (HttpURLConnection)
presignedUrl.openConnection();
        connection.setDoOutput(true);
        metadata.forEach((k, v) -> connection.setRequestProperty("x-amz-
meta-" + k, v));
        connection.setRequestMethod("PUT");
        OutputStream out = connection.getOutputStream();

        try (RandomAccessFile file = new RandomAccessFile(fileToPut, "r");
            FileChannel inChannel = file.getChannel()) {
            ByteBuffer buffer = ByteBuffer.allocate(8192); //Buffer size is
8k

```

```

        while (inChannel.read(buffer) > 0) {
            buffer.flip();
            for (int i = 0; i < buffer.limit(); i++) {
                out.write(buffer.get());
            }
            buffer.clear();
        }
    } catch (IOException e) {
        logger.error(e.getMessage(), e);
    }

    out.close();
    connection.getResponseCode();
    logger.info("HTTP response code is " + connection.getResponseCode());

} catch (S3Exception | IOException e) {
    logger.error(e.getMessage(), e);
}
}

```

Use the JDK `HttpClient` (since v11) class to do the upload.

```

/* Use the JDK HttpClient (since v11) class to do the upload. */
public void useHttpClientToPut(String presignedUrlString, File fileToPut,
    Map<String, String> metadata) {
    logger.info("Begin [{}] upload", fileToPut.toString());

    HttpRequest.Builder requestBuilder = HttpRequest.newBuilder();
    metadata.forEach((k, v) -> requestBuilder.header("x-amz-meta-" + k, v));

    HttpClient httpClient = HttpClient.newHttpClient();
    try {
        final HttpResponse<Void> response = httpClient.send(requestBuilder
            .uri(new URL(presignedUrlString).toURI())

        .PUT(HttpRequest.BodyPublishers.ofFile(Path.of(fileToPut.toURI()))
            .build(),
            HttpResponse.BodyHandlers.discarding());

        logger.info("HTTP response code is " + response.statusCode());
    }
}

```

```

    } catch (URISyntaxException | InterruptedException | IOException e) {
        logger.error(e.getMessage(), e);
    }
}

```

Use the AWS for Java V2 SdkHttpClient class to do the upload.

```

/* Use the AWS SDK for Java V2 SdkHttpClient class to do the upload. */
public void useSdkHttpClientToPut(String presignedUrlString, File fileToPut,
Map<String, String> metadata) {
    logger.info("Begin [{}] upload", fileToPut.toString());

    try {
        URL presignedUrl = new URL(presignedUrlString);

        SdkHttpRequest.Builder requestBuilder = SdkHttpRequest.builder()
            .method(SdkHttpMethod.PUT)
            .uri(presignedUrl.toURI());
        // Add headers
        metadata.forEach((k, v) -> requestBuilder.putHeader("x-amz-meta-" +
k, v));
        // Finish building the request.
        SdkHttpRequest request = requestBuilder.build();

        HttpExecuteRequest executeRequest = HttpExecuteRequest.builder()
            .request(request)
            .contentStreamProvider(new
FileContentStreamProvider(fileToPut.toPath()))
            .build();

        try (SdkHttpClient sdkHttpClient = ApacheHttpClient.create()) {
            HttpExecuteResponse response =
sdkHttpClient.prepareRequest(executeRequest).call();
            logger.info("Response code: {}",
response.httpResponse().statusCode());
        }
    } catch (URISyntaxException | IOException e) {
        logger.error(e.getMessage(), e);
    }
}

```

Generate a pre-signed URL with query parameters for an upload, then upload a file (PUT request).

### Imports.

```
import com.example.s3.util.PresignUrlUtils;

```

### Generate the URL.

```
/**
 * Creates a presigned URL to use in a subsequent HTTP PUT request. The code
 * adds query parameters
 * to the request instead of using headers. By using query parameters, you
 * do not need to add the
 * the parameters as headers when the PUT request is eventually sent.
 *
 * @param bucketName Bucket name where the object will be uploaded.
```

```
    * @param keyName Key name of the object that will be uploaded.
    * @param queryParams Query string parameters to be added to the presigned
URL.
    * @return
    */
    public String createPresignedUrl(String bucketName, String keyName,
Map<String, String> queryParams) {
        try (S3Presigner presigner = S3Presigner.create()) {
            // Create an override configuration to store the query parameters.
            AwsRequestOverrideConfiguration.Builder overrideConfigurationBuilder
= AwsRequestOverrideConfiguration.builder();

queryParams.forEach(overrideConfigurationBuilder::putRawQueryParameter);

            PutObjectRequest objectRequest = PutObjectRequest.builder()
                .bucket(bucketName)
                .key(keyName)

.overrideConfiguration(overrideConfigurationBuilder.build()) // Add the override
configuration.

sdkHttpClient.prepareRequest(executeRequest).call();
            logger.info("Response code: {}",
response.httpResponse().statusCode());
        }
    } catch (URISyntaxException | IOException e) {
        logger.error(e.getMessage(), e);
    }
}
```

## JavaScript

### SDK for JavaScript (v3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a presigned URL to upload an object to a bucket.

```
import https from "node:https";

import { XMLParser } from "fast-xml-parser";
import { PutObjectCommand, S3Client } from "@aws-sdk/client-s3";
import { fromIni } from "@aws-sdk/credential-providers";
import { HttpRequest } from "@smithy/protocol-http";
import {
  getSignedUrl,
  S3RequestPresigner,
} from "@aws-sdk/s3-request-presigner";
import { parseUrl } from "@smithy/url-parser";
import { formatUrl } from "@aws-sdk/util-format-url";
import { Hash } from "@smithy/hash-node";

const createPresignedUrlWithoutClient = async ({ region, bucket, key }) => {
  const url = parseUrl(`https://${bucket}.s3.${region}.amazonaws.com/${key}`);
  const presigner = new S3RequestPresigner({
    credentials: fromIni(),
    region,
    sha256: Hash.bind(null, "sha256"),
  });

## Kotlin

### SDK for Kotlin

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a `GetObject` presigned request and use the URL to download an object.

```
suspend fun getObjectPresigned(
    s3: S3Client,
    bucketName: String,
    keyName: String,
): String {
    // Create a GetObjectRequest.
    val unsignedRequest =
        GetObjectRequest {
```

```

        bucket = bucketName
        key = keyName
    }

    // Presign the GetObject request.
    val presignedRequest = s3.presignGetObject(unsignedRequest, 24.hours)

    // Use the URL from the presigned HttpRequest in a subsequent HTTP GET
    request to retrieve the object.
    val objectContents = URL(presignedRequest.url.toString()).readText()

    return objectContents
}

```

Create a GetObject presigned request with advanced options.

```

suspend fun getObjectPresignedMoreOptions(
    s3: S3Client,
    bucketName: String,
    keyName: String,
): HttpRequest {
    // Create a GetObjectRequest.
    val unsignedRequest =
        GetObjectRequest {
            bucket = bucketName
            key = keyName
        }

    // Presign the GetObject request.
    val presignedRequest =
        s3.presignGetObject(unsignedRequest, signer = CrtAwsSigner) {
            signingDate = Instant.now() + 12.hours // Presigned request can be
            used 12 hours from now.
            algorithm = AwsSigningAlgorithm.SIGV4_ASYMMETRIC
            signatureType = AwsSignatureType.HTTP_REQUEST_VIA_QUERY_PARAMS
            expiresAfter = 8.hours // Presigned request expires 8 hours later.
        }
    return presignedRequest
}

```

Create a PutObject presigned request and use it to upload an object.

```
suspend fun putObjectPresigned(
    s3: S3Client,
    bucketName: String,
    keyName: String,
    content: String,
) {
    // Create a PutObjectRequest.
    val unsignedRequest =
        PutObjectRequest {
            bucket = bucketName
            key = keyName
        }

    // Presign the request.
    val presignedRequest = s3.presignPutObject(unsignedRequest, 24.hours)

    // Use the URL and any headers from the presigned HttpRequest in a subsequent
    HTTP PUT request to retrieve the object.
    // Create a PUT request using the OkHttpClient API.
    val putRequest =
        Request
            .Builder()
            .url(presignedRequest.url.toString())
            .apply {
                presignedRequest.headers.forEach { key, values ->
                    header(key, values.joinToString(", "))
                }
            }.put(content.toRequestBody())
            .build()

    val response = OkHttpClient().newCall(putRequest).execute()
    assert(response.isSuccessful)
}
```

## Create a photo asset management application that lets users manage photos using labels

The following code examples show how to create a serverless application that lets users manage photos using labels.

.NET

### SDK for .NET

Shows how to develop a photo asset management application that detects labels in images using Amazon Rekognition and stores them for later retrieval.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

For a deep dive into the origin of this example see the post on [AWS Community](#).

### Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon Rekognition
- Amazon S3
- Amazon SNS

## C++

### SDK for C++

Shows how to develop a photo asset management application that detects labels in images using Amazon Rekognition and stores them for later retrieval.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

For a deep dive into the origin of this example see the post on [AWS Community](#).

### Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon Rekognition
- Amazon S3
- Amazon SNS

## Java

### SDK for Java 2.x

Shows how to develop a photo asset management application that detects labels in images using Amazon Rekognition and stores them for later retrieval.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

For a deep dive into the origin of this example see the post on [AWS Community](#).

### Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon Rekognition
- Amazon S3
- Amazon SNS

## JavaScript

### SDK for JavaScript (v3)

Shows how to develop a photo asset management application that detects labels in images using Amazon Rekognition and stores them for later retrieval.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

For a deep dive into the origin of this example see the post on [AWS Community](#).

### Services used in this example

- API Gateway
- DynamoDB

### A web page that lists Amazon S3 objects using an AWS SDK

The following code example shows how to list Amazon S3 objects in a web page.

JavaScript

### SDK for JavaScript (v3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

The following code is the relevant React component that makes calls to the AWS SDK. A runnable version of the application containing this component can be found at the preceding GitHub link.

```
import { useEffect, useState } from "react";
import {
  ListObjectsCommand,
  type ListObjectsCommandOutput,
  S3Client,
} from "@aws-sdk/client-s3";
import { fromCognitoIdentityPool } from "@aws-sdk/credential-providers";
import "./App.css";

function App() {
  const [objects, setObjects] = useState<
    Required<ListObjectsCommandOutput>["Contents"]
  >([]);

  useEffect(() => {
    const client = new S3Client({
      region: "us-east-1",
      // Unless you have a public bucket, you'll need access to a private bucket.
      // One way to do this is to create an Amazon Cognito identity pool, attach
      // a role to the pool,
      // and grant the role access to the 's3:GetObject' action.
      //
      // You'll also need to configure the CORS settings on the bucket to allow
      // traffic from
      // this example site. Here's an example configuration that allows all
      // origins. Don't
      // do this in production.
      // [
      //   {
      //     "AllowedHeaders": ["*"],
      //     "AllowedMethods": ["GET"],
      //     "AllowedOrigins": ["*"],
      //     "ExposeHeaders": [],
      //   },
      // ],
      // ]
      credentials: fromCognitoIdentityPool({
        clientConfig: { region: "us-east-1" },
        identityPoolId: "<YOUR_IDENTITY_POOL_ID>",
      })
    });
  });
}
```

```
    }),
  });
  const command = new ListObjectsCommand({ Bucket: "bucket-name" });
  client.send(command).then(({ Contents }) => setObjects(Contents || []));
}, []);

return (
  <div className="App">
    {objects.map((o) => (
      <div key={o.ETag}>{o.Key}</div>
    ))}
  </div>
);
}

export default App;
```

- For API details, see [ListObjects](#) in *AWS SDK for JavaScript API Reference*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Create an Amazon Textract explorer application

The following code examples show how to explore Amazon Textract output through an interactive application.

### JavaScript

#### SDK for JavaScript (v3)

Shows how to use the AWS SDK for JavaScript to build a React application that uses Amazon Textract to extract data from a document image and display it in an interactive web page. This example runs in a web browser and requires an authenticated Amazon Cognito identity for credentials. It uses Amazon Simple Storage Service (Amazon S3) for storage, and for notifications it polls an Amazon Simple Queue Service (Amazon SQS) queue that is subscribed to an Amazon Simple Notification Service (Amazon SNS) topic.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Cognito Identity
- Amazon S3
- Amazon SNS
- Amazon SQS
- Amazon Textract

## Python

### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) with Amazon Textract to detect text, form, and table elements in a document image. The input image and Amazon Textract output are shown in a Tkinter application that lets you explore the detected elements.

- Submit a document image to Amazon Textract and explore the output of detected elements.
- Submit images directly to Amazon Textract or through an Amazon Simple Storage Service (Amazon S3) bucket.
- Use asynchronous APIs to start a job that publishes a notification to an Amazon Simple Notification Service (Amazon SNS) topic when the job completes.
- Poll an Amazon Simple Queue Service (Amazon SQS) queue for a job completion message and display the results.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Cognito Identity
- Amazon S3
- Amazon SNS
- Amazon SQS

- Amazon Textract

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Delete all objects in a given Amazon S3 bucket using an AWS SDK

The following code example shows how to delete all of the objects in an Amazon S3 bucket.

JavaScript

### SDK for JavaScript (v3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Delete all objects for a given Amazon S3 bucket.

```
import {
  DeleteObjectsCommand,
  paginateListObjectsV2,
  S3Client,
} from "@aws-sdk/client-s3";

/**
 *
 * @param {{ bucketName: string }} config
 */
export const main = async ({ bucketName }) => {
  const client = new S3Client({});
  try {
    console.log(`Deleting all objects in bucket: ${bucketName}`);

    const paginator = paginateListObjectsV2(
      { client },
      {
        Bucket: bucketName,
```

```
    },
  );

  const objectKeys = [];
  for await (const { Contents } of paginator) {
    objectKeys.push(...Contents.map((obj) => ({ Key: obj.Key })));
  }

  const deleteCommand = new DeleteObjectsCommand({
    Bucket: bucketName,
    Delete: { Objects: objectKeys },
  });

  await client.send(deleteCommand);

  console.log(`All objects deleted from bucket: ${bucketName}`);
} catch (caught) {
  if (caught instanceof Error) {
    console.error(
      `Failed to empty ${bucketName}. ${caught.name}: ${caught.message}`,
    );
  }
}
};

// Call function if run directly.
import { fileURLToPath } from "node:url";
import { parseArgs } from "node:util";
if (process.argv[1] === fileURLToPath(import.meta.url)) {
  const options = {
    bucketName: {
      type: "string",
    },
  },
  };

  const { values } = parseArgs({ options });
  main(values);
}
```

- For API details, see the following topics in *AWS SDK for JavaScript API Reference*.
  - [DeleteObjects](#)
  - [ListObjectsV2](#)

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Delete incomplete multipart uploads to Amazon S3 using an AWS SDK

The following code example shows how to delete or stop incomplete Amazon S3 multipart uploads.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

To stop multipart uploads that are in-progress or incomplete for any reason, you can get a list uploads and then delete them as shown in the following example.

```
/**
 * Aborts all incomplete multipart uploads from the specified S3 bucket.
 * <p>
 * This method retrieves a list of all incomplete multipart uploads in the
 * specified S3 bucket,
 * and then aborts each of those uploads.
 */
public static void abortIncompleteMultipartUploadsFromList() {
    ListMultipartUploadsRequest listMultipartUploadsRequest =
ListMultipartUploadsRequest.builder()
        .bucket(bucketName)
        .build();

    ListMultipartUploadsResponse response =
s3Client.listMultipartUploads(listMultipartUploadsRequest);
    List<MultipartUpload> uploads = response.uploads();

    AbortMultipartUploadRequest abortMultipartUploadRequest;
    for (MultipartUpload upload : uploads) {
        abortMultipartUploadRequest = AbortMultipartUploadRequest.builder()
```

```

        .bucket(bucketName)
        .key(upload.key())
        .expectedBucketOwner(accountId)
        .uploadId(upload.uploadId())
        .build();

        AbortMultipartUploadResponse abortMultipartUploadResponse =
s3Client.abortMultipartUpload(abortMultipartUploadRequest);
        if (abortMultipartUploadResponse.sdkHttpResponse().isSuccessful()) {
            logger.info("Upload ID [{}] to bucket [{}] successfully
aborted.", upload.uploadId(), bucketName);
        }
    }
}

```

To delete incomplete multipart uploads that were initiated before or after a date, you can selectively delete multipart uploads based on a point in time as shown in the following example.

```

static void abortIncompleteMultipartUploadsOlderThan(Instant pointInTime) {
    ListMultipartUploadsRequest listMultipartUploadsRequest =
ListMultipartUploadsRequest.builder()
        .bucket(bucketName)
        .build();

    ListMultipartUploadsResponse response =
s3Client.listMultipartUploads(listMultipartUploadsRequest);
    List<MultipartUpload> uploads = response.uploads();

    AbortMultipartUploadRequest abortMultipartUploadRequest;
    for (MultipartUpload upload : uploads) {
        logger.info("Found multipartUpload with upload ID [{}], initiated
[{}]", upload.uploadId(), upload.initiated());
        if (upload.initiated().isBefore(pointInTime)) {
            abortMultipartUploadRequest =
AbortMultipartUploadRequest.builder()
                .bucket(bucketName)
                .key(upload.key())
                .expectedBucketOwner(accountId)
                .uploadId(upload.uploadId())
                .build();

```

```

        AbortMultipartUploadResponse abortMultipartUploadResponse =
s3Client.abortMultipartUpload(abortMultipartUploadRequest);
        if
(abortMultipartUploadResponse.sdkHttpResponse().isSuccessful()) {
            logger.info("Upload ID [{}] to bucket [{}] successfully
aborted.", upload.uploadId(), bucketName);
        }
    }
}
}

```

If you have access to the upload ID after you begin a multipart upload, you can delete the in-progress upload by using the ID.

```

static void abortMultipartUploadUsingUploadId() {
    String uploadId = startUploadReturningUploadId();
    AbortMultipartUploadResponse response = s3Client.abortMultipartUpload(b -
> b
        .uploadId(uploadId)
        .bucket(bucketName)
        .key(key));

    if (response.sdkHttpResponse().isSuccessful()) {
        logger.info("Upload ID [{}] to bucket [{}] successfully aborted.",
uploadId, bucketName);
    }
}
}

```

To consistently delete incomplete multipart uploads older than a certain number of days, set up a bucket lifecycle configuration for the bucket. The following example shows how to create a rule to delete incomplete uploads older than 7 days.

```

static void abortMultipartUploadsUsingLifecycleConfig() {
    Collection<LifecycleRule> lifeCycleRules =
List.of(LifecycleRule.builder()
        .abortIncompleteMultipartUpload(b -> b.
            daysAfterInitiation(7))
        .status("Enabled")
        .filter(SdkBuilder::build) // Filter element is required.
        .build());
}

```

```
// If the action is successful, the service sends back an HTTP 200
response with an empty HTTP body.
PutBucketLifecycleConfigurationResponse response =
s3Client.putBucketLifecycleConfiguration(b -> b
    .bucket(bucketName)
    .lifecycleConfiguration(b1 -> b1.rules(lifeCycleRules)));

if (response.sdkHttpResponse().isSuccessful()) {
    logger.info("Rule to abort incomplete multipart uploads added to
bucket.");
} else {
    logger.error("Unsuccessfully applied rule. HTTP status code is [{}]",
response.sdkHttpResponse().statusCode());
}
}
```

## Detect PPE in images with Amazon Rekognition using an AWS SDK

The following code example shows how to build an app that uses Amazon Rekognition to detect Personal Protective Equipment (PPE) in images.

Java

### SDK for Java 2.x

Shows how to create an AWS Lambda function that detects images with Personal Protective Equipment.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

## Services used in this example

- DynamoDB
- Amazon Rekognition
- Amazon S3
- Amazon SES

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Detect entities in text extracted from an image using an AWS SDK

The following code example shows how to use Amazon Comprehend to detect entities in text extracted by Amazon Textract from an image that is stored in Amazon S3.

Python

### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) in a Jupyter notebook to detect entities in text that is extracted from an image. This example uses Amazon Textract to extract text from an image stored in Amazon Simple Storage Service (Amazon S3) and Amazon Comprehend to detect entities in the extracted text.

This example is a Jupyter notebook and must be run in an environment that can host notebooks. For instructions on how to run the example using Amazon SageMaker AI, see the directions in [TextractAndComprehendNotebook.ipynb](#).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

## Services used in this example

- Amazon Comprehend
- Amazon S3
- Amazon Textract

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Detect faces in an image using an AWS SDK

The following code example shows how to:

- Save an image in an Amazon S3 bucket.
- Use Amazon Rekognition to detect facial details, such as age range, gender, and emotion (such as smiling).
- Display those details.

Rust

### SDK for Rust

Save the image in an Amazon S3 bucket with an **uploads** prefix, use Amazon Rekognition to detect facial details, such as age range, gender, and emotion (smiling, etc.), and display those details.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon S3

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Detect objects in images with Amazon Rekognition using an AWS SDK

The following code examples show how to build an app that uses Amazon Rekognition to detect objects by category in images.

## .NET

### SDK for .NET

Shows how to use Amazon Rekognition .NET API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

## Java

### SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

## JavaScript

### SDK for JavaScript (v3)

Shows how to use Amazon Rekognition with the AWS SDK for JavaScript to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

Learn how to:

- Create an unauthenticated user using Amazon Cognito.
- Analyze images for objects using Amazon Rekognition.
- Verify an email address for Amazon SES.
- Send an email notification using Amazon SES.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

## Kotlin

### SDK for Kotlin

Shows how to use Amazon Rekognition Kotlin API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Rekognition
- Amazon S3

- Amazon SES

## Python

### SDK for Python (Boto3)

Shows you how to use the AWS SDK for Python (Boto3) to create a web application that lets you do the following:

- Upload photos to an Amazon Simple Storage Service (Amazon S3) bucket.
- Use Amazon Rekognition to analyze and label the photos.
- Use Amazon Simple Email Service (Amazon SES) to send email reports of image analysis.

This example contains two main components: a webpage written in JavaScript that is built with React, and a REST service written in Python that is built with Flask-RESTful.

You can use the React webpage to:

- Display a list of images that are stored in your S3 bucket.
- Upload images from your computer to your S3 bucket.
- Display images and labels that identify items that are detected in the image.
- Get a report of all images in your S3 bucket and send an email of the report.

The webpage calls the REST service. The service sends requests to AWS to perform the following actions:

- Get and filter the list of images in your S3 bucket.
- Upload photos to your S3 bucket.
- Use Amazon Rekognition to analyze individual photos and get a list of labels that identify items that are detected in the photo.
- Analyze all photos in your S3 bucket and use Amazon SES to email a report.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Detect people and objects in a video with Amazon Rekognition using an AWS SDK

The following code examples show how to detect people and objects in a video with Amazon Rekognition.

Java

### SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES
- Amazon SNS
- Amazon SQS

Python

### SDK for Python (Boto3)

Use Amazon Rekognition to detect faces, objects, and people in videos by starting asynchronous detection jobs. This example also configures Amazon Rekognition to notify an Amazon Simple Notification Service (Amazon SNS) topic when jobs complete and subscribes an Amazon Simple Queue Service (Amazon SQS) queue to the topic. When the queue receives a message about a job, the job is retrieved and the results are output.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES
- Amazon SNS
- Amazon SQS

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Download S3 'directories' from an Amazon Simple Storage Service (Amazon S3) bucket

The following code example shows how to download and filter the contents of Amazon S3 bucket 'directories'.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

This example show how to use the [S3TransferManager](#) in the AWS SDK for Java 2.x to download 'directories' from an Amazon S3 bucket. It also demonstrates how to use [DownloadFilters](#) in the request.

```
/**
 * For standard buckets, S3 provides the illusion of a directory structure
 through the use of keys. When you upload
```

```
* an object to an S3 bucket, you specify a key, which is essentially the
"path" to the object. The key can contain
* forward slashes ("/") to make it appear as if the object is stored in a
directory structure, but this is just a
* logical representation, not an actual directory.
* <p><pre>
* In this example, our S3 bucket contains the following objects:
*
* folder1/file1.txt
* folder1/file2.txt
* folder1/file3.txt
* folder2/file1.txt
* folder2/file2.txt
* folder2/file3.txt
* folder3/file1.txt
* folder3/file2.txt
* folder3/file3.txt
*
* When method `downloadS3Directories` is invoked with
* `destinationPathURI` set to `/test`, the downloaded
* directory looks like:
*
* |- test
*   |- folder1
*     |- file1.txt
*     |- file2.txt
*     |- file3.txt
*   |- folder3
*     |- file1.txt
*     |- file2.txt
*     |- file3.txt
* </pre>
*
* @param transferManager An S3TransferManager instance.
* @param destinationPathURI local directory to hold the downloaded S3
'directories' and files.
* @param bucketName The S3 bucket that contains the 'directories' to
download.
* @return The number of objects (files, in this case) that were downloaded.
*/
public Integer downloadS3Directories(S3TransferManager transferManager,
URI destinationPathURI, String
bucketName) {
```

```
// Define the filters for which 'directories' we want to download.
DownloadFilter folder1Filter = (S3Object s3Object) ->
s3Object.key().startsWith("folder1/");
DownloadFilter folder3Filter = (S3Object s3Object) ->
s3Object.key().startsWith("folder3/");
DownloadFilter folderFilter = s3Object ->
folder1Filter.or(folder3Filter).test(s3Object);

DirectoryDownload directoryDownload =
transferManager.downloadDirectory(DownloadDirectoryRequest.builder()
    .destination(Paths.get(destinationPathURI))
    .bucket(bucketName)
    .filter(folderFilter)
    .build());

## Get an Amazon S3 object from a Multi-Region Access Point by using an AWS SDK

The following code example shows how to get an object from a Multi-Region Access Point.

Kotlin

### SDK for Kotlin

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Configure the S3 client to use the Asymmetric Sigv4 (Sigv4a) signing algorithm.

```
suspend fun createS3Client(): S3Client {
```

```
// Configure your S3Client to use the Asymmetric SigV4 (SigV4a)
signing algorithm.
val sigV4aScheme = SigV4AsymmetricAuthScheme(DefaultAwsSigner)
val s3 = S3Client.fromEnvironment {
    authSchemes = listOf(sigV4aScheme)
}
return s3
}
```

Use the Multi-Region Access Point ARN instead of a bucket name to retrieve the object.

```
suspend fun getObjectFromMrap(
    s3: S3Client,
    mrapArn: String,
    keyName: String,
): String? {
    val request = GetObjectRequest {
        bucket = mrapArn // Use the ARN instead of the bucket name for object
operations.
        key = keyName
    }

    var stringObj: String? = null
    s3.getObject(request) { resp ->
        stringObj = resp.body?.decodeToString()
        if (stringObj != null) {
            println("Successfully read $keyName from $mrapArn")
        }
    }
    return stringObj
}
```

## Get started with Amazon S3 using the CLI

The following code example shows how to:

- Create an S3 bucket with unique naming and regional configuration
- Configure bucket security settings including public access blocking
- Enable versioning and default encryption for data protection
- Upload objects with and without custom metadata
- Download objects from the bucket to local storage
- Copy objects within the bucket to organize data in folders
- List bucket contents and objects with specific prefixes
- Add tags to buckets for resource management
- Clean up all resources including versioned objects

## Bash

### AWS CLI with Bash script

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [Sample developer tutorials](#) repository.

```
#!/bin/bash

# Amazon S3 Getting Started Tutorial Script
# This script demonstrates basic S3 operations including:
# - Creating a bucket
# - Configuring bucket settings
# - Uploading, downloading, and copying objects
# - Deleting objects and buckets

# Latest fixes:
# 1. Fixed folder creation using temporary file
# 2. Corrected versioned object deletion in cleanup
# 3. Improved error handling for cleanup operations

# Set up error handling
set -e
trap 'cleanup_handler $?' EXIT

# Log file setup
LOG_FILE="s3-tutorial-$(date +%Y%m%d-%H%M%S).log"
exec > >(tee -a "$LOG_FILE") 2>&1

# Function to log messages
log() {
    echo "[$(date +"%Y-%m-%d %H:%M:%S")] $1"
}

# Function to handle errors
handle_error() {
    log "ERROR: $1"
    exit 1
}
```

```
# Function to check if a bucket exists
bucket_exists() {
    if aws s3api head-bucket --bucket "$1" 2>/dev/null; then

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

## Run an interactive scenario demonstrating Amazon S3 object lock features.

```
import software.amazon.awssdk.services.s3.model.ObjectLockLegalHold;
import software.amazon.awssdk.services.s3.model.ObjectLockRetention;
import java.io.BufferedWriter;
import java.io.IOException;
import java.util.ArrayList;
import java.util.List;
import java.util.Scanner;
import java.util.stream.Collectors;

/*
Before running this Java V2 code example, set up your development
environment, including your credentials.

For more information, see the following documentation topic:
https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/setup.html

This Java example performs the following tasks:
  1. Create test Amazon Simple Storage Service (S3) buckets with different lock
  policies.
  2. Upload sample objects to each bucket.
  3. Set some Legal Hold and Retention Periods on objects and buckets.
  4. Investigate lock policies by viewing settings or attempting to delete or
  overwrite objects.
  5. Clean up objects and buckets.

## Make Amazon S3 conditional requests using an AWS SDK

The following code examples show how to add preconditions to Amazon S3 requests.

.NET

### SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Run an interactive scenario demonstrating Amazon S3 conditional request features.

```

## JavaScript

### SDK for JavaScript (v3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Entrypoint for the workflow (index.js). This orchestrates all of the steps. Visit GitHub to see the implementation details for Scenario, ScenarioInput, ScenarioOutput, and ScenarioAction.

```
import * as Scenarios from "@aws-doc-sdk-examples/lib/scenario/index.js";

This example demonstrates the use of conditional requests for S3
operations.
You can use conditional requests to add preconditions to S3 read requests
to return or copy
an object based on its Entity tag (ETag), or last modified date.
You can use a conditional write requests to prevent overwrites by
ensuring
there is no existing object with the same key.

This example will allow you to perform conditional reads
and writes that will succeed or fail based on your selected options.

Sample buckets and a sample object will be created as part of the
example.

## Manage versioned Amazon S3 objects in batches with a Lambda function using an AWS SDK

The following code example shows how to manage versioned S3 objects in batches with a Lambda function.

Python

### SDK for Python (Boto3)

Shows how to manipulate Amazon Simple Storage Service (Amazon S3) versioned objects in batches by creating jobs that call AWS Lambda functions to perform processing. This example creates a version-enabled bucket, uploads the stanzas from the poem *You Are Old, Father William* by Lewis Carroll, and uses Amazon S3 batch jobs to twist the poem in various ways.

#### Learn how to:

- Create Lambda functions that operate on versioned objects.
- Create a manifest of objects to update.
- Create batch jobs that invoke Lambda functions to update objects.
- Delete Lambda functions.
- Empty and delete a versioned bucket.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon S3

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Parse Amazon S3 URIs using an AWS SDK

The following code example shows how to parse Amazon S3 URIs to extract important components like the bucket name and object key.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Parse an Amazon S3 URI by using the [S3Uri](#) class.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.services.s3.S3Uri;
import software.amazon.awssdk.services.s3.S3Utilities;

import java.net.URI;
import java.util.List;
import java.util.Map;

/**
 *
 * @param s3Client - An S3Client through which you acquire an S3Uri
instance.
 * @param s3objectUrl - A complex URL (String) that is used to demonstrate
S3Uri
 * capabilities.
 */

## Receive and process Amazon S3 event notifications by using an AWS SDK

The following code example shows how to work with S3 event notifications in an object-oriented way.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

This example show how to process S3 notification event by using Amazon SQS.

```
/**  
 * This method receives S3 event notifications by using an SqsAsyncClient.  
 * After the client receives the messages it deserializes the JSON payload  
and logs them. It uses  
 * the S3EventNotification class (part of the S3 event notification API for  
Java) to deserialize  
 * the JSON payload and access the messages in an object-oriented way.
```

```

*
* @param queueUrl The URL of the AWS SQS queue that receives the S3 event
notifications.
* @see <a href="https://sdk.amazonaws.com/java/api/latest/software.amazon/
awssdk/eventnotifications/s3/model/package-summary.html">S3EventNotification
API</a>.
* <p>
* To use S3 event notification serialization/deserialization to objects, add
the following
* dependency to your Maven pom.xml file.
* <dependency>
* <groupId>software.amazon.awssdk</groupId>
* <artifactId>s3-event-notifications</artifactId>
* <version><LATEST></version>
* </dependency>
* <p>
* The S3 event notification API became available with version 2.25.11 of the
Java SDK.
* <p>
* This example shows the use of the API with AWS SQS, but it can be used to
process S3 event notifications
* in AWS SNS or AWS Lambda as well.
* <p>
* Note: The S3EventNotification class does not work with messages routed
through AWS EventBridge.
*/
static void processS3Events(String bucketName, String queueUrl, String
queueArn) {
    try {
        // Configure the bucket to send Object Created and Object Tagging
notifications to an existing SQS queue.
        s3Client.putBucketNotificationConfiguration(b -> b
            .notificationConfiguration(ncb -> ncb
                .queueConfigurations(qcb -> qcb
                    .events(Event.S3_OBJECT_CREATED,
Event.S3_OBJECT_TAGGING)
                    .queueArn(queueArn)))
            .bucket(bucketName)
        ).join();

        triggerS3EventNotifications(bucketName);
        // Wait for event notifications to propagate.
        Thread.sleep(Duration.ofSeconds(5).toMillis());
    }
}

```

```
        boolean didReceiveMessages = true;
        while (didReceiveMessages) {
            // Display the number of messages that are available in the
queue.
            sqsClient.getQueueAttributes(b -> b
                .queueUrl(queueUrl)

## Save EXIF and other image information using an AWS SDK

The following code example shows how to:

- Get EXIF information from a a JPG, JPEG, or PNG file.

- Upload the image file to an Amazon S3 bucket.
- Use Amazon Rekognition to identify the three top attributes (labels) in the file.
- Add the EXIF and label information to an Amazon DynamoDB table in the Region.

## Rust

### SDK for Rust

Get EXIF information from a JPG, JPEG, or PNG file, upload the image file to an Amazon S3 bucket, use Amazon Rekognition to identify the three top attributes (*labels* in Amazon Rekognition) in the file, and add the EXIF and label information to a Amazon DynamoDB table in the Region.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Amazon Rekognition
- Amazon S3

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Send S3 event notifications to Amazon EventBridge using an AWS SDK

The following code example shows how to enable a bucket to send S3 event notifications to EventBridge and route notifications to an Amazon SNS topic and Amazon SQS queue.

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```

/** This method configures a bucket to send events to AWS EventBridge and
creates a rule
 * to route the S3 object created events to a topic and a queue.
 *
 * @param bucketName Name of existing bucket
 * @param topicArn ARN of existing topic to receive S3 event notifications
 * @param queueArn ARN of existing queue to receive S3 event notifications
 *
 * An AWS CloudFormation stack sets up the bucket, queue, topic before the
method runs.
 */
public static String setBucketNotificationToEventBridge(String bucketName,
String topicArn, String queueArn) {
    try {
        // Enable bucket to emit S3 Event notifications to EventBridge.

## Track an Amazon S3 object upload or download using an AWS SDK

The following code example shows how to track an Amazon S3 object upload or download.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Track the progress of a file upload.

```
public void trackUploadFile(S3TransferManager transferManager, String
bucketName,
                        String key, URI filePathURI) {
    UploadFileRequest uploadFileRequest = UploadFileRequest.builder()
        .putObjectRequest(b -> b.bucket(bucketName).key(key))
        .addTransferListener(LoggingTransferListener.create()) // Add
listener.
        .source(Paths.get(filePathURI))
        .build();

    FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);

    fileUpload.completionFuture().join();
    /*
    The SDK provides a LoggingTransferListener implementation of the
    TransferListener interface.
    You can also implement the interface to provide your own logic.

    Configure log4j2 with settings such as the following.
    <Configuration status="WARN">
        <Appenders>
            <Console name="AlignedConsoleAppender"
target="SYSTEM_OUT">
                <PatternLayout pattern="%m%n"/>
            </Console>
        </Appenders>
```

```

        <Loggers>
            <logger
name="software.amazon.awssdk.transfer.s3.progress.LoggingTransferListener"
level="INFO" additivity="false">
                <AppenderRef ref="AlignedConsoleAppender"/>
            </logger>
        </Loggers>
    </Configuration>

```

Log4J2 logs the progress. The following is example output for a 21.3 MB file upload.

```

        Transfer initiated...
        |                               | 0.0%
        |====                          | 21.1%
        |=====                        | 60.5%
        |=====|                       | 100.0%
        Transfer complete!
    */
}

```

## Track the progress of a file download.

```

public void trackDownloadFile(S3TransferManager transferManager, String
bucketName,
                               String key, String downloadedFilePath) {
    DownloadFileRequest downloadFileRequest = DownloadFileRequest.builder()
        .getObjectRequest(b -> b.bucket(bucketName).key(key))
        .addTransferListener(LoggingTransferListener.create()) // Add
listener.
        .destination(Paths.get(downloadedFilePath))
        .build();

    FileDownload downloadFile =
transferManager.downloadFile(downloadFileRequest);

    CompletedFileDownload downloadResult =
downloadFile.completionFuture().join();
    /*
        The SDK provides a LoggingTransferListener implementation of the
TransferListener interface.
        You can also implement the interface to provide your own logic.
    */
}

```

```

        Configure log4J2 with settings such as the following.
        <Configuration status="WARN">
            <Appenders>
                <Console name="AlignedConsoleAppender"
target="SYSTEM_OUT">
                    <PatternLayout pattern="%m%n"/>
                </Console>
            </Appenders>

            <Loggers>
                <logger
name="software.amazon.awssdk.transfer.s3.progress.LoggingTransferListener"
level="INFO" additivity="false">
                    <AppenderRef ref="AlignedConsoleAppender"/>
                </logger>
            </Loggers>
        </Configuration>

```

Log4J2 logs the progress. The following is example output for a 21.3 MB file download.

```

        Transfer initiated...
        |=====          | 39.4%
        |=====          | 78.8%
        |=====          | 100.0%
        Transfer complete!
    */
}

```

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Call functions that transfer files to and from an S3 bucket using the `S3TransferManager`.

```
public Integer downloadObjectsToDirectory(S3TransferManager transferManager,
    URI destinationPathURI, String bucketName) {
    DirectoryDownload directoryDownload =
transferManager.downloadDirectory(DownloadDirectoryRequest.builder()
        .destination(Paths.get(destinationPathURI))
        .bucket(bucketName)
        .build());
    CompletedDirectoryDownload completedDirectoryDownload =
directoryDownload.completionFuture().join();

    completedDirectoryDownload.failedTransfers()
        .forEach(fail -> logger.warn("Object [{}] failed to transfer",
fail.toString()));
    return completedDirectoryDownload.failedTransfers().size();
}
```

Upload an entire local directory.

```
public Integer uploadDirectory(S3TransferManager transferManager,
    URI sourceDirectory, String bucketName) {
    DirectoryUpload directoryUpload =
transferManager.uploadDirectory(UploadDirectoryRequest.builder()
    .source(Paths.get(sourceDirectory))
    .bucket(bucketName)
    .build());

    CompletedDirectoryUpload completedDirectoryUpload =
directoryUpload.completionFuture().join();
    completedDirectoryUpload.failedTransfers()
        .forEach(fail -> logger.warn("Object [{}] failed to transfer",
fail.toString()));
    return completedDirectoryUpload.failedTransfers().size();
}
```

### Upload a single file.

```
public String uploadFile(S3TransferManager transferManager, String
bucketName,
    String key, URI filePathURI) {
    UploadFileRequest uploadFileRequest = UploadFileRequest.builder()
    .putObjectRequest(b -> b.bucket(bucketName).key(key))
    .source(Paths.get(filePathURI))
    .build();

    FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);

    CompletedFileUpload uploadResult = fileUpload.completionFuture().join();
    return uploadResult.response().eTag();
}
```

### The code examples use the following imports.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.core.exception.SdkException;
import software.amazon.awssdk.core.sync.RequestBody;
import software.amazon.awssdk.services.s3.S3AsyncClient;
```

```
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.services.s3.model.CompletedMultipartUpload;
import software.amazon.awssdk.services.s3.model.CompletedPart;
import software.amazon.awssdk.services.s3.model.CreateMultipartUploadResponse;
import software.amazon.awssdk.services.s3.model.PutObjectResponse;
import software.amazon.awssdk.services.s3.model.UploadPartRequest;
import software.amazon.awssdk.services.s3.model.UploadPartResponse;
import software.amazon.awssdk.services.s3.waiters.S3Waiter;
import software.amazon.awssdk.transfer.s3.S3TransferManager;
import software.amazon.awssdk.transfer.s3.model.FileUpload;
import software.amazon.awssdk.transfer.s3.model.UploadFileRequest;

import java.io.IOException;
import java.io.RandomAccessFile;
import java.net.URISyntaxException;
import java.net.URL;
import java.nio.ByteBuffer;
import java.nio.file.Paths;
import java.util.ArrayList;
import java.util.List;
import java.util.Objects;
import java.util.UUID;
import java.util.concurrent.CompletableFuture;
```

Use the [S3 Transfer Manager](#) on top of the [AWS CRT-based S3 client](#) to transparently perform a multipart upload when the size of the content exceeds a threshold. The default threshold size is 8 MB.

```
/**
 * Uploads a file to an Amazon S3 bucket using the S3TransferManager.
 *
 * @param filePath the file path of the file to be uploaded
 */
public void multipartUploadWithTransferManager(String filePath) {
    S3TransferManager transferManager = S3TransferManager.create();
    UploadFileRequest uploadFileRequest = UploadFileRequest.builder()
        .putObjectRequest(b -> b
            .bucket(bucketName)
            .key(key))
        .source(Paths.get(filePath))
        .build();
    FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);
}
```

```
        fileUpload.completionFuture().join();
        transferManager.close();
    }
```

Use the [S3Client API](#) to perform a multipart upload.

```
/**
 * Performs a multipart upload to Amazon S3 using the provided S3 client.
 *
 * @param filePath the path to the file to be uploaded
 */
public void multipartUploadWithS3Client(String filePath) {

    // Initiate the multipart upload.
    CreateMultipartUploadResponse createMultipartUploadResponse =
s3Client.createMultipartUpload(b -> b
        .bucket(bucketName)
        .key(key));
    String uploadId = createMultipartUploadResponse.uploadId();

    // Upload the parts of the file.
    int partNumber = 1;
    List<CompletedPart> completedParts = new ArrayList<>();
    ByteBuffer bb = ByteBuffer.allocate(1024 * 1024 * 5); // 5 MB byte buffer

    try (RandomAccessFile file = new RandomAccessFile(filePath, "r")) {
        long fileSize = file.length();
        long position = 0;
        while (position < fileSize) {
            file.seek(position);
            long read = file.getChannel().read(bb);

            bb.flip(); // Swap position and limit before reading from the
buffer.

            UploadPartRequest uploadPartRequest = UploadPartRequest.builder()
                .bucket(bucketName)
                .key(key)
                .uploadId(uploadId)
                .partNumber(partNumber)
                .build();

            UploadPartResponse partResponse = s3Client.uploadPart(
```

```
        uploadPartRequest,
        RequestBody.fromByteBuffer(bb));

        CompletedPart part = CompletedPart.builder()
            .partNumber(partNumber)
            .eTag(partResponse.eTag())
            .build();
        completedParts.add(part);

        bb.clear();
        position += read;
        partNumber++;
    }
} catch (IOException e) {
    logger.error(e.getMessage());
}

// Complete the multipart upload.
s3Client.completeMultipartUpload(b -> b
    .bucket(bucketName)
    .key(key)
    .uploadId(uploadId)

.multipartUpload(CompletedMultipartUpload.builder().parts(completedParts).build()));
}
```

Use the [S3AsyncClient API](#) with multipart support enabled to perform a multipart upload.

```
/**
 * Uploads a file to an S3 bucket using the S3AsyncClient and enabling
 * multipart support.
 *
 * @param filePath the local file path of the file to be uploaded
 */
public void multipartUploadWithS3AsyncClient(String filePath) {
    // Enable multipart support.
    S3AsyncClient s3AsyncClient = S3AsyncClient.builder()
        .multipartEnabled(true)
        .build();
}
```

```
        CompletableFuture<PutObjectResponse> response = s3AsyncClient.putObject(b
-> b
            .bucket(bucketName)
            .key(key),
            Paths.get(filePath));

        response.join();
        logger.info("File uploaded in multiple 8 MiB parts using
S3AsyncClient.");
    }
}
```

## JavaScript

### SDK for JavaScript (v3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

### Upload a large file.

```
import { S3Client } from "@aws-sdk/client-s3";
import { Upload } from "@aws-sdk/lib-storage";

import {
    ProgressBar,

## Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create functions that transfer files using several of the available transfer manager settings. Use a callback class to write callback progress during file transfer.

```
import sys
import threading

import boto3
from boto3.s3.transfer import TransferConfig

MB = 1024 * 1024
s3 = boto3.resource("s3")

class TransferCallback:
    """
    Handle callbacks from the transfer manager.

    The transfer manager periodically calls the __call__ method throughout
    the upload and download process so that it can take action, such as
    displaying progress to the user and collecting data about the transfer.
    """

    def __init__(self, target_size):
        self._target_size = target_size
        self._total_transferred = 0
        self._lock = threading.Lock()
        self.thread_info = {}

    def __call__(self, bytes_transferred):
        """
        The callback method that is called by the transfer manager.

        Display progress during file transfer and collect per-thread transfer
        data. This method can be called by multiple threads, so shared instance
        data is protected by a thread lock.
        """
        thread = threading.current_thread()
        with self._lock:
            self._total_transferred += bytes_transferred
            if thread.ident not in self.thread_info.keys():
                self.thread_info[thread.ident] = bytes_transferred
            else:
                self.thread_info[thread.ident] += bytes_transferred

        target = self._target_size * MB
```

```
        sys.stdout.write(
            f"\r{self._total_transferred} of {target} transferred "
            f"({(self._total_transferred / target) * 100:.2f}%)."

    }
}
```

## Swift

### SDK for Swift

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
import ArgumentParser
import AWSClientRuntime
import AWSS3
import Foundation
import Smithy
import SmithyHTTPAPI
import SmithyStreams

/// Upload a file to the specified bucket.
///
/// - Parameters:
///   - bucket: The Amazon S3 bucket name to store the file into.
///   - key: The name (or path) of the file to upload to in the `bucket`.
///   - sourcePath: The pathname on the local filesystem of the file to
///     upload.
```

```
func uploadFile(sourcePath: String, bucket: String, key: String?) async
throws {
    let fileURL: URL = URL(fileURLWithPath: sourcePath)
    let fileName: String

    // If no key was provided, use the last component of the filename.

    if key == nil {
        fileName = fileURL.lastPathComponent
    } else {
        fileName = key!
    }

    let s3Client = try await S3Client()

    // Create a FileHandle for the source file.

    let fileHandle = FileHandle(forReadingAtPath: sourcePath)
    guard let fileHandle = fileHandle else {
        throw TransferError.readError
    }

    // Create a byte stream to retrieve the file's contents. This uses the
    // Smithy FileStream and ByteStream types.

    let stream = FileStream(fileHandle: fileHandle)
    let body = ByteStream.stream(stream)

    // Create a `PutObjectInput` with the ByteStream as the body of the
    // request's data. The AWS SDK for Swift will handle sending the
    // entire file in chunks, regardless of its size.

    let putInput = PutObjectInput(
        body: body,
        bucket: bucket,
        key: fileName
    )

    do {
        _ = try await s3Client.putObject(input: putInput)
    } catch {
        throw TransferError.uploadError("Error uploading the file: \(error)")
    }
}
```

```
        print("File uploaded to \" + fileURL.path + ".")
    }
```

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use checksums to work with an Amazon S3 object using an AWS SDK

The following code example shows how to use checksums to work with an Amazon S3 object.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

The code examples use a subset of the following imports.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.core.exception.SdkException;
import software.amazon.awssdk.core.sync.RequestBody;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.services.s3.model.ChecksumAlgorithm;
import software.amazon.awssdk.services.s3.model.ChecksumMode;
import software.amazon.awssdk.services.s3.model.CompletedMultipartUpload;
import software.amazon.awssdk.services.s3.model.CompletedPart;
import software.amazon.awssdk.services.s3.model.CreateMultipartUploadResponse;
import software.amazon.awssdk.services.s3.model.GetObjectResponse;
import software.amazon.awssdk.services.s3.model.UploadPartRequest;
import software.amazon.awssdk.services.s3.model.UploadPartResponse;
import software.amazon.awssdk.services.s3.waiters.S3Waiter;
import software.amazon.awssdk.transfer.s3.S3TransferManager;
import software.amazon.awssdk.transfer.s3.model.FileUpload;
```

```
import software.amazon.awssdk.transfer.s3.model.UploadFileRequest;

import java.io.FileInputStream;
import java.io.IOException;
import java.io.RandomAccessFile;
import java.net.URISyntaxException;
import java.net.URL;
import java.nio.ByteBuffer;
import java.nio.file.Paths;
import java.security.DigestInputStream;
import java.security.MessageDigest;
import java.security.NoSuchAlgorithmException;
import java.util.ArrayList;
import java.util.Base64;
import java.util.List;
import java.util.Objects;
import java.util.UUID;
```

Specify a checksum algorithm for the `putObject` method when you [build the PutObjectRequest](#).

```
public void putObjectWithChecksum() {
    s3Client.putObject(b -> b
        .bucket(bucketName)
        .key(key)
        .checksumAlgorithm(ChecksumAlgorithm.CRC32),
        RequestBody.fromString("This is a test"));
}
```

Verify the checksum for the `getObject` method when you [build the GetObjectRequest](#).

```
public GetObjectResponse getObjectWithChecksum() {
    return s3Client.getObject(b -> b
        .bucket(bucketName)
        .key(key)
        .checksumMode(ChecksumMode.ENABLED))
        .response();
}
```

Pre-calculate a checksum for the `putObject` method when you [build the PutObjectRequest](#).

```
public void putObjectWithPrecalculatedChecksum(String filePath) {
    String checksum = calculateChecksum(filePath, "SHA-256");

    s3Client.putObject((b -> b
        .bucket(bucketName)
        .key(key)
        .checksumSHA256(checksum)),
        RequestBody.fromFile(Paths.get(filePath)));
}
```

Use the [S3 Transfer Manager](#) on top of the [AWS CRT-based S3 client](#) to transparently perform a multipart upload when the size of the content exceeds a threshold. The default threshold size is 8 MB.

You can specify a checksum algorithm for the SDK to use. By default, the SDK uses the CRC32 algorithm.

```
public void multipartUploadWithChecksumTm(String filePath) {
    S3TransferManager transferManager = S3TransferManager.create();
    UploadFileRequest uploadFileRequest = UploadFileRequest.builder()
        .putObjectRequest(b -> b
            .bucket(bucketName)
            .key(key)
            .checksumAlgorithm(ChecksumAlgorithm.SHA1))
        .source(Paths.get(filePath))
        .build();
    FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);
    fileUpload.completionFuture().join();
    transferManager.close();
}
```

Use the [S3Client API](#) or ([S3AsyncClient API](#)) to perform a multipart upload. If you specify an additional checksum, you must specify the algorithm to use on the initiation of the upload. You must also specify the algorithm for each part request and provide the checksum calculated for each part after it is uploaded.

```
public void multipartUploadWithChecksumS3Client(String filePath) {
    ChecksumAlgorithm algorithm = ChecksumAlgorithm.CRC32;

    // Initiate the multipart upload.
    CreateMultipartUploadResponse createMultipartUploadResponse =
s3Client.createMultipartUpload(b -> b
        .bucket(bucketName)
        .key(key)
        .checksumAlgorithm(algorithm)); // Checksum specified on initiation.
    String uploadId = createMultipartUploadResponse.uploadId();

    // Upload the parts of the file.
    int partNumber = 1;
    List<CompletedPart> completedParts = new ArrayList<>();
    ByteBuffer bb = ByteBuffer.allocate(1024 * 1024 * 5); // 5 MB byte buffer

    try (RandomAccessFile file = new RandomAccessFile(filePath, "r")) {
        long fileSize = file.length();
        long position = 0;
        while (position < fileSize) {
            file.seek(position);
            long read = file.getChannel().read(bb);

            bb.flip(); // Swap position and limit before reading from the
buffer.

            UploadPartRequest uploadPartRequest = UploadPartRequest.builder()
                .bucket(bucketName)
                .key(key)
                .uploadId(uploadId)
                .checksumAlgorithm(algorithm) // Checksum specified on each
part.

                .partNumber(partNumber)
                .build();

            UploadPartResponse partResponse = s3Client.uploadPart(
                uploadPartRequest,
                RequestBody.fromByteBuffer(bb));

            CompletedPart part = CompletedPart.builder()
                .partNumber(partNumber)
                .checksumCRC32(partResponse.checksumCRC32()) // Provide the
calculated checksum.

                .eTag(partResponse.eTag())
```

```
        .build();
        completedParts.add(part);

        bb.clear();
        position += read;
        partNumber++;
    }
} catch (IOException e) {
    System.err.println(e.getMessage());
}

// Complete the multipart upload.
s3Client.completeMultipartUpload(b -> b
    .bucket(bucketName)
    .key(key)
    .uploadId(uploadId)

.multipartUpload(CompletedMultipartUpload.builder().parts(completedParts).build()));
}
```

## Work with Amazon S3 object integrity features using an AWS SDK

The following code example shows how to work with S3 object integrity features.

## C++

## SDK for C++

 **Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Run an interactive scenario demonstrating Amazon S3 object integrity features.

```
#!/ Routine which runs the S3 object integrity workflow.
/*!

## Work with Amazon S3 versioned objects using an AWS SDK

The following code example shows how to:

- Create a versioned S3 bucket.
- Get all versions of an object.
- Roll an object back to a previous version.
- Delete and restore a versioned object.
- Permanently delete all versions of an object.

Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create functions that wrap S3 actions.

```
def create_versioned_bucket(bucket_name, prefix):
    """
    Creates an Amazon S3 bucket, enables it for versioning, and configures a
    lifecycle
    that expires noncurrent object versions after 7 days.
```

Adding a lifecycle configuration to a versioned bucket is a best practice. It helps prevent objects in the bucket from accumulating a large number of noncurrent versions, which can slow down request performance.

Usage is shown in the `usage_demo_single_object` function at the end of this module.

```
:param bucket_name: The name of the bucket to create.
:param prefix: Identifies which objects are automatically expired under the
               configured lifecycle rules.
:return: The newly created bucket.
"""
try:

## Serverless examples for Amazon S3

The following code examples show how to use Amazon S3 with AWS SDKs.

### Examples

- [Invoke a Lambda function from an Amazon S3 trigger](#)

## Invoke a Lambda function from an Amazon S3 trigger

The following code examples show how to implement a Lambda function that receives an event triggered by uploading an object to an S3 bucket. The function retrieves the S3 bucket name and object key from the event parameter and calls the Amazon S3 API to retrieve and log the content type of the object.

.NET

## Code examples for Amazon S3 Control using AWS SDKs

The following code examples show how to use Amazon S3 Control with an AWS software development kit (SDK).

*Basics* are code examples that show you how to perform the essential operations within a service.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Learn the basics of Amazon S3 Control with an AWS SDK

The following code example shows how to learn core operations for Amazon S3 Control.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Learn core operations.

```
package com.example.s3.batch;

import software.amazon.awssdk.services.s3.model.S3Exception;
import java.io.IOException;
import java.util.Map;
import java.util.Scanner;
import java.util.UUID;
import java.util.concurrent.CompletionException;

public class S3BatchScenario {

    public static final String DASHES = new String(new char[80]).replace("\0",
"-");
    private static final String STACK_NAME = "MyS3Stack";
    public static void main(String[] args) throws IOException {
        S3BatchActions actions = new S3BatchActions();
        String accountId = actions.getAccountId();
        String uuid = java.util.UUID.randomUUID().toString();
        Scanner scanner = new Scanner(System.in);

        System.out.println(DASHES);
        System.out.println("Welcome to the Amazon S3 Batch basics scenario.");
        System.out.println("""
            S3 Batch operations enables efficient and cost-effective processing
of large-scale
            data stored in Amazon S3. It automatically scales resources to handle
varying workloads
```

without the need for manual intervention.

One of the key features of S3 Batch is its ability to perform tagging operations on objects stored in S3 buckets. Users can leverage S3 Batch to apply, update, or remove tags on thousands or millions of objects in a single operation, streamlining the management and organization of their data.

This can be particularly useful for tasks such as cost allocation, lifecycle management, or metadata-driven workflows, where consistent and accurate tagging is essential.

S3 Batch's scalability and serverless nature make it an ideal solution for organizations with growing data volumes and complex data management requirements.

This Java program walks you through Amazon S3 Batch operations.

Let's get started...

```
        "");

## Actions for Amazon S3 Control using AWS SDKs

The following code examples demonstrate how to perform individual Amazon S3 Control actions with AWS SDKs. Each example includes a link to GitHub, where you can find instructions for setting up and running the code.

The following examples include only the most commonly used actions. For a complete list, see the [Amazon S3 Control API Reference](#).

### Examples

- [Use CreateJob with an AWS SDK or CLI](#)

- [Use DeleteJobTagging with an AWS SDK](#)
- [Use DescribeJob with an AWS SDK or CLI](#)
- [Use GetJobTagging with an AWS SDK](#)
- [Use PutJobTagging with an AWS SDK](#)
- [Use UpdateJobPriority with an AWS SDK or CLI](#)
- [Use UpdateJobStatus with an AWS SDK or CLI](#)

## Use CreateJob with an AWS SDK or CLI

The following code examples show how to use CreateJob.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- [Learn the basics](#)

### CLI

#### AWS CLI

##### To create an Amazon S3 batch operations job

The following create-job example creates an Amazon S3 batch operations job to tag objects as confidential in the bucket employee-records.

```
aws s3control create-job \  
  --account-id 123456789012 \  
  --operation '{"S3PutObjectTagging": { "TagSet": [{"Key":"confidential",  
  "Value":"true"}] }}' \  
  --report '{"Bucket":"arn:aws:s3:::employee-records-logs","Prefix":"batch-op-  
create-job",  
  "Format":"Report_CSV_20180820","Enabled":true,"ReportScope":"AllTasks"}' \  
  --manifest '{"Spec":{"Format":"S3BatchOperations_CSV_20180820","Fields":  
["Bucket","Key"],"Location":{"ObjectArn":"arn:aws:s3:::employee-records-logs/  
inv-report/7a6a9be4-072c-407e-85a2-  
ec3e982f773e.csv","ETag":"69f52a4e9f797e987155d9c8f5880897"}}}' \  
  --priority 42 \  
  --role-arn arn:aws:iam::123456789012:role/S3BatchJobRole
```

Output:

```
{
  "JobId": "93735294-df46-44d5-8638-6356f335324e"
}
```

- For API details, see [CreateJob](#) in *AWS CLI Command Reference*.

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create an asynchronous S3 job.

```
/**
 * Creates an asynchronous S3 job using the AWS Java SDK.
 *
 * @param accountId      the AWS account ID associated with the job
 * @param iamRoleArn     the ARN of the IAM role to be used for the job
 * @param manifestLocation the location of the job manifest file in S3
 * @param reportBucketName the name of the S3 bucket to store the job report
 * @param uuid           a unique identifier for the job
 * @return a CompletableFuture that represents the asynchronous creation of
 the S3 job.
 *       The CompletableFuture will return the job ID if the job is created
 successfully,
 *       or throw an exception if there is an error.
 */

## Use UpdateJobPriority with an AWS SDK or CLI

The following code examples show how to use UpdateJobPriority.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- [Learn the basics](#)

### CLI

#### AWS CLI

#### To update the job priority of an Amazon S3 batch operations job

The following update-job-priority example updates the specified job to a new priority.

```
aws s3control update-job-priority \
  --account-id 123456789012 \
  --job-id 8d9a18fe-c303-4d39-8ccc-860d372da386 \
  --priority 52
```

Output:

```
{
  "JobId": "8d9a18fe-c303-4d39-8ccc-860d372da386",
  "Priority": 52
}
```

```
}
```

- For API details, see [UpdateJobPriority](#) in *AWS CLI Command Reference*.

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**
 * Updates the priority of a job asynchronously.
 *
 * @param jobId      the ID of the job to update
 * @param accountId  the ID of the account associated with the job
 * @return a {@link CompletableFuture} that represents the asynchronous
 * operation, which completes when the job priority has been updated or an error
 * has occurred
 */
public CompletableFuture<Void> updateJobPriorityAsync(String jobId, String
accountId) {
    UpdateJobPriorityRequest priorityRequest =
UpdateJobPriorityRequest.builder()
        .accountId(accountId)
        .jobId(jobId)
        .priority(60)
        .build();

    CompletableFuture<Void> future = new CompletableFuture<>();
    getAsyncClient().updateJobPriority(priorityRequest)
        .thenAccept(response -> {
            System.out.println("The job priority was updated");
            future.complete(null); // Complete the CompletableFuture on
successful execution
        })
        .exceptionally(ex -> {
            System.err.println("Failed to update job priority: " +
ex.getMessage());
```

```
        future.completeExceptionally(ex); // Complete the
CompletableFuture exceptionally on error
        return null; // Return null to handle the exception
    });

    return future;
}
```

- For API details, see [UpdateJobPriority](#) in *AWS SDK for Java 2.x API Reference*.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Use UpdateJobStatus with an AWS SDK or CLI

The following code examples show how to use UpdateJobStatus.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- [Learn the basics](#)

### CLI

#### AWS CLI

##### To update the status of an Amazon S3 batch operations job

The following update-job-status example cancels the specified job which is awaiting approval.

```
aws s3control update-job-status \
  --account-id 123456789012 \
  --job-id 8d9a18fe-c303-4d39-8ccc-860d372da386 \
  --requested-job-status Cancelled
```

Output:

```
{
```

```
"Status": "Cancelled",
"JobId": "8d9a18fe-c303-4d39-8ccc-860d372da386"
}
```

The following `update-job-status` example confirms and runs the specified which is awaiting approval.

```
aws s3control update-job-status \
  --account-id 123456789012 \
  --job-id 5782949f-3301-4fb3-be34-8d5bab54dbca \
  --requested-job-status Ready
```

**Output::**

```
{
  "Status": "Ready",
  "JobId": "5782949f-3301-4fb3-
be34-8d5bab54dbca"
}
```

The following `update-job-status` example cancels the specified job which is running.

```
aws s3control update-job-status \
  --account-id 123456789012 \
  --job-id 5782949f-3301-4fb3-be34-8d5bab54dbca \
  --requested-job-status Cancelled
```

Output::

```
{
  "Status": "Cancelling",
  "JobId": "5782949f-3301-4fb3-be34-8d5bab54dbca"
}
```

- For API details, see [UpdateJobStatus](#) in *AWS CLI Command Reference*.

## Java

## SDK for Java 2.x

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**
 * Cancels a job asynchronously.
 *
 * @param jobId The ID of the job to be canceled.
 * @param accountId The ID of the account associated with the job.
 * @return A {@link CompletableFuture} that completes when the job status has
 *         been updated to "CANCELLED".
 *         If an error occurs during the update, the returned future will
 *         complete exceptionally.
 */

## Code examples for S3 Directory Buckets using AWS SDKs

The following code examples show how to use S3 Directory Buckets with an AWS software development kit (SDK).

*Basics* are code examples that show you how to perform the essential operations within a service.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

*Scenarios* are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

### Get started

#### Hello Amazon S3 directory buckets

The following code example shows how to get started using Amazon S3 directory buckets.

Java

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```

/**
 * Before running this example:
 * <p>
 * The SDK must be able to authenticate AWS requests on your behalf. If you have
 * not configured
 * authentication for SDKs and tools, see
 * https://docs.aws.amazon.com/sdkref/latest/guide/access.html in the AWS SDKs
 * and Tools Reference Guide.
 * <p>
 * You must have a runtime environment configured with the Java SDK.
 * See
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/setup.html in
 * the Developer Guide if this is not set up.
 * <p>
 * To use S3 directory buckets, configure a gateway VPC endpoint. This is the
 * recommended method to enable directory bucket traffic without
 * requiring an internet gateway or NAT device. For more information on
 * configuring VPC gateway endpoints, visit
```

```
* https://docs.aws.amazon.com/AmazonS3/latest/userguide/s3-express-networking.html#s3-express-networking-vpc-gateway.
* <p>
* Directory buckets are available in specific AWS Regions and Zones. For
* details on Regions and Zones supporting directory buckets, see
* https://docs.aws.amazon.com/AmazonS3/latest/userguide/s3-express-networking.html#s3-express-endpoints.

- For API details, see the following topics in *AWS SDK for Java 2.x API Reference*.
  - [CreateBucket](#)
  - [ListDirectoryBuckets](#)

For a complete list of AWS SDK developer guides and code examples, see [Developing with Amazon S3 using the AWS SDKs](#). This topic also includes information about getting started and details about previous SDK versions.

## Learn the basics of S3 Directory Buckets with an AWS SDK

The following code examples show how to:

- Set up a VPC and VPC Endpoint.
- Set up the Policies, Roles, and User to work with S3 directory buckets and the S3 Express One Zone storage class.
- Create two S3 Clients.
- Create two buckets.
- Create an object and copy it over.
- Demonstrate performance difference.
- Populate the buckets to show the lexicographical difference.
- Prompt the user to see if they want to clean up the resources.

## Java

difference
store
name
    "Directory". Where regular buckets store their key/value pairs in a
flat manner, directory buckets use actual directories/folders.
This allows for more rapid indexing, traversing, and therefore
retrieval times!

    The more segmented your bucket is, with lots of
directories, sub-directories, and objects, the more efficient it
becomes.

    This structural difference also causes `ListObject` operations to
behave
more
    differently, which can cause unexpected results. Let's add a few
objects in sub-directories to see how the output of
ListObjects changes.

```
        It's important to remember the user permissions when interacting
with
        directory buckets. Instead of validating permissions on every call
as
        regular buckets do, directory buckets utilize the user credentials
and session
        token to validate. This allows for much faster connection speeds on
every call.
        For single calls, this is low, but for many concurrent calls
        this adds up to a lot of time saved.

## PHP

## SDK for PHP

 **Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Run a scenario demonstrating the basics of Amazon S3 directory buckets and S3 Express One Zone.

```
echo "\n";
echo "-----\n";
echo "Welcome to the Amazon S3 Express Basics demo using PHP!\n";
echo "-----\n";

// Change these both of these values to use a different region/
availability zone.
$region = "us-west-2";
$az = "usw2-az1";

$this->s3Service = new S3Service(new S3Client(['region' => $region]));
$this->iamService = new IAMService(new IamClient(['region' => $region]));

$uuid = uniqid();

echo <<<INTRO
Let's get started! First, please note that S3 Express One Zone works best when
working within the AWS infrastructure,
specifically when working in the same Availability Zone. To see the best results
in this example, and when you implement
Directory buckets into your infrastructure, it is best to put your Compute
resources in the same AZ as your Directory
bucket.\n
INTRO;
    pressEnter();
    // 1. Configure a gateway VPC endpoint. This is the recommended method to
allow S3 Express One Zone traffic without
    // the need to pass through an internet gateway or NAT device.
echo "\n";
```

```
    echo "1. First, we'll set up a new VPC and VPC Endpoint if this program
    is running in an EC2 instance in the same AZ as your Directory buckets will be.
    \n";

#### 7. Populate the buckets to show the lexicographical difference.

Now let's explore how Directory buckets store objects in a different manner to regular buckets. The key is in the name

"Directory". Where regular buckets store their key/value pairs in a flat manner, Directory buckets use actual

directories/folders. This allows for more rapid indexing, traversing, and therefore retrieval times! The more segmented

your bucket is, with lots of directories, sub-directories, and objects, the more efficient it becomes. This structural

difference also causes ListObjects to behave differently, which can cause unexpected results. Let's add a few more

objects with layered directories to see how the output of ListObjects changes.

## Actions for S3 Directory Buckets using AWS SDKs

The following code examples demonstrate how to perform individual S3 Directory Buckets actions with AWS SDKs. Each example includes a link to GitHub, where you can find instructions for setting up and running the code.

These excerpts call the S3 Directory Buckets API and are code excerpts from larger programs that must be run in context. You can see actions in context in [Scenarios for S3 Directory Buckets using AWS SDKs](#).

The following examples include only the most commonly used actions. For a complete list, see the [Amazon S3 Directory Buckets API Reference](#).

## Examples

- [Use AbortMultipartUpload with an AWS SDK](#)
- [Use CompleteMultipartUpload with an AWS SDK](#)
- [Use CopyObject with an AWS SDK](#)
- [Use CreateBucket with an AWS SDK](#)
- [Use CreateMultipartUpload with an AWS SDK](#)
- [Use CreateSession with an AWS SDK](#)
- [Use DeleteBucket with an AWS SDK](#)
- [Use DeleteBucketEncryption with an AWS SDK](#)
- [Use DeleteBucketPolicy with an AWS SDK](#)
- [Use DeleteObject with an AWS SDK](#)
- [Use DeleteObjects with an AWS SDK](#)
- [Use GetBucketEncryption with an AWS SDK](#)
- [Use GetBucketPolicy with an AWS SDK](#)
- [Use GetObject with an AWS SDK](#)
- [Use GetObjectAttributes with an AWS SDK](#)
- [Use HeadBucket with an AWS SDK](#)
- [Use HeadObject with an AWS SDK](#)
- [Use ListDirectoryBuckets with an AWS SDK](#)
- [Use ListMultipartUploads with an AWS SDK](#)
- [Use ListObjectsV2 with an AWS SDK](#)
- [Use ListParts with an AWS SDK](#)
- [Use PutBucketEncryption with an AWS SDK](#)
- [Use PutBucketPolicy with an AWS SDK](#)
- [Use PutObject with an AWS SDK](#)
- [Use UploadPart with an AWS SDK](#)
- [Use UploadPartCopy with an AWS SDK](#)

## Use AbortMultipartUpload with an AWS SDK

The following code example shows how to use AbortMultipartUpload.

## Java

## SDK for Java 2.x

 **Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Abort a multipart upload in a directory bucket.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.regions.Region;

## Scenarios for S3 Directory Buckets using AWS SDKs

The following code examples show you how to implement common scenarios in S3 Directory Buckets with AWS SDKs. These scenarios show you how to accomplish specific tasks by calling multiple functions within S3 Directory Buckets or combined with other AWS services. Each scenario includes a link to the complete source code, where you can find instructions on how to set up and run the code.

Scenarios target an intermediate level of experience to help you understand service actions in context.

### Examples

# Authenticating Requests (AWS Signature Version 4)

## Topics

- [Authentication Methods](#)
- [Introduction to Signing Requests](#)
- [Authenticating Requests: Using the Authorization Header \(AWS Signature Version 4\)](#)
- [Authenticating Requests: Using Query Parameters \(AWS Signature Version 4\)](#)
- [Examples: Signature Calculations in AWS Signature Version 4](#)
- [Authenticating Requests: Browser-Based Uploads Using POST \(AWS Signature Version 4\)](#)
- [Amazon S3 Signature Version 4 Authentication Specific Policy Keys](#)

Every interaction with Amazon S3 is either authenticated or anonymous. This section explains request authentication with the AWS Signature Version 4 algorithm.

### Note

If you use the AWS SDKs (see [Sample Code and Libraries](#)) to send your requests, you don't need to read this section because the SDK clients authenticate your requests by using access keys that you provide. Unless you have a good reason not to, you should always use the AWS SDKs. In Regions that support both signature versions, you can request AWS SDKs to use specific signature version. For more information, see [Sending authenticated requests using the AWS SDKs](#). You need to read this section only if you are implementing the AWS Signature Version 4 algorithm in your custom client.

Authentication with AWS Signature Version 4 provides some or all of the following, depending on how you choose to sign your request:

- **Verification of the identity of the requester** – Authenticated requests require a signature that you create by using your access keys (access key ID, secret access key). For information about getting access keys, see [Understanding and Getting Your Security Credentials](#) in the *AWS General Reference*. If you are using temporary security credentials, the signature calculations also require a security token. For more information, see [Requesting Temporary Security Credentials](#) in the *IAM User Guide*.

- **In-transit data protection** – In order to prevent tampering with a request while it is in transit, you use some of the request elements to calculate the request signature. Upon receiving the request, Amazon S3 calculates the signature by using the same request elements. If any request component received by Amazon S3 does not match the component that was used to calculate the signature, Amazon S3 will reject the request.
- **Protect against reuse of the signed portions of the request** – The signed portions (using AWS Signatures) of requests are valid within 15 minutes of the timestamp in the request. An unauthorized party who has access to a signed request can modify the unsigned portions of the request without affecting the request's validity in the 15 minute window. Because of this, we recommend that you maximize protection by signing request headers and body, making HTTPS requests to Amazon S3, and by using the `s3:x-amz-content-sha256` condition key (see [Amazon S3 Signature Version 4 Authentication Specific Policy Keys](#)) in AWS policies to require users to sign Amazon S3 request bodies.

#### Note

Amazon S3 supports Signature Version 4, a protocol for authenticating inbound API requests to AWS services, in all AWS Regions. At this time, AWS Regions created before January 30, 2014 will continue to support the previous protocol, Signature Version 2. Any new Regions after January 30, 2014 will support only Signature Version 4 and therefore all requests to those Regions must be made with Signature Version 4. For more information about AWS Signature Version 2, see [Signing and Authenticating REST Requests](#) in the *Amazon Simple Storage Service User Guide*.

## Authentication Methods

You can express authentication information by using one of the following methods:

- **HTTP Authorization header** – Using the HTTP Authorization header is the most common method of authenticating an Amazon S3 request. All of the Amazon S3 REST operations (except for browser-based uploads using POST requests) require this header. For more information about the Authorization header value, and how to calculate signature and related options, see [Authenticating Requests: Using the Authorization Header \(AWS Signature Version 4\)](#).

- **Query string parameters** – You can use a query string to express a request entirely in a URL. In this case, you use query parameters to provide request information, including the authentication information. Because the request signature is part of the URL, this type of URL is often referred to as a presigned URL. You can use presigned URLs to embed clickable links, which can be valid for up to seven days, in HTML. For more information, see [Authenticating Requests: Using Query Parameters \(AWS Signature Version 4\)](#).

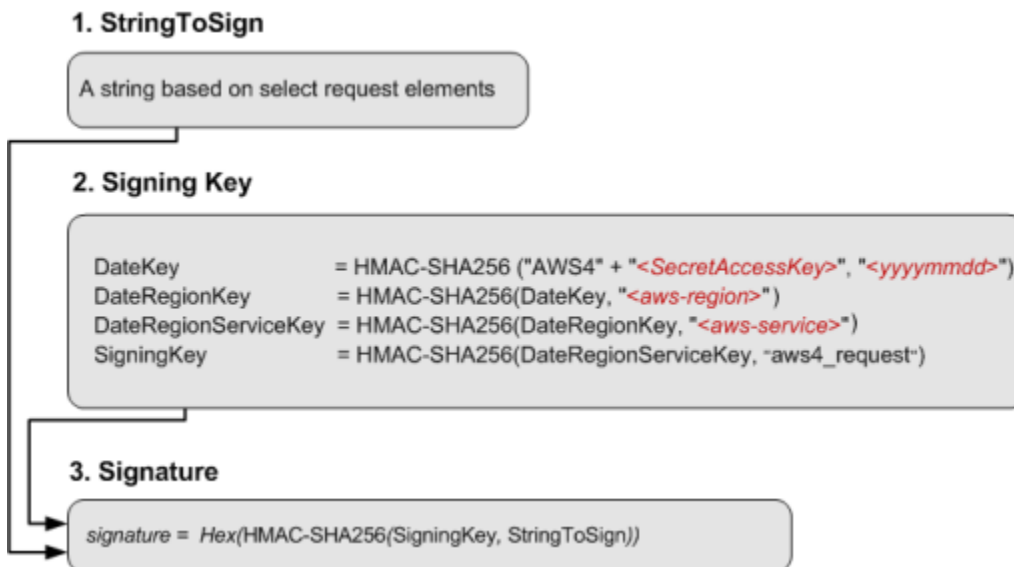

Amazon S3 also supports browser-based uploads that use HTTP POST requests. With an HTTP POST request, you can upload content to Amazon S3 directly from the browser. For information about authenticating POST requests, see [Browser-Based Uploads Using POST \(AWS Signature Version 4\)](#).

## Introduction to Signing Requests

Authentication information that you send in a request must include a signature. To calculate a signature, you first concatenate select request elements to form a string, referred to as the *string to sign*. You then use a signing key to calculate the hash-based message authentication code (HMAC) of the string to sign.

In AWS Signature Version 4, you don't use your secret access key to sign the request. Instead, you first use your secret access key to derive a signing key. The derived signing key is specific to the date, service, and Region. For more information about how to derive a signing key in different programming languages, see [Examples of how to derive a signing key for Signature Version 4](#).

The following diagram illustrates the general process of computing a signature.

The string to sign depends on the request type. For example, when you use the HTTP Authorization header or the query parameters for authentication, you use a varying combination of request elements to create the string to sign. For an HTTP POST request, the POST policy in the request is the string you sign. For more information about computing string to sign, follow links provided at the end of this section.

For signing key, the diagram shows series of calculations, where result of each step you feed into the next step. The final step is the signing key.

Upon receiving an authenticated request, Amazon S3 servers re-create the signature by using the authentication information that is contained in the request. If the signatures match, Amazon S3 processes your request; otherwise, the request is rejected.

For more information about authenticating requests, see the following topics:

- [Authenticating Requests: Using the Authorization Header \(AWS Signature Version 4\)](#)
- [Authenticating Requests: Using Query Parameters \(AWS Signature Version 4\)](#)
- [Browser-Based Uploads Using POST \(AWS Signature Version 4\)](#)

## Authenticating Requests: Using the Authorization Header (AWS Signature Version 4)

### Topics

- [Overview](#)

- [Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk \(AWS Signature Version 4\)](#)
- [Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks \(Chunked Upload\) \(AWS Signature Version 4\)](#)
- [Signature calculations for trailing headers \(chunked uploads\) \(AWS Signature Version 4\)](#)

## Overview

Using the HTTP `Authorization` header is the most common method of providing authentication information. Except for [POST requests](#) and requests that are signed by using query parameters, all Amazon S3 operations use the `Authorization` request header to provide authentication information.

The following is an example of the `Authorization` header value. Line breaks are added to this example for readability:

```
Authorization: AWS4-HMAC-SHA256
Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/s3/aws4_request,
SignedHeaders=host;range;x-amz-date,
Signature=fe5f80f77d5fa3beca038a248ff027d0445342fe2855ddc963176630326f1024
```

The following table describes the various components of the `Authorization` header value in the preceding example:

Component	Description
AWS4-HMAC-SHA256	<p>The algorithm that was used to calculate the signature. You must provide this value when you use AWS Signature Version 4 for authentication.</p> <p>The string specifies AWS Signature Version 4 (AWS4) and the signing algorithm (HMAC-SHA256 ).</p>
Credential	

Component	Description
	<p>Your access key ID and the scope information, which includes the date, Region, and service that were used to calculate the signature.</p> <p>This string has the following form:</p> <pre data-bbox="602 489 1507 606">&lt;your-access-key-id&gt; /&lt;date&gt;/&lt;aws-region&gt; /&lt;aws-service&gt; /aws4_request</pre> <p>Where:</p> <ul style="list-style-type: none"><li>• <i>&lt;date&gt;</i> value is specified using YYYYMMDD format.</li><li>• <i>&lt;aws-service&gt;</i> value is s3 when sending request to Amazon S3.</li></ul>
SignedHeaders	<p>A semicolon-separated list of request headers that you used to compute Signature . The list includes header names only, and the header names must be in lowercase. For example:</p> <pre data-bbox="602 1346 1507 1423">host;range;x-amz-date</pre>
Signature	<p>The 256-bit signature expressed as 64 lowercase hexadecimal characters. For example:</p> <pre data-bbox="602 1612 1507 1730">fe5f80f77d5fa3beca038a248ff027d0445342fe2855d dc963176630326f1024</pre> <p>Note that the signature calculations vary depending on the option you choose to transfer the payload.</p>

The signature calculations vary depending on the method you choose to transfer the request payload. S3 supports the following options:

- **Transfer payload in a single chunk** – In this case, you have the following signature calculation options:
  - **Signed payload option** – You can optionally compute the entire payload checksum and include it in signature calculation. This provides added security but you need to read your payload twice or buffer it in memory.

For example, in order to upload a file, you need to read the file first to compute a payload hash for signature calculation and again for transmission when you create the request. For smaller payloads, this approach might be preferable. However, for large files, reading the file twice can be inefficient, so you might want to upload data in chunks instead.

We recommend you include payload checksum for added security.

- **Unsigned payload option** – Do not include payload checksum in signature calculation.

For step-by-step instructions to calculate signature and construct the Authorization header value, see [Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk \(AWS Signature Version 4\)](#).

- **Transfer payload in multiple chunks (chunked upload)** – In this case you transfer payload in chunks. You can transfer a payload in chunks regardless of the payload size.

You can break up your payload into chunks. These can be fixed or variable-size chunks. By uploading data in chunks, you avoid reading the entire payload to calculate the signature. Instead, for the first chunk, you calculate a seed signature that uses only the request headers. The second chunk contains the signature for the first chunk, and each subsequent chunk contains the signature for the chunk that precedes it. At the end of the upload, you send a final chunk with 0 bytes of data that contains the signature of the last chunk of the payload. For more information, see [Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks \(Chunked Upload\) \(AWS Signature Version 4\)](#).

When signing your requests, you can use either AWS Signature Version 4 or AWS Signature Version 4A. The key difference between the two is determined by how the signature is calculated. With AWS Signature Version 4A, the signature does not include Region-specific information and is calculated using the AWS4-ECDSA-P256-SHA256 algorithm.

In addition to these options, you have the option of including a trailer with your request. In order to include a trailer with your request, you need to specify that in the header by setting `x-amz-content-sha256` to the appropriate value. If you are using a trailing header, you must include `x-amz-trailer` in the header and specify the trailing header names as a string in a comma-separated list. All trailing headers are written after the final chunk. If you're uploading the data in multiple chunks, you must send a final chunk with 0 bytes of data before sending the trailing header.

When you send a request, you must tell Amazon S3 which of the preceding options you have chosen in your signature calculation, by adding the `x-amz-content-sha256` header with one of the following values:

Header value	Description
Actual payload checksum value	This value is the actual checksum of your object and is only possible when you are uploading the data in a single chunk.
UNSIGNED-PAYLOAD	Use this when you are uploading the object as a single unsigned chunk.
STREAMING-UNSIGNED-PAYLOAD-TRAILER	Use this when sending an unsigned payload over multiple chunks. In this case you also have a trailing header after the chunk is uploaded.
STREAMING-AWS4-HMAC-SHA256-PAYLOAD	Use this when sending a payload over multiple chunks, and the chunks are signed using <code>AWS4-HMAC-SHA256</code> . This produces a SigV4 signature.
STREAMING-AWS4-HMAC-SHA256-PAYLOAD-TRAILER	Use this when sending a payload over multiple chunks, and the chunks are signed using <code>AWS4-HMAC-SHA256</code> . This produces a SigV4 signature. In addition, the digest for the chunks is included as a trailing header.
STREAMING-AWS4-ECDSA-P256-SHA256-PAYLOAD	Use this when sending a payload over multiple chunks, and the chunks are signed using <code>AWS4-ECDSA-P256-SHA256</code> . This produces a SigV4A signature.

Header value	Description
STREAMING-AWS4-ECDSA-P256-SHA256-PAYLOAD-TRAILER	Use this when sending a payload over multiple chunks, and the chunks are signed using AWS4-ECDSA-P256-SHA256. This produces a SigV4A signature. In addition, the digest for the chunks is included as a trailing header.

Upon receiving the request, Amazon S3 re-creates the string to sign using information in the `Authorization` header and the date header. It then verifies with authentication service the signatures match. The request date can be specified by using either the `HTTP Date` or the `x-amz-date` header. If both headers are present, `x-amz-date` takes precedence.

If the signatures match, Amazon S3 processes your request; otherwise, your request will fail.

For more information, see the following topics:

[Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk \(AWS Signature Version 4\)](#)

[Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks \(Chunked Upload\) \(AWS Signature Version 4\)](#)

[Signature calculations for trailing headers \(chunked uploads\) \(AWS Signature Version 4\)](#)

## Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (AWS Signature Version 4)

When using the `Authorization` header to authenticate requests, the header value includes, among other things, a signature. The signature calculations vary depending on the choice you make for transferring the payload ([Overview](#)). This section explains signature calculations when you choose to transfer the payload in a single chunk. The example section (see [Examples: Signature Calculations](#)) shows signature calculations and resulting `Authorization` headers that you can use as a test suite to verify your code.

### Important

When transferring payload in a single chunk, you can optionally choose to include the payload hash in the signature calculations, referred as *signed payload* (if you don't include

it, the payload is considered *unsigned*). The signing procedure discussed in the following section applies to both, but note the following differences:

- **Signed payload option** – You include the payload hash when constructing the canonical request (that then becomes part of `StringToSign`, as explained in the signature calculation section). You also specify the same value as the `x-amz-content-sha256` header value when sending the request to S3.
- **Unsigned payload option** – You include the literal string `UNSIGNED-PAYLOAD` when constructing a canonical request, and set the same value as the `x-amz-content-sha256` header value when sending the request to Amazon S3.

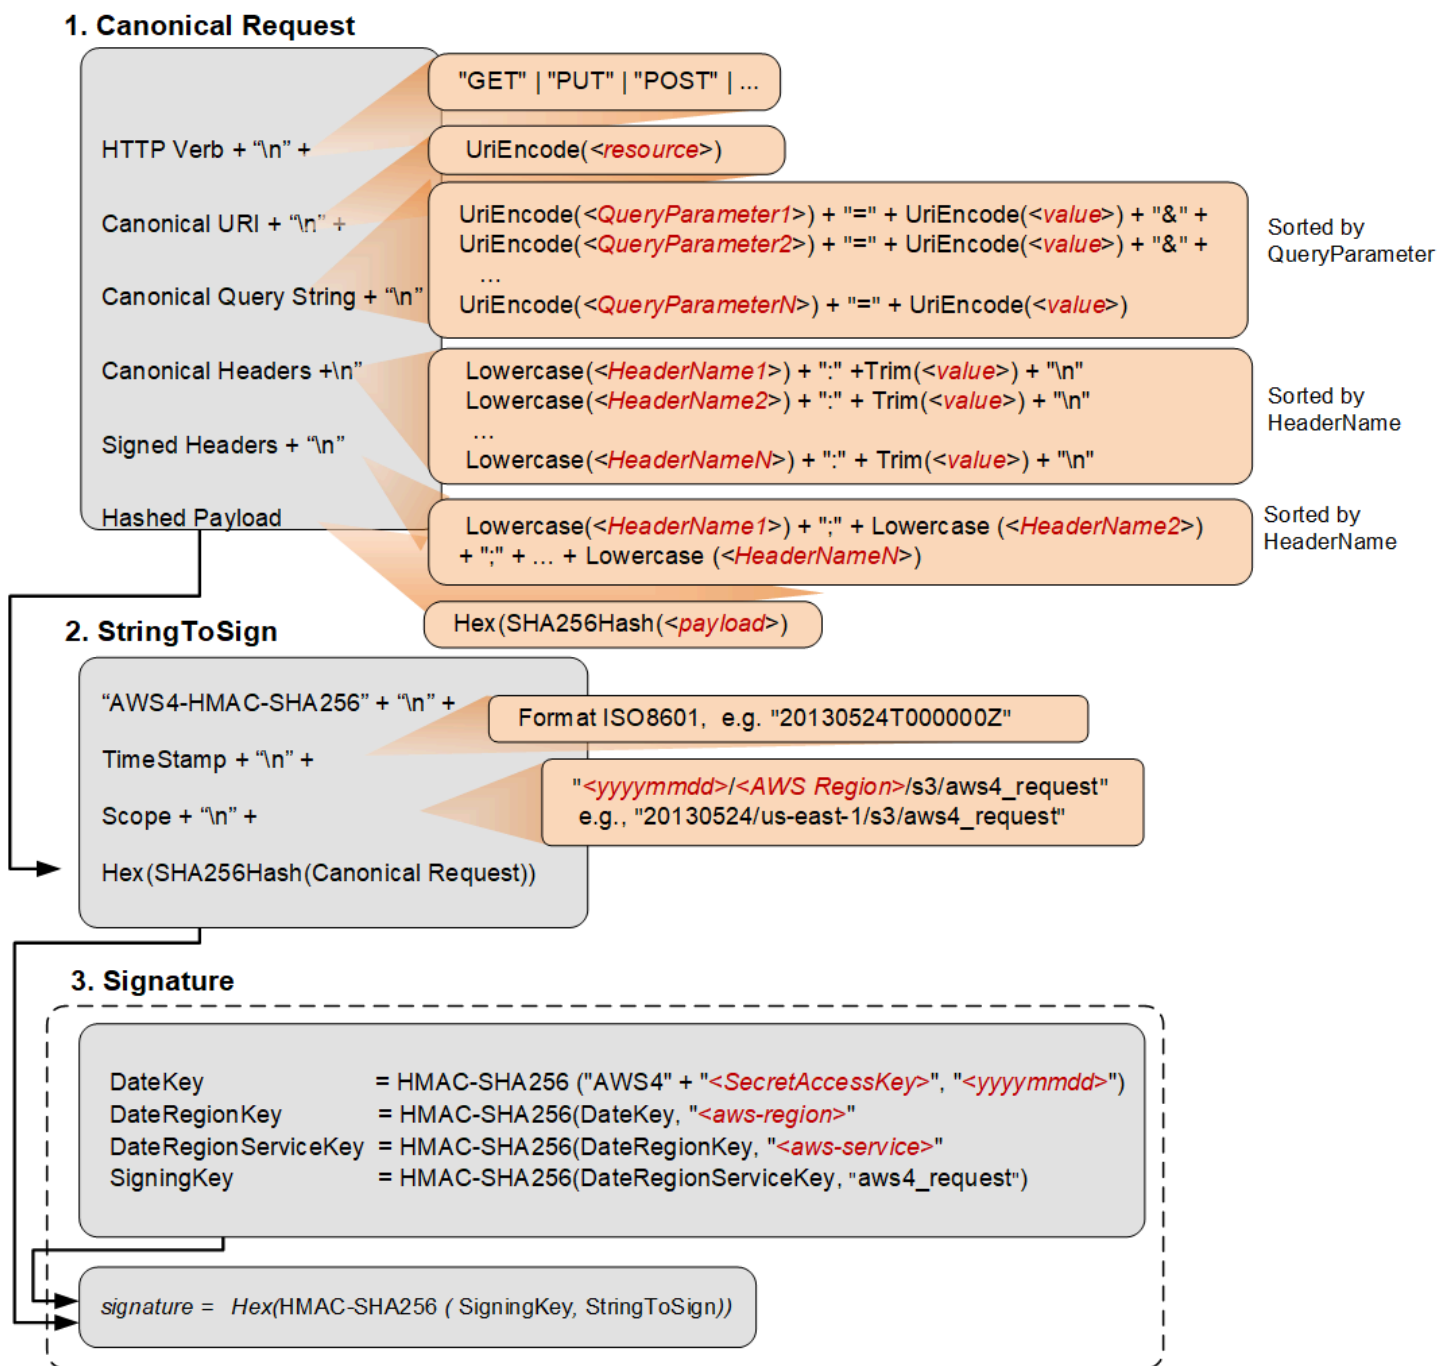

When you send your request to Amazon S3, the `x-amz-content-sha256` header value informs Amazon S3 whether the payload is signed or not. Amazon S3 can then create the signature accordingly for verification.

In both cases, because the `x-amz-content-sha256` header value is already part of your `HashedPayload`, you are not required to include the `x-amz-content-sha256` header as a canonical header.

## Calculating a Signature

To calculate a signature, you first need a string to sign. You then calculate a HMAC-SHA256 hash of the string to sign by using a signing key. The following diagram illustrates the process, including the various components of the string that you create for signing

When Amazon S3 receives an authenticated request, it computes the signature and then compares it with the signature that you provided in the request. For that reason, you must compute the signature by using the same method that is used by Amazon S3. The process of putting a request in an agreed-upon form for signing is called canonicalization.

The following table describes the functions that are shown in the diagram. You need to implement code for these functions.

Function	Description
<code>Lowercase()</code>	Convert the string to lowercase.

Function	Description
<code>Hex()</code>	Lowercase base 16 encoding.
<code>SHA256Hash()</code>	Secure Hash Algorithm (SHA) cryptographic hash function.
<code>HMAC-SHA256()</code>	Computes HMAC by using the SHA256 algorithm with the signing key provided. This is the final signature.
<code>Trim()</code>	Remove any leading or trailing whitespace.

Function	Description
UriEncode()	<p>URI encode every byte. UriEncode() must enforce the following rules:</p> <ul style="list-style-type: none"><li>• URI encode every byte except the unreserved characters: 'A'-'Z', 'a'-'z', '0'-'9', '-', '.', '_', and '~'.</li><li>• The space character is a reserved character and must be encoded as "%20" (and not as "+").</li><li>• Each URI encoded byte is formed by a '%' and the two-digit hexadecimal value of the byte.</li><li>• Letters in the hexadecimal value must be uppercase, for example "%1A".</li><li>• Encode the forward slash character, '/', everywhere except in the object key name. For example, if the object key name is photos/Jan/sample.jpg , the forward slash in the key name is not encoded.</li></ul> <div data-bbox="597 1024 1507 1436" style="border: 1px solid #f08080; border-radius: 10px; padding: 10px;"><p> <b>Important</b></p><p>The standard UriEncode functions provided by your development platform may not work because of differences in implementation and related ambiguity in the underlying RFCs. We recommend that you write your own custom UriEncode function to ensure that your encoding will work.</p></div> <p>To see an example of a UriEncode function in Java, see <a href="#">Java Utilities</a> on the GitHub website.</p>

## Task 1: Create a Canonical Request

This section provides an overview of creating a canonical request.

The following is the canonical request format that Amazon S3 uses to calculate a signature. For signatures to match, you must create a canonical request in this format:

```
<HTTPMethod>\n
<CanonicalURI>\n
<CanonicalQueryString>\n
<CanonicalHeaders>\n
<SignedHeaders>\n
<HashedPayload>
```

Where:

- *HTTPMethod* is one of the HTTP methods, for example GET, PUT, HEAD, and DELETE.
- *CanonicalURI* is the URI-encoded version of the absolute path component of the URI—everything starting with the "/" that follows the domain name and up to the end of the string or to the question mark character (?) if you have query string parameters. The URI in the following example, /examplebucket/myphoto.jpg, is the absolute path and you don't encode the "/" in the absolute path:

```
http://s3.amazonaws.com/examplebucket/myphoto.jpg
```

#### Note

You do not normalize URI paths for requests to Amazon S3. For example, you may have a bucket with an object named "my-object//example//photo.user". Normalizing the path changes the object name in the request to "my-object/example/photo.user". This is an incorrect path for that object.

- *CanonicalQueryString* specifies the URI-encoded query string parameters. You URI-encode name and values individually. You must also sort the parameters in the canonical query string alphabetically by key name. The sorting occurs after encoding. The query string in the following URI example is prefix=somePrefix&marker=someMarker&max-keys=20:

```
http://s3.amazonaws.com/examplebucket?prefix=somePrefix&marker=someMarker&max-keys=20
```

The canonical query string is as follows (line breaks are added to this example for readability):

```
UriEncode("marker")+ "=" + UriEncode("someMarker") + "&" +  
UriEncode("max-keys")+ "=" + UriEncode("20") + "&" +  
UriEncode("prefix")+ "=" + UriEncode("somePrefix")
```

When a request targets a subresource, the corresponding query parameter value will be an empty string (""). For example, the following URI identifies the ACL subresource on the `examplebucket` bucket:

```
http://s3.amazonaws.com/examplebucket?acl
```

The `CanonicalQueryString` in this case is as follows:

```
UriEncode("acl") + "=" + ""
```

If the URI does not include a '?', there is no query string in the request, and you set the canonical query string to an empty string (""). You will still need to include the `"\n"`.

- *CanonicalHeaders* is a list of request headers with their values. Individual header name and value pairs are separated by the newline character ("`\n`"). Header names must be in lowercase. You must sort the header names alphabetically to construct the string, as shown in the following example:

```
Lowercase(<HeaderName1>)+ ":" + Trim(<value>) + "\n"  
Lowercase(<HeaderName2>)+ ":" + Trim(<value>) + "\n"  
...  
Lowercase(<HeaderNameN>)+ ":" + Trim(<value>) + "\n"
```

The `Lowercase()` and `Trim()` functions used in this example are described in the preceding section.

The *CanonicalHeaders* list must include the following:

- HTTP host header.

- If the Content-MD5 header is present in the request, you must add it to the *CanonicalHeaders* list.
- Any x-amz-\* headers that you plan to include in your request must also be added. For example, if you are using temporary security credentials, you need to include x-amz-security-token in your request. You must add this header in the list of *CanonicalHeaders*.

**Note**

- The x-amz-content-sha256 header is required for all AWS Signature Version 4 requests. It provides a hash of the request payload. However, you are not required to include the x-amz-content-sha256 as a canonical header because S3 will automatically use its value when calculating the payload hash sent in the request.
- If there is no payload, you must provide the hash of an empty string.
- If you do not want S3 to check against the hash of the request, you can use the literal string "UNSIGNED-PAYLOAD" instead.

The following are example CanonicalHeaders strings. The header names are in lowercase and sorted.

**Example Example 1**

```
host:s3.amazonaws.com
x-amz-content-sha256:e3b0c44298fc1c149afb4c8996fb92427ae41e4649b934ca495991b7852b855
x-amz-date:20130708T220855Z
```

**Example Example 2**

```
host:s3.amazonaws.com
x-amz-content-sha256:UNSIGNED-PAYLOAD
x-amz-date:20130708T220855Z
```

**Example Example 3**

```
host:s3.amazonaws.com
x-amz-date:20130708T220855Z
```

**Note**

For the purpose of calculating an authorization signature, the host header and all `x-amz-*` headers, excluding `x-amz-content-sha256`, are required. However, in order to prevent data tampering, you should consider including all the headers in the signature calculation.

Signing the `x-amz-content-sha256` header is optional because S3 will use its value when calculating the received request payload hash.

- *SignedHeaders* is an alphabetically sorted, semicolon-separated list of lowercase request header names. The request headers in the list are the same headers that you included in the CanonicalHeaders string. In the previous examples, the value of *SignedHeaders* would be as follows:

**Example Examples 1 and 2**

```
host;x-amz-content-sha256;x-amz-date
```

**Example Example 3**

```
host;x-amz-date
```

- *HashedPayload* is the hexadecimal value of the SHA256 hash of the request payload.

```
Hex(SHA256Hash(<payload>))
```

If there is no payload in the request, you compute a hash of the empty string as follows:

```
Hex(SHA256Hash(""))
```

The hash returns the following value:

```
e3b0c44298fc1c149afb4c8996fb92427ae41e4649b934ca495991b7852b855
```

For example, when you upload an object by using a PUT request, you provide object data in the body. When you retrieve an object by using a GET request, you compute the empty string hash.

## Task 2: Create a String to Sign

This section provides an overview of creating a string to sign. For step-by-step instructions, see [Task 2: Create a String to Sign](#) in the *AWS General Reference*.

The string to sign is a concatenation of the following strings:

```
"AWS4-HMAC-SHA256" + "\n" +  
timeStampISO8601Format + "\n" +  
<Scope> + "\n" +  
Hex(SHA256Hash(<CanonicalRequest>))
```

The constant string `AWS4-HMAC-SHA256` specifies the hash algorithm that you are using, HMAC-SHA256. The `timeStamp` is the current UTC time in ISO 8601 format (for example, `20130524T000000Z`).

Scope binds the resulting signature to a specific date, an AWS Region, and a service. Thus, your resulting signature will work only in the specific Region and for a specific service. The signature is valid for seven days after the specified date.

```
date.Format(<YYYYMMDD>) + "/" + <region> + "/" + <service> + "/aws4_request"
```

For Amazon S3, the service string is `s3`. For a list of *region* strings, see [Regions and Endpoints](#) in the *AWS General Reference*. The Region column in this table provides the list of valid Region strings.

The following scope restricts the resulting signature to the `us-east-1` Region and Amazon S3.

```
20130606/us-east-1/s3/aws4_request
```

### Note

Scope must use the same date that you use to compute the signing key, as discussed in the following section.

### Task 3: Calculate Signature

In AWS Signature Version 4, instead of using your AWS access keys to sign a request, you first create a signing key that is scoped to a specific Region and service. For more information about signing keys, see [Introduction to Signing Requests](#).

```
DateKey           = HMAC-SHA256("AWS4"+"<SecretAccessKey>", "<YYYYMMDD>")
DateRegionKey     = HMAC-SHA256(<DateKey>, "<aws-region>")
DateRegionServiceKey = HMAC-SHA256(<DateRegionKey>, "<aws-service>")
SigningKey        = HMAC-SHA256(<DateRegionServiceKey>, "aws4_request")
```

#### Note

Some use cases can process signature keys for up to 7 days. For more information see [Share an Object with Others](#).

For a list of Region strings, see [Regions and Endpoints](#) in the *AWS General Reference*.

Using a signing key enables you to keep your AWS credentials in one safe place. For example, if you have multiple servers that communicate with Amazon S3, you share the signing key with those servers; you don't have to keep a copy of your secret access key on each server. Signing key is valid for up to seven days. So each time you calculate signing key you will need to share the signing key with your servers. For more information, see [Authenticating Requests \(AWS Signature Version 4\)](#).

The final signature is the HMAC-SHA256 hash of the string to sign, using the signing key as the key.

```
HMAC-SHA256(SigningKey, StringToSign)
```

For step-by-step instructions on creating a signature, see [Task 3: Create a Signature](#) in the *AWS General Reference*.

### Examples: Signature Calculations

You can use the examples in this section as a reference to check signature calculations in your code. The calculations shown in the examples use the following data:

- Example access keys.

Parameter	Value
AWSAccessKeyId	AKIAIOSFODNN7EXAMPLE
AWSecretAccessKey	wJalrXUtnFEMI/K7MDENG/bPxrFiCYEXAMPLEKEY

- Request timestamp of 20130524T000000Z (Fri, 24 May 2013 00:00:00 GMT).
- Bucket name examplebucket.
- The bucket is assumed to be in the US East (N. Virginia) Region. The credential Scope and the Signing Key calculations use us-east-1 as the Region specifier. For information about other Regions, see [Regions and Endpoints](#) in the *AWS General Reference*.
- You can use either path-style or virtual hosted-style requests. The following examples show how to sign a virtual hosted-style request, for example:

```
https://examplebucket.s3.amazonaws.com/photos/photo1.jpg
```

For more information, see [Virtual Hosting of Buckets](#) in the *Amazon Simple Storage Service User Guide*.

### Example: GET Object

The following example gets the first 10 bytes of an object (test.txt) from examplebucket. For more information about the API action, see [GetObject](#).

```
GET /test.txt HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Authorization: SignatureToBeCalculated
Range: bytes=0-9
x-amz-content-sha256: e3b0c44298fc1c149afb4c8996fb92427ae41e4649b934ca495991b7852b855
x-amz-date: 20130524T000000Z
```

Because this GET request does not provide any body content, the x-amz-content-sha256 value can either be the hash of the empty request body or the literal string "UNSIGNED-PAYLOAD". The

following steps show signature calculations and construction of the Authorization header using the hash of an empty string.

## 1. StringToSign

### a. CanonicalRequest

```
GET
/test.txt

host:examplebucket.s3.amazonaws.com
range:bytes=0-9
x-amz-content-sha256:e3b0c44298fc1c149afb4c8996fb92427ae41e4649b934ca495991b7852b855
x-amz-date:20130524T000000Z

host;range;x-amz-content-sha256;x-amz-date
e3b0c44298fc1c149afb4c8996fb92427ae41e4649b934ca495991b7852b855
```

In the canonical request string, the last line is the hash of the empty request body. The third line is empty because there are no query parameters in the request.

### b. StringToSign

```
AWS4-HMAC-SHA256
20130524T000000Z
20130524/us-east-1/s3/aws4_request
7344ae5b7ee6c3e7e6b0fe0640412a37625d1fbfff95c48bbb2dc43964946972
```

## 2. SigningKey

```
signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" +
"<YourSecretAccessKey>", "20130524"), "us-east-1"), "s3"), "aws4_request")
```

## 3. Signature

```
f0e8bdb87c964420e857bd35b5d6ed310bd44f0170aba48dd91039c6036bdb41
```

## 4. Authorization header

The resulting Authorization header is as follows:

```
AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/
s3/aws4_request,SignedHeaders=host;range;x-amz-content-sha256;x-amz-
date,Signature=f0e8bdb87c964420e857bd35b5d6ed310bd44f0170aba48dd91039c6036bdb41
```

### Example: PUT Object

This example PUT request creates an object (`test$file.txt`) in `examplebucket`. The example assumes the following:

- You are requesting `REDUCED_REDUNDANCY` as the storage class by adding the `x-amz-storage-class` request header. For information about storage classes, see [Storage Classes](#) in the *Amazon Simple Storage Service User Guide*.
- The content of the uploaded file is a string, "Welcome to Amazon S3." The value of `x-amz-content-sha256` in the request is based on this string.

For information about the API action, see [PutObject](#).

```
PUT test$file.txt HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Fri, 24 May 2013 00:00:00 GMT
Authorization: SignatureToBeCalculated
x-amz-date: 20130524T000000Z
x-amz-storage-class: REDUCED_REDUNDANCY
x-amz-content-sha256: 44ce7dd67c959e0d3524ffac1771dfbba87d2b6b4b4e99e42034a8b803f8b072

<Payload>
```

The following steps show signature calculations.

## 1. StringToSign

### a. CanonicalRequest

```
PUT
/test%24file.text

date:Fri, 24 May 2013 00:00:00 GMT
host:examplebucket.s3.amazonaws.com
x-amz-content-
sha256:44ce7dd67c959e0d3524ffac1771dfbba87d2b6b4b4e99e42034a8b803f8b072
x-amz-date:20130524T000000Z
x-amz-storage-class:REDUCED_REDUNDANCY

date;host;x-amz-content-sha256;x-amz-date;x-amz-storage-class
44ce7dd67c959e0d3524ffac1771dfbba87d2b6b4b4e99e42034a8b803f8b072
```

In the canonical request, the third line is empty because there are no query parameters in the request. The `x-amz-content-sha256` canonical header may optionally be signed since its payload hash is already provided at the bottom of the request. The last line is the hash of the body, which should be the same as the `x-amz-content-sha256` header value sent to S3 in the HTTP request.

### b. StringToSign

```
AWS4-HMAC-SHA256
20130524T000000Z
20130524/us-east-1/s3/aws4_request
9e0e90d9c76de8fa5b200d8c849cd5b8dc7a3be3951ddb7f6a76b4158342019d
```

## 2. SigningKey

```
signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" +
"<YourSecretAccessKey>", "20130524"), "us-east-1"), "s3"), "aws4_request")
```

## 3. Signature

```
98ad721746da40c64f1a55b78f14c238d841ea1380cd77a1b5971af0ece108bd
```

#### 4. Authorization header

The resulting Authorization header is as follows:

```
AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/s3/
aws4_request, SignedHeaders=date;host;x-amz-content-sha256;x-amz-date;x-amz-storage-
class, Signature=98ad721746da40c64f1a55b78f14c238d841ea1380cd77a1b5971af0ece108bd
```

#### Example: GET Bucket Lifecycle

The following GET request retrieves the lifecycle configuration of `examplebucket`. For information about the API action, see [GetBucketLifecycleConfiguration](#).

```
GET ?lifecycle HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Authorization: SignatureToBeCalculated
x-amz-date: 20130524T000000Z
x-amz-content-sha256: e3b0c44298fc1c149afb4c8996fb92427ae41e4649b934ca495991b7852b855
```

Because the request does not provide any body content, the `x-amz-content-sha256` header value is the hash of the empty request body. The following steps show signature calculations.

#### 1. StringToSign

##### a. CanonicalRequest

```
GET
/
lifecycle=
host:examplebucket.s3.amazonaws.com
x-amz-content-
sha256:e3b0c44298fc1c149afb4c8996fb92427ae41e4649b934ca495991b7852b855
x-amz-date:20130524T000000Z

host;x-amz-content-sha256;x-amz-date
```

```
e3b0c44298fc1c149afb4c8996fb92427ae41e4649b934ca495991b7852b855
```

In the canonical request, the last line is the hash of the empty request body.

## b. **StringToSign**

```
AWS4-HMAC-SHA256  
20130524T000000Z  
20130524/us-east-1/s3/aws4_request  
9766c798316ff2757b517bc739a67f6213b4ab36dd5da2f94eaebf79c77395ca
```

## 2. **SigningKey**

```
signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" +  
"<YourSecretAccessKey>", "20130524"), "us-east-1"), "s3"), "aws4_request")
```

## 3. **Signature**

```
fea454ca298b7da1c68078a5d1bdbfbbe0d65c699e0f91ac7a200a0136783543
```

## 4. **Authorization header**

The resulting Authorization header is as follows:

```
AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/  
s3/aws4_request,SignedHeaders=host;x-amz-content-sha256;x-amz-  
date,Signature=fea454ca298b7da1c68078a5d1bdbfbbe0d65c699e0f91ac7a200a0136783543
```

## **Example: Get Bucket (List Objects)**

The following example retrieves a list of objects from `examplebucket` bucket. For information about the API action, see [ListObjects](#).

```
GET ?max-keys=2&prefix=J HTTP/1.1  
Host: examplebucket.s3.amazonaws.com
```

```
Authorization: SignatureToBeCalculated
x-amz-date: 20130524T000000Z
x-amz-content-sha256: e3b0c44298fc1c149afb4c8996fb92427ae41e4649b934ca495991b7852b855
```

Because the request does not provide a body, the value of `x-amz-content-sha256` is the hash of the empty request body. The following steps show signature calculations.

## 1. StringToSign

### a. CanonicalRequest

```
GET
/
max-keys=2&prefix=J
host:examplebucket.s3.amazonaws.com
x-amz-content-
sha256:e3b0c44298fc1c149afb4c8996fb92427ae41e4649b934ca495991b7852b855
x-amz-date:20130524T000000Z

host;x-amz-content-sha256;x-amz-date
e3b0c44298fc1c149afb4c8996fb92427ae41e4649b934ca495991b7852b855
```

In the canonical string, the last line is the hash of the empty request body.

### b. StringToSign

```
AWS4-HMAC-SHA256
20130524T000000Z
20130524/us-east-1/s3/aws4_request
df57d21db20da04d7fa30298dd4488ba3a2b47ca3a489c74750e0f1e7df1b9b7
```

## 2. SigningKey

```
signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" +
"<YourSecretAccessKey>", "20130524"), "us-east-1"), "s3"), "aws4_request")
```

## 3. Signature

```
34b48302e7b5fa45bde8084f4b7868a86f0a534bc59db6670ed5711ef69dc6f7
```

#### 4. Authorization header

The resulting Authorization header is as follows:

```
AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/  
s3/aws4_request,SignedHeaders=host;x-amz-content-sha256;x-amz-  
date,Signature=34b48302e7b5fa45bde8084f4b7868a86f0a534bc59db6670ed5711ef69dc6f7
```

## Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks (Chunked Upload) (AWS Signature Version 4)

As described in the [Overview](#), when authenticating requests using the `Authorization` header, you have an option of uploading the payload in chunks. You can send data in fixed size or variable size chunks. This section describes the signature calculation process in chunked upload, how you create the chunk body, and how the delayed signing works where you first upload the chunk, and send its signature in the subsequent chunk. The example section (see [Example: PUT Object](#)) shows signature calculations and resulting `Authorization` headers that you can use as a test suite to verify your code.

### Note

When transferring data in a series of chunks, you must do one of the following:

- Explicitly specify the total content length (object length in bytes plus metadata in each chunk) using the `Content-Length` HTTP header. To do this, you must pre-compute the total length of the payload, including the metadata that you send in each chunk, before starting your request.
- Specify the `Transfer-Encoding` HTTP header. If you include the `Transfer-Encoding` header and specify any value other than `identity`, you must omit the `Content-Length` header.

For all requests, you must include the `x-amz-decoded-content-length` header, specifying the size of the object in bytes.

Each chunk signature calculation includes the signature of the previous chunk. To begin, you create a *seed* signature using only the headers. You use the seed signature in the signature calculation of the first chunk. For each subsequent chunk, you create a chunk signature that includes the signature of the previous chunk. Thus, the chunk signatures are chained together; that is, the signature of chunk  $n$  is a function  $F(\text{chunk } n, \text{signature}(\text{chunk } n-1))$ . The chaining ensures that you send the chunks in the correct order.

To perform a chunked upload, do the following:

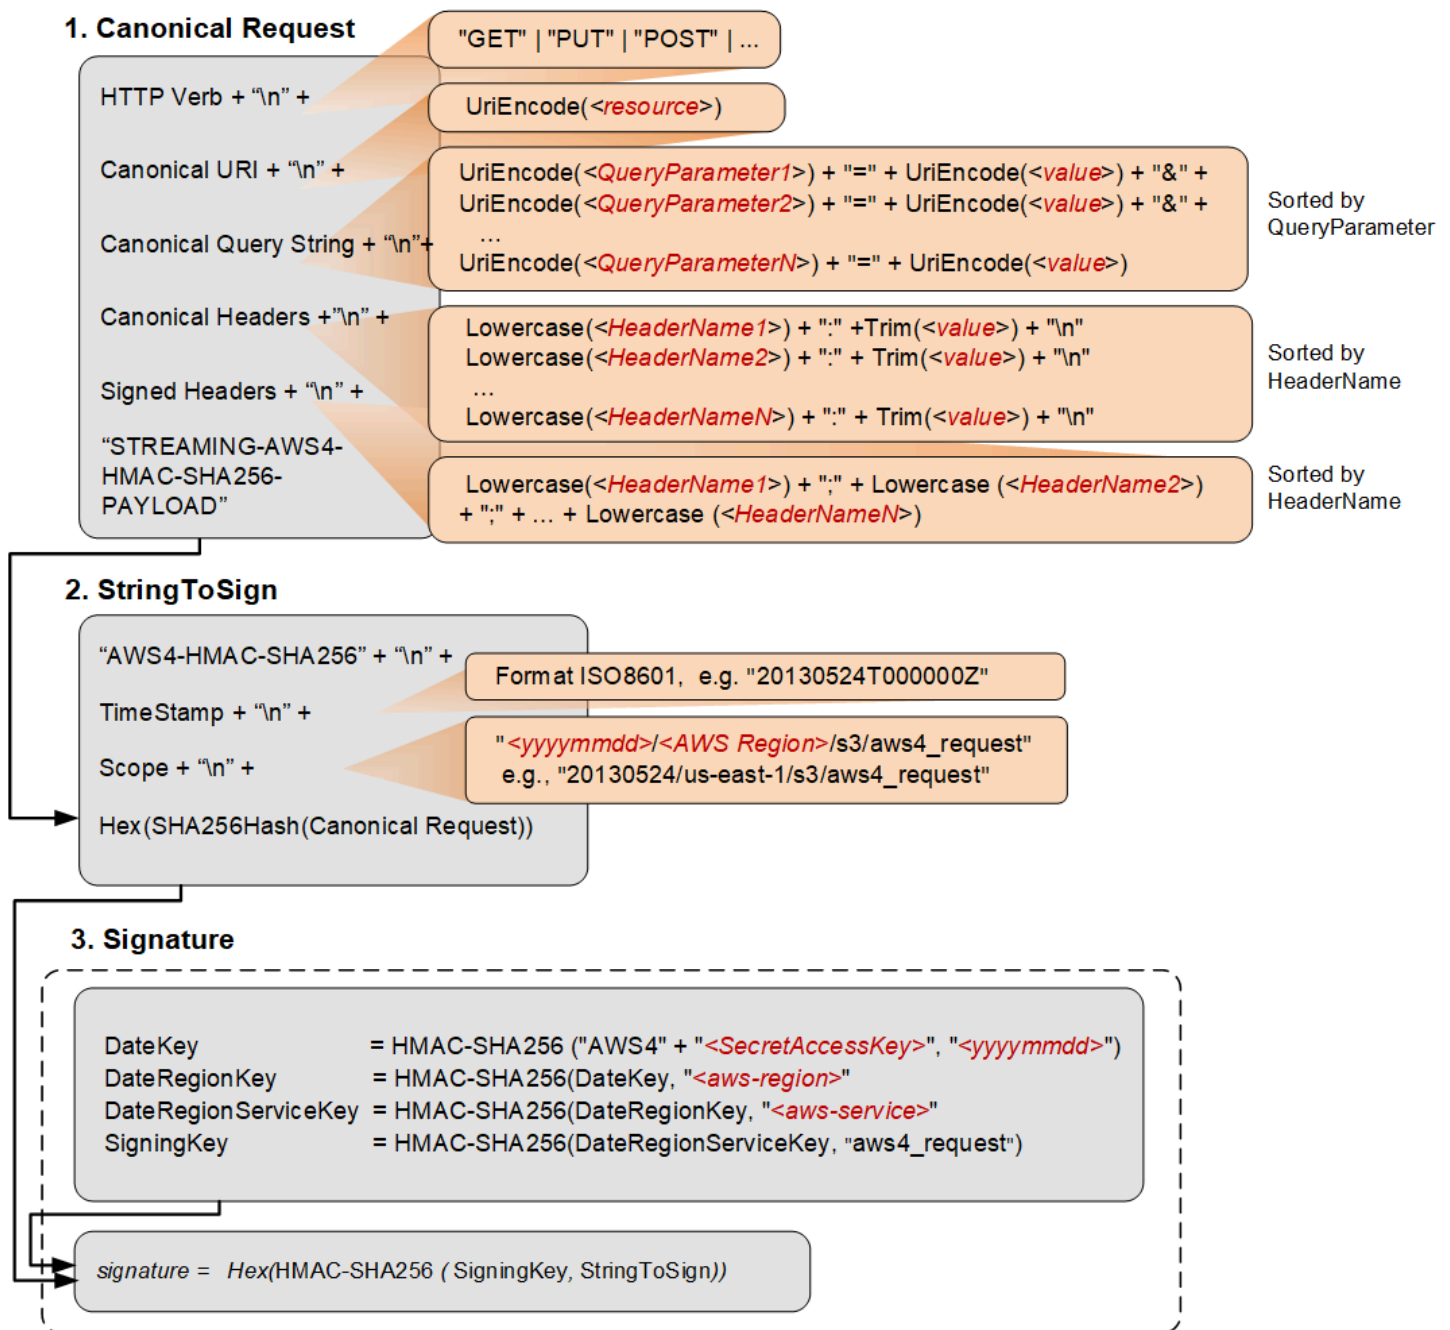

1. Decide the payload chunk size. You need this when you write the code.

The chunk size must be at least 8 KB. We recommend a chunk size of at least 64 KB for better performance. This chunk size applies to all chunks except the last one. The last chunk you send can be smaller than 8 KB. If your payload is small and can fit into one chunk, then it can be smaller than the 8 KB.

2. Create the seed signature for inclusion in the first chunk. For more information, see [Calculating the Seed Signature](#).
3. Create the first chunk and stream it. For more information, see [Defining the Chunk Body](#).
4. For each subsequent chunk, calculate the chunk signature that includes the previous signature in the string you sign, construct the chunk, and send it. For more information, see [Defining the Chunk Body](#).
5. Send the final additional chunk, which is the same as the other chunks in the construction, but it has zero data bytes. For more information, see [Defining the Chunk Body](#).

## Calculating the Seed Signature

The following diagram illustrates the process of calculating the seed signature.

The following table describes the functions that are shown in the diagram. You need to implement code for these functions.

Function	Description
<code>Lowercase()</code>	Convert the string to lowercase.
<code>Hex()</code>	Lowercase base 16 encoding.

Function	Description
SHA256Hash()	Secure Hash Algorithm (SHA) cryptographic hash function.
HMAC-SHA256()	Computes HMAC by using the SHA256 algorithm with the signing key provided. This is the final signature.
Trim()	Remove any leading or trailing whitespace.

Function	Description
UriEncode()	<p>URI encode every byte. UriEncode() must enforce the following rules:</p> <ul style="list-style-type: none"><li>• URI encode every byte except the unreserved characters: 'A'-'Z', 'a'-'z', '0'-'9', '-', '.', '_', and '~'.</li><li>• The space character is a reserved character and must be encoded as "%20" (and not as "+").</li><li>• Each URI encoded byte is formed by a '%' and the two-digit hexadecimal value of the byte.</li><li>• Letters in the hexadecimal value must be uppercase, for example "%1A".</li><li>• Encode the forward slash character, '/', everywhere except in the object key name. For example, if the object key name is photos/Jan/sample.jpg , the forward slash in the key name is not encoded.</li></ul> <div data-bbox="597 1024 1507 1436" style="border: 1px solid #f08080; border-radius: 10px; padding: 10px;"><p><b> Important</b></p><p>The standard UriEncode functions provided by your development platform may not work because of differences in implementation and related ambiguity in the underlying RFCs. We recommend that you write your own custom UriEncode function to ensure that your encoding will work.</p></div> <p>To see an example of a UriEncode function in Java, see <a href="#">Java Utilities</a> on the GitHub website.</p>

For information about the signing process, see [Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk \(AWS Signature Version 4\)](#). The process is the same, except that the creation of CanonicalRequest differs as follows:

- In addition to the request headers you plan to add, you must include the following headers:

Header	Description
<code>x-amz-content-sha256</code>	<p>This header is required for all AWS Signature Version 4 requests. Set the value to <code>STREAMING-AWS4-HMAC-SHA256-PAYLOAD</code> to indicate that the signature covers only headers and that there is no payload.</p>
<code>Content-Encoding</code>	<p>Set the value to <code>aws-chunked</code> .</p> <p>Amazon S3 supports multiple content encoding values. You can specify your custom content-encoding when using the Signature Version 4 streaming API.</p> <p>For example:</p> <pre>Content-Encoding : aws-chunked,gzip</pre> <p>Amazon S3 stores the resulting object without the <code>aws-chunked</code> value in the <code>content-encoding</code> header. If <code>aws-chunked</code> is the only value that you pass in the <code>content-encoding</code> header, S3 considers the <code>content-encoding</code> header empty and does not return this header when you retrieve the object.</p>
<code>x-amz-decoded-content-length</code>	<p>Set the value to the length, in bytes, of the data to be chunked, without counting any metadata. For example, if you are uploading a 4 GB file, set the value to 4294967296. This is the raw size of the object to be uploaded (data you want to store in Amazon S3).</p>

Header	Description
Content-Length	Set the value to the actual size of the transmitted HTTP body, which includes the length of your data (value set for <code>x-amz-decoded-content-length</code> ), plus chunk metadata. Each chunk has metadata, such as the signature of the previous chunk. Chunk calculations are discussed in the following section. If you include the <code>Transfer-Encoding</code> header and specify any value other than <code>identity</code> , you must not include the <code>Content-Length</code> header.

You send the first chunk with the seed signature. You must construct the chunk as described in the following section.

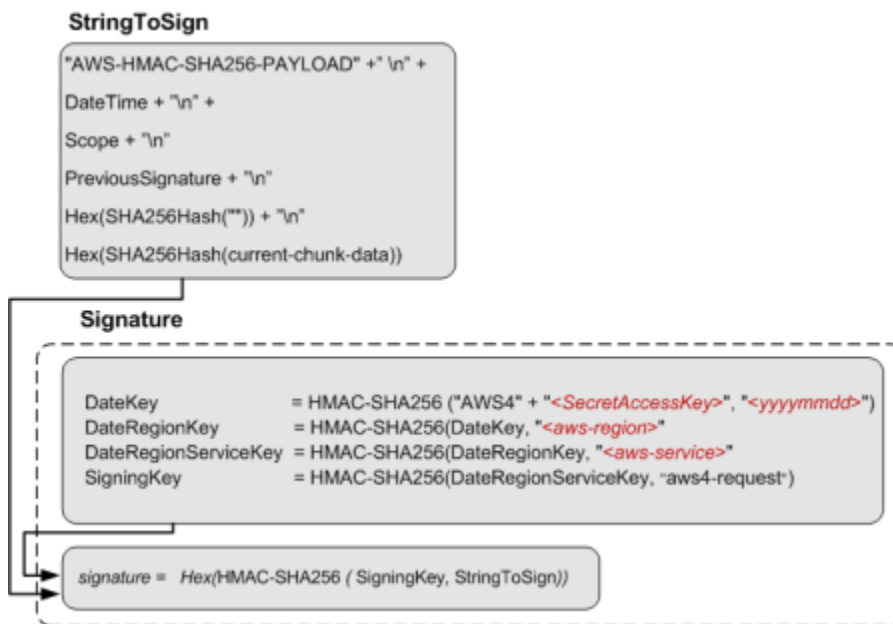

## Defining the Chunk Body

All chunks include some metadata. Each chunk must conform to the following structure:

```
string(IntHexBase(chunk-size)) + ";chunk-signature=" + signature + \r\n + chunk-data + \r\n
```

Where:

- `IntHexBase()` is a function that you write to convert an integer `chunk-size` to hexadecimal. For example, if `chunk-size` is 65536, hexadecimal string is "10000".
- `chunk-size` is the size, in bytes, of the `chunk-data`, without metadata. For example, if you are uploading a 65 KB object and using a chunk size of 64 KB, you upload the data in three chunks: the first would be 64 KB, the second 1 KB, and the final chunk with 0 bytes.
- `signature` For each chunk, you calculate the signature using the following string to sign. For the first chunk, you use the seed-signature as the previous signature.

The size of the final chunk data that you send is 0, although the chunk body still contains metadata, including the signature of the previous chunk.

## Example: PUT Object

You can use the examples in this section as a reference to check signature calculations in your code. Before you review the examples, note the following:

- The signature calculations in these examples use the following example security credentials.

Parameter	Value
AWSAccessKeyId	AKIAIOSFODNN7EXAMPLE
AWSecretAccessKey	wJalrXUtnFEMI/K7MDENG/bPxrFiCYEXAMPLEKEY

- All examples use the request timestamp 20130524T000000Z (Fri, 24 May 2013 00:00:00 GMT).
- All examples use `examplebucket` as the bucket name.

- The bucket is assumed to be in the US East (N. Virginia) Region, and the credential Scope and the Signing Key calculations use `us-east-1` as the Region specifier. For more information, see [Regions and Endpoints](#) in the *Amazon Web Services General Reference*.
- You can use either path style or virtual-hosted style requests. The following examples use virtual-hosted style requests, for example:

```
https://examplebucket.s3.amazonaws.com/photos/photo1.jpg
```

For more information, see [Virtual Hosting of Buckets](#) in the *Amazon Simple Storage Service User Guide*.

The following example sends a PUT request to upload an object. The signature calculations assume the following:

- You are uploading a 65 KB text file, and the file content is a one-character string made up of the letter 'a'.
- The chunk size is 64 KB. As a result, the payload is uploaded in three chunks, 64 KB, 1 KB, and the final chunk with 0 bytes of chunk data.
- The resulting object has the key name `chunkObject.txt`.
- You are requesting `REDUCED_REDUNDANCY` as the storage class by adding the `x-amz-storage-class` request header.

For information about the API action, see [PutObject](#). The general request syntax is as follows:

```
PUT /examplebucket/chunkObject.txt HTTP/1.1
Host: s3.amazonaws.com
x-amz-date: 20130524T000000Z
x-amz-storage-class: REDUCED_REDUNDANCY
Authorization: SignatureToBeCalculated
x-amz-content-sha256: STREAMING-AWS4-HMAC-SHA256-PAYLOAD
Content-Encoding: aws-chunked
x-amz-decoded-content-length: 66560
Content-Length: 66824
<Payload>
```

The following steps show signature calculations.

## 1. Seed signature — Create String to Sign

### a. CanonicalRequest

```
PUT
/examplebucket/chunk0bject.txt

content-encoding:aws-chunked
content-length:66824
host:s3.amazonaws.com
x-amz-content-sha256:STREAMING-AWS4-HMAC-SHA256-PAYLOAD
x-amz-date:20130524T000000Z
x-amz-decoded-content-length:66560
x-amz-storage-class:REDUCED_REDUNDANCY

content-encoding;content-length;host;x-amz-content-sha256;x-amz-date;x-amz-
decoded-content-length;x-amz-storage-class
STREAMING-AWS4-HMAC-SHA256-PAYLOAD
```

In the canonical request, the third line is empty because there are no query parameters in the request. The last line is the constant string provided as the value of the hashed Payload, which should be same as the value of `x-amz-content-sha256` header.

### b. StringToSign

```
AWS4-HMAC-SHA256
20130524T000000Z
20130524/us-east-1/s3/aws4_request
cee3fed04b70f867d036f722359b0b1f2f0e5dc0efadbc082b76c4c60e316455
```

#### Note

For information about each of line in the string to sign, see the diagram that explains seed signature calculation.

## 2. SigningKey

```
signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" +  
"<YourSecretAccessKey>", "20130524"), "us-east-1"), "s3"), "aws4_request")
```

### 3. Seed Signature

```
4f232c4386841ef735655705268965c44a0e4690baa4adea153f7db9fa80a0a9
```

### 4. Authorization header

The resulting Authorization header is as follows:

```
AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/s3/  
aws4_request,SignedHeaders=content-encoding;content-length;host;x-amz-  
content-sha256;x-amz-date;x-amz-decoded-content-length;x-amz-storage-  
class,Signature=4f232c4386841ef735655705268965c44a0e4690baa4adea153f7db9fa80a0a9
```

### 5. Chunk 1: (65536 bytes, with value 97 for letter 'a')

#### a. Chunk string to sign:

```
AWS4-HMAC-SHA256-PAYLOAD  
20130524T000000Z  
20130524/us-east-1/s3/aws4_request  
4f232c4386841ef735655705268965c44a0e4690baa4adea153f7db9fa80a0a9  
e3b0c44298fc1c149afb4c8996fb92427ae41e4649b934ca495991b7852b855  
bf718b6f653bec184e1479f1935b8da974d701b893afcf49e701f3e2f9f9c5a
```

#### Note

For information about each line in the string to sign, see the preceding diagram that shows various components of the string to sign (for example, the last three lines are, previous-signature, hash(""), and hash(current-chunk-data)).

#### b. Chunk signature:

```
ad80c730a21e5b8d04586a2213dd63b9a0e99e0e2307b0ade35a65485a288648
```

c. **Chunk data sent:**

```
10000; chunk-  
signature=ad80c730a21e5b8d04586a2213dd63b9a0e99e0e2307b0ade35a65485a288648  
<65536-bytes>
```

6. **Chunk 2: (1024 bytes, with value 97 for letter 'a')**

a. **Chunk string to sign:**

```
AWS4-HMAC-SHA256-PAYLOAD  
20130524T000000Z  
20130524/us-east-1/s3/aws4_request  
ad80c730a21e5b8d04586a2213dd63b9a0e99e0e2307b0ade35a65485a288648  
e3b0c44298fc1c149afb4c8996fb92427ae41e4649b934ca495991b7852b855  
2edc986847e209b4016e141a6dc8716d3207350f416969382d431539bf292e4a
```

b. **Chunk signature:**

```
0055627c9e194cb4542bae2aa5492e3c1575bbb81b612b7d234b86a503ef5497
```

c. **Chunk data sent:**

```
400; chunk-  
signature=0055627c9e194cb4542bae2aa5492e3c1575bbb81b612b7d234b86a503ef5497  
<1024 bytes>
```

7. **Chunk 3: (0 byte data)**

a. **Chunk string to sign:**

```
AWS4-HMAC-SHA256-PAYLOAD  
20130524T000000Z  
20130524/us-east-1/s3/aws4_request  
0055627c9e194cb4542bae2aa5492e3c1575bbb81b612b7d234b86a503ef5497  
e3b0c44298fc1c149afb4c8996fb92427ae41e4649b934ca495991b7852b855  
e3b0c44298fc1c149afb4c8996fb92427ae41e4649b934ca495991b7852b855
```

b. **Chunk signature:**

```
b6c6ea8a5354eaf15b3cb7646744f4275b71ea724fed81ceb9323e279d449df9
```

c. **Chunk data sent:**

```
0; chunk-  
signature=b6c6ea8a5354eaf15b3cb7646744f4275b71ea724fed81ceb9323e279d449df9
```

## Signature calculations for trailing headers (chunked uploads) (AWS Signature Version 4)

When authenticating requests using the Authorization header, you can also upload the payload in chunks. When you send the data for the object in chunks, you also have the option of including trailing headers. (For more information, see [Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks \(Chunked Upload\) \(AWS Signature Version 4\)](#).) This section describes the steps you need to take when you want to include a trailing header at the end of your multiple chunk upload.

### Important

When you are including trailing headers, you must send the following in your initial header:

- You must set `x-amz-content-sha256` to an appropriate value that indicates a trailer will be included. To see the acceptable values for `x-amz-content-sha256`, see [Authenticating Requests: Using the Authorization Header \(AWS Signature Version 4\)](#).
- You must set `x-amz-trailer` to indicate the contents you are including in your trailing header.

Trailing headers are only sent after the chunks have been uploaded. Previous chunks are sent as normal and signed as described in the previous sections, including sending the final chunk with a payload of 0 bytes. The trailing headers are included as their own chunk and sent after the final chunk with a payload of 0 bytes. For example, if your data ended with a 100 KB chunk, you would send the following:

- Previous data chunks
- 100 KB final chunk of the object
- 0 bytes chunk signifying the end of the object
- Trailing headers chunk

### Examples: Checking signature calculations

You can use the examples in this section as a reference to check signature calculations in your code. Before you review the examples, note the following:

- The signature calculations in these examples use the following example security credentials.

Parameter	Value
AWSAccessKeyId	AKIAIOSFODNN7EXAMPLE
AWSSecret AccessKey	wJalrXUtnFEMI/K7MDENG/bPxrFiCYEXAMPLEKEY

- All examples use the request timestamp 20130524T000000Z (Fri, 24 May 2013 00:00:00 GMT).
- All examples use `examplebucket` as the bucket name.
- The bucket is assumed to be in the US East (N. Virginia) Region, and the credential Scope and the Signing Key calculations use `us-east-1` as the Region specifier. For more information, see [Regions and endpoints](#) in the *Amazon Web Services General Reference*.
- You can use either path style or virtual-hosted style requests. The following examples use virtual-hosted style requests, for example:

```
https://examplebucket.s3.amazonaws.com/photos/photo1.jpg
```

For more information, see [Virtual Hosting of Buckets](#) in the *Amazon Simple Storage Service User Guide*.

The following example sends a PUT request to upload an object. The signature calculations assume the following:

- You are uploading a 65 KB text file, and the file content is a one-character string made up of the letter 'a'.
- The chunk size is 64 KB. As a result, the payload is uploaded in three chunks, 64 KB, 1 KB, and the final chunk with 0 bytes of chunk data.
- The resulting object has the key name `chunkObject.txt`.
- You are requesting `REDUCED_REDUNDANCY` as the storage class by adding the `x-amz-storage-class` request header.
- The transfer is including a CRC32C checksum value as a trailing header.

For information about the API action, see [PutObject](#). The general request syntax is as follows:

```
PUT /examplebucket/chunkObject.txt HTTP/1.1
Host: s3.amazonaws.com
x-amz-date: 20130524T000000Z
x-amz-storage-class: REDUCED_REDUNDANCY
Authorization: SignatureToBeCalculated
x-amz-content-sha256: STREAMING-AWS4-HMAC-SHA256-PAYLOAD-TRAILER
Content-Encoding: aws-chunked
x-amz-decoded-content-length: 66560
x-amz-trailer: x-amz-checksum-crc32c
Content-Length: 66824
<Payload>
```

The following steps show signature calculations.

## 1. Seed signature — Create String to Sign

### a. CanonicalRequest

```
PUT
/examplebucket/chunkObject.txt

content-encoding:aws-chunked
host:s3.amazonaws.com
x-amz-content-sha256:STREAMING-AWS4-HMAC-SHA256-PAYLOAD-TRAILER
x-amz-date:20130524T000000Z
x-amz-decoded-content-length:66560
x-amz-storage-class:REDUCED_REDUNDANCY
x-amz-trailer:x-amz-checksum-crc32c

content-encoding;host;x-amz-content-sha256;x-amz-date;x-amz-decoded-content-
length;x-amz-storage-class;x-amz-trailer
STREAMING-AWS4-HMAC-SHA256-PAYLOAD-TRAILER
```

In the canonical request, the third line is empty because there are no query parameters in the request. The last line is the constant string provided as the value of the hashed Payload, which should be same as the value of `x-amz-content-sha256` header.

### b. StringToSign

```
AWS4-HMAC-SHA256
20130524T000000Z
20130524/us-east-1/s3/aws4_request
44d48b8c2f70eae815a0198cc73d7a546a73a93359c070abbaa5e6c7de112559
```

### Note

For information about each of line in the string to sign, see the diagram that explains seed signature calculation.

## 2. SigningKey

```
signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" +
"<YourSecretAccessKey>", "20130524"), "us-east-1"), "s3"), "aws4_request")
```

## 3. Seed Signature

```
106e2a8a18243abcf37539882f36619c00e2dfc72633413f02d3b74544bfeb8e
```

## 4. Authorization header

The resulting Authorization header is as follows:

```
AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/s3/
aws4_request,SignedHeaders=content-encoding;content-length;host;x-amz-
content-sha256;x-amz-date;x-amz-decoded-content-length;x-amz-storage-
class,Signature=106e2a8a18243abcf37539882f36619c00e2dfc72633413f02d3b74544bfeb8e
```

## 5. Chunk 1: (65536 bytes, with value 97 for letter 'a')

### a. Chunk string to sign:

```
AWS4-HMAC-SHA256-PAYLOAD
20130524T000000Z
```

```
20130524/us-east-1/s3/aws4_request
106e2a8a18243abcf37539882f36619c00e2dfc72633413f02d3b74544bfeb8e
e3b0c44298fc1c149afb4c8996fb92427ae41e4649b934ca495991b7852b855
bf718b6f653bebc184e1479f1935b8da974d701b893afcf49e701f3e2f9f9c5a
```

**Note**

For information about each line in the string to sign, see the diagram in the preceding topic ([Calculating the Seed Signature](#)) that shows various components of the string to sign. For example, the last three lines consist of the following:

- *previous-signature*
- `hash("")`
- `hash(current-chunk-data)`

b. Chunk signature:

```
b474d8862b1487a5145d686f57f013e54db672cee1c953b3010fb58501ef5aa2
```

c. Chunk data sent:

```
10000; chunk-
signature=b474d8862b1487a5145d686f57f013e54db672cee1c953b3010fb58501ef5aa2
<65536-bytes>
```

**6. Chunk 2: (1024 bytes, with value 97 for letter 'a')**

a. Chunk string to sign:

```
AWS4-HMAC-SHA256-PAYLOAD
20130524T000000Z
20130524/us-east-1/s3/aws4_request
b474d8862b1487a5145d686f57f013e54db672cee1c953b3010fb58501ef5aa2
e3b0c44298fc1c149afb4c8996fb92427ae41e4649b934ca495991b7852b855
2edc986847e209b4016e141a6dc8716d3207350f416969382d431539bf292e4a
```

b. Chunk signature:

```
1c1344b170168f8e65b41376b44b20fe354e373826ccbbe2c1d40a8cae51e5c7
```

## c. Chunk data sent:

```
400;chunk-
signature=1c1344b170168f8e65b41376b44b20fe354e373826ccbbe2c1d40a8cae51e5c7
<1024-bytes>
```

7. **Chunk 3: (0 byte data)**

## a. Chunk string to sign:

```
AWS4-HMAC-SHA256-PAYLOAD
20130524T000000Z
20130524/us-east-1/s3/aws4_request
1c1344b170168f8e65b41376b44b20fe354e373826ccbbe2c1d40a8cae51e5c7
e3b0c44298fc1c149afb4c8996fb92427ae41e4649b934ca495991b7852b855
e3b0c44298fc1c149afb4c8996fb92427ae41e4649b934ca495991b7852b855
```

## b. Chunk signature:

```
2ca2aba2005185cf7159c6277faf83795951dd77a3a99e6e65d5c9f85863f992
```

## c. Chunk data sent:

```
0;chunk-
signature=2ca2aba2005185cf7159c6277faf83795951dd77a3a99e6e65d5c9f85863f992
```

8. **Chunk 4: Trailing headers**

## a. Trailer chunk string to sign:

```
AWS4-HMAC-SHA256-TRAILER
20130524T000000Z
20130524/us-east-1/s3/aws4_request
2ca2aba2005185cf7159c6277faf83795951dd77a3a99e6e65d5c9f85863f992
1e376db7e1a34a8ef1c4bcee131a2d60a1cb62503747488624e10995f448d774
```

**Note**

The last two lines are previous-signature (the 0 byte data chunk signature), hash(*trailing-checksum-header-name:base64-encoded-trailing-checksum-value*\n).

The hash is calculated as follows with no whitespace:

- The trailing checksum header name
- A colon (:)
- The base64-encoded trailing checksum value
- A newline character (\n).

In this example, where we are using the `crc32c` hash algorithm, with the base64-encoded checksum value `s008/Q==`, we can represent the computation as follows:  
`hash('x-amz-checksum-crc32c:s008/Q==\n')`.

b. Chunk signature:

```
d81f82fc3505edab99d459891051a732e8730629a2e4a59689829ca17fe2e435
```

c. Chunk data sent:

```
x-amz-checksum-crc32c:s008/Q==  
x-amz-trailer-  
signature:d81f82fc3505edab99d459891051a732e8730629a2e4a59689829ca17fe2e435
```

## Authenticating Requests: Using Query Parameters (AWS Signature Version 4)

As described in the authentication overview (see [Authentication Methods](#)), you can provide authentication information using query string parameters. Using query parameters to authenticate requests is useful when you want to express a request entirely in a URL. This method is also referred as presigning a URL.

A use case scenario for presigned URLs is that you can grant temporary access to your Amazon S3 resources. For example, you can embed a presigned URL on your website or alternatively use it in command line client (such as Curl) to download objects.

**Note**

You can also use the AWS CLI to create presigned URLs. For more information, see [presign](#) in the *AWS CLI Command Reference*.

The following is an example presigned URL.

```
https://examplebucket.s3.amazonaws.com/test.txt
?X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=<your-access-key-id>/20130721/us-east-1/s3/aws4_request
&X-Amz-Date=20130721T201207Z
&X-Amz-Expires=86400
&X-Amz-SignedHeaders=host
&X-Amz-Signature=<signature-value>
```

In the example URL, note the following:

- The line feeds are added for readability.
- The `X-Amz-Credential` value in the URL shows the `/` character only for readability. In practice, it should be encoded as `%2F`. For example:

```
&X-Amz-Credential=<your-access-key-id>%2F20130721%2Fus-east-1%2Fs3%2Faws4_request
```

The following table describes the query parameters in the URL that provide authentication information.

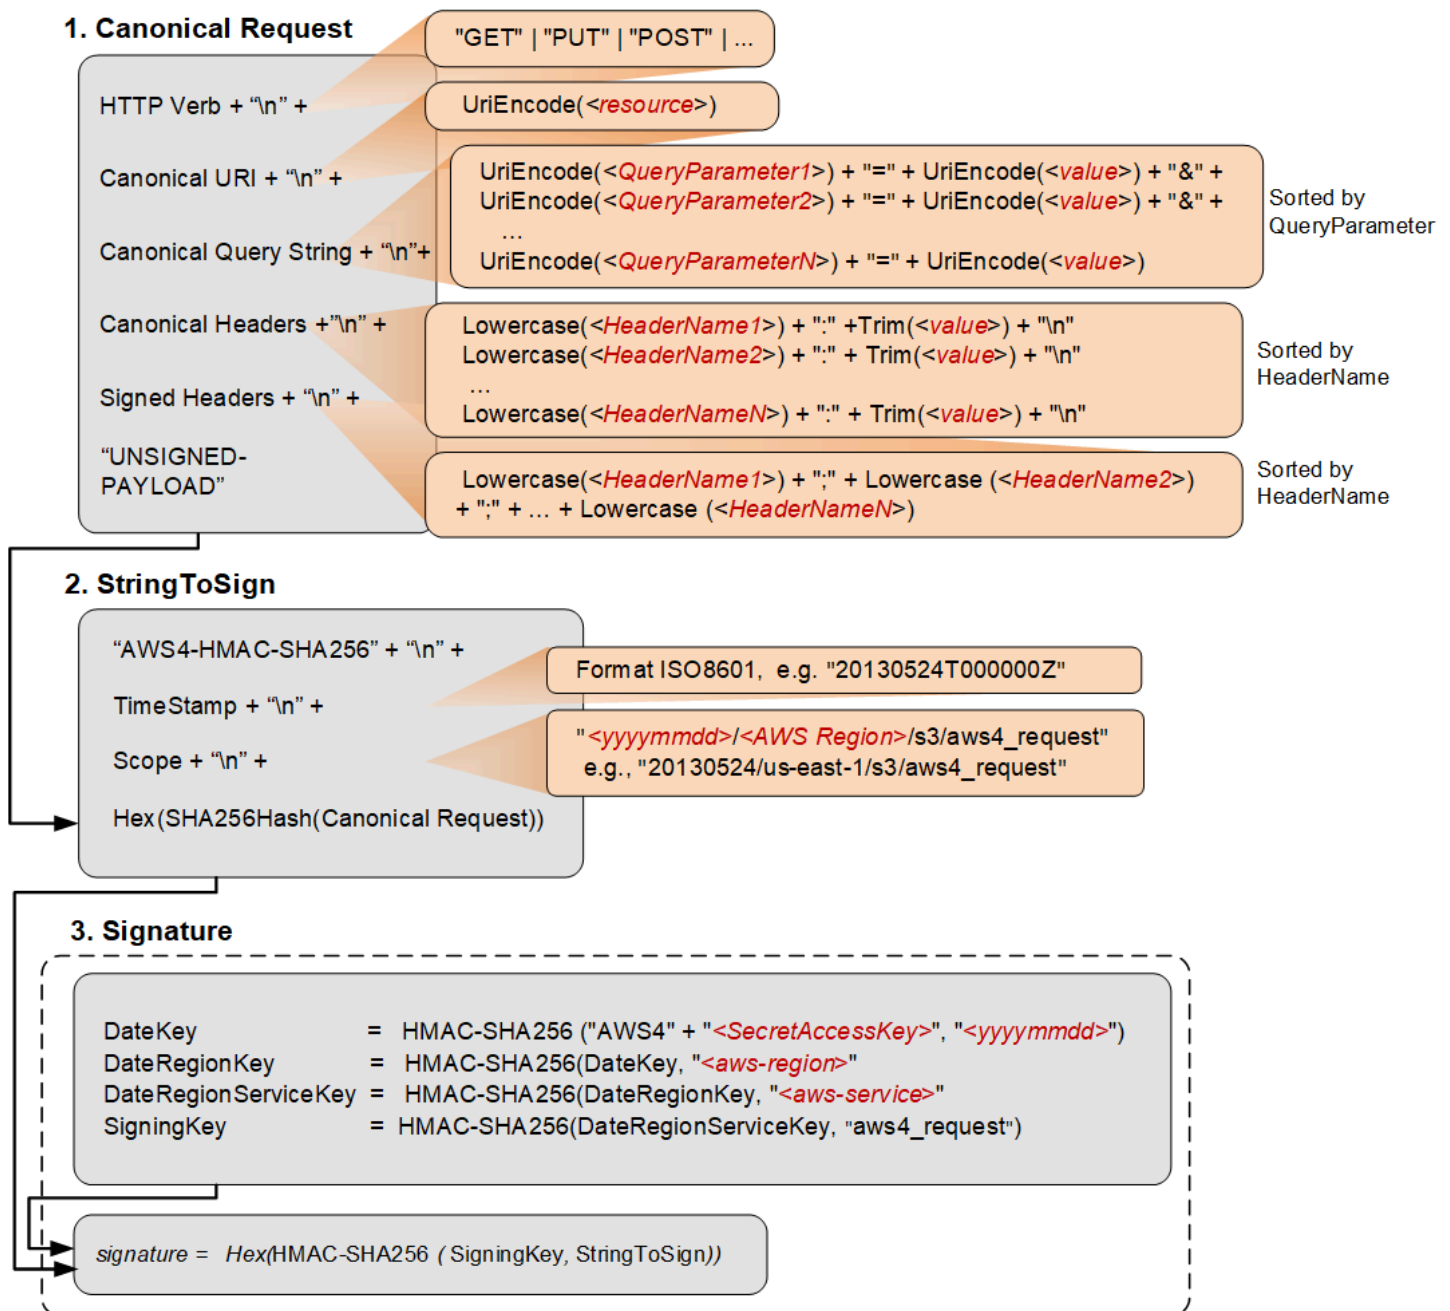

Query String Parameter Name	Example Value
<code>X-Amz-Algorithm</code>	Identifies the version of AWS Signature and the algorithm that you used to calculate the signature.  For AWS Signature Version 4, you set this parameter value to <code>AWS4-HMAC-SHA256</code> . This string identifies AWS Signature

Query String Parameter Name	Example Value
X-Amz-Credential	<p>Version 4 (AWS4) and the HMAC-SHA256 algorithm (HMAC-SHA256).</p> <p>In addition to your access key ID, this parameter also provides scope (AWS Region and service) for which the signature is valid. This value must match the scope you use in signature calculations, discussed in the following section. The general form for this parameter value is as follows:</p> <pre data-bbox="602 684 1507 800">&lt;your-access-key-id&gt; /&lt;date&gt;/&lt;AWS Region&gt;/&lt;AWS-service&gt; /aws4_request</pre> <p>For example:</p> <pre data-bbox="602 947 1507 1062">AKIAIOSFODNN7EXAMPLE/20130721/us-east-1/s3/aws4_request</pre> <p>For Amazon S3, the <i>AWS-service</i> string is <code>s3</code>. For a list of S3 <i>AWS-region</i> strings, see <a href="#">Regions and Endpoints</a> in the <i>AWS General Reference</i>.</p>
X-Amz-Date	<p>The date and time format must follow the ISO 8601 standard, and must be formatted with the "<i>yyyyMMddTHHmmsZ</i>" format. For example if the date and time was "08/01/2016 15:32:41.982-700" then it must first be converted to UTC (Coordinated Universal Time) and then submitted as "20160801T223241Z".</p>

Query String Parameter Name	Example Value
X-Amz-Expires	<p>Provides the time period, in seconds, for which the generated presigned URL is valid. For example, 86400 (24 hours). This value is an integer. The minimum value you can set is 1, and the maximum is 604800 (seven days).</p> <p>A presigned URL can be valid for a maximum of seven days because the signing key you use in signature calculation is valid for up to seven days.</p>
X-Amz-SignedHeaders	<p>Lists the headers that you used to calculate the signature. The following headers are required in the signature calculations:</p> <ul style="list-style-type: none"><li>• The HTTP host header.</li><li>• Any x-amz-* headers that you plan to add to the request.</li></ul> <div data-bbox="597 1094 1508 1314" style="border: 1px solid #00a0e3; border-radius: 10px; padding: 10px;"><p> <b>Note</b></p><p>For added security, you should sign all the request headers that you plan to include in your request.</p></div>
X-Amz-Signature	<p>Provides the signature to authenticate your request. This signature must match the signature Amazon S3 calculates; otherwise, Amazon S3 denies the request. For example,</p> <pre>733255ef022bec3f2a8701cd61d4b371f3f28c9f193a1f02279211d48d5193d7</pre> <p>Signature calculations are described in the following section.</p>
X-Amz-Security-Token	<p>Optional credential parameter if using credentials sourced from the STS service.</p>

# Calculating a Signature

The following diagram illustrates the signature calculation process.

The following table describes the functions that are shown in the diagram. You need to implement code for these functions.

Function	Description
<code>Lowercase()</code>	Convert the string to lowercase.
<code>Hex()</code>	Lowercase base 16 encoding.
<code>SHA256Hash()</code>	Secure Hash Algorithm (SHA) cryptographic hash function.
<code>HMAC-SHA256()</code>	Computes HMAC by using the SHA256 algorithm with the signing key provided. This is the final signature.
<code>Trim()</code>	Remove any leading or trailing whitespace.
<code>UriEncode()</code>	<p>URI encode every byte. <code>UriEncode()</code> must enforce the following rules:</p> <ul style="list-style-type: none"><li>• URI encode every byte except the unreserved characters: 'A'-'Z', 'a'-'z', '0'-'9', '-', '.', '_', and '~'.</li><li>• The space character is a reserved character and must be encoded as "%20" (and not as "+").</li><li>• Each URI encoded byte is formed by a '%' and the two-digit hexadecimal value of the byte.</li><li>• Letters in the hexadecimal value must be uppercase, for example "%1A".</li><li>• Encode the forward slash character, '/', everywhere except in the object key name. For example, if the object key name is <code>photos/Jan/sample.jpg</code>, the forward slash in the key name is not encoded.</li></ul>

**⚠ Important**

The standard `UriEncode` functions provided by your development platform may not work because of differences in implementation and related ambiguity in the underlying RFCs. We recommend that you write

Function	Description
	<p data-bbox="597 205 1505 331">your own custom UriEncode function to ensure that your encoding will work.</p> <p data-bbox="597 401 1455 485">To see an example of a UriEncode function in Java, see <a href="#">Java Utilities</a> on the GitHub website.</p>

For more information about the signing process (details of creating a canonical request, string to sign, and signature calculations), see [Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk \(AWS Signature Version 4\)](#). The process is generally the same except that the creation of **CanonicalRequest** in a presigned URL differs as follows:

- You don't include a payload hash in the **Canonical Request**, because when you create a presigned URL, you don't know the payload content because the URL is used to upload an arbitrary payload. Instead, you use a constant string `UNSIGNED-PAYLOAD`.
- The **Canonical Query String** must include all the query parameters from the preceding table except for `X-Amz-Signature`.
- For S3, you must include the `X-Amz-Security-Token` query parameter in the URL if using credentials sourced from the STS service.
- **Canonical Headers** must include the HTTP host header. If you plan to include any of the `x-amz-*` headers, these headers must also be added for signature calculation. You can optionally add all other headers that you plan to include in your request. For added security, you should sign as many headers as possible. If you add a signed header that is also a signed query parameter, and they differ in value, you will receive an `InvalidRequest` error as the input is conflicting.

## An Example

Suppose you have an object `test.txt` in your `examplebucket` bucket. You want to share this object with others for a period of 24 hours (86400 seconds) by creating a presigned URL.

```
https://examplebucket.s3.amazonaws.com/test.txt
?X-Amz-Algorithm=AWS4-HMAC-SHA256
```

```
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE%2F20130524%2Fus-east-1%2Fs3%2Faws4_request
&X-Amz-Date=20130524T000000Z&X-Amz-Expires=86400&X-Amz-SignedHeaders=host
&X-Amz-Signature=<signature-value>
```

The following steps illustrate first the signature calculations and then construction of the presigned URL. The example makes the following additional assumptions:

- Request timestamp is `Fri, 24 May 2013 00:00:00 GMT`.
- The bucket is in the US East (N. Virginia) region, and the credential Scope and the Signing Key calculations use `us-east-1` as the region specifier. For more information, see [Regions and Endpoints](#) in the *AWS General Reference*.

You can use this example as a test case to verify the signature that your code calculates; however, you must use the same bucket name, object key, time stamp, and the following example credentials:

Parameter	Value
<code>AWSAccessKeyId</code>	<code>AKIAIOSFODNN7EXAMPLE</code>
<code>AWSecretAccessKey</code>	<code>wJalrXUtnFEMI/K7MDENG/bPxrFiCYEXAMPLEKEY</code>

## 1. StringToSign

### a. CanonicalRequest

```
GET
/test.txt
X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE
%2F20130524%2Fus-east-1%2Fs3%2Faws4_request&X-Amz-Date=20130524T000000Z&X-Amz-
Expires=86400&X-Amz-SignedHeaders=host
host:examplebucket.s3.amazonaws.com

host
UNSIGNED-PAYLOAD
```

The rest of this section describes the examples in Java and C#. The topics include instructions for downloading the samples and for executing them.

## Signature Calculation Examples Using Java (AWS Signature Version 4)

The Java sample that shows signature calculation can be downloaded at <https://docs.aws.amazon.com/AmazonS3/latest/API/samples/AWSS3SigV4JavaSamples.zip>. Note that these samples use AWS SDK for Java v1, and we recommend using [AWS SDK for Java v2](#) for new applications. In `RunAllSamples.java`, the `main()` function executes sample requests to create an object, retrieve an object, and create a presigned URL for the object. The sample creates an object from the text string provided in the code:

```
PutS3ObjectSample.putS3Object(bucketName, regionName, awsAccessKey, awsSecretKey);
GetS3ObjectSample.getS3Object(bucketName, regionName, awsAccessKey, awsSecretKey);
PresignedUrlSample.getPresignedUrlToS3Object(bucketName, regionName, awsAccessKey,
awsSecretKey);
PutS3ObjectChunkedSample.putS3ObjectChunked(bucketName, regionName, awsAccessKey,
awsSecretKey);
```

### To test the examples on a Linux-based computer

The following instructions are for the Linux operating system.

1. In a terminal, navigate to the directory that contains `AWSS3SigV4JavaSamples.zip`.
2. Extract the `.zip` file.
3. In a text editor, open the file `./com/amazonaws/services/s3/samples/RunAllSamples.java`. Update code with the following information:
  - The name of a bucket where the new object can be created.

#### Note

The examples use a virtual-hosted style request to access the bucket. To avoid potential errors, ensure that your bucket name conforms to the bucket naming rules as explained in [Bucket Restrictions and Limitations](#) in the *Amazon Simple Storage Service User Guide*.

- AWS Region where the bucket resides.

If bucket is in the US East (N. Virginia) region, use `us-east-1` to specify the region. For a list of other AWS Regions, go to [Amazon Simple Storage Service \(S3\)](#) in the *AWS General Reference*.

4. Compile the source code and store the compiled classes into the `bin/` directory.

```
javac -d bin -source 6 -verbose com
```

5. Change the directory to `bin/`, and then run `RunAllSamples`.

```
java com.amazonaws.services.s3.sample.RunAllSamples
```

The code runs all the methods in `main()`. For each request, the output will show the canonical request, the string to sign, and the signature.

## Examples of Signature Calculations Using C# (AWS Signature Version 4)

The C# sample that shows signature calculation can be downloaded at [https://docs.aws.amazon.com/AmazonS3/latest/API/samples/AmazonS3SigV4\\_Samples\\_CSharp.zip](https://docs.aws.amazon.com/AmazonS3/latest/API/samples/AmazonS3SigV4_Samples_CSharp.zip).

Note that these samples use AWS SDK for .NET v1, and we recommend using [AWS SDK for .NET v3](#) for new applications. In `Program.cs`, the `main()` function executes sample requests to create an object, retrieve an object, and create a presigned URL for the object. The code for signature calculation is in the `\Signers` folder.

```
PutS3ObjectSample.Run(awsRegion, bucketName, "MySampleFile.txt");

Console.WriteLine("\n\n*****");
PutS3ObjectChunkedSample.Run(awsRegion, bucketName, "MySampleFileChunked.txt");

Console.WriteLine("\n\n*****");
GetS3ObjectSample.Run(awsRegion, bucketName, "MySampleFile.txt");

Console.WriteLine("\n\n*****");
PresignedUrlSample.Run(awsRegion, bucketName, "MySampleFile.txt");
```

### To test the examples with Microsoft Visual Studio 2010 or later

1. Extract the `.zip` file.
2. Start Visual Studio, and then open the `.sln` file.

3. Update the App.config file with valid security credentials.
4. Update the code as follows:
  - In Program.cs, provide the bucket name and the AWS Region where the bucket resides. The sample creates an object in this bucket.
5. Run the code.
6. To verify that the object was created, copy the presigned URL that the program creates, and then paste it in a browser window.

## Authenticating Requests: Browser-Based Uploads Using POST (AWS Signature Version 4)

Amazon S3 supports HTTP POST requests so that users can upload content directly to Amazon S3. Using HTTP POST to upload content simplifies uploads and reduces upload latency where users upload data to store in Amazon S3. This section describes how you authenticate HTTP POST requests. For more information about HTTP POST requests, how to create a form, create a POST policy, and an example, see [Browser-Based Uploads Using POST \(AWS Signature Version 4\)](#).

To authenticate an HTTP POST request you do the following:

1. The form must include the following fields to provide signature and relevant information that Amazon S3 can use to re-calculate the signature upon receiving the request:

Element Name	Description
<code>policy</code>	The Base64-encoded security policy that describes what is permitted in the request. For signature calculation this policy is the string you sign. Amazon S3 must get this policy so it can re-calculate the signature.
<code>x-amz-algorithm</code>	The signing algorithm used. For AWS Signature Version 4, the value is <code>AWS4-HMAC-SHA256</code> .
<code>x-amz-credential</code>	

Element Name	Description
	<p>In addition to your access key ID, this provides scope information you used in calculating the signing key for signature calculation.</p> <p>It is a string of the following form:</p> <pre>&lt;your-access-key-id&gt; /&lt;date&gt;/&lt;aws-region&gt; /&lt;aws-service&gt; /aws4_request</pre> <p>For example:</p> <pre>AKIAIOSFODNN7EXAMPLE/20130728/us-east-1/s3/aws4_request . .</pre> <p>For Amazon S3, the <i>aws-service</i> string is <i>s3</i>. For a list of Amazon S3 <i>aws-region</i> strings, see <a href="#">Regions and Endpoints</a> in the <i>AWS General Reference</i>.</p>
x-amz-date	<p>It is the date value in ISO8601 format. For example, 20130728T000000Z .</p> <p>It is the same date you used in creating the signing key. This must also be the same value you provide in the policy (x-amz-date ) that you signed.</p>
x-amz-signature	<p>(AWS Signature Version 4) The HMAC-SHA256 hash of the security policy.</p> <p>For more information on options for the signature, see <a href="#">Add the signature to the HTTP request</a> in the <i>AWS General Reference</i>.</p>

2. The POST policy must include the following elements:

Element Name	Description
x-amz-algorithm	

Element Name	Description
	The signing algorithm that you used to calculation the signature. For AWS Signature Version 4, the value is <code>AWS4-HMAC-SHA256</code> .
<code>x-amz-credential</code>	<p>In addition to your access key ID, this provides scope information you used in calculating the signing key for signature calculation.</p> <p>It is a string of the following form:</p> <pre data-bbox="727 674 1474 758"><i>&lt;your-access-key-id&gt; /&lt;date&gt;/&lt;aws-region&gt; /&lt;aws-service&gt; /aws4_request</i></pre> <p>For example,</p> <pre data-bbox="727 884 1403 968">AKIAIOSFODNN7EXAMPLE/20130728/us-east-1/s3/aws4_request . .</pre>
<code>x-amz-date</code>	The date value specified in the ISO8601 formatted string. For example, "20130728T000000Z". The date must be the same that you used in creating the signing key for signature calculation.

3. For signature calculation the POST policy is the string to sign.

## Calculating a Signature

The following diagram illustrates the signature calculation process.

## To Calculate a signature

1. Create a policy using UTF-8 encoding.
2. Convert the UTF-8-encoded policy to Base64. The result is the string to sign.
3. Create the signature as an HMAC-SHA256 hash of the string to sign. You will provide the signing key as key to the hash function.
4. Encode the signature by using hex encoding.

For more information about creating HTML forms, security policies, and an example, see the following subtopics:

- [Creating an HTML Form \(Using AWS Signature Version 4\)](#)
- [POST Policy](#)
- [Example: Browser-Based Upload using HTTP POST \(Using AWS Signature Version 4\)](#)

# Amazon S3 Signature Version 4 Authentication Specific Policy Keys

The following table shows the policy keys related Amazon S3 Signature Version 4 authentication that can be in Amazon S3 policies. In a bucket policy, you can add these conditions to enforce specific behavior when requests are authenticated by using Signature Version 4. For example policies, see [Bucket policy examples using Signature Version 4 related condition keys](#).

Applicable Keys	Description
<code>s3:signatureversion</code>	<p>Identifies the version of AWS Signature that you want to support for authenticated requests. For authenticated requests, Amazon S3 supports both Signature Version 4 and Signature Version 2. You can add this condition in your bucket policy to require a specific signature version.</p> <p>Valid values:</p> <p>"AWS" identifies Signature Version 2</p> <p>"AWS4-HMAC-SHA256" identifies Signature Version 4</p>
<code>s3:authType</code>	<p>Amazon S3 supports various methods of authentication (see <a href="#">Authenticating Requests (AWS Signature Version 4)</a>). You can optionally use this condition key to restrict incoming requests to use a specific authentication method. For example, you can allow only the HTTP Authorization header to be used in request authentication.</p> <p>Valid values:</p> <p>REST-HEADER</p>

Applicable Keys	Description
	REST-QUERY-STRING  POST
s3:signatureAge	<p>The length of time, in milliseconds, that a signature is valid in an authenticated request.</p> <p>This condition works for:</p> <ul style="list-style-type: none"><li>• <i>Presigned URLs</i> — where the most restrictive condition wins. For more information, see <a href="#">Working with presigned URLs</a>.</li><li>• <i>Presigned POST</i> — upload files directly to S3 using pre-signed POST. For more information, see <a href="#">Amazon S3 POST Policy</a>.</li></ul> <p>In Signature Version 2, this value is always set to 0.</p> <p>In Signature Version 4, the signing key is valid for up to seven days. Therefore, the signatures are also valid for up to seven days. You can use this condition to further limit the signature age. For more information, see <a href="#">Introduction to Signing Requests</a>.</p> <p>Example value: 100</p>

Applicable Keys	Description
s3:x-amz-content-sha256	<p>You can use this condition key to disallow unsigned content in your bucket.</p> <p>When you use Signature Version 4, for requests that use the <code>Authorization</code> header, you add the <code>x-amz-content-sha256</code> header in the signature calculation and then set its value to the hash payload. Note that this condition key doesn't support the <code>x-amz-content-sha256</code> header as a query string parameter.</p> <p>You can use this condition key in your bucket policy to deny any uploads where payloads are not signed. For example, you can deny uploads that use the <code>Authorization</code> header to authenticate requests but don't sign the payload. For more information, see <a href="#">Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (AWS Signature Version 4)</a>.</p> <p>Valid value: UNSIGNED-PAYLOAD</p>

## Bucket policy examples using Signature Version 4 related condition keys

The following bucket policy denies any Amazon S3 presigned URL request on objects in `examplebucket` if the signature is more than ten minutes old.

JSON

```
{  
  "Version": "2012-10-17",  
  "Statement": [  
    {  
      "Effect": "Deny",  
      "Principal": "*",  
      "Action": "s3:*",  
      "Resource": "arn:aws:s3:::examplebucket/*",  
      "Condition": {  
        "Bool": {  
          "aws:isMultipartUpload": "false",  
          "aws:signatureAge60seconds": "gt;600"  
        }  
      }  
    }  
  ]  
}
```

```

    {
      "Sid": "Deny a presigned URL request if the signature is more than 10
min old",
      "Effect": "Deny",
      "Principal": "*",
      "Action": "s3:*",
      "Resource": "arn:aws:s3:::examplebucket3/*",
      "Condition": {
        "NumericGreaterThan": {
          "s3:signatureAge": 600000
        }
      }
    }
  ]
}

```

The following bucket policy allows only requests that use the Authorization header for request authentication. Any POST or presigned URL requests will be denied.

JSON

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "Allow only requests that use Authorization header for
request authentication. Deny POST or presigned URL requests.",
      "Effect": "Deny",
      "Principal": "*",
      "Action": "s3:*",
      "Resource": "arn:aws:s3:::examplebucket3/*",
      "Condition": {
        "StringNotEquals": {
          "s3:authType": "REST-HEADER"
        }
      }
    }
  ]
}

```

The following bucket policy denies requests that use presigned URLs for request authentication:

The following bucket policy denies any uploads with unsigned payloads:

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "Deny uploads with unsigned payloads that use the
Authorization header.",
      "Effect": "Deny",
      "Principal": "*",
      "Action": "s3:*",
      "Resource": "arn:aws:s3:::examplebucket3/*",
      "Condition": {
        "StringEquals": {
          "s3:x-amz-content-sha256": "UNSIGNED-PAYLOAD"
        }
      }
    }
  ]
}
```

# Browser-Based Uploads Using POST (AWS Signature Version 4)

This section discusses how to upload files directly to Amazon S3 through a browser using HTTP POST requests. It also contains information about how to use the AWS Amplify JavaScript library for browser-based file uploads to Amazon S3.

## Topics

- [POST Object](#)
- [POST Object restore](#)
- [Browser-Based Uploads Using HTTP POST](#)
- [Calculating a Signature](#)
- [Creating an HTML Form \(Using AWS Signature Version 4\)](#)
- [POST Policy](#)
- [Example: Browser-Based Upload using HTTP POST \(Using AWS Signature Version 4\)](#)
- [Browser-based uploads to Amazon S3 using the AWS Amplify library](#)

# POST Object

## Description

The POST operation adds an object to a specified bucket by using HTML forms. POST is an alternate form of PUT that enables browser-based uploads as a way of putting objects in buckets. Parameters that are passed to PUT through HTTP headers are instead passed as form fields to POST in the multipart/form-data encoded message body. To add an object to a bucket, you must have WRITE access on the bucket. Amazon S3 never stores partial objects. If you receive a successful response, you can be confident that the entire object was stored.

Amazon S3 is a distributed system. Unless you've enabled versioning for a bucket, if Amazon S3 receives multiple write requests for the same object simultaneously, only the last version of the object written is stored.

To ensure that data is not corrupted while traversing the network, use the Content-MD5 form field. When you use this form field, Amazon S3 checks the object against the provided MD5 value. If they do not match, Amazon S3 returns an error. Additionally, you can calculate the MD5 value while posting an object to Amazon S3 and compare the returned ETag to the calculated MD5 value. The ETag reflects only changes to the contents of an object, not its metadata.

### Note

To configure your application to send the request headers before sending the request body, use the HTTP status code 100 (Continue). For POST operations, using this status code helps you avoid sending the message body if the message is rejected based on the headers (for example, because of an authentication failure or redirect). For more information about the HTTP status code 100 (Continue), go to Section 8.2.3 of <http://www.ietf.org/rfc/rfc2616.txt>.

Amazon S3 automatically encrypts all new objects that are uploaded to an S3 bucket. The encryption setting of an uploaded object depends on the default encryption configuration of the destination bucket. By default, all buckets have a default encryption configuration that uses server-side encryption with Amazon S3 managed keys (SSE-S3).

If the destination bucket has an encryption configuration that uses server-side encryption with an AWS Key Management Service (AWS KMS) key (SSE-KMS), dual-layer server-side encryption with

an AWS KMS key (DSSE-KMS), or a customer-provided encryption key (SSE-C), Amazon S3 uses the corresponding KMS key or customer-provided key to encrypt the uploaded object. When uploading an object, if you want to change the encryption setting of the uploaded object, you can specify the type of server-side encryption. You can configure SSE-S3, SSE-KMS, DSSE-KMS, or SSE-C. For more information, see [Protecting data using server-side encryption](#) in the *Amazon Simple Storage Service User Guide*.

### Important

When constructing your request, make sure that the `file` field is the last field in the form.

## Versioning

If you enable versioning for a bucket, POST automatically generates a unique version ID for the object being added. Amazon S3 returns this ID in the response by using the `x-amz-version-id` response header.

If you suspend versioning for a bucket, Amazon S3 always uses `null` as the version ID of the object stored in a bucket.

For more information about returning the versioning state of a bucket, see [GET Bucket \(Versioning Status\)](#).

Amazon S3 is a distributed system. If you enable versioning for a bucket and Amazon S3 receives multiple write requests for the same object simultaneously, all versions of the object are stored.

To see sample requests that use versioning, see [Sample Request](#).

## Requests

### Syntax

```
POST / HTTP/1.1
Host: destinationBucket.s3.amazonaws.com
User-Agent: browser_data
Accept: file_types
Accept-Language: Regions
Accept-Encoding: encoding
Accept-Charset: character_set
Keep-Alive: 300
```

```
Connection: keep-alive
Content-Type: multipart/form-data; boundary=9431149156168
Content-Length: length

--9431149156168

## Request Parameters

This implementation of the operation does not use request parameters.

## Form Fields

This operation can use the following form fields.

Name	Description	Required
AWSAccessKeyId	<p>The AWS access key ID of the owner of the bucket who grants an Anonymous user access for a request that satisfies the set of constraints in the policy.</p> <p>Type: String</p> <p>Default: None</p> <p>Constraints: Required if a policy document is included with the request.</p>	Conditional
acl	<p>The specified Amazon S3 access control list (ACL). If the specified ACL is not valid, an error is generated. For more information about ACLs, see <a href="#">Access control list (ACL) overview</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>Type: String</p> <p>Default: private</p>	No

Name	Description	Required
	Valid Values: <code>private</code>   <code>public-read</code>   <code>public-read-write</code>   <code>aws-exec-read</code>   <code>authenticated-read</code>   <code>bucket-owner-read</code>   <code>bucket-owner-full-control</code>	
Cache-Control , Content-Type , Content-Disposition , Content-Encoding , Expires	<p>The REST-specific headers. For more information, see <a href="#">PutObject</a>.</p> <p>Type: String</p> <p>Default: None</p>	No
file	<p>The file or text content.</p> <p>The file or text content must be the last field in the form.</p> <p>You cannot upload more than one file at a time.</p> <p>Type: File or text content</p> <p>Default: None</p>	Yes
key	<p>The name of the uploaded key.</p> <p>To use the file name provided by the user, use the <code>\${filename}</code> variable. For example, if a user named Mary uploads the file <code>example.jpg</code> and you specify <code>/user/mary/\${filename}</code> , the key name is <code>/user/mary/example.jpg</code> .</p> <p>For more information, see <a href="#">Object key and metadata</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>Type: String</p> <p>Default: None</p>	Yes

Name	Description	Required
policy	<p>The security policy that describes what is permitted in the request. Requests without a security policy are considered anonymous and work only on publicly writable buckets. For more information, see <a href="#">HTML forms</a> and <a href="#">Upload examples</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>Type: String</p> <p>Default: None</p> <p>Constraints: A security policy is required if the bucket is not publicly writable.</p>	Conditional

Name	Description	Required
<code>success_action_redirect</code> , <code>redirect</code>	<p>The URL to which the client is redirected upon a successful upload.</p> <p>If <code>success_action_redirect</code> is not specified, Amazon S3 returns the empty document type specified in the <code>success_action_status</code> field.</p> <p>If Amazon S3 cannot interpret the URL, it acts as if the field is not present.</p> <p>If the upload fails, Amazon S3 displays an error and does not redirect the user to a URL.</p> <p>Type: String</p> <p>Default: None</p> <div data-bbox="597 989 1338 1257"><p><b>Note</b></p><p>The <code>redirect</code> field name is deprecated, and support for the <code>redirect</code> field name will be removed in the future.</p></div>	No

Name	Description	Required
success_action_status	<p>If you don't specify <code>success_action_redirect</code>, the status code is returned to the client when the upload succeeds.</p> <p>This field accepts the values <code>200</code>, <code>201</code>, or <code>204</code> (the default).</p> <p>If the value is set to <code>200</code> or <code>204</code>, Amazon S3 returns an empty document with a <code>200</code> or <code>204</code> status code.</p> <p>If the value is set to <code>201</code>, Amazon S3 returns an XML document with a <code>201</code> status code.</p> <p>If the value is not set or if it is set to a value that is not valid, Amazon S3 returns an empty document with a <code>204</code> status code.</p> <p>Type: String</p> <p>Default: None</p>	No

Name	Description	Required
tagging	<p>The specified set of tags to add to the object. To add tags, use the following encoding scheme.</p> <pre data-bbox="597 380 1336 774"> &lt;Tagging&gt;   &lt;TagSet&gt;     &lt;Tag&gt;       &lt;Key&gt;TagName&lt;/Key&gt;       &lt;Value&gt;TagValue&lt;/Value&gt;     &lt;/Tag&gt;     ...   &lt;/TagSet&gt; &lt;/Tagging&gt; </pre> <p>For more information, see <a href="#">Object tagging</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>Type: String</p> <p>Default: None</p>	No
x-amz-storage-class	<p>The storage class to use for storing the object. If you don't specify a class, Amazon S3 uses the default storage class, STANDARD. Amazon S3 supports other storage classes. For more information, see <a href="#">Storage classes</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>Type: String</p> <p>Default: STANDARD</p> <p>Valid values: REDUCED_REDUNDANCY   EXPRESS_ONEZONE   DEEP_ARCHIVE   GLACIER   GLACIER_IR   INTELLIGENT_TIERING   ONEZONE_IA   STANDARD   STANDARD_IA</p>	No

Name	Description	Required
x-amz-meta-*	<p>Headers starting with this prefix are user-defined metadata. Each one is stored and returned as a set of key-value pairs. Amazon S3 doesn't validate or interpret user-defined metadata. For more information, see <a href="#">PutObject</a>.</p> <p>Type: String</p> <p>Default: None</p>	No
x-amz-security-token	<p>The Amazon DevPay security token.</p> <p>Each request that uses Amazon DevPay requires two x-amz-security-token form fields: one for the product token and one for the user token.</p> <p>Type: String</p> <p>Default: None</p>	No
x-amz-signature	<p>(AWS Signature Version 4) The HMAC-SHA256 hash of the security policy.</p> <p>Type: String</p> <p>Default: None</p>	Conditional

Name	Description	Required
x-amz-website-redirect-location	<p>If the bucket is configured as a website, this field redirects requests for this object to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata. For information about object metadata, see <a href="#">Object key and metadata</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>In the following example, the request header sets the redirect to an object (<code>anotherPage.html</code>) in the same bucket:</p> <pre>x-amz-website-redirect-location: /anotherPage.html</pre> <p>In the following example, the request header sets the object redirect to another website:</p> <pre>x-amz-website-redirect-location: http://www.example.com/</pre> <p>For more information about website hosting in Amazon S3, see <a href="#">Hosting websites on Amazon S3</a> and <a href="#">How to configure website page redirects</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>Type: String</p> <p>Default: None</p> <p>Constraints: The value must be prefixed by <code>/</code>, <code>http://</code>, or <code>https://</code>. The length of the value is limited to 2 KB.</p>	No

## Additional Checksum Request Form Fields

When uploading an object, you can specify various checksums that you would like to use to verify your data integrity. You can specify one additional checksum algorithm for Amazon S3 to use. For more information about additional checksum values, see [Checking object integrity](#) in the *Amazon Simple Storage Service User Guide*.

Name	Description	Required
<code>x-amz-checksum-algorithm</code>	Indicates the algorithm used to create the checksum for the object. If a value is specified, you must include the matching checksum header. Otherwise, your request will generate a 400 error.  Possible values include CRC32, CRC32C, SHA1, and SHA256.	No
<code>x-amz-checksum-crc32</code>	Specifies the base64-encoded, 32-bit CRC32 checksum of the object.  This parameter is required if the value of <code>x-amz-checksum-algorithm</code> is CRC32.	Conditional
<code>x-amz-checksum-crc32c</code>	Specifies the base64-encoded, 32-bit CRC32C checksum of the object.  This parameter is required if the value of <code>x-amz-checksum-algorithm</code> is CRC32C.	Conditional
<code>x-amz-checksum-sha1</code>	Specifies the base64-encoded, 160-bit SHA-1 digest of the object.  This parameter is required if the value of <code>x-amz-checksum-algorithm</code> is SHA1.	Conditional
<code>x-amz-checksum-sha256</code>	Specifies the base64-encoded, 256-bit SHA-256 digest of the object.  This parameter is required if the value of <code>x-amz-checksum-algorithm</code> is SHA256.	Conditional

## Server-Side Encryption Specific Request Form Fields

Server-side encryption is data encryption at rest. Amazon S3 encrypts your data while writing it to disks in AWS data centers and decrypts your data when you access it. When uploading an object, you can specify the type of server-side encryption that you want Amazon S3 to use for encrypting the object.

There are four types of server-side encryption:

- **Server-side encryption with Amazon S3 managed keys (SSE-S3)** – Starting May 2022, all Amazon S3 buckets have encryption configured by default. The default option for server-side encryption is with SSE-S3. Each object is encrypted with a unique key. As an additional safeguard, SSE-S3 encrypts the key itself with a root key that it regularly rotates. SSE-S3 uses one of the strongest block ciphers available, 256-bit Advanced Encryption Standard (AES-256), to encrypt your data.
- **Server-side encryption with AWS KMS keys (SSE-KMS)** – SSE-KMS is provided through an integration of the AWS KMS service with Amazon S3. With AWS KMS, you have more control over your keys. For example, you can view separate keys, edit control policies, and follow the keys in AWS CloudTrail. Additionally, you can create and manage customer managed keys or use AWS managed keys that are unique to you, your service, and your Region.
- **Dual-layer server-side encryption with AWS KMS keys (DSSE-KMS)** – Dual-layer server-side encryption with AWS KMS keys (DSSE-KMS) is similar to SSE-KMS, but applies two individual layers of object-level encryption instead of one layer.
- **Server-side encryption with customer-provided keys (SSE-C)** – With SSE-C, you manage the encryption keys, and Amazon S3 manages the encryption as it writes to disks, and the decryption when you access your objects.

For more information, see [Protecting data using server-side encryption](#) in the *Amazon Simple Storage Service User Guide*.

Depending on which type of server-side encryption you want to use, specify the following form fields.

- **Use SSE-S3, SSE-KMS, or DSSE-KMS** – If you want to use these types of server-side encryption, specify the following form fields in the request.

Name	Description	Required
<code>x-amz-server-side-encryption</code>	<p>Specifies the server-side encryption algorithm to use when Amazon S3 creates an object. To use SSE-S3, specify AES256. To use SSE-KMS, specify <code>aws:kms</code>. To use DSSE-KMS, specify <code>aws:kms:dsse</code> .</p> <p>Type: String</p> <p>Valid Value: <code>aws:kms</code>, <code>AES256</code>, <code>aws:kms:dsse</code></p>	Yes
<code>x-amz-server-side-encryption-aws-kms-key-id</code>	<p>If the <code>x-amz-server-side-encryption</code> header has a valid value of <code>aws:kms</code> or <code>aws:kms:dsse</code> , this header specifies the ID of the AWS KMS key that was used to encrypt the object.</p> <p>Type: String</p>	Yes, if the value of <code>x-amz-server-side-encryption</code> is <code>aws:kms</code> or <code>aws:kms:dsse</code>
<code>x-amz-server-side-encryption-context</code>	<p>If <code>x-amz-server-side-encryption</code> has a valid value of <code>aws:kms</code> or <code>aws:kms:dsse</code> , this header specifies the encryption context for the object. The value of this header is a base64-encoded UTF-8 string that contains JSON-formatted key-value pairs for the encryption context.</p> <p>Type: String</p>	No

Name	Description	Required
<code>x-amz-server-side-encryption-bucket-key-enabled</code>	<p>If <code>x-amz-server-side-encryption</code> has a valid value of <code>aws:kms</code> or <code>aws:kms:dsse</code>, this header specifies whether Amazon S3 should use an S3 Bucket Key with SSE-KMS or DSSE-KMS. Setting this header to <code>true</code> causes Amazon S3 to use an S3 Bucket Key for object encryption with SSE-KMS or DSSE-KMS.</p> <p>Type: Boolean</p>	No

 **Note**

If you specify `x-amz-server-side-encryption:aws:kms` or `x-amz-server-side-encryption:aws:kms:dsse`, but do not provide `x-amz-server-side-encryption-aws-kms-key-id`, Amazon S3 uses the AWS managed key (`aws/S3`) to protect the data.

- **Use SSE-C** – If you want to manage your own encryption keys, you must provide all the following form fields in the request.

 **Note**

If you use SSE-C, the ETag value that Amazon S3 returns in the response is not the MD5 of the object.

Name	Description	Required
<code>x-amz-server-side-encryption-customer-algorithm</code>	<p>Specifies the algorithm to use to when encrypting the object.</p> <p>Type: String</p> <p>Default: None</p> <p>Valid Value: AES256</p>	Yes

Name	Description	Required
	<p>Constraints: Must be accompanied by valid <code>x-amz-server-side-encryption-customer-key</code> and <code>x-amz-server-side-encryption-customer-key-MD5</code> fields.</p>	
<code>x-amz-server-side-encryption-customer-key</code>	<p>Specifies the customer-provided base64-encoded encryption key for Amazon S3 to use in encrypting data. This value is used to store the object, and then it is discarded. Amazon does not store the encryption key. The key must be appropriate for use with the algorithm specified in the <code>x-amz-server-side-encryption-customer-algorithm</code> header.</p> <p>Type: String</p> <p>Default: None</p> <p>Constraints: Must be accompanied by valid <code>x-amz-server-side-encryption-customer-algorithm</code> and <code>x-amz-server-side-encryption-customer-key-MD5</code> fields.</p>	Yes
<code>x-amz-server-side-encryption-customer-key-MD5</code>	<p>Specifies the base64-encoded 128-bit MD5 digest of the encryption key according to <a href="#">RFC 1321</a>. Amazon S3 uses this header for a message-integrity check to ensure that the encryption key was transmitted without error.</p> <p>Type: String</p> <p>Default: None</p> <p>Constraints: Must be accompanied by valid <code>x-amz-server-side-encryption-customer-algorithm</code> and <code>x-amz-server-side-encryption-customer-key</code> fields.</p>	Yes

## Responses

### Response Headers

This implementation of the operation can include the following response headers in addition to the response headers common to all responses. For more information, see [Common Response Headers](#).

Name	Description
<code>x-amz-checksum-crc32</code>	The base64-encoded, 32-bit CRC32 checksum of the object.  Type: String
<code>x-amz-checksum-crc32c</code>	The base64-encoded, 32-bit CRC32C checksum of the object.  Type: String
<code>x-amz-checksum-sha1</code>	The base64-encoded, 160-bit SHA-1 digest of the object.  Type: String
<code>x-amz-checksum-sha256</code>	The base64-encoded, 256-bit SHA-256 digest of the object.  Type: String
<code>x-amz-expiration</code>	If an <code>Expiration</code> action is configured for the object as part of the bucket's lifecycle configuration, Amazon S3 returns this header. The header value includes an <code>expiry-date</code> component and a URL-encoded <code>rule-id</code> component. For version-enabled buckets, this header applies only to current versions. Amazon S3 does not provide a header to indicate when a noncurrent version is eligible for permanent deletion. For more information, see <a href="#">PutBucketLifecycleConfiguration</a> .

Name	Description
	Type: String
success_action_redirect, redirect	The URL to which the client is redirected on a successful upload.  Type: String  Ancestor: PostResponse
x-amz-server-side-encryption	The server-side encryption algorithm that was used when storing this object in Amazon S3 (for example, AES256, aws:kms, aws:kms:dsse ).  Type: String
x-amz-server-side-encryption-aws-kms-key-id	If the x-amz-server-side-encryption header has a valid value of aws:kms, this header specifies the ID of the KMS key that was used to encrypt the object.  Type: String
x-amz-server-side-encryption-bucket-key-enabled	If x-amz-server-side-encryption has a valid value of aws:kms, this header indicates whether the object is encrypted with SSE-KMS by using an S3 Bucket Key. If this header is set to true, the object uses an S3 Bucket Key with SSE-KMS.  Type: Boolean
x-amz-server-side-encryption-customer-algorithm	If SSE-C was requested, the response includes this header, which confirms the encryption algorithm that was used.  Type: String  Valid Values: AES256

Name	Description
x-amz-server-side-encryption-customer-key-MD5	<p>If SSE-C was requested, the response includes this header to verify round-trip message integrity of the customer-provided encryption key.</p> <p>Type: String</p>
x-amz-version-id	<p>Version of the object.</p> <p>Type: String</p>

## Response Elements

Name	Description
Bucket	<p>The name of the bucket that the object was stored in.</p> <p>Type: String</p> <p>Ancestor: PostResponse</p>
ETag	<p>The entity tag (ETag) is an MD5 hash of the object that you can use to do conditional GET operations by using the <code>If-Modified</code> request tag with the GET request operation. ETag reflects changes only to the contents of an object, not to its metadata.</p> <p>Type: String</p> <p>Ancestor: PostResponse</p>
Key	<p>The object key name.</p> <p>Type: String</p> <p>Ancestor: PostResponse</p>
Location	<p>The URI of the object.</p>

Name	Description
	Type: String
	Ancestor: PostResponse

## Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see [Error Responses](#).

## Examples

### Sample Request

```
POST /Neo HTTP/1.1
Content-Length: 4
Host: quotes.s3.amazonaws.com
Date: Wed, 01 Mar 2006 12:00:00 GMT
Authorization: authorization string
Content-Type: text/plain
Expect: the 100-continue HTTP status code
```

*ObjectContent*

### Sample Response with Versioning Suspended

The following is a sample response when bucket versioning is suspended:

```
HTTP/1.1 100 Continue
HTTP/1.1 200 OK
x-amz-id-2: LriYPLdm0dAiIfgSm/F1YsViT1LW94/xUQxMsF7xiEb1a0wiI0Ix1+zbwZ163pt7
x-amz-request-id: 0A49CE4060975EAC
x-amz-version-id: default
Date: Wed, 12 Oct 2009 17:50:00 GMT
ETag: "1b2cf535f27731c974343645a3985328"
Content-Length: 0
Connection: close
Server: AmazonS3
```

In this response, the version ID is null.

## Sample Response with Versioning Enabled

The following is a sample response when bucket versioning is enabled.

```
HTTP/1.1 100 Continue
HTTP/1.1 200 OK
x-amz-id-2: LriYPLdm0dAiIfgSm/F1YsViT1LW94/xUQxMsF7xiEb1a0wiI0Ix1+zbwZ163pt7
x-amz-request-id: 0A49CE4060975EAC
x-amz-version-id: 43jfkodU8493jnFJD9fjj3HHNVfdsQUIFDNsidf038jfdsjGFDSIRp
Date: Wed, 01 Mar 2006 12:00:00 GMT
ETag: "828ef3fdfa96f00ad9f27c383fc9ac7f"
Content-Length: 0
Connection: close
Server: AmazonS3
```

# POST Object restore

## Description

This operation performs the following types of requests:

- `select` – Perform a select query on an archived object
- `restore an archive` – Restore an archived object

To use this operation, you must have permissions to perform the `s3:RestoreObject` and `s3:GetObject` actions. The bucket owner has this permission by default and can grant this permission to others. For more information about permissions, see [Permissions Related to Bucket Subresource Operations](#) and [Managing Access Permissions to Your Amazon S3 Resources](#) in the *Amazon Simple Storage Service User Guide*.

## Querying Archives with Select Requests

You use a select type of request to perform SQL queries on archived objects. The archived objects that are being queried by the select request must be formatted as uncompressed comma-separated values (CSV) files. You can run queries and custom analytics on your archived data without having to restore your data to a hotter Amazon S3 tier. For an overview about select requests, see [Querying Archived Objects](#) in the *Amazon Simple Storage Service User Guide*.

When making a select request, do the following:

- Define an output location for the select query's output. This must be an Amazon S3 bucket in the same AWS Region as the bucket that contains the archive object that is being queried. The AWS account that initiates the job must have permissions to write to the S3 bucket. You can specify the storage class and encryption for the output objects stored in the bucket. For more information about output, see [Querying Archived Objects](#) in the *Amazon Simple Storage Service User Guide*.

For more information about the S3 structure in the request body, see the following:

- [PutObject](#)
- [Managing Access with ACLs](#) in the *Amazon Simple Storage Service User Guide*
- [Protecting Data Using Server-Side Encryption](#) in the *Amazon Simple Storage Service User Guide*

- Define the SQL expression for the SELECT type of restoration for your query in the request body's `SelectParameters` structure. You can use expressions like the following examples.
- The following expression returns all records from the specified object.

```
SELECT * FROM Object
```

- Assuming that you are not using any headers for data stored in the object, you can specify columns with positional headers.

```
SELECT s._1, s._2 FROM Object s WHERE s._3 > 100
```

- If you have headers and you set the `fileHeaderInfo` in the CSV structure in the request body to `USE`, you can specify headers in the query. (If you set the `fileHeaderInfo` field to `IGNORE`, the first row is skipped for the query.) You cannot mix ordinal positions with header column names.

```
SELECT s.Id, s.FirstName, s.SSN FROM S3Object s
```

For more information about using SQL with S3 Glacier Select restore, see [SQL Reference for Amazon S3 Select and S3 Glacier Select](#) in the *Amazon Simple Storage Service User Guide*.

When making a select request, you can also do the following:

- To expedite your queries, specify the `Expedited` tier. For more information about tiers, see "Restoring Archives," later in this topic.
- Specify details about the data serialization format of both the input object that is being queried and the serialization of the CSV-encoded query results.

The following are additional important facts about the select feature:

- The output results are new Amazon S3 objects. Unlike archive retrievals, they are stored until explicitly deleted—manually or through a lifecycle policy.
- You can issue more than one select request on the same Amazon S3 object. Amazon S3 doesn't deduplicate requests, so avoid issuing duplicate requests.
- Amazon S3 accepts a select request even if the object has already been restored. A select request doesn't return error response 409.

## Restoring Archives

Objects in the GLACIER and DEEP\_ARCHIVE storage classes are archived. To access an archived object, you must first initiate a restore request. This restores a temporary copy of the archived object. In a restore request, you specify the number of days that you want the restored copy to exist. After the specified period, Amazon S3 deletes the temporary copy but the object remains archived in the GLACIER or DEEP\_ARCHIVE storage class that object was restored from.

To restore a specific object version, you can provide a version ID. If you don't provide a version ID, Amazon S3 restores the current version.

The time it takes restore jobs to finish depends on which storage class the object is being restored from and which data access tier you specify.

When restoring an archived object (or using a select request), you can specify one of the following data access tier options in the `Tier` element of the request body:

- **Expedited** - Expedited retrievals allow you to quickly access your data stored in the GLACIER storage class when occasional urgent requests for a subset of archives are required. For all but the largest archived objects (250 MB+), data accessed using Expedited retrievals are typically made available within 1–5 minutes. Provisioned capacity ensures that retrieval capacity for Expedited retrievals is available when you need it. Expedited retrievals and provisioned capacity are not available for the DEEP\_ARCHIVE storage class.
- **Standard** - Standard retrievals allow you to access any of your archived objects within several hours. This is the default option for the GLACIER and DEEP\_ARCHIVE retrieval requests that do not specify the retrieval option. Standard retrievals typically complete within 3-5 hours from the GLACIER storage class and typically complete within 12 hours from the DEEP\_ARCHIVE storage class.
- **Bulk** - Bulk retrievals are Amazon S3 Glacier's lowest-cost retrieval option, enabling you to retrieve large amounts, even petabytes, of data inexpensively in a day. Bulk retrievals typically complete within 5-12 hours from the GLACIER storage class and typically complete within 48 hours from the DEEP\_ARCHIVE storage class.

For more information about archive retrieval options and provisioned capacity for Expedited data access, see [Restoring Archived Objects](#) in the *Amazon Simple Storage Service User Guide*.

You can use Amazon S3 restore speed upgrade to change the restore speed to a faster speed while it is in progress. You upgrade the speed of an in-progress restoration by issuing another

restore request to the same object, setting a new `Tier` request element. When issuing a request to upgrade the restore tier, you must choose a tier that is faster than the tier that the in-progress restore is using. You must not change any other parameters, such as the `Days` request element. For more information, see [Upgrading the Speed of an In-Progress Restore](#) in the *Amazon Simple Storage Service User Guide*.

To get the status of object restoration, you can send a HEAD request. Operations return the `x-amz-restore` header, which provides information about the restoration status, in the response. You can use Amazon S3 event notifications to notify you when a restore is initiated or completed. For more information, see [Configuring Amazon S3 Event Notifications](#) in the *Amazon Simple Storage Service User Guide*.

After restoring an archived object, you can update the restoration period by reissuing the request with a new period. Amazon S3 updates the restoration period relative to the current time and charges only for the request—there are no data transfer charges. You cannot update the restoration period when Amazon S3 is actively processing your current restore request for the object.

If your bucket has a lifecycle configuration with a rule that includes an expiration action, the object expiration overrides the life span that you specify in a restore request. For example, if you restore an object copy for 10 days, but the object is scheduled to expire in 3 days, Amazon S3 deletes the object in 3 days. For more information about lifecycle configuration, see [PutBucketLifecycleConfiguration](#) and [Object Lifecycle Management](#) in *Amazon Simple Storage Service User Guide*.

## Requests

### Syntax

```
POST /ObjectName?restore&versionId=VersionID HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests \(AWS Signature Version 4\))
Content-MD5: MD5

request body
```

**Note**

The syntax shows some of the request headers. For a complete list, see "Request Headers," later in this topic.

## Request Parameters

This implementation of the operation does not use request parameters.

## Request Headers

Name	Description	Required
Content-MD5	<p>The base64-encoded 128-bit MD5 digest of the data. You must use this header as a message integrity check to verify that the request body was not corrupted in transit. For more information, see <a href="#">RFC 1864</a>.</p> <p>Type: String</p> <p>Default: None</p>	Yes

## Request Elements

The following is an XML example of a request body for restoring an archive.

```
<RestoreRequest>
  <Days>2</Days>
  <GlacierJobParameters>
    <Tier>Bulk</Tier>
  </GlacierJobParameters>
</RestoreRequest>
```

The following table explains the XML for archive restoration in the request body.

Name	Description	Required
RestoreRequest	Container for restore information.  Type: Container	Yes
Days	Lifetime of the restored (active) copy. The minimum number of days that you can restore an object from S3 Glacier is 1. After the object copy reaches the specified lifetime, Amazon S3 removes it from the bucket. If you are restoring an archive, this element is required.  Do not use this element with a SELECT type of request.  Type: Positive integer  Ancestors: RestoreRequest	Yes, if restoring an archive
GlacierJobParameters	Container for Glacier job parameters.  Do not use this element with a SELECT type of request.  Type: Container  Ancestors: RestoreRequest	No
Tier	The data access tier to use when restoring the archive. Standard is the default.  Type: Enum  Valid values: Expedited   Standard   Bulk  Ancestors: GlacierJobParameters	No

The following XML is the request body for a select query on an archived object:

```

<RestoreRequest>
  <Type>SELECT</Type>
  <Tier>Expedited</Tier>
  <Description>Job description</Description>
  <SelectParameters>
    <Expression>Select * from Object</Expression>
    <ExpressionType>SQL</ExpressionType>
    <InputSerialization>
      <CSV>
        <FileHeaderInfo>IGNORE</FileHeaderInfo>
        <RecordDelimiter>\n</RecordDelimiter>
        <FieldDelimiter>,</FieldDelimiter>
        <QuoteCharacter>"</QuoteCharacter>
        <QuoteEscapeCharacter>"</QuoteEscapeCharacter>
        <Comments>#</Comments>
      </CSV>
    </InputSerialization>
    <OutputSerialization>
      <CSV>
        <QuoteFields>ASNEEDED</QuoteFields>

</Tagging>
    <StorageClass>Storage class</StorageClass>
</S3>
    </OutputLocation>
</RestoreRequest>

```

The following tables explain the XML for a SELECT type of restoration in the request body.

Name	Description	Required
RestoreRequest	Container for restore information.  Type: Container	Yes
Tier	The data access tier to use when restoring the archive. Standard is the default.  Type: Enum  Valid values: Expedited   Standard   Bulk  Ancestors: RestoreRequest	No

Name	Description	Required
Description	The optional description for the request.  Type: String  Ancestors: RestoreRequest	No
SelectParameters	Describes the parameters for the select job request.  Type: Container  Ancestors: RestoreRequest	Yes, if request type is SELECT
OutputLocation	Describes the location that receives the results of the select restore request.  Type: Container for Amazon S3  Ancestors: RestoreRequest	Yes, if request type is SELECT

**The SelectParameters container element contains the following elements.**

Name	Description	Required
Expression	The SQL expression. For example: <ul style="list-style-type: none"> <li>The following SQL expression retrieves the first column of the data from the object stored in CSV format:  <code>SELECT s._1 FROM Object s</code></li> <li>The following SQL expression returns everything from the object:  <code>SELECT * FROM Object</code></li> </ul>	Yes

Name	Description	Required
	Type: String Ancestors: <code>SelectParameters</code>	
<code>ExpressionType</code>	Identifies the expression type. Type: String Valid values: SQL Ancestors: <code>SelectParameters</code>	Yes
<code>InputSerialization</code>	Describes the serialization format of the object. Type: Container for CSV Ancestors: <code>SelectParameters</code>	Yes
<code>OutputSerialization</code>	Describes how the results of the select job are serialized. Type: Container for CSV Ancestors: <code>SelectParameters</code>	Yes

The `CSV` container element in the `InputSerialization` element contains the following elements.

Name	Description	Required
<code>RecordDelimiter</code>	A single character used to separate individual records in the input. Instead of the default value, you can specify an arbitrary delimiter. Type: String Default: <code>\n</code>	No

Name	Description	Required
	Ancestors: CSV	
FieldDelimiter	<p>A single character used to separate individual fields in a record. You can specify an arbitrary delimiter.</p> <p>Type: String</p> <p>Default: ,</p> <p>Ancestors: CSV</p>	No
QuoteCharacter	<p>A single character used for escaping when the field delimiter is part of the value.</p> <p>Consider this example in a CSV file:</p> <p>"a, b"</p> <p>Wrapping the value in quotation marks makes this value a single field. If you don't use the quotation marks, the comma is a field delimiter (which makes it two separate field values, a and b).</p> <p>Type: String</p> <p>Default: "</p> <p>Ancestors: CSV</p>	No

Name	Description	Required
QuoteEscapeCharacter	<p>A single character used for escaping the quotation mark character inside an already escaped value. For example, the value <code>"" a , b ""</code> is parsed as <code>" a , b "</code>.</p> <p>Type: String</p> <p>Default: <code>"</code></p> <p>Ancestors: CSV</p>	No
FileHeaderInfo	<p>Describes the first line in the input data. It is one of the ENUM values.</p> <ul style="list-style-type: none"> <li>• NONE: First line is not a header.</li> <li>• IGNORE: First line is a header, but you can't use the header values to indicate the column in an expression. You can use column position (such as <code>_1, _2, ...</code>) to indicate the column (<code>SELECT s._1 FROM OBJECT s</code>).</li> <li>• Use: First line is a header, and you can use the header value to identify a column in an expression (<code>SELECT "name" FROM OBJECT</code>).</li> </ul> <p>Type: Enum</p> <p>Valid values: NONE   USE   IGNORE</p> <p>Ancestors: CSV</p>	No

Name	Description	Required
Comments	<p>A single character used to indicate that a row should be ignored when the character is present at the start of that row. You can specify any character to indicate a comment line.</p> <p>Type: String</p> <p>Ancestors: CSV</p>	No

The CSV container element (in the `OutputSerialization` elements) contains the following elements.

Name	Description	Required
QuoteFields	<p>Indicates whether to use quotation marks around output fields.</p> <ul style="list-style-type: none"> <li>• ALWAYS: Always use quotation marks for output fields.</li> <li>• ASNEEDED: Use quotation marks for output fields when needed.</li> </ul> <p>Type: Enum</p> <p>Valid values: ALWAYS   ASNEEDED</p> <p>Default: AsNeeded</p> <p>Ancestors: CSV</p>	No
RecordDelimiter	<p>A single character used to separate individual records in the output. Instead of the default value, you can specify an arbitrary delimiter.</p>	No

Name	Description	Required
	Type: String Default: \n Ancestors: CSV	
FieldDelimiter	A single character used to separate individual fields in a record. You can specify an arbitrary delimiter.  Type: String  Default: ,  Ancestors: CSV	No
QuoteCharacter	A single character used for escaping when the field delimiter is part of the value. For example, if the value is a, b, Amazon S3 wraps this field value in quotation marks, as follows: " a , b ".  Type: String  Default: "  Ancestors: CSV	No
QuoteEscapeCharacter	A single character used for escaping the quotation mark character inside an already escaped value. For example, if the value is " a , b ", Amazon S3 wraps the value in quotation marks, as follows: "" " a , b "" .  Type: String  Ancestors: CSV	No

**The S3 container element (in the OutputLocation element) contains the following elements.**

Name	Description	Required
AccessControlList	<p>A list of grants that control access to the staged results.</p> <p>Type: Container for Grant</p> <p>Ancestors: S3</p>	No
BucketName	<p>The name of the S3 bucket where the select restore results are stored. The bucket must be in the same AWS Region as the bucket that contains the input archive object.</p> <p>Type: String</p> <p>Ancestors: S3</p>	Yes
CannedACL	<p>The canned access control list (ACL) to apply to the select restore results.</p> <p>Type: String</p> <p>Valid values: <code>private</code>   <code>public-read</code>   <code>public-read-write</code>   <code>aws-exec-read</code>   <code>authenticated-read</code>   <code>bucket-owner-read</code>   <code>bucket-owner-full-control</code></p> <p>Ancestors: S3</p>	No
Encryption	<p>Contains encryption information for the stored results.</p> <p>Type: Container for Encryption</p> <p>Ancestors: S3</p>	No
Prefix		Yes

Name	Description	Required
	<p>The prefix that is prepended to the select restore results. The maximum length for the prefix is 512 bytes.</p> <p>Type: String</p> <p>Ancestors: S3</p>	
StorageClass	<p>The class of storage used to store the select request results.</p> <p>Type: String</p> <p>Valid values: STANDARD   REDUCED_REDUNDANCY   STANDARD_IA   ONEZONE_IA</p> <p>Ancestors: S3</p>	No
Tagging	<p>Container for tag information.</p> <p>Type: Tag structure</p> <p>Ancestors: S3</p>	No
UserMetadata	<p>Contains a list of metadata to store with the select restore results.</p> <p>Type: MetadataEntry structure</p> <p>Ancestors: S3</p>	No

**The Grantee container element (in the AccessControlList element) contains the following elements.**

Name	Description	Required
DisplayName	The screen name of the grantee.	No

Name	Description	Required
	Type: String Ancestors: Grantee	
EmailAddress	The email address of the grantee. Type: String Ancestors: Grantee	No
ID	The canonical user ID of the grantee. Type: String Ancestors: Grantee	No
Type	The type of the grantee. Type: String Ancestors: Grantee	No
URI	The URI of the grantee group. Type: String Ancestors: Grantee	No
Permission	Granted permission. Type: String Ancestors: Grantee	No

**The Encryption container element (in S3) contains the following elements.**

Name	Description	Required
EncryptionType	<p>The server-side encryption algorithm used when storing job results. The default is no encryption.</p> <p>Type: String</p> <p>Valid Values <code>aws:kms</code>   <code>AES256</code></p> <p>Ancestors: Encryption</p>	No
KMSContext	<p>Optional. If the encryption type is <code>aws:kms</code>, you can use this value to specify the encryption context for the select restore results.</p> <p>Type: String</p> <p>Ancestors: Encryption</p>	No
KMSKeyId	<p>The AWS Key Management Service (AWS KMS) key ID to use for object encryption.</p> <p>Type: String</p> <p>Ancestors: Encryption</p>	No

**The TagSet container element (in the Tagging element) contains the following element.**

Name	Description	Required
Tag	<p>Contains tags.</p> <p>Type: Container</p> <p>Ancestors: TagSet</p>	No

The **Tag** container element (in the **TagSet** element) contains the following elements.

Name	Description	Required
Key	Name of the tag.  Type: String  Ancestors: Tag	No
Value	Value of the tag.  Type: String  Ancestors: Tag	No

The **MetadataEntry** container element (in the **UserMetadata** element) contains the following key-value pair elements to store with an object.

Name	Description	Required
MetadataKey	The metadata key.  Type: String  Ancestors:	No
MetadataEntry	The metadata value.  Type: String  Ancestors:	No

## Responses

A successful operation returns either the **200 OK** or **202 Accepted** status code.

- If the object copy is not previously restored, then Amazon S3 returns `202 Accepted` in the response.
- If the object copy is previously restored, Amazon S3 returns `200 OK` in the response.

## Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see [Common Response Headers](#).

## Response Elements

This operation does not return response elements.

## Special Errors

Error Code	Description	HTTP Status Code	SOAP Fault Code Prefix
<code>RestoreAlreadyInProgress</code>	Object restore is already in progress. (This error does not apply to <code>SELECT</code> type requests.)	409 Conflict	Client
<code>GlacierExpeditedRetrievalNotAvailable</code>	Glacier expedited retrievals are currently not available. Try again later. (Returned if there is insufficient capacity to process the Expedited request. This error applies only to Expedited retrievals and not to Standard or Bulk retrievals.)	503	N/A

## Examples

### Restore an Object for Two Days Using the Expedited Retrieval Option

The following restore request restores a copy of the `photo1.jpg` object from S3 Glacier for a period of two days using the expedited retrieval option.

```
POST /photo1.jpg?restore HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Mon, 22 Oct 2012 01:49:52 GMT
Authorization: authorization string
Content-Length: content length
```

```
<RestoreRequest>
  <Days>2</Days>
  <GlacierJobParameters>
    <Tier>Expedited</Tier>
  </GlacierJobParameters>
</RestoreRequest>
```

If the `examplebucket` does not have a restored copy of the object, Amazon S3 returns the following `202 Accepted` response.

```
HTTP/1.1 202 Accepted
x-amz-id-2: GFihv3y6+kE7KG11GEkQhU7/2/cHR3Yb2fCb2S04nxI423Dqwg2XiQ0B/
UZLzYQvPiBlZNRcovw=
x-amz-request-id: 9F341CD3C4BA79E0
Date: Sat, 20 Oct 2012 23:54:05 GMT
Content-Length: 0
Server: AmazonS3
```

If a copy of the object is already restored, Amazon S3 returns a `200 OK` response, and updates only the restored copy's expiry time.

## Query an Archive with a SELECT Request

The following is an example select restore request.

```
POST /object-one.csv?restore HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Date: Sat, 20 Oct 2012 23:54:05 GMT
Authorization: authorization string
Content-Length: content length

<RestoreRequest xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Type>SELECT</Type>
  <Tier>Expedited</Tier>
  <Description>this is a description</Description>
  <SelectParameters>
```

```

<InputSerialization>
  <CSV>
    <FileHeaderInfo>IGNORE</FileHeaderInfo>
    <Comments>#</Comments>
    <QuoteEscapeCharacter>"</QuoteEscapeCharacter>
    <RecordDelimiter>\n</RecordDelimiter>
    <FieldDelimiter>,</FieldDelimiter>
    <QuoteCharacter>"</QuoteCharacter>
  </CSV>
</InputSerialization>
<ExpressionType>SQL</ExpressionType>
<Expression>select * from object</Expression>
<OutputSerialization>
  <CSV>
    <QuoteFields>ALWAYS</QuoteFields>
    <QuoteEscapeCharacter>"</QuoteEscapeCharacter>
    <RecordDelimiter>\n</RecordDelimiter>
    <FieldDelimiter>\t</FieldDelimiter>
    <QuoteCharacter>\'</QuoteCharacter>
  </CSV>
</OutputSerialization>
</SelectParameters>
<OutputLocation>
  <S3>
    <BucketName>example-output-bucket</BucketName>
    <Prefix>test-s3</Prefix>
    <AccessControlList>
      <Grant>
        <Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:type="AmazonCustomerByEmail">
          <EmailAddress>jane-doe@example.com</EmailAddress>
        </Grantee>
        <Permission>FULL_CONTROL</Permission>
      </Grant>
    </AccessControlList>
    <UserMetadata>
      <MetadataEntry>
        <Name>test</Name>
        <Value>test-value</Value>
      </MetadataEntry>
      <MetadataEntry>
        <Name>other</Name>
        <Value>something else</Value>
      </MetadataEntry>
    </UserMetadata>
  </S3>
</OutputLocation>

```

```
</UserMetadata>
  <StorageClass>STANDARD</StorageClass>
</S3>
</OutputLocation>
</RestoreRequest>
```

Amazon S3 returns the following 202 Accepted response.

```
HTTP/1.1 202 Accepted
x-amz-id-2: GFihv3y6+kE7KG11GEkQhU7/2/cHR3Yb2fCb2S04nxI423Dqwg2XiQ0B/

## Browser-Based Uploads Using HTTP POST

Amazon S3 supports HTTP POST requests so that users can upload content directly to Amazon S3. By using POST, end users can authenticate requests without having to pass data through a secure intermediary node that protects your credentials. Thus, HTTP POST has the potential to reduce latency.

The following figure shows an Amazon S3 upload using a POST request.

1. The user accesses your page from a web browser.
2. Your webpage contains an HTML form that contains all the information necessary for the user to upload content to Amazon S3.
3. The user uploads content to Amazon S3 through the web browser.

The process for sending browser-based POST requests is as follows:

1. Create a security policy specifying conditions that restrict what you want to allow in the request, such as the bucket name where objects can be uploaded, and key name prefixes that you want to allow for the object that is being created.

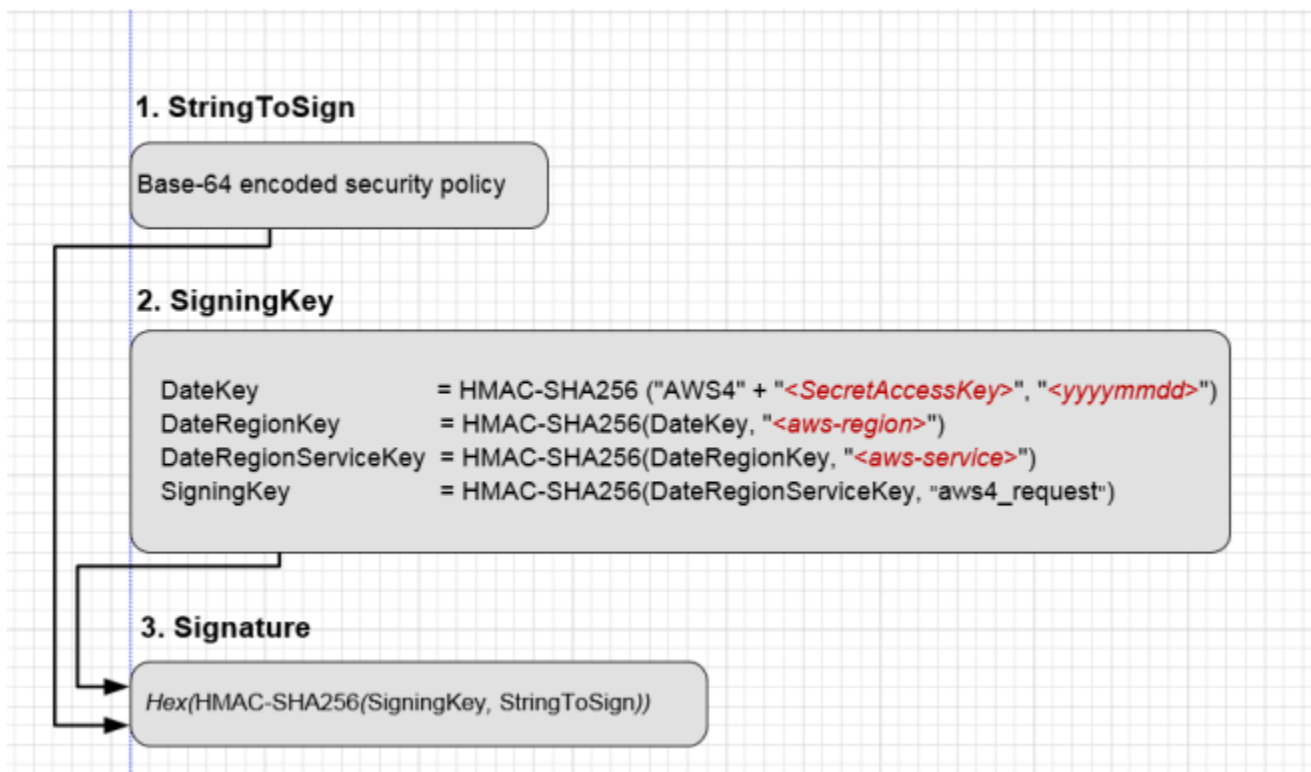

2. Create a signature that is based on the policy. For authenticated requests, the form must include a valid signature and the policy.
3. Create an HTML form that your users can access in order to upload objects to your Amazon S3 bucket.

The following section describes how to create a signature to authenticate a request. For information about creating forms and security policies, see [Creating an HTML Form \(Using AWS Signature Version 4\)](#).

## Calculating a Signature

For authenticated requests, the HTML form must include fields for a security policy and a signature.

- A security policy (see [POST Policy](#)) controls what is allowed in the request.
- The security policy is the `StringToSign` (see [Introduction to Signing Requests](#)) in your signature calculation.

## To Calculate a signature

1. Create a policy using UTF-8 encoding.
2. Convert the UTF-8-encoded policy bytes to base64. The result is the `StringToSign`.
3. Create a signing key.
4. Use the signing key to sign the `StringToSign` using HMAC-SHA256 signing algorithm.

For more information about creating HTML forms, security policies, and an example, see the following:

- [Creating an HTML Form \(Using AWS Signature Version 4\)](#)
- [POST Policy](#)
- [Example: Browser-Based Upload using HTTP POST \(Using AWS Signature Version 4\)](#)

## Creating an HTML Form (Using AWS Signature Version 4)

### Topics

- [HTML Form Declaration](#)
- [HTML Form Fields](#)

To allow users to upload content to Amazon S3 by using their browsers (HTTP POST requests), you use HTML forms. HTML forms consist of a form declaration and form fields. The form declaration contains high-level information about the request. The form fields contain detailed request information.

This section describes how to create HTML forms. For a working example of browser-based upload using HTTP POST and related signature calculations for request authentication, see [Example: Browser-Based Upload using HTTP POST \(Using AWS Signature Version 4\)](#).

The form and policy must be UTF-8 encoded. You can apply UTF-8 encoding to the form by specifying `charset=UTF-8` in the content attribute. The following is an example of UTF-8 encoding in the HTML heading.

```
<html>
```

```
<head>
  ...
  <meta http-equiv="Content-Type" content="text/html; charset=UTF-8" />
  ...
</head>
<body>
```

Following is an example of UTF-8 encoding in a request header.

```
Content-Type: text/html; charset=UTF-8
```

### Note

The form data and boundaries (excluding the contents of the file) cannot exceed 20KB.

## HTML Form Declaration

The HTML form declaration has the following three attributes:

- **action** – The URL that processes the request, which must be set to the URL of the bucket. For example, if the name of your bucket is `examplebucket`, the URL is `http://examplebucket.s3.amazonaws.com/`.

### Note

The key name is specified in a form field.

- **method** – The method must be `POST`.
- **enctype** – The enclosure type (`enctype`) must be set to `multipart/form-data` for both file uploads and text area uploads. For more information about `enctype`, see [RFC 1867](#).

This is a form declaration for the bucket `examplebucket`.

```
<form action="http://examplebucket.s3.amazonaws.com/" method="post"
enctype="multipart/form-data">
```

## HTML Form Fields

The following table describes a list of fields that you can use within a form. Among other fields, there is a signature field that you can use to authenticate requests. There are fields for you to specify the signature calculation algorithm (`x-amz-algorithm`), the credential scope (`x-amz-credential`) that you used to generate the signing key, and the date (`x-amz-date`) used to calculate the signature. Amazon S3 uses this information to re-create the signature. If the signatures match, Amazon S3 processes the request.

### Note

The variable `${filename}` is automatically replaced with the name of the file provided by the user and is recognized by all form fields. If the browser or client provides a full or partial path to the file, only the text following the last slash (/) or backslash (\) is used (for example, `C:\Program Files\directory1\file.txt` is interpreted as `file.txt`). If no file or file name is provided, the variable is replaced with an empty string.

If you don't provide elements required for authenticated requests, such as the `policy` element, the request is assumed to be anonymous and will succeed only if you have configured the bucket for public read and write.

Element Name	Description	Required
<code>acl</code>	<p>An Amazon S3 access control list (ACL). If an invalid ACL is specified, Amazon S3 denies the request. For more information about ACLs, see <a href="#">Using Amazon S3 ACLs</a>.</p> <p>Type: String</p> <p>Default: <code>private</code></p> <p>Valid Values: <code>private</code>   <code>public-read</code>   <code>public-read-write</code>   <code>aws-exec-read</code>   <code>authenticated-read</code></p>	No

Element Name	Description	Required
	bucket-owner-read   bucket-owner-full-control	
Cache-Control Content-Type Content-Disposition Content-Encoding Expires	REST-specific headers. For more information, see <a href="#">PutObject</a> .	No
key	<p>The key name of the uploaded object.</p> <p>To use the file name provided by the user, use the <code>\${filename}</code> variable. For example, if you upload a file <code>photo1.jpg</code> and you specify <code>/user/user1/\${filename}</code> as key name, the file is stored as <code>/user/user1/photo1.jpg</code>.</p> <p>For more information, see <a href="#">Object Key and Metadata</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p>	Yes
policy	<p>The base64-encoded security policy that describes what is permitted in the request. For authenticated requests, a policy is required.</p> <p>Requests without a security policy are considered anonymous and will succeed only on a publicly writable bucket.</p>	Required for authenticated requests

Element Name	Description	Required
success_action_redirect	<p>The URL to which the client is redirected upon successful upload.</p> <p>If success_action_redirect is not specified, or Amazon S3 cannot interpret the URL, Amazon S3 returns the empty document type that is specified in the success_action_status field.</p> <p>If the upload fails, Amazon S3 returns an error and does not redirect the user to another URL.</p>	No

Element Name	Description	Required
success_action_status	<p>The status code returned to the client upon successful upload if success_action_redirect is not specified.</p> <p>Valid values are 200, 201, or 204 (default).</p> <p>If the value is set to 200 or 204, Amazon S3 returns an empty document with the specified status code.</p> <p>If the value is set to 201, Amazon S3 returns an XML document with a 201 status code. For information about the content of the XML document, see <a href="#">POST Object</a>.</p> <p>If the value is not set or is invalid, Amazon S3 returns an empty document with a 204 status code.</p> <div data-bbox="609 1083 1268 1545" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px;"><p> <b>Note</b></p><p>Some versions of the Adobe Flash player do not properly handle HTTP responses with an empty body. To support uploads through Adobe Flash, we recommend setting success_action_status to 201.</p></div>	No

Element Name	Description	Required
x-amz-algorithm	<p>The signing algorithm used to authenticate the request. For AWS Signature Version 4, the value is <code>AWS4-HMAC-SHA256</code> .</p> <p>This field is required if a policy document is included with the request.</p>	Required for authenticated requests
x-amz-credential	<p>In addition to your access key ID, this field also provides scope information identifying region and service for which the signature is valid. This should be the same scope you used in calculating the signing key for signature calculation.</p> <p>It is a string of the following form:</p> <pre>&lt;your-access-key-id&gt; /&lt;date&gt;/&lt;aws-region&gt; /&lt;aws-service&gt; /aws4_request</pre> <p>For example:</p> <pre>AKIAIOSFODNN7EXAMPLE/20130728/us-east-1/s3/aws4_request</pre> <p>For Amazon S3, the <i>aws-service</i> string is <code>s3</code>. For a list of Amazon S3 <i>aws-region</i> strings, see <a href="#">Regions and Endpoints</a> in the <i>AWS General Reference</i>. This is required if a policy document is included with the request.</p>	Required for authenticated requests

Element Name	Description	Required
x-amz-date	<p>It is the date value in ISO8601 format. For example, 20130728T000000Z .</p> <p>It is the same date you used in creating the signing key (for example, 20130728). This must also be the same value you provide in the policy (x-amz-date ) that you signed.</p> <p>This is required if a policy document is included with the request.</p>	Required for authenticated requests
x-amz-security-token	<p>A security token used by Amazon DevPay and session credentials</p> <p>If the request is using Amazon DevPay, it requires two x-amz-security-token form fields: one for the product token and one for the user token. For more information, see <a href="#">Using DevPay</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>If the request is using session credentials, it requires one x-amz-security-token form. For more information, see <a href="#">Requesting Temporary Security Credentials</a> in the <i>IAM User Guide</i>.</p>	No
x-amz-signature	<p>(AWS Signature Version 4) The HMAC-SHA256 hash of the security policy.</p> <p>This field is required if a policy document is included with the request.</p>	Required for authenticated requests

Element Name	Description	Required
x-amz-meta-*	Field names starting with this prefix are user-defined metadata. Each one is stored and returned as a set of key-value pairs. Amazon S3 doesn't validate or interpret user-defined metadata. For more information, see <a href="#">PutObject</a> .	No
x-amz-*	See POST Object ( <a href="#">POST Object</a> for other x-amz-* headers).	No
file	File or text content.  The file or content must be the last field in the form.  You cannot upload more than one file at a time.	Yes

Conditional items are required for authenticated requests and are optional for anonymous requests.

Now that you know how to create forms, next you can create a security policy that you can sign. For more information, see [POST Policy](#).

## POST Policy

### Topics

- [Expiration](#)
- [Condition Matching](#)
- [Conditions](#)
- [Character Escaping](#)

The policy required for making authenticated requests using HTTP POST is a UTF-8 and base64-encoded document written in JavaScript Object Notation (JSON) that specifies conditions that the request must meet. Depending on how you design your policy document, you can control the access granularity per-upload, per-user, for all uploads, or according to other designs that meet your needs.

This section describes the POST policy. For example signature calculations using POST policy, see [Example: Browser-Based Upload using HTTP POST \(Using AWS Signature Version 4\)](#).

### Note

Although the policy document is optional, we highly recommend that you use one in order to control what is allowed in the request. If you make the bucket publicly writable, you have no control at all over which users can write to your bucket.

The following is an example of a POST policy document.

```
{ "expiration": "2007-12-01T12:00:00.000Z",
  "conditions": [
    {"acl": "public-read" },
    {"bucket": "johnsmith" },
    ["starts-with", "$key", "user/eric/"],
  ]
}
```

The POST policy always contains the `expiration` and `conditions` elements. The example policy uses two condition matching types (exact matching and `starts-with` matching). The following sections describe these elements.

## Expiration

The `expiration` element specifies the expiration date and time of the POST policy in ISO8601 GMT date format. For example, `2013-08-01T12:00:00.000Z` specifies that the POST policy is not valid after midnight GMT on August 1, 2013.

## Condition Matching

Following is a table that describes condition matching types that you can use to specify POST policy conditions (described in the next section). Although you must specify at least one condition

for each form field that you specify in the form, you can create more complex matching criteria by specifying multiple conditions for a form field.

Condition Match Type	Description
Exact Matches	<p>The form field value must match the value specified. This example indicates that the ACL must be set to public-read:</p> <pre data-bbox="375 579 1507 659">{"acl": "public-read" }</pre> <p>This example is an alternate way to indicate that the ACL must be set to public-read:</p> <pre data-bbox="375 842 1507 921">[ "eq", "\$acl", "public-read" ]</pre>
Starts With	<p>The value must start with the specified value. This example indicates that the object key must start with user/user1:</p> <pre data-bbox="375 1115 1507 1194">["starts-with", "\$key", "user/user1/"]</pre>
Matching Content-Types in a Comma-Separated List	<p>Content-Types values for a starts-with condition that include commas are interpreted as lists. Each value in the list must meet the condition for the whole condition to pass. For example, given the following condition:</p> <pre data-bbox="375 1398 1507 1478">["starts-with", "\$Content-Type", "image/"]</pre> <p>The following value would pass the condition:</p> <pre data-bbox="375 1587 1507 1667">"image/jpg,image/png,image/gif"</pre> <p>The following value would not pass the condition:</p> <pre data-bbox="375 1776 1507 1856">["image/jpg,text/plain"]</pre>

Condition Match Type	Description
	<p><b>Note</b></p> <p>Data elements other than <code>Content-Type</code> are treated as strings, regardless of the presence of commas.</p>
Matching Any Content	<p>To configure the POST policy to allow any content within a form field, use <code>starts-with</code> with an empty value (<code>""</code>). This example allows any value for <code>success_action_redirect</code> :</p> <pre data-bbox="375 716 1507 793">["starts-with", "\$success_action_redirect", ""]</pre>
Specifying Ranges	<p>For form fields that accept a range, separate the upper and lower limit with a comma. This example allows a file size from 1 to 10 MiB:</p> <pre data-bbox="375 982 1507 1060">["content-length-range", 1048576, 10485760]</pre>

The specific conditions supported in a POST policy are described in [Conditions](#).

## Conditions

The conditions in a POST policy is an array of objects, each of which is used to validate the request. You can use these conditions to restrict what is allowed in the request. For example, the preceding policy conditions require the following:

- Request must specify the `johnsmith` bucket name.
- Object key name must have the `user/eric` prefix.
- Object ACL must be set to `public-read`.

Each form field that you specify in a form (except `x-amz-signature`, `file`, `policy`, and field names that have an `x-ignore-` prefix) must appear in the list of conditions.

**Note**

All variables within the form are expanded prior to validating the POST policy. Therefore, all condition matching should be against the expanded form fields. Suppose that you want to restrict your object key name to a specific prefix (user/user1). In this case, you set the key form field to user/user1/\${filename}. Your POST policy should be [ "starts-with", "\$key", "user/user1/" ] (do not enter [ "starts-with", "\$key", "user/user1/\${filename}" ]). For more information, see [Condition Matching](#).

Policy document conditions are described in the following table.

Element Name	Description
acl	<p>Specifies the ACL value that must be used in the form submission.</p> <p>This condition supports exact matching and starts-with condition match type discussed in the following section.</p>
bucket	<p>Specifies the acceptable bucket name.</p> <p>This condition supports exact matching condition match type.</p>
content-length-range	<p>The minimum and maximum allowable size for the uploaded content.</p> <p>This condition supports content-length-range condition match type.</p>
Cache-Control	<p>REST-specific headers. For more information, see <a href="#">POST Object</a>.</p>
Content-Type	
Content-Disposition	

Element Name	Description
Content-Encoding Expires	This condition supports exact matching and <code>starts-with</code> condition match type.
key	<p>The acceptable key name or a prefix of the uploaded object.</p> <p>This condition supports exact matching and <code>starts-with</code> condition match type.</p>
success_action_redirect redirect	<p>The URL to which the client is redirected upon successful upload.</p> <p>This condition supports exact matching and <code>starts-with</code> condition match type.</p>
success_action_status	<p>The status code returned to the client upon successful upload if <code>success_action_redirect</code> is not specified.</p> <p>This condition supports exact matching.</p>
x-amz-algorithm	<p>The signing algorithm that must be used during signature calculation. For AWS Signature Version 4, the value is <code>AWS4-HMAC-SHA256</code> .</p> <p>This condition supports exact matching.</p>

Element Name	Description
x-amz-credential	<p>The credentials that you used to calculate the signature. It provides access key ID and scope information identifying region and service for which the signature is valid. This should be the same scope you used in calculating the signing key for signature calculation.</p> <p>It is a string of the following form:</p> <pre data-bbox="646 604 1393 695">&lt;your-access-key-id&gt; /&lt;date&gt;/&lt;aws-region&gt; /&lt;aws-service&gt; /aws4_request</pre> <p>For example:</p> <pre data-bbox="646 814 1317 905">AKIAIOSFODNN7EXAMPLE/20130728/us-east-1/s3/aws4_request</pre> <p>For Amazon S3, the aws-service string is s3. For a list of Amazon S3 aws-region strings, see <a href="#">Regions and Endpoints</a> in the <i>AWS General Reference</i>. This is required if a POST policy document is included with the request.</p> <p>This condition supports exact matching.</p>
x-amz-date	<p>The date value specified in the ISO8601 formatted string. For example, 20130728T000000Z . The date must be same that you used in creating the signing key for signature calculation.</p> <p>This is required if a POST policy document is included with the request.</p> <p>This condition supports exact matching.</p>

Element Name	Description
x-amz-security-token	<p>Amazon DevPay security token.</p> <p>Each request that uses Amazon DevPay requires two <code>x-amz-security-token</code> form fields: one for the product token and one for the user token. As a result, the values must be separated by commas. For example, if the user token is <code>eW91dHVIZQ==</code> and the product token is <code>b0hnNVNKWVJIQTA=</code>, you set the POST policy entry to: <pre>{ "x-amz-security-token": "eW91dHVIZQ==,b0hnNVNKWVJIQTA=" }</pre></p> <p>For more information about Amazon DevPay, see <a href="#">Using DevPay</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p>
x-amz-meta-*	<p>User-specified metadata.</p> <p>This condition supports exact matching and <code>starts-with</code> condition match type.</p>
x-amz-*	<p>See POST Object (<a href="#">POST Object</a> for other <code>x-amz-*</code> headers.</p> <p>This condition supports exact matching.</p>

**Note**

If your toolkit adds more form fields (for example, Flash adds `filename`), you must add them to the POST policy document. If you can control this functionality, prefix `x-ignore-` to the field so Amazon S3 ignores the feature and it won't affect future versions of this feature.

## Character Escaping

Characters that must be escaped within a POST policy document are described in the following table.

Escape Sequence	Description
\\	Backslash
\\$	Dollar symbol
\b	Backspace
\f	Form feed
\n	New line
\r	Carriage return
\t	Horizontal tab
\v	Vertical tab
\uXXXX	All Unicode characters

Now that you are acquainted with forms and policies, and understand how signing works, you can try a POST upload example. You need to write the code to calculate the signature. The example provides a sample form, and a POST policy that you can use to test your signature calculations. For more information, see [Example: Browser-Based Upload using HTTP POST \(Using AWS Signature Version 4\)](#).

## Example: Browser-Based Upload using HTTP POST (Using AWS Signature Version 4)

This section shows an example of using an HTTP POST request to upload content directly to Amazon S3.

For more information on Signature Version 4, see [Signature Version 4 Signing Process](#).

### Uploading a File to Amazon S3 Using HTTP POST

This example provides a sample POST policy and a form that you can use to upload a file. The topic uses the example policy and fictitious credentials to show you the workflow and resulting signature and policy hash. You can use this data as test suite to verify your signature calculation code.

The example uses the following example credentials the signature calculations. You can use these credentials to verify your signature calculation code. However, you must then replace these with your own credentials when sending requests to AWS.

Parameter	Value
AWSAccessKeyId	AKIAIOSFODNN7EXAMPLE
AWSSecretAccessKey	wJalrXUtnFEMI/K7MDENG/bPxrFiCYEXAMPLEKEY

### Sample Policy and Form

The following POST policy supports uploads to Amazon S3 with specific conditions.

```
{ "expiration": "2015-12-30T12:00:00.000Z",
  "conditions": [
    {"bucket": "sigv4examplebucket"},
    ["starts-with", "$key", "user/user1/"],
    {"acl": "public-read"},
    {"success_action_redirect": "http://sigv4examplebucket.s3.amazonaws.com/successful_upload.html"},
    ["starts-with", "$Content-Type", "image/"],
    {"x-amz-meta-uuid": "14365123651274"}
  ]
}
```

```
{
  "x-amz-server-side-encryption": "AES256"},
  ["starts-with", "$x-amz-meta-tag", ""],

  {"x-amz-credential": "AKIAIOSFODNN7EXAMPLE/20151229/us-east-1/s3/aws4_request"},
  {"x-amz-algorithm": "AWS4-HMAC-SHA256"},
  {"x-amz-date": "20151229T000000Z" }
]
}
```

This POST policy sets the following conditions on the request:

- The upload must occur before noon UTC on December 30, 2015.
- The content can be uploaded only to the `sigv4examplebucket`. The bucket must be in the region that you specified in the credential scope (`x-amz-credential` form parameter), because the signature you provided is valid only within this scope.
- You can provide any key name that starts with `user/user1`. For example, `user/user1/MyPhoto.jpg`.
- The ACL must be set to `public-read`.
- If the upload succeeds, the user's browser is redirected to `http://sigv4examplebucket.s3.amazonaws.com/successful_upload.html`.
- The object must be an image file.
- The `x-amz-meta-uuid` tag must be set to `14365123651274`.
- The `x-amz-meta-tag` can contain any value.

The following is a Base64-encoded version of this POST policy. You use this value as your `StringToSign` in signature calculation.

```
eyJhZXBhYXQ6XGh0G1vbiI6IClYmDE1LTEyLTMwVDEyOjAwOjAwLjAwMFoiLA0KICAiY29uZG10aW9ucyI6IFsNCiAgICB7ImJ
```

When you copy/paste the preceding policy, it should have carriage returns and new lines for your computed hash to match this value (ie. ASCII text, with CRLF line terminators).

Using example credentials to create a signature, the signature value is as follows (in signature calculation, the date is same as the `x-amz-date` in the policy (20151229)):

```
8afdbf4008c03f22c2cd3cdb72e4afbb1f6a588f3255ac628749a66d7f09699e
```

The following example form specifies the preceding POST policy and supports a POST request to the `sigv4examplebucket`. Copy/paste the content in a text editor and save it as `exampleform.html`. You can then upload image files to the specific bucket using the `exampleform.html`. Your request will succeed if the signature you provide matches the signature Amazon S3 calculates.

### Note

You must update the bucket name, dates, credential, policy, and signature with valid values for this to successfully upload to S3.

```
<html>
  <head>

    <meta http-equiv="Content-Type" content="text/html; charset=UTF-8" />

  </head>
  <body>

    <form action="http://sigv4examplebucket.s3.amazonaws.com/" method="post"
    enctype="multipart/form-data">
      Key to upload:
      <input type="input" name="key" value="user/user1/${filename}" /><br />
      <input type="hidden" name="acl" value="public-read" />
      <input type="hidden" name="success_action_redirect" value="http://
sigv4examplebucket.s3.amazonaws.com/successful_upload.html" />
      Content-Type:
      <input type="input" name="Content-Type" value="image/jpeg" /><br />
      <input type="hidden" name="x-amz-meta-uuid" value="14365123651274" />
      <input type="hidden" name="x-amz-server-side-encryption" value="AES256" />
      <input type="text" name="X-Amz-Credential" value="AKIAIOSFODNN7EXAMPLE/20151229/
us-east-1/s3/aws4_request" />
      <input type="text" name="X-Amz-Algorithm" value="AWS4-HMAC-SHA256" />
      <input type="text" name="X-Amz-Date" value="20151229T000000Z" />

      Tags for File:
      <input type="input" name="x-amz-meta-tag" value="" /><br />
      <input type="hidden" name="Policy" value='<Base64-encoded policy string>' />
      <input type="hidden" name="X-Amz-Signature" value="<signature-value>" />
      File:
      <input type="file" name="file" /> <br />
```

```
<!-- The elements after this will be ignored -->
<input type="submit" name="submit" value="Upload to Amazon S3" />
</form>

</html>
```

The post parameters are case insensitive. For example, you can specify `x-amz-signature` or `X-Amz-Signature`.

## Browser-based uploads to Amazon S3 using the AWS Amplify library

This section describes how to upload files to Amazon S3 using the AWS Amplify JavaScript library.

For information about setting up the AWS Amplify library, see [AWS Amplify Installation and Configuration](#).

### Using the AWS Amplify JavaScript library to Upload Files to Amazon S3

The AWS Amplify library `Storage` module gives a simple browser-based upload mechanism for managing user content in public or private Amazon S3 storage.

#### Example : AWS Amplify Manual Setup

The following example shows the manual setup for using the AWS Amplify `Storage` module. The default implementation of the `Storage` module uses Amazon S3.

```
import Amplify from 'aws-amplify';
Amplify.configure(
  Auth: {
    identityPoolId: 'XX-XXXX-X:XXXXXXXX-XXXX-1234-abcd-1234567890ab', //REQUIRED -
    Amazon Cognito Identity Pool ID
    region: 'XX-XXXX-X', // REQUIRED - Amazon Cognito Region
    userPoolId: 'XX-XXXX-X_abcd1234', //OPTIONAL - Amazon Cognito User Pool ID
    userPoolWebClientId: 'XX-XXXX-X_abcd1234', //OPTIONAL - Amazon Cognito Web
    Client ID
  },
  Storage: {
    bucket: '', //REQUIRED - Amazon S3 bucket
    region: 'XX-XXXX-X', //OPTIONAL - Amazon service region
  }
}
```

```
);
```

### Example : Put data into Amazon S3

The following example shows how to put public data into Amazon S3.

```
Storage.put('test.txt', 'Hello')
  .then (result => console.log(result))
  .catch(err => console.log(err));
```

The following example shows how to put private data into Amazon S3.

```
Storage.put('test.txt', 'Private Content', {
  level: 'private',
  contentType: 'text/plain'
})
  .then (result => console.log(result))
  .catch(err => console.log(err));
```

For more information about using the AWS Amplify Storage module, see [AWS Amplify Storage](#).

## More Info

[AWS Amplify Quick Start](#)

## Common request headers

The following table describes headers that can be used by various types of Amazon S3 REST requests.

Header Name	Description
Authorization	The information required for request authentication. For more information, go to <a href="#">The Authentication Header</a> in the <i>Amazon Simple Storage Service Developer Guide</i> . For anonymous requests this header is not required.
Access-Control-Request-Method	A list of HTTP methods that is sent as a pre-flight CORS request. If the pre-flight CORS evaluation is successful, then the specified methods are allowed to be used in the following CORS request.
Content-Length	Length of the message (without the headers) according to RFC 2616. This header is required for PUTs and operations that load XML, such as logging and ACLs.
Content-Type	The content type of the resource in case the request has content in the body. Example: <code>text/plain</code>
Content-MD5	The base64 encoded 128-bit MD5 digest of the message (without the headers) according to RFC 1864. This header can be used as a message integrity check to verify that the data is the same data that was originally sent. Although it is optional, we recommend using the Content-MD5 mechanism as an end-to-end integrity check. For more information about REST request authentication, go to <a href="#">REST Authentication</a> in the <i>Amazon Simple Storage Service Developer Guide</i> .
Date	The date that can be used to create the signature contained in the <code>Authorization</code> header. If the Date header is to be used for signing it must be specified in the ISO 8601 basic format. In this case, the <code>x-amz-date</code> header is not needed.

Header Name	Description
	<p>Note that when <code>x-amz-date</code> is present, it always overrides the value of the <code>Date</code> header.</p> <p>If the <code>Date</code> header is not used for signing, it can be one of the full date formats specified by <a href="#">RFC 2616</a>, section 3.3. For example, the date/time <code>Wed, 01 Mar 2006 12:00:00 GMT</code> is a valid date/time header for use with Amazon S3.</p> <p>If you are using the <code>Date</code> header for signing, then it must be in the ISO 8601 basic <code>YYYYMMDD'T'HHMMSS'Z'</code> format.</p> <p>If <code>Date</code> is specified but is not in ISO 8601 basic format, then you must also include the <code>x-amz-date</code> header. If <code>Date</code> is specified in ISO 8601 basic format, then this is sufficient for signing requests and you do not need the <code>x-amz-date</code> header. For more information, see <a href="#">Handling Dates in Signature Version 4</a> in the <i>Amazon Web Services Glossary</i>.</p>
Expect	<p>When your application uses <code>100-continue</code>, it does not send the request body until it receives an acknowledgment. If the message is rejected based on the headers, the body of the message is not sent. This header can be used only if you are sending a body.</p> <p>Valid Values: <code>100-continue</code></p>
Host	<p>For path-style requests, the value is <code>s3.amazonaws.com</code>. For virtual-style requests, the value is <code>BucketName.s3.amazonaws.com</code>. For more information, go to <a href="#">Virtual Hosting</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>This header is required for HTTP 1.1 (most toolkits add this header automatically); optional for HTTP/1.0 requests.</p>
Origin	<p>An endpoint that specifies the server name of the initial requester.</p>

Header Name	Description
x-amz-content-sha256	<p>When using signature version 4 to authenticate request, this header provides a hash of the request payload. For more information see <a href="#">Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (AWS Signature Version 4)</a>. When uploading object in chunks, you set the value to <code>STREAMING-AWS4-HMAC-SHA256-PAYLOAD</code> to indicate that the signature covers only headers and that there is no payload. For more information, see <a href="#">Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks (Chunked Upload) (AWS Signature Version 4)</a>.</p>
x-amz-date	<p>The date used to create the signature in the Authorization header. The format must be ISO 8601 basic in the <code>YYYYMMDD'T'HHMMSS'Z'</code> format. For example, the date/time <code>20170210T120000Z</code> is a valid <code>x-amz-date</code> for use with Amazon S3.</p> <p><code>x-amz-date</code> is optional for all requests; it can be used to override the date used for signing requests. If the Date header is specified in the ISO 8601 basic format, then <code>x-amz-date</code> is not needed. When <code>x-amz-date</code> is present, it always overrides the value of the Date header. For more information, see <a href="#">Handling Dates in Signature Version 4</a> in the <i>Amazon Web Services Glossary</i>.</p>

Header Name	Description
x-amz-security-token	<p>This header can be used in the following scenarios:</p> <ul style="list-style-type: none"><li>• To provide security tokens for Amazon DevPay operations - Each request that uses Amazon DevPay requires two <code>x-amz-security-token</code> headers: one for the product token and one for the user token. When Amazon S3 receives an authenticated request, it compares the computed signature with the provided signature. Improperly formatted multi-value headers that are used to calculate a signature can cause authentication issues.</li><li>• To provide a security token when using temporary security credentials - When making requests using temporary security credentials that you obtained from IAM, you must provide a security token by using this header. To learn more about temporary security credentials, see <a href="#">Making Requests</a>.</li></ul> <p>This header is required for requests that use Amazon DevPay and requests that are signed by using temporary security credentials.</p>

## Common response headers

The following table describes response headers that are common to most Amazon S3 responses.

Name	Description
<code>Access-Control-Allow-Credentials</code>	<p>A Boolean that determines if the server allows CORS requests to contain credentials. If the <code>Access-Control-Allow-Origin</code> request header is set to <code>*</code> then the <code>Access-Control-Allow-Credentials</code> response header will be omitted, else it is set to <code>true</code> when CORS evaluation is successful.</p> <p>Type: Boolean</p> <p>Default: None</p>
<code>Access-Control-Allow-Headers</code>	<p>A list of HTTP headers allowed for your CORS requests. The <code>Access-Control-Allow-Headers</code> response header is returned for successful CORS evaluations and explicitly specifies all allowed <code>Access-Control-Request-Headers</code>.</p> <p>Type: String</p> <p>Default: None</p>
<code>Access-Control-Allow-Methods</code>	<p>A list that specifies which HTTP methods are allowed. Amazon S3 will only allow CORS requests from allowed CORS methods when the CORS evaluation is successful.</p> <p>Type: String</p> <p>Default: None</p>
<code>Access-Control-Allow-Origin</code>	<p>The location of the allowed origin. Amazon S3 will only send the <code>Access-Control-Allow-Origin</code> response header when the CORS evaluation is successful. If the request origin matches <code>*</code> in the CORS configuration's allowed origins then the <code>*</code> is returned in this response header instead of the original origin.</p>

Name	Description
	<p>Type: String</p> <p>Default: None</p>
Access-Control-Expose-Headers	<p>A list that allows a server to identify a response header that exposes access for applications when the CORS evaluation is successful.</p> <p>Type: String</p> <p>Default: None</p>
Access-Control-Max-Age	<p>The time in seconds that your browser can cache the response for a CORS pre-flight request as identified by the resource, the HTTP method, and the origin. The <code>Access-Control-Max-Age</code> response header is only returned when the CORS evaluation is successful.</p> <p>Type: Integer</p> <p>Default: None</p>
Vary	<p>A list that indicates which request headers the CORS evaluation result varies on. The <code>Vary</code> response header is only returned when the CORS evaluation is successful.</p> <p>Type: String</p> <p>Default: None</p>
Content-Length	<p>The length in bytes of the body in the response.</p> <p>Type: String</p> <p>Default: None</p>
Content-Type	<p>The MIME type of the content. For example, <code>Content-Type: text/html; charset=utf-8</code> .</p> <p>Type: String</p> <p>Default: None</p>

Name	Description
Connection	<p>A value that specifies whether the connection to the server is open or closed.</p> <p>Type: Enum</p> <p>Valid Values: open   close</p> <p>Default: None</p>
Date	<p>The date and time that Amazon S3 responded; for example, Wed, 01 Mar 2006 12:00:00 GMT.</p> <p>Type: String</p> <p>Default: None</p>
ETag	<p>The entity tag (ETag) represents a specific version of the object. The ETag reflects changes only to the contents of an object, not its metadata. The ETag might or might not be an MD5 digest of the object data. Whether or not it is depends on how the object was created and how it is encrypted, as follows:</p> <ul style="list-style-type: none"><li>• Objects created through the AWS Management Console or by the PUT Object, POST Object, or Copy operation:<ul style="list-style-type: none"><li>• Objects that are plaintext or encrypted by server-side encryption with Amazon S3 managed keys (SSE-S3) have ETags that are an MD5 digest of their data.</li><li>• Objects encrypted by server-side encryption with customer-provided keys (SSE-C) or AWS Key Management Service (AWS KMS) keys (SSE-KMS) have ETags that are not an MD5 digest of their object data.</li></ul></li><li>• Objects created by either the Multipart Upload or Upload Part Copy operation have ETags that are not MD5 digests, regardless of the method of encryption.</li></ul> <p>Type: String</p>

Name	Description
Server	<p>The name of the server that created the response.</p> <p>Type: String</p> <p>Default: AmazonS3</p>
x-amz-delete-marker	<p>A value that specifies whether the object returned was (<code>true</code>) or was not (<code>false</code>) a delete marker.</p> <p>Type: Boolean</p> <p>Valid Values: <code>true</code>   <code>false</code></p> <p>Default: <code>false</code></p>
x-amz-id-2	<p>A special token that is used together with the <code>x-amz-request-id</code> header to help AWS troubleshoot problems. For information about Support using these request IDs, see <a href="#">Troubleshooting Amazon S3</a>.</p> <p>Type: String</p> <p>Default: None</p>
x-amz-request-id	<p>A value created by Amazon S3 that uniquely identifies the request. This value is used together with the <code>x-amz-id-2</code> header to help AWS troubleshoot problems. For information about Support using these request IDs, see <a href="#">Troubleshooting Amazon S3</a>.</p> <p>Type: String</p> <p>Default: None</p>
x-amz-server-side-encryption	<p>The server-side encryption algorithm used when storing this object in Amazon S3 (for example, <code>AES256</code>, <code>aws:kms</code>).</p> <p>Valid Values: <code>AES256</code>   <code>aws:kms</code></p>

Name	Description
x-amz-version-id	<p>The version of the object. When you enable versioning, Amazon S3 generates a random number for objects added to a bucket. The value is UTF-8 encoded and URL ready. When you PUT an object in a bucket where versioning has been suspended, the version ID is always <code>null</code>.</p> <p>Type: String</p> <p>Valid Values: <code>null</code>   any URL-ready, UTF-8 encoded string</p> <p>Default: <code>null</code></p>

# Error responses

This section provides reference information about Amazon S3 errors.

## Note

- In general, S3 bucket owners are billed for requests with HTTP 200 OK successful responses and HTTP 4XX client error responses. Bucket owners aren't billed for HTTP 5XX server error responses, such as HTTP 503 Slow Down errors. For more information on S3 error codes under HTTP 3XX and 4XX status codes that aren't billed, see [Billing for Amazon S3 error responses](#) in the Amazon S3 User Guide. For more information about billing charges if your bucket is configured as a Requester Pays bucket, see [How Requester Pays charges work](#) in the Amazon S3 User Guide.
- SOAP support over HTTP is deprecated, but SOAP is still available over HTTPS. New Amazon S3 features are not supported for SOAP. Instead of using SOAP, we recommend that you use either the REST API or the AWS SDKs.

## REST error responses

When an error occurs, the header information contains the following:

- Content-Type: application/xml
- An appropriate 3xx, 4xx, or 5xx HTTP status code

The body of the response also contains information about the error. The following sample error response shows the structure of response elements common to all REST error responses.

```
<?xml version="1.0" encoding="UTF-8"?>
<Error>
  <Code>NoSuchKey</Code>
  <Message>The resource you requested does not exist</Message>
  <Resource>/mybucket/myfoto.jpg</Resource>
  <RequestId>4442587FB7D0A2F9</RequestId>
</Error>
```

The following table explains the REST error response elements.

Name	Description
Code	The error code is a string that uniquely identifies an error condition. It is meant to be read and understood by programs that detect and handle errors by type. For more information, see <a href="#">List of error codes</a> .  Type: String  Ancestor: Error
Error	Container for all error elements.  Type: Container  Ancestor: None
Message	The error message contains a generic description of the error condition in English. It is intended for a human audience. Simple programs display the message directly to the end user if they encounter an error condition they

Name	Description
	<p>don't know how or don't care to handle. Sophisticated programs with more exhaustive error handling and proper internationalization are more likely to ignore the error message.</p> <p>Type: String</p> <p>Ancestor: Error</p>
RequestId	<p>ID of the request associated with the error.</p> <p>Type: String</p> <p>Ancestor: Error</p>
Resource	<p>The bucket or object that is involved in the error.</p> <p>Type: String</p> <p>Ancestor: Error</p>

Many error responses contain additional structured data meant to be read and understood by a developer diagnosing programming errors. For example, if you send a Content-MD5 header with a REST PUT request that doesn't match the digest calculated on the server, you receive a `BadDigest` error. The error response also includes as detail elements the digest that the server calculated, and the digest that you told the server to expect. During development, you can use this information to diagnose the error. In production, a well-behaved program might include this information in its error log.

For information about general response elements, go to [Error responses](#).

## List of error codes

The following table lists Amazon S3 error codes.

Error code	Description	HTTP status code	SOAP fault code prefix
AccessControlListNotSupported	The bucket does not allow ACLs.	400 Bad Request	Client
AccessDenied	Access Denied	403 Forbidden	Client
AccessPointAlreadyOwnedByYou	An access point with an identical name already exists in your account.	409 Conflict	Client
AccountProblem	There is a problem with your AWS account that prevents the operation from completing successfully. For further assistance, see <a href="#">Contact Us</a> .	403 Forbidden	Client
AllAccessDisabled	All access to this Amazon S3 resource has been disabled. For further assistance, see <a href="#">Contact Us</a> .	403 Forbidden	Client
AmbiguousGrantByEmailAddress	The email address that you provided is associated with more than one account.	400 Bad Request	Client
AuthorizationHeaderMalformed	The authorization header that you provided is not valid.	400 Bad Request	N/A
AuthorizationQueryParametersError	The authorization query parameters that you provided are not valid.	400 Bad Request	N/A

Error code	Description	HTTP status code	SOAP fault code prefix
BadDigest	The Content-MD5 or checksum value that you specified did not match what the server received.	400 Bad Request	Client
BucketAlreadyExists	The requested bucket name is not available. The bucket namespace is shared by all users of the system. Specify a different name and try again.	409 Conflict	Client
BucketAlreadyOwnedByYou	The bucket that you tried to create already exists, and you own it. Amazon S3 returns this error in all AWS Regions except in the US East (N. Virginia) Region (us-east-1). For legacy compatibility, if you re-create an existing bucket that you already own in us-east-1, Amazon S3 returns 200 OK and resets the bucket access control lists (ACLs).  For Amazon S3 on Outposts, the bucket that you tried to create already exists in your Outpost and you own it.	409 Conflict (in all Regions except us-east-1)	Client
BucketHasAccessPointsAttached	The bucket you tried to delete has access points attached. Delete your access points before deleting your bucket.	400 Bad Request	Client
BucketNotEmpty	The bucket that you tried to delete is not empty.	409 Conflict	Client

Error code	Description	HTTP status code	SOAP fault code prefix
<code>ClientTokenConflict</code>	Your Multi-Region Access Point idempotency token was already used for a different request.	409 Conflict	Client
<code>ConnectionClosedByRequester</code>	Returned to the original caller when an error is encountered while reading the <code>WriteGetObjectResponse</code> body.	400 Bad Request	Client
<code>ConditionalRequestConflict</code>	A conflicting operation occurred. If using <code>PutObject</code> you can retry the request. If using multipart upload you should initiate another <code>CreateMultipartUpload</code> request and re-upload each part.	409 Conflict	Client
<code>CredentialsNotSupported</code>	This request does not support credentials.	400 Bad Request	Client
<code>CrossLocationLoggingProhibited</code>	Cross-Region logging is not allowed. Buckets in one AWS Region cannot log information to a bucket in another Region.	403 Forbidden	Client
<code>DeviceNotActiveError</code>	The device is not currently active.	400 Bad Request	Client
<code>EndpointNotFound</code>	Direct requests to the correct endpoint.	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
EntityTooSmall	Your proposed upload is smaller than the minimum allowed object size.	400 Bad Request	Client
EntityTooLarge	Your proposed upload exceeds the maximum allowed object size. For more information, see <a href="#">Amazon Simple Storage Service endpoints and quotas</a> in the <i>AWS General Reference</i> .	400 Bad Request	Client
ExpiredToken	The provided token has expired.	400 Bad Request	Client
IllegalLocationConstraintException	This error might occur for the following reasons: <ul style="list-style-type: none"><li>You are trying to access a bucket from a different Region than where the bucket exists.</li><li>You attempt to create a bucket with a location constraint that corresponds to a different region than the regional endpoint the request was sent to.</li></ul>	400 Bad Request	Client
IllegalVersioningConfigurationException	The versioning configuration specified in the request is not valid.	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
IncompleteBody	You did not provide the number of bytes specified by the Content-Length HTTP header.	400 Bad Request	Client
IncorrectEndpoint	The specified bucket exists in another Region. Direct requests to the correct endpoint.	400 Bad Request	Client
IncorrectNumberOfFilesInPostRequest	POST requires exactly one file upload per request.	400 Bad Request	Client
InlineDataTooLarge	The inline data exceeds the maximum allowed size.	400 Bad Request	Client
InternalError	An internal error occurred. Try again.	500 Internal Server Error	Server
InvalidAccessKeyId	The AWS access key ID that you provided does not exist in our records.	403 Forbidden	Client
InvalidAccessPoint	The specified access point name or account is not valid.	400 Bad Request	Client
InvalidAccessPointAliasError	The specified access point alias name is not valid.	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
InvalidAddressingHeader	You must specify the Anonymous role.	N/A	Client
InvalidArgument	<p>This error might occur for the following reasons:</p> <ul style="list-style-type: none"> <li>• A ListBuckets request is made to a Regional endpoint that is different from the Region specified in the bucket-region parameter.</li> <li>• The specified argument was not valid.</li> <li>• The request was missing a required header.</li> <li>• The specified argument was incomplete or in the wrong format.</li> <li>• The specified argument must have a length greater than or equal to 3.</li> </ul>	400 Bad Request	Client
InvalidBucketAclWithObjectOwnership	Bucket cannot have ACLs set with ObjectOwnership's BucketOwner Enforced setting.	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
InvalidBucketName	The specified bucket is not valid.	400 Bad Request	Client
InvalidBucketOwner AWSAccountID	The value of the expected bucket owner parameter must be an AWS account ID.	400 Bad Request	Client
InvalidBucketState	The request is not valid for the current state of the bucket.	409 Conflict	Client
InvalidDigest	The Content-MD5 or checksum value that you specified is not valid.	400 Bad Request	Client
InvalidEncryptionAlgorithmError	The encryption request that you specified is not valid. The valid value is AES256.	400 Bad Request	Client
InvalidHostHeader	The host headers provided in the request used the incorrect style addressing.	400 Bad Request	Client
InvalidHttpMethod	The request is made using an unexpected HTTP method.	400 Bad Request	Client
InvalidLocationConstraint	The specified location (Region) constraint is not valid. For more information about selecting a Region for your buckets, see <a href="#">Buckets overview</a> .	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
InvalidObjectState	The operation is not valid for the current state of the object.	403 Forbidden	Client
InvalidPart	One or more of the specified parts could not be found. The part might not have been uploaded, or the specified entity tag might not have matched the part's entity tag.	400 Bad Request	Client
InvalidPartOrder	The list of parts was not in ascending order. The parts list must be specified in order by part number.	400 Bad Request	Client
InvalidPayer	All access to this object has been disabled. For further assistance, see <a href="#">Contact Us</a> .	403 Forbidden	Client
InvalidPolicyDocument	The content of the form does not meet the conditions specified in the policy document.	400 Bad Request	Client
InvalidRange	The requested range cannot be satisfied.	416 Requested Range Not Satisfiable	Client

<b>Error code</b>	<b>Description</b>	<b>HTTP status code</b>	<b>SOAP fault code prefix</b>
InvalidRegion	You've attempted to create a Multi-Region Access Point in a Region that you haven't opted in to.	403 Forbidden	Client

Error code	Description	HTTP status code	SOAP fault code prefix
InvalidRequest	<p>This error might occur for the following reasons:</p> <ul style="list-style-type: none"><li data-bbox="704 506 1214 898">• An unpaginated ListBuckets request is made from an account that has an approved general purpose bucket quota higher than 10,000. You must make paginated requests to list the buckets in an account with more than 10,000 buckets.</li><li data-bbox="704 940 1182 1129">• The request is using the wrong signature version. Use AWS4-HMAC-SHA256 (Signature Version 4).</li><li data-bbox="704 1171 1182 1266">• An access point can be created only for an existing bucket.</li><li data-bbox="704 1308 1206 1402">• The access point is not in a state where it can be deleted.</li><li data-bbox="704 1444 1149 1539">• An access point can be listed only for an existing bucket.</li><li data-bbox="704 1581 1130 1623">• The next token is not valid.</li><li data-bbox="704 1665 1133 1759">• At least one action must be specified in a lifecycle rule.</li><li data-bbox="704 1791 721 1812">•</li></ul>	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
	<p>At least one lifecycle rule must be specified.</p> <ul style="list-style-type: none"><li>• The number of lifecycle rules must not exceed the allowed limit of 1000 rules.</li><li>• The range for the MaxResults parameter is not valid.</li><li>• SOAP requests must be made over an HTTPS connection.</li><li>• Amazon S3 Transfer Acceleration is not supported for buckets with non-DNS compliant names.</li><li>• Amazon S3 Transfer Acceleration is not supported for buckets with periods (.) in their names.</li><li>• The Amazon S3 Transfer Acceleration endpoint supports only virtual style requests.</li><li>• Amazon S3 Transfer Acceleration is not configured on this bucket.</li><li>• Amazon S3 Transfer Acceleration is disabled on this bucket.</li><li>•</li></ul>		

Error code	Description	HTTP status code	SOAP fault code prefix
	<p>Amazon S3 Transfer Acceleration is not supported on this bucket. For assistance, contact <a href="#">Support</a>.</p> <ul style="list-style-type: none"> <li>• Amazon S3 Transfer Acceleration cannot be enabled on this bucket. For assistance, contact <a href="#">Support</a>.</li> <li>• Conflicting values provided in HTTP headers and query parameters.</li> <li>• Conflicting values provided in HTTP headers and POST form fields.</li> <li>• CopyObject request made on objects larger than 5GB in size.</li> </ul>		
InvalidSessionException	Returned if the session doesn't exist anymore because it timed out or expired.	400 Bad Request	Client
InvalidSignature	The request signature that the server calculated does not match the signature that you provided. Check your AWS secret access key and signing method. For more information, see <a href="#">Signing and authenticating REST requests</a> .	400 Bad Request	Client

<b>Error code</b>	<b>Description</b>	<b>HTTP status code</b>	<b>SOAP fault code prefix</b>
<code>InvalidSecurity</code>	The provided security credentials are not valid.	403 Forbidden	Client
<code>InvalidSOAPRequest</code>	The SOAP request body is not valid.	400 Bad Request	Client
<code>InvalidStorageClass</code>	The storage class that you specified is not valid.	400 Bad Request	Client
<code>InvalidTargetBucketForLogging</code>	The target bucket for logging either does not exist, is not owned by you, or does not have the appropriate grants for the log-delivery group.	400 Bad Request	Client
<code>InvalidToken</code>	The provided token is malformed or otherwise not valid.	400 Bad Request	Client
<code>InvalidURI</code>	The specified URI couldn't be parsed.	400 Bad Request	Client
<code>KeyTooLongError</code>	Your key is too long.	400 Bad Request	Client
<code>KMS.DisabledException</code>	The request was rejected because the specified KMS key is not enabled.	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
KMS.InvalidKeyUsageException	<p>The request was rejected for one of the following reasons:</p> <ul style="list-style-type: none"><li>• The KeyUsage value of the KMS key is incompatible with the API operation.</li><li>• The encryption algorithm or signing algorithm specified for the operation is incompatible with the type of key material in the KMS key (KeySpec).</li></ul> <p>For encrypting, decrypting, re-encrypting, and generating data keys, the KeyUsage must be ENCRYPT_DECRYPT. For signing and verifying messages, the KeyUsage must be SIGN_VERIFY. For generating and verifying message authentication codes (MACs), the KeyUsage must be GENERATE_VERIFY_MAC. For deriving key agreement secrets, the KeyUsage must be KEY_AGREEMENT. To find the KeyUsage of a KMS key, use the DescribeKey operation.</p> <p>To find the encryption or signing algorithms supported for a</p>	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
	particular KMS key, use the DescribeKey operation.		
KMS.KMSInvalidStateException	<p>The request was rejected because the state of the specified resource is not valid for this request. This exception means one of the following:</p> <ul style="list-style-type: none"><li>The key state of the KMS key is not compatible with the operation.</li></ul> <p>To find the key state, use the DescribeKey operation. For more information about which key states are compatible with each KMS operation, see <a href="#">Key states of AWS KMS keys</a> in the <i>AWS Key Management Service Developer Guide</i>.</p> <ul style="list-style-type: none"><li>For cryptographic operations on KMS keys in custom key stores, this exception represents a general failure with many possible causes. To identify the cause, see the error message that accompanies the exception.</li></ul>	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
KMS.NotFoundException	The request was rejected because the specified entity or resource could not be found.	400 Bad Request	Client
MalformedACLError	The ACL that you provided was not well formed or did not validate against our published schema.	400 Bad Request	Client
MalformedPOSTRequest	The body of your POST request is not well-formed multipart/form-data.	400 Bad Request	Client
MalformedXML	The XML that you provided was not well formed or did not validate against our published schema.	400 Bad Request	Client
MaxMessageLengthExceeded	Your request was too large.	400 Bad Request	Client
MaxPostPreDataLengthExceededError	Your POST request fields preceding the upload file were too large.	400 Bad Request	Client
MetadataTooLarge	Your metadata headers exceed the maximum allowed metadata size.	400 Bad Request	Client
MethodNotAllowed	The specified method is not allowed against this resource.	405 Method Not Allowed	Client

<b>Error code</b>	<b>Description</b>	<b>HTTP status code</b>	<b>SOAP fault code prefix</b>
MissingAttachment	A SOAP attachment was expected, but none was found.	400 Bad Request	Client
MissingAuthenticationToken	The request was not signed.	403 Forbidden	Client
MissingContentLength	You must provide the Content-Length HTTP header.	411 Length Required	Client
MissingRequestBodyError	You sent an empty XML document as a request.	400 Bad Request	Client
MissingSecurityElement	The SOAP 1.1 request is missing a security element.	400 Bad Request	Client
MissingSecurityHeader	Your request is missing a required header.	400 Bad Request	Client
NoLoggingStatusForKey	There is no such thing as a logging status subresource for a key.	400 Bad Request	Client
NoSuchAsyncRequest	The specified request was not found.	404 Not Found	Client
NoSuchBucket	The specified bucket does not exist.	404 Not Found	Client

<b>Error code</b>	<b>Description</b>	<b>HTTP status code</b>	<b>SOAP fault code prefix</b>
NoSuchBucketPolicy	The specified bucket does not have a bucket policy.	404 Not Found	Client
NoSuchCORSConfiguration	The specified bucket does not have a CORS configuration.	404 Not Found	Client
NoSuchKey	The specified key does not exist.	404 Not Found	Client
NoSuchLifecycleConfiguration	The specified lifecycle configuration does not exist.	404 Not Found	Client
NoSuchMultiRegionAccessPoint	The specified Multi-Region Access Point does not exist.	404 Not Found	Client
NoSuchObjectLockConfiguration	The specified object does not have an ObjectLock configuration.	404 Not Found	Client
NoSuchWebsiteConfiguration	The specified bucket does not have a website configuration.	404 Not Found	Client
NoSuchTagSet	The specified tag does not exist.	404 Not Found	Client

Error code	Description	HTTP status code	SOAP fault code prefix
NoSuchUpload	The specified multipart upload does not exist. The upload ID might not be valid, or the multipart upload might have been aborted or completed.	404 Not Found	Client
NoSuchVersion	The version ID specified in the request does not match an existing version.	404 Not Found	Client
NotDeviceOwnerError	The device that generated the token is not owned by the authenticated user.	400 Bad Request	Client
NotImplemented	A header that you provided implies functionality that is not implemented.	501 Not Implemented	Server
NotModified	The resource was not changed.	304 Not Modified	Server
NoTransformationDefined	No transformation found for this Object Lambda Access Point.	404 Not Found	Client
NotSignedUp	Your account is not signed up for the Amazon S3 service. You must sign up before you can use Amazon S3. You can sign up at the following URL: <a href="https://aws.amazon.com/s3">https://aws.amazon.com/s3</a>	403 Forbidden	Client

Error code	Description	HTTP status code	SOAP fault code prefix
ObjectLockConfigurationNotFoundError	The Object Lock configuration does not exist for this bucket.	404 Not Found	Client
OwnershipControlsNotFoundError	The bucket ownership controls were not found.	404 Not Found	Client
OperationAborted	A conflicting conditional operation is currently in progress against this resource. Try again.	409 Conflict	Client
PermanentRedirect	The bucket that you are attempting to access must be addressed using the specified endpoint. Send all future requests to this endpoint.	301 Moved Permanently	Client
PermanentRedirectControlError	The API operation you are attempting to access must be addressed using the specified endpoint. Send all future requests to this endpoint.	301 Moved Permanently	Client
PreconditionFailed	At least one of the preconditions that you specified did not hold.	412 Precondition Failed	Client
Redirect	Temporary redirect. You are being redirected to the bucket while the Domain Name System (DNS) server is being updated.	307 Temporary Redirect	Client

Error code	Description	HTTP status code	SOAP fault code prefix
RequestHeaderSectionTooLarge	The request header and query parameters used to make the request exceed the maximum allowed size.	400 Bad Request	Client
RequestIsNotMultipartContent	A bucket POST request must be of the enclosure-type multipart/form-data.	412 Precondition Failed	Client
RequestTimeout	Your socket connection to the server was not read from or written to within the timeout period.	400 Bad Request	Client
RequestTimeTooSkewed	The difference between the request time and the server's time is too large.	403 Forbidden	Client
RequestTorrentOfBucketError	Requesting the torrent file of a bucket is not permitted.	400 Bad Request	Client
ResponseInterrupted	Returned to the original caller when an error is encountered while reading the WriteGetObjectResponse body.	400 Bad Request	Client
RestoreAlreadyInProgress	The object restore is already in progress.	409 Conflict	Client

Error code	Description	HTTP status code	SOAP fault code prefix
ServerSideEncryptionConfigurationNotFound	The server-side encryption configuration was not found.	400 Bad Request	Client
ServiceUnavailable	Service is unable to handle request.	503 Service Unavailable	Server
SignatureDoesNotMatch	The request signature that the server calculated does not match the signature that you provided. Check your AWS secret access key and signing method. For more information, see <a href="#">REST Authentication</a> and <a href="#">SOAP Authentication</a> .	403 Forbidden	Client
SlowDown	Please reduce your request rate.	503 Slow Down	Server
503 SlowDown	Slow Down	503 Slow Down	Server
TagPolicyException	The tag policy does not allow the specified value for the following tag key.	400 Bad Request	Client
TemporaryRedirect	You are being redirected to the bucket while the Domain Name System (DNS) server is being updated.	307 Temporary Redirect	Client

Error code	Description	HTTP status code	SOAP fault code prefix
TokenCodeInvalidError	The serial number and/or token code you provided is not valid.	400 Bad Request	Client
TokenRefreshRequired	The provided token must be refreshed.	400 Bad Request	Client
TooManyAccessPoints	You have attempted to create more access points than are allowed for an account. For more information, see <a href="#">Amazon Simple Storage Service endpoints and quotas</a> in the <i>AWS General Reference</i> .	400 Bad Request	Client
TooManyBuckets	You have attempted to create more buckets than are allowed for an account. For more information, see <a href="#">Amazon Simple Storage Service endpoints and quotas</a> in the <i>AWS General Reference</i> .	400 Bad Request	Client
TooManyMultiRegionAccessPointregionsError	You have attempted to create a Multi-Region Access Point with more Regions than are allowed for an account. For more information, see <a href="#">Amazon Simple Storage Service endpoints and quotas</a> in the <i>AWS General Reference</i> .	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
TooManyMultiRegionAccessPoints	You have attempted to create more Multi-Region Access Points than are allowed for an account. For more information, see <a href="#">Amazon Simple Storage Service endpoints and quotas</a> in the <i>AWS General Reference</i> .	400 Bad Request	Client
UnauthorizedAccessError	Applicable in China Regions only. Returned when a request is made to a bucket that doesn't have an ICP license. For more information, see <a href="#">ICP Recordal</a> .	403 Forbidden	Client
UnexpectedContent	This request contains unsupported content.	400 Bad Request	Client
UnexpectedIPError	Applicable in China Regions only. This request was rejected because the IP was unexpected.	403 Forbidden	Client
UnsupportedArgument	The request contained an unsupported argument.	400 Bad Request	Client
UnsupportedSignature	The provided request is signed with an unsupported STS Token version or the signature version is not supported.	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
UnresolvableGrantByEmailAddress	The email address that you provided does not match any account on record.	400 Bad Request	Client
UserKeyMustBeSpecified	The bucket POST request must contain the specified field name. If it is specified, check the order of the fields.	400 Bad Request	Client
NoSuchAccessPoint	The specified access point does not exist.	404 Not Found	Client
InvalidTag	Your request contains tag input that is not valid. For example, your request might contain duplicate keys, keys or values that are too long, or system tags.	400 Bad Request	Client
MalformedPolicy	Your policy contains a principal that is not valid.	400 Bad Request	Client

## List of SELECT Object Content Error Codes

### Important

Amazon S3 Select is no longer available to new customers. Existing customers of Amazon S3 Select can continue to use the feature as usual. [Learn more](#)

The following table contains special errors that `SELECT Object Content` might return. For general information about Amazon S3 errors and a list of error codes, see [Error responses](#).

Error code	Description	HTTP status code	SOAP fault code prefix
<code>AmbiguousFieldName</code>	The field name matches to multiple fields in the file. Check the SQL expression and the file, and try again.	400	Client
<code>Busy</code>	The service is unavailable. Try again later.	503	Client
<code>CastFailed</code>	An attempt to convert from one data type to another using <code>CAST</code> failed in the SQL expression.	400	Client
<code>ColumnTooLong</code>	The length of a column in the result is greater than <code>maxCharsPerColumn</code> of 1 MB.	400	Client
<code>CSVEscapingRecordDelimiter</code>	A quoted record delimiter was found in the file. To allow quoted record delimiters, set <code>AllowQuotedRecordDelimiter</code> to <code>'TRUE'</code> .	400	Client
<code>CSVParsingError</code>	An error occurred while parsing the CSV file. Check the file and try again.	400	Client
<code>CSVUnescapedQuote</code>	An unescaped quote was found while parsing the CSV file. To allow quoted record delimiters, set <code>AllowQuotedRecordDelimiter</code> to <code>'TRUE'</code> .	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
EmptyRequestBody	The request body cannot be empty.	400	Client
EvaluatorBindingDoesNotExist	A column name or a path provided does not exist in the SQL expression.	400	Client
EvaluatorInvalidArguments	There is an incorrect number of arguments in the function call in the SQL expression.	400	Client
EvaluatorInvalidTimestampFormatPattern	The timestamp format string in the SQL expression is not valid.	400	Client
EvaluatorInvalidTimestampFormatPatternSymbol	The timestamp format pattern contains a symbol in the SQL expression that is not valid.	400	Client
EvaluatorInvalidTimestampFormatPatternSymbolForParsing	The timestamp format pattern contains a valid format symbol that cannot be applied to timestamp parsing in the SQL expression.	400	Client
EvaluatorInvalidTimestampFormatPatternToken	The timestamp format pattern contains a token in the SQL expression that is not valid.	400	Client
EvaluatorLikePatternInvalidEscapeSequence	An argument given to the LIKE expression was not valid.	400	Client
EvaluatorNegativeLimit	LIMIT must not be negative.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
EvaluatorTimestampFormatPatternDuplicateFields	The timestamp format pattern contains multiple format specifiers representing the timestamp field in the SQL expression.	400	Client
EvaluatorTimestampFormatPatternHourClockAmPmMismatch	The timestamp format pattern contains a 12-hour hour of day format symbol but doesn't also contain an AM/PM field, or it contains a 24-hour hour of day format specifier and contains an AM/PM field in the SQL expression.	400	Client
EvaluatorUnterminatedTimestampFormatPatternToken	The timestamp format pattern contains an unterminated token in the SQL expression.	400	Client
ExpressionTooLong	The SQL expression is too long. The maximum byte-length for an SQL expression is 256 KB.	400	Client
ExternalEvalException	The query cannot be evaluated. Check the file and try again.	400	Client
IllegalSqlFunctionArgument	An illegal argument was used in the SQL function.	400	Client
IncorrectSqlFunctionArgumentType	An incorrect argument type was specified in a function call in the SQL expression.	400	Client
IntegerOverflow	An integer overflow or underflow occurred in the SQL expression.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
<code>InternalError</code>	An internal error occurred.	500	Client
<code>InvalidCast</code>	An attempt to convert from one data type to another using <code>CAST</code> failed in the SQL expression.	400	Client
<code>InvalidColumnIndex</code>	The column index in the SQL expression is not valid.	400	Client
<code>InvalidCompressionFormat</code>	The file is not in a supported compression format. Only GZIP and BZIP2 are supported.	400	Client
<code>InvalidDataSource</code>	The data source type is not valid. Only CSV, JSON, and Parquet are supported.	400	Client
<code>InvalidDataType</code>	The SQL expression contains a data type that is not valid.	400	Client
<code>InvalidExpressionType</code>	The <code>ExpressionType</code> value is not valid. Only SQL expressions are supported.	400	Client
<code>InvalidFileHeaderInfo</code>	The <code>FileHeaderInfo</code> value is not valid. Only NONE, USE, and IGNORE are supported.	400	Client
<code>InvalidJsonType</code>	The <code>JsonType</code> value is not valid. Only DOCUMENT and LINES are supported.	400	Client
<code>InvalidKeyPath</code>	The key path in the SQL expression is not valid.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
InvalidQuoteFields	The QuoteFields value is not valid. Only ALWAYS and ASNEEDED are supported.	400	Client
InvalidRequestParameter	The value of a parameter in the SelectRequest element is not valid. Check the service API documentation and try again.	400	Client
InvalidScanRange	The provided scan range is not valid.	400	Client
InvalidTableAlias	The SQL expression contains a table alias that is not valid.	400	Client
InvalidTextEncoding	The encoding type is not valid. Only UTF-8 encoding is supported.	400	Client
JSONParsingError	An error occurred while parsing the JSON file. Check the file and try again.	400	Client
LexerInvalidChar	The SQL expression contains a character that is not valid.	400	Client
LexerInvalidIONLiteral	The SQL expression contains an operator that is not valid.	400	Client
LexerInvalidLiteral	The SQL expression contains an operator that is not valid.	400	Client
LexerInvalidOperator	The SQL expression contains a literal that is not valid.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
<code>LikeInvalidInputs</code>	The argument given to the LIKE clause in the SQL expression is not valid.	400	Client
<code>MalformedXML</code>	The XML provided was not well formed or did not validate against our published schema. Check the service documentation and try again.	400	Client
<code>MaxOperatorsExceeded</code>	Failed to parse SQL expression, try reducing complexity. For example, reduce number of operators used.	400	Client
<code>MethodNotAllowed</code>	The specified method is not allowed against this resource.	405 Method Not Allowed	Client
<code>MissingRequiredParameter</code>	The <code>SelectRequest</code> entity is missing a required parameter. Check the service documentation and try again.	400	Client
<code>MultipleDataSourcesUnsupported</code>	Multiple data sources are not supported.	400	Client
<code>NumberFormatException</code>	An error occurred while parsing a number. This error can be caused by underflow or overflow of integers.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
ObjectSerializationConflict	InputSerialization specifies more than one format (CSV, JSON, or Parquet), or OutputSerialization specifies more than one format (CSV or JSON). For InputSerialization and OutputSerialization, you can specify only one format for each.	400	Client
OverMaxColumn	The number of columns in the result is greater than the maximum allowable number of columns.	400	Client
OverMaxParquetBlockSize	The Parquet file is above the maximum row group size.	400	Client
OverMaxRecordSize	The length of a record in the input or result is greater than the maxCharsPerRecord limit of 1 MB.	400	Client
ParquetParsingError	An error occurred while parsing the Parquet file. Check the file and try again.	400	Client
ParquetUnsupportedCompressionCodec	The specified Parquet compression codec is not supported.	400	Client
ParseAsteriskIsNotAloneInSelectList	Other expressions are not allowed in the SELECT list when * is used without dot notation in the SQL expression.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
ParseCannotMixSqbandWildcardInSelectList	Cannot mix [] and * in the same expression in a SELECT list in the SQL expression.	400	Client
ParseCastArity	The SQL expression CAST has incorrect arity.	400	Client
ParseEmptySelect	The SQL expression contains an empty SELECT clause.	400	Client
ParseExpected2TokenTypes	The expected token in the SQL expression was not found.	400	Client
ParseExpectedArgumentDelimiter	The expected argument delimiter in the SQL expression was not found.	400	Client
ParseExpectedDatePart	The expected date part in the SQL expression was not found.	400	Client
ParseExpectedExpression	The expected SQL expression was not found.	400	Client
ParseExpectedIdentifierForAlias	The expected identifier for the alias in the SQL expression was not found.	400	Client
ParseExpectedIdentifierForAt	The expected identifier for AT name in the SQL expression was not found.	400	Client
ParseExpectedIdentifierForGroupName	GROUP is not supported in the SQL expression.	400	Client
ParseExpectedKeyword	The expected keyword in the SQL expression was not found.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
ParseExpectedLeftParenAfterCast	The expected left parenthesis after CAST in the SQL expression was not found.	400	Client
ParseExpectedLeftParenBuiltinFunctionCall	The expected left parenthesis in the SQL expression was not found.	400	Client
ParseExpectedLeftParenValueConstructor	The expected left parenthesis in the SQL expression was not found.	400	Client
ParseExpectedMember	The SQL expression contains an unsupported use of MEMBER.	400	Client
ParseExpectedNumber	The expected number in the SQL expression was not found.	400	Client
ParseExpectedRightParenBuiltinFunctionCall	The expected right parenthesis character in the SQL expression was not found.	400	Client
ParseExpectedTokenType	The expected token in the SQL expression was not found.	400	Client
ParseExpectedTypeName	The expected type name in the SQL expression was not found.	400	Client
ParseExpectedWhenClause	The expected WHEN clause in the SQL expression was not found. CASE is not supported.	400	Client
ParseInvalidContextForWildcardInSelectList	The use of * in the SELECT list in the SQL expression is not valid.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
ParseInvalidPathComponent	The SQL expression contains a path component that is not valid.	400	Client
ParseInvalidTypeParameter	The SQL expression contains a parameter value that is not valid.	400	Client
ParseMalformedJoin	JOIN is not supported in the SQL expression.	400	Client
ParseMissingIdentifierAfterAt	The expected identifier after the @ symbol in the SQL expression was not found.	400	Client
ParseNonUnaryAggregateFunctionCall	Only one argument is supported for aggregate functions in the SQL expression.	400	Client
ParseSelectMissingFrom	The SQL expression contains a missing FROM after the SELECT list.	400	Client
ParseUnexpectedKeyword	The SQL expression contains an unexpected keyword.	400	Client
ParseUnexpectedOperator	The SQL expression contains an unexpected operator.	400	Client
ParseUnexpectedTerm	The SQL expression contains an unexpected term.	400	Client
ParseUnexpectedToken	The SQL expression contains an unexpected token.	400	Client
ParseUnknownOperator	The SQL expression contains an operator that is not valid.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
ParseUnsupportedAlias	The SQL expression contains an unsupported use of ALIAS.	400	Client
ParseUnsupportedCallWithStar	Only COUNT with ( * ) as a parameter is supported in the SQL expression.	400	Client
ParseUnsupportedCase	The SQL expression contains an unsupported use of CASE.	400	Client
ParseUnsupportedCaseClause	The SQL expression contains an unsupported use of CASE.	400	Client
ParseUnsupportedLiteralsGroupBy	The SQL expression contains an unsupported use of GROUP BY .	400	Client
ParseUnsupportedSelect	The SQL expression contains an unsupported use of SELECT.	400	Client
ParseUnsupportedSyntax	The SQL expression contains unsupported syntax.	400	Client
ParseUnsupportedToken	The SQL expression contains an unsupported token.	400	Client
TruncatedInput	Object decompression failed. Check that the object is properly compressed using the format specified in the request.	400	Client
UnauthorizedAccess	You are not authorized to perform this operation.	401	Client
UnrecognizedFormatException	We encountered a record type that is not valid.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
UnsupportedFunction	We encountered an unsupported SQL function.	400	Client
UnsupportedParquet Type	The specified Parquet type is not supported.	400	Client
UnsupportedRangeHeader	A range header is not supported for this operation.	400	Client
UnsupportedScanRangeInput	Scan range queries are not supported on this type of object.	400	Client
UnsupportedSqlOperation	We encountered an unsupported SQL operation.	400	Client
UnsupportedSqlStructure	We encountered an unsupported SQL structure. Check the SQL Reference.	400	Client
UnsupportedStorageClass	We encountered a storage class that is not supported. Only STANDARD, STANDARD_IA , and ONEZONE_IA storage classes are supported.	400	Client
UnsupportedSyntax	We encountered syntax that is not valid.	400	Client
UnsupportedTypeForQuerying	Your query contains an unsupported type for comparison (e.g. verifying that a Parquet INT96 column type is greater than 0).	400	Client
ValueParseFailure	A timestamp parse failure occurred in the SQL expression.	400	Client

## List of Replication-related error codes

The following table contains special errors that the Replication operation might return. For general information about Amazon S3 errors and a list of error codes, see [Error responses](#).

Error code	Description	HTTP status code	SOAP fault code prefix
InvalidArgument	<p>This error might occur for the following reasons:</p> <ul style="list-style-type: none"><li>• The &lt;Account&gt; element is empty. It must contain a valid account ID.</li><li>• The AWS account specified in the &lt;Account&gt; element must match the destination bucket owner.</li><li>• ReplicationTime-Status must contain a value.</li><li>• ReplicationTime-ReplicationTimeValue must contain a value.</li><li>• Replication-ReplicationTimeValue-Minutes value must be 15.</li><li>• ReplicationMetrics must contain a Status.</li><li>• ReplicationMetrics must contain an EventThreshold .</li></ul>	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
	<ul style="list-style-type: none"> <li>EventThreshold-ReplicationTimeValue-Minutes value must be 15.</li> <li>Rule ID must not contain non-ASCII characters.</li> </ul>		
InvalidRequest	<p>This error might occur for the following reasons:</p> <ul style="list-style-type: none"> <li>The &lt;Owner&gt; in &lt;AccessControlTranslation&gt; has a value, so the &lt;Account&gt; element must be specified.</li> <li>The &lt;Account&gt; element is empty. It must contain a valid account ID.</li> <li>The replication destination must contain both ReplicationTime and Metrics, or neither.</li> <li>ReplicationTime and ReplicationMetrics must have the same status.</li> <li>S3 Replication Time Control (S3 RTC) is not supported in this AWS Region.</li> </ul>	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
ReplicationConfigurationNotFoundError	There is no replication configuration for this bucket.	404 Not Found	Client

## List of Tagging-related error codes

The following table contains special errors that the `TagResource`, `UntagResource`, and `ListTagsForResource` operations might return for Storage Lens groups. For general information about general Amazon S3 errors and a list of error codes, see [Error responses](#).

Error Code	Description	HTTP Status Code	SOAP Fault Code Prefix
InvalidRequest	The AWS Region in the resource ARN doesn't match the Region that's specified in this request. The AWS account in the resource ARN doesn't match the account ID that's specified in this request. The AWS partition in the resource ARN is invalid.	400 Bad Request	Not supported
InvalidTag	This request contains a tag key or value that isn't valid. Valid characters include the following : [a-zA-Z+-. _:/] . Tag keys can contain up to 128 characters. Tag values can contain up to 256 characters. There are duplicate tag keys in your request. User-defined tag keys can't start with <code>aws:</code> .	400 Bad Request	Not supported

Error Code	Description	HTTP Status Code	SOAP Fault Code Prefix
NoSuchResource	The specified resource doesn't exist.	404 Not Found	Not supported
TagPolicyException	The tag policy does not allow the specified value for the following tag key.	400 Bad Request	Not supported
TooManyTags	The number of tags exceeds the limit of 50 tags.	400 Bad Request	Not supported

## List of Amazon S3 on Outposts error codes

The following table contains special errors that an Amazon S3 on Outposts operation might return. For general information about Amazon S3 errors and a list of error codes, see [Error responses](#).

Error code	Description	HTTP status code	SOAP fault code prefix
BadRequest	The bucket is in a transitional state because of a previous deletion attempt. Try again later.	400 Bad Request	Not supported
InvalidRequest	This error might occur for the following reasons: <ul style="list-style-type: none"> <li>Amazon VPC configuration is required.</li> <li>Public access is not allowed on S3 on Outposts access points.</li> </ul>	400 Bad Request	Client
InvalidOutpostState	The request is not valid for the current state of the Outpost.	409 Conflict	Not supported

Error code	Description	HTTP status code	SOAP fault code prefix
InvalidRequest	The access point is not in a state where it can be deleted.	400 Bad Request	Not supported
NoSuchOutpost	The specified Outpost does not exist.	404 Not Found	Not supported
UnsupportedOperation	The specified action was not supported.	404 Not Found	Not supported
InsufficientCapacity	Insufficient capacity.	507 Insufficient Storage	Not supported

## List of Amazon S3 Storage Lens error codes

The following table contains special errors that Amazon S3 Storage Lens operations might return. For general information about general Amazon S3 errors and a list of error codes, see [Error responses](#).

Error code	Description	HTTP status code	SOAP fault code prefix
AccessDenied	This Region is not supported as a home Region for S3 Storage Lens.	403 Forbidden	Not supported
AccountNotAuthorized	This account not authorized to use AWS Organizations. Use your management account or delegated administrator account.	403 Forbidden	Not supported
ActivityMetricsMustEnabled	Activity metrics must be enabled.	400 Bad Request	Not supported

Error code	Description	HTTP status code	SOAP fault code prefix
<code>AWSOrganizationsNotInUseException</code>	This account is not part of your organization.	403 Forbidden	Not supported
<code>DefaultConfigurationDeleteForbidden</code>	The Default configuration cannot be deleted.	403 Forbidden	Not supported
<code>DuplicateStorageLensGroupARN</code>	There are two or more entries of the same Storage Lens group ARN in this configuration.	400 Bad Request	Not supported
<code>EmptyExcludeContainer</code>	This error occurs for the following reasons: <ul style="list-style-type: none"> <li>The exclude container cannot be empty.</li> <li>The exclude container cannot have zero buckets.</li> <li>The exclude container cannot have zero Regions.</li> </ul>	400 Bad Request	Not supported
<code>EmptyExcludeElement</code>	You must specify a Storage Lens group with your Exclude element.	400 Bad Request	Not supported

Error code	Description	HTTP status code	SOAP fault code prefix
EmptyIncludeContainer	<p>This error occurs for the following reasons:</p> <ul style="list-style-type: none"> <li>The include container cannot be empty.</li> <li>The include container cannot have zero buckets.</li> <li>The include container cannot have zero Regions.</li> </ul>	400 Bad Request	Not supported
InvalidAWSOrgArn	There is a malformed AWS Organizations ARN in the configuration.	400 Bad Request	Not supported
EmptyIncludeElement	You must specify a Storage Lens group with your Include element.	400 Bad Request	Not supported
InvalidBucketFilter	Organization-level configurations do not support bucket filters.	400 Bad Request	Not supported
InvalidConfigId	The configuration ID is not valid.	400 Bad Request	Not supported
InvalidDestination	The S3 bucket ARN is malformed.	400 Bad Request	Not supported
InvalidEncryptionMethod	Only one encryption method can be specified.	400 Bad Request	Not supported
InvalidFilterForDefaultConfiguration	The default configuration must not include any filters.	400 Bad Request	Not supported

Error code	Description	HTTP status code	SOAP fault code prefix
InvalidIncludeExcludeContainers	You can specify either an Include container or an Exclude container in a configuration. You cannot specify both in a configuration.	400 Bad Request	Not supported
InvalidIncludeExcludeElements	Only one Include or Exclude element is allowed. At least one Include or Exclude element must be present.	400 Bad Request	Not supported
InvalidKMSEncryptionKeyId	The KMS key ID ARN is not valid.	400 Bad Request	Not supported
InvalidMaximumPrefixDepth	MaxDepth must be within the range [1,10].	400 Bad Request	Not supported
InvalidMinimumStorageBytesPercentage	MinStorageBytesPercentage must be within the range [1.00,100.00].	400 Bad Request	Not supported
InvalidOrganizationARN	The AWS Organizations ARN in the configuration is not valid.	400 Bad Request	Not supported
InvalidOrganizationForDefaultConfiguration	The default configuration does not support organization-level metrics.	400 Bad Request	Not supported
InvalidRegionForDefaultConfiguration	The specified Region is not supported for default configuration.	400 Bad Request	Not supported
InvalidRegionName	The Region name is not valid.	400 Bad Request	Not supported
InvalidStorageLensArn	The S3 Storage Lens ARN is not required in input.	400 Bad Request	Not supported

Error code	Description	HTTP status code	SOAP fault code prefix
InvalidStorageLensGroupARN	This Storage Lens group ARN isn't valid or only Storage Lens groups in your account are allowed. Additionally, you must follow the Storage Lens group ARN structure :arn::s3:::storage-lens-group/ and adhere to the 64 character limit. Storage Lens group names can also contain only the following characters: a-z, A-Z, 0-9, hyphens (-), and underscores (_).	400 Bad Request	Not supported
MissingAccountLevelActivityMetrics	Activity metrics must be enabled at the account level when activity metrics are enabled at the bucket level.	400 Bad Request	Not supported
MissingBucketLevelActivityMetrics	Activity metrics must be enabled at the bucket level when activity metrics are enabled at the account level.	400 Bad Request	Not supported
MissingEncryptionMethod	The encryption method cannot be blank. Specify either SSE-KMS or SSE-S3.	400 Bad Request	Not supported
MissingPrefixLevelStorageMetrics	Storage metrics at the prefix level are mandatory when the prefix level is enabled.	400 Bad Request	Not supported
OrganizationAccessDenied	This account is not authorized to add AWS Organizations.	403 Forbidden	Not supported

Error code	Description	HTTP status code	SOAP fault code prefix
OrgConfigurationNotSupported	The specified Region does not support AWS Organizations in the configuration.	403 Forbidden	Not supported
ServiceNotEnabledForOrg	The S3 Storage Lens service-linked role is not enabled for the organization.	403 Forbidden	Not supported
StorageMetricsMustEnabled	Prefix-level storage metrics must be enabled.	400 Bad Request	Not supported
TooManyBuckets	The buckets container cannot have more than 50 buckets.	400 Bad Request	Not supported
TooManyRegions	The Regions container cannot have more than 50 Regions.	400 Bad Request	Not supported
TooManyStorageLensGroups	You can't attach more than 50 Storage Lens groups to your Storage Lens dashboard.	400 Bad Request	Not supported

The following table contains special errors that S3 Storage Lens groups operations might return. For general information about general Amazon S3 errors and a list of error codes, see [Error responses](#).

Error code	Description	HTTP status code	SOAP fault code prefix
AccessDenied	You don't have permission to perform Storage Lens group actions. This Region is not supported as home Region for S3 Storage Lens groups.	403 Forbidden	Not supported

Error code	Description	HTTP status code	SOAP fault code prefix
ConfigurationAlreadyExists	The specified configuration already exists.	409 Conflict	Not supported
DuplicateElement	Tags must be unique. The And logical operator includes duplicate tag keys. The Or logical operator includes duplicate tags. Logical operator includes duplicate prefixes or suffixes.	400 Bad Request	Not supported
InvalidAge	DaysLessThan and DaysGreaterThan must be positive numbers.	400 Bad Request	Not supported
InvalidFilter	A filter must include one of the following elements: And, Or, MatchAnyTag , MatchAnyPrefix , MatchAnySuffix , MatchObjectAge , MatchObjectSize .	400 Bad Request	Not supported
InvalidLogicalOperator	At least two sub elements must be present in the logical operators And or Or.	400 Bad Request	Not supported
InvalidMatchAnyPrefix	The MatchAnyPrefix parameter can't be empty.	400 Bad Request	Not supported
InvalidMatchAnySuffix	The MatchAnySuffix parameter can't be empty.	400 Bad Request	Not supported
InvalidMatchAnyTag	The MatchAnyTag parameter can't be empty.	400 Bad Request	Not supported

Error code	Description	HTTP status code	SOAP fault code prefix
InvalidMatchObjectAge	The MatchObjectAge parameter can't be empty.	400 Bad Request	Not supported
InvalidMatchObjectSize	The MatchObjectSize parameter can't be empty.	400 Bad Request	Not supported
InvalidName	Storage Lens group Name parameter must be between 1 and 64 characters. The Storage Lens group Name parameter must use the <code>^[a-zA-Z0-9\-\_]+\$</code> pattern.	400 Bad Request	Not supported
InvalidNumericCombination	This object age or object size combination isn't valid.	400 Bad Request	Not supported
InvalidPrefix	The maximum length of a prefix is 1,024 characters. The prefix string can't be empty.	400 Bad Request	Not supported
InvalidSize	BytesLessThan and BytesGreaterThan must be positive numbers. The maximum object size can't exceed 5 TB. The minimum object size can't be greater than or equal to 5 TB.	400 Bad Request	Not supported
InvalidSuffix	The maximum length of a suffix is 1,024 characters. The suffix string can't be empty.	400 Bad Request	Not supported

Error code	Description	HTTP status code	SOAP fault code prefix
InvalidTag	The object tag key can't exceed 128 characters. The object tag key string can't be null or empty. The maximum length of a tag value is 256 characters. The object tag key contains characters that aren't valid. The object tag key must contain only a-z, A-Z, 0-9, spaces, and the following characters: <code>^(\. :/=\+ \-@]* )\$ .</code>	400 Bad Request	Not supported
MismatchedName	The name specified in the request doesn't match the Storage Lens group name.	400 Bad Request	Not supported
TooManyConfigurations	You have attempted to create more Storage Lens group configurations than the 50 allowed.	400 Bad Request	Not supported
TooManyElements	The Element exceeds the maximum number of elements allowed within a logical operator. Only 10 prefixes, suffixes, or tags are allowed.	400 Bad Request	Not supported

## List of Amazon S3 Object Lambda error codes

The following table contains special errors that S3 Object Lambda might return. For information about general Amazon S3 errors and a list of error codes, see [Error responses](#).

Error responses received from the supporting access points during non-GetObject requests are sent to the caller unaltered.

Error code	Description	HTTP status code	
LambdaInvalidResponse	<p>Returned to the original caller when <code>WriteGetObjectResponse</code> responds with <code>ValidationError</code> to AWS Lambda.</p> <p>See the <code>ValidationError</code> message for more details. Not all cases of <code>ValidationError</code> result in a <code>LambdaInvalidResponse</code> error.</p>	400 Bad Request	
LambdaInvocationFailed	<p>Lambda function invocation failed.</p> <p>Callers might receive the following error when S3 Object Lambda is unable to successfully invoke the configured Lambda function.</p> <p>The error message might contain details about an eventual error returned by the AWS Lambda service when invoking the function (for example, status code, error code, error message and request ID).</p>	400 Bad Request	
LambdaNotFound	<p>The AWS Lambda function was not found.</p> <p>The configured Lambda function, version, or alias was not found when attempting to invoke it. Ensure that the S3 Object Lambda Access Point configuration points to the correct Lambda function ARN.</p>	404 Not Found	

Error code	Description	HTTP status code	
	<p>The error message might contain details about an eventual error returned by the AWS Lambda service when invoking the function (for example, status code, error code, error message and request ID).</p>		
LambdaPermissionError	<p>The caller is not authorized to invoke the Lambda function.</p> <p>The caller must have permission to invoke the Lambda function. Check the policies attached to the caller and ensure that they've been allowed to use <code>lambda:Invoke</code> for the configured function.</p> <p>The error message might contain details about an eventual error returned by the AWS Lambda service when invoking the function (for example, status code, error code, error message and request ID).</p>	403 Forbidden	

Error code	Description	HTTP status code	
LambdaResponseNotReceived	<p>The Lambda function exited without successfully calling <code>WriteGetObjectResponse</code> .</p> <p><code>GetObject</code> response data is provided by the Lambda function by calling the <code>WriteGetObjectResponse</code> API operation . The Amazon CloudWatch logs for the function might provide more insight into why the function did not successfully call this API operation despite exiting normally.</p>	500 Internal Service Error	
LambdaRuntimeError	<p>The Lambda function failed during execution.</p> <p>An explicit error was received from the Lambda function. For details about the failure, check the AWS CloudFormation logs.</p>	500 Internal Service Error	
LambdaTimeout	<p>The Lambda function did not respond in the allowed time.</p> <p>The Lambda function failed to complete its call to <code>WriteGetObjectResponse</code> within 60 seconds.</p>	500 Internal Service Error	

Error code	Description	HTTP status code
SlowDown	<p>Reduce your request rate for operations involving AWS Lambda.</p> <p>The function invocation was throttled by AWS Lambda, perhaps because it has reached its configured concurrency limitation. For more information, see <a href="#">Managing concurrency for a Lambda function</a> in the <i>AWS Lambda Developer Guide</i>.</p> <p>The error message might contain details about an eventual error returned by the AWS Lambda service when invoking the function (for example, status code, error code, error message and request ID).</p>	503 Slow Down
ValidationError	<p>Validation errors might be returned from the <code>WriteGetObjectResponse</code> API operation and can occur for numerous reasons. See the error message for more details.</p>	400 Bad Request

## List of Amazon S3 asynchronous error codes

The following table contains special errors that asynchronous requests might return. For general information about Amazon S3 errors and a list of error codes, see [Error responses](#).

These errors are returned when you query about the state of an asynchronous request, such as by using `DescribeMultiRegionAccessPointOperation`. Because these requests are asynchronous, all of these errors have a status code of 200 OK.

Error code	Description	HTTP status code
AccessDenied	Access denied.	200 OK
InternalErrors	An internal server error occurred.	200 OK
MalformedPolicy	The specified policy syntax is not valid.	200 OK
MultiRegionAccessPointAlreadyOwnedByYou	You already have a Multi-Region Access Point with the same name.	200 OK
MultiRegionAccessPointModifiedByAnotherRequest	The action failed because another request is modifying the specified resource. Try resubmitting your request after the previous request has been completed.	200 OK
MultiRegionAccessPointNotReady	The specified Multi-Region Access Point is not ready to be updated.	200 OK
MultiRegionAccessPointSameBucketRegion	The buckets used to create a Multi-Region Access Point cannot be in the same Region.	200 OK
MultiRegionAccessPointUnsupportedRegion	One of the buckets supplied to create the Multi-Region Access Point is in a Region that is not supported.	200 OK
NoSuchBucket	The specified bucket does not exist.	200 OK
NoSuchMultiRegionAccessPoint	The specified Multi-Region Access Point does not exist.	200 OK

## List of Amazon S3 Access Grants error codes

The following table contains special errors that S3 Access Grants requests might return. For general information about Amazon S3 errors and a list of error codes, see [Error responses](#).

Error Code	Description	HTTP Status Code
AccessGrantAlreadyExists	The specified access grant already exists	409
AccessGrantsInstanceAlreadyExists	Access Grants Instance already exists	409
AccessGrantsInstanceNotEmptyError	Please clean up locations before deleting the access grants instance	400
AccessGrantsInstanceDoesNotExistError	Access Grants Instance does not exist	404
AccessGrantsInstanceResourcePolicyDoesNotExist	Access Grants Instance Resource Policy does not exist	404
AccessGrantsLocationAlreadyExistsError	The specified access grants location already exists	409
AccessGrantsLocationNotEmptyError	Please clean up access grants before deleting access grants location	400
AccessGrantsLocationsQuotaExceededError	The access grants location quota has been exceeded. Access Grants Locations Quota: <i>&lt;value&gt;</i> . Please reach out to S3 if an increase is required.	409
AccessGrantsQuotaExceededError	The access grants quota has been exceeded. Access Grants Quota:	409

Error Code	Description	HTTP Status Code
	<i>&lt;value&gt;</i> . Please reach out to S3 if an increase is required.	
InvalidTag	There are duplicate tag keys in your request. Remove the duplicate tag keys and try again.	400
InvalidAccessGrant	The specified Access Grant is invalid	400
InvalidAccessGrantLocation	The specified Access Grants Location is invalid	400
InvalidIamRole	The specified IAM Role is invalid	400
InvalidIdentityCenterInstance	The specified identity center instance is invalid	400
InvalidResourcePolicy	The specified Resource Policy is invalid	400
InvalidResourcePolicy	The specified Resource Policy is invalid	400
InvalidTag	This request contains a tag key or value that isn't valid. Valid characters include the following: [a-zA-Z+-. _:/]. Tag keys can contain up to 128 characters. Tag values can contain up to 256 characters.	400
NoSuchAccessGrantError	The specified access grant does not exist	404
NoSuchAccessGrantsLocationError	The specified access grants location does not exist	404

Error Code	Description	HTTP Status Code
AccessDenied	You do not have <i>&lt;requested permission&gt;</i> permissions to the requested S3 Prefix: <i>&lt;requested target&gt;</i>	403 Forbidden
StsNotAuthorizedError	An error occurred (StsNotAuthorizedError ) when calling the GetDataAccess operation: User: access-grants.s3.amazonaws.com is not authorized to perform: sts:AssumeRole on resource: <i>&lt;IAM Role ARN&gt;</i>	403
StsPackedPolicyTooLargeError	An error occurred (StsPackedPolicyTooLargeError ) when calling the GetDataAccess operation : Serialized token too large for session	400
StsValidationError	<i>The error message varies depending on the validation error.</i>	400
InvalidTags	Tag keys cannot start with AWS reserved prefix for system tags."	400
TooManyTags	The number of tags exceeds the limit of 50 tags. Remove some tags and try again.	400

## List of Amazon FSx-related error codes

The following table contains special errors that requests made to Amazon FSx through an Amazon S3 access point might return. For general information about Amazon S3 errors and a list of error codes, see [Error responses](#).

Error Code	Description	HTTP Status Code	
AccessDenied	This error might occur for the following reasons: <ul style="list-style-type: none"><li>• Caller is not authorized to perform specified S3 operation.</li><li>• Caller is not authorized to access the Amazon FSx resource for the specified key.</li></ul>	403 Forbidden	
InsufficientCapacity	Maximum storage capacity of file system has been reached.	507 Insufficient Capacity	
InvalidKey	The specified key is not valid.	400 Bad Request	
SlowDown	Please reduce your request rate.	503 Slow Down	

## Amazon S3 error best practices

Many error responses contain additional structured data meant to be read and understood by a developer diagnosing programming errors. For example, if you send a Content-MD5 header with a REST PUT request that doesn't match the digest calculated on the server, you receive a BadDigest error. The error response also includes as detail elements the digest we calculated, and the digest you told us to expect. During development, you can use this information to diagnose the error. In production, a well-behaved program might include this information in its error log.

When designing an application for use with Amazon S3, it is important to handle Amazon S3 errors appropriately. This section describes issues to consider when designing your application.

## Retry InternalErrors

Internal errors are errors that occur within the Amazon S3 environment.

Requests that receive an InternalError response might not have processed. For example, if a PUT request returns InternalError, a subsequent GET might retrieve the old value or the updated value.

If Amazon S3 returns an InternalError response, retry the request.

## Tune application for repeated SlowDown errors

As with any distributed system, S3 has protection mechanisms which detect intentional or unintentional resource over-consumption and react accordingly. SlowDown errors can occur when a high request rate triggers one of these mechanisms. Reducing your request rate will decrease or eliminate errors of this type. Generally speaking, most users will not experience these errors regularly; however, if you would like more information or are experiencing high or unexpected SlowDown errors, please post to our [Amazon S3 developer forum](https://aws.amazon.com/developer/forum) or sign up for Support <https://aws.amazon.com/premiumsupport/>.

## Isolate errors

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

Amazon S3 provides a set of error codes that are used by both the SOAP and REST API. The SOAP API returns standard Amazon S3 error codes. The REST API is designed to look like a standard HTTP server and interact with existing HTTP clients (e.g., browsers, HTTP client libraries, proxies, caches, and so on). To ensure the HTTP clients handle errors properly, we map each Amazon S3 error to an HTTP status code.

HTTP status codes are less expressive than Amazon S3 error codes and contain less information about the error. For example, the NoSuchKey and NoSuchBucket Amazon S3 errors both map to the HTTP 404 Not Found status code.

Although the HTTP status codes contain less information about the error, clients that understand HTTP, but not the Amazon S3 API, will usually handle the error correctly.

Therefore, when handling errors or reporting Amazon S3 errors to end users, use the Amazon S3 error code instead of the HTTP status code as it contains the most information about the error. Additionally, when debugging your application, you should also consult the human readable `<Details>` element of the XML error response.

# AWS Glossary

For the latest AWS terminology, see the [AWS glossary](#) in the *AWS Glossary Reference*.

# Amazon S3 Resources

Following is a table that lists related resources that you'll find useful as you work with this service.

Resource	Description
<a href="#">Amazon Simple Storage Service User Guide</a>	The getting started guide provides a quick tutorial of the service based on a simple use case.
<a href="#">Amazon Simple Storage Service User Guide</a>	The developer guide describes how to accomplish tasks using Amazon S3 operations.
<a href="#">Amazon S3 Technical FAQ</a>	The FAQ covers the top 20 questions developers have asked about this product.
<a href="#">Amazon S3 Release Notes</a>	The Release Notes give a high-level overview of the current release. They specifically note any new features, corrections, and known issues.
<a href="#">Tools for Amazon Web Services</a>	A central starting point to find documentation, code samples, release notes, and other information to help you build innovative applications with AWS SDKs and tools.
<a href="#">AWS Management Console</a>	The console allows you to perform most of the functions of Amazon S3 without programming.
<a href="#">Discussion Forums</a>	A community-based forum for developers to discuss technical questions related to Amazon Web Services.
<a href="#">Support Center</a>	The home page for AWS Technical Support, including access to our Developer Forums, Technical FAQs, Service Status page, and Premium Support.
<a href="#">Support</a>	The primary web page for information about Support, a one-on-one, fast-response support channel to help you build and run applications on AWS Infrastructure Services.

Resource	Description
<a href="#">Amazon S3 product information</a>	The primary web page for information about Amazon S3.
<a href="#">Contact Us</a>	A central contact point for inquiries concerning AWS billing, account, events, abuse, etc.
<a href="#">Conditions of Use</a>	Detailed information about the copyright and trademark usage at Amazon.com and other topics.

## Document History

The following table describes the important changes in each release of the *Amazon Simple Storage Service API Reference* up to March 27, 2019. For changes after March 27, 2019, see the consolidated [Document History](#) in the *Amazon Simple Storage Service User Guide*.

- **API version:** 2006-03-01
- **Latest documentation update:** March 27, 2019

Change	Description	Release Date
New archive storage class	Amazon S3 now offers a new archive storage class, DEEP_ARCHIVE, for storing rarely accessed objects. For more information, see <a href="#">Storage Classes</a> in the <i>Amazon Simple Storage Service User Guide</i> .	March 27, 2019
Support for Parquet-formatted Amazon S3 inventory files	Amazon S3 now supports the <a href="#">Apache Parquet (Parquet)</a> format in addition to the <a href="#">Apache optimized row columnar (ORC)</a> and comma-separated values (CSV) file formats for inventory output files. For more information, see <a href="#">Amazon S3 Inventory</a> in the <i>Amazon Simple Storage Service User Guide</i> .  The following APIs were updated accordingly: <ul style="list-style-type: none"> <li>• <a href="#">GetBucketInventoryConfiguration</a></li> <li>• <a href="#">PutBucketInventoryConfiguration</a></li> </ul>	December 04, 2018
PUT directly to the GLACIER storage class	The Amazon S3 PUT and related operations now support specifying GLACIER as the storage class when creating objects. Previously, you had to transition to the GLACIER storage class from another Amazon S3 storage class. For more information about the GLACIER storage class, see	November 26, 2018

Change	Description	Release Date
	<p data-bbox="475 258 1247 338"><a href="#">Storage Classes</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p data-bbox="475 386 1135 422">The following APIs were updated accordingly:</p> <ul data-bbox="475 474 846 800" style="list-style-type: none"><li data-bbox="475 474 659 533">• <a href="#">PutObject</a></li><li data-bbox="475 562 696 621">• <a href="#">POST Object</a></li><li data-bbox="475 651 680 709">• <a href="#">CopyObject</a></li><li data-bbox="475 739 846 800">• <a href="#">CreateMultipartUpload</a></li></ul>	
Object Lock	<p data-bbox="475 846 1271 1119">Amazon S3 now supports locking objects using a Write Once Read Many (WORM) model. You can lock objects for a definite period of time using a retention period or indefinitely using a legal hold. For more information about Amazon S3 Object Lock, see <a href="#">Locking Objects</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p data-bbox="475 1163 1247 1199">The following APIs were updated for S3 Object Lock:</p> <ul data-bbox="475 1251 704 1667" style="list-style-type: none"><li data-bbox="475 1251 659 1310">• <a href="#">PutObject</a></li><li data-bbox="475 1339 659 1398">• <a href="#">GetObject</a></li><li data-bbox="475 1428 683 1486">• <a href="#">HeadObject</a></li><li data-bbox="475 1516 704 1575">• <a href="#">CreateBucket</a></li><li data-bbox="475 1604 683 1663">• <a href="#">HeadBucket</a></li></ul>	November 26, 2018

Change	Description	Release Date
New storage class	<p>Amazon S3 now offers a new storage class named INTELLIGENT_TIERING that is for storing data that has changing or unknown access patterns. For more information, see <a href="#">Storage Classes</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>The following APIs were updated accordingly:</p> <ul style="list-style-type: none"><li>• <a href="#">PutObject</a></li><li>• <a href="#">POST Object</a></li><li>• <a href="#">CopyObject</a></li><li>• <a href="#">CreateMultipartUpload</a></li></ul>	November 26, 2018
Block Public Access	<p>Amazon S3 now includes the ability to block public access to buckets and objects on a per-bucket or account-wide basis. For more information, see <a href="#">Using Amazon S3 Block Public Access</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p>	November 15, 2018

Change	Description	Release Date
Filtering enhancements in cross-region replication (CRR) rules	<p>In a CRR rule configuration, you can specify an object filter to choose a subset of objects to apply the rule to. Previously, you could filter only on an object key prefix. In this release, you can filter on an object key prefix, one or more object tags, or both. For more information, see <a href="#">Replication Configuration Overview</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>The following APIs are updated accordingly:</p> <ul style="list-style-type: none"><li>• <a href="#">PutBucketReplication</a></li><li>• <a href="#">GetBucketReplication</a></li><li>• <a href="#">DeleteBucketReplication</a></li></ul>	September 19, 2018
New storage class	Amazon S3 now offers a new storage class, ONEZONE_IA (IA, for infrequent access) for storing objects. For more information, see <a href="#">Storage Classes</a> in the <i>Amazon Simple Storage Service User Guide</i> .	April 4, 2018
Amazon S3 Select	<p>Amazon S3 Select is now generally available. This feature retrieves object content based on an SQL expression. For more information, see <a href="#">Selecting Content from Objects</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>The following API has been updated:</p> <ul style="list-style-type: none"><li>• <a href="#">SelectObjectContent</a></li></ul>	April 4, 2018

Change	Description	Release Date
Asia Pacific (Osaka-Local) Region	<p>Amazon S3 is now available in the Asia Pacific (Osaka-Local) Region. For more information about Amazon S3 Regions and endpoints, see <a href="#">Regions and Endpoints</a> in the <i>AWS General Reference</i>.</p> <div data-bbox="477 495 1313 810" style="border: 1px solid #f08080; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p><b>⚠ Important</b></p> <p>You can use the Asia Pacific (Osaka-Local) Region only in conjunction with the Asia Pacific (Tokyo) Region. To request access to Asia Pacific (Osaka-Local) Region, contact your sales representative.</p> </div>	February 12, 2018
Europe (Paris) Region	<p>Amazon S3 is now available in the Europe (Paris) Region. For more information about Amazon S3 regions and endpoints, see <a href="#">Regions and Endpoints</a> in the <i>AWS General Reference</i>.</p>	December 18, 2017
China (Ningxia) Region	<p>Amazon S3 is now available in the China (Ningxia) Region. For more information about Amazon S3 regions and endpoints, see <a href="#">Regions and Endpoints</a> in the <i>AWS General Reference</i>.</p>	December 11, 2017
Querying archives with SQL	<p>Amazon S3 now supports querying S3 Glacier data archives with SQL. For more information, see <a href="#">Querying Archived Objects</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>The following API changed:</p> <ul style="list-style-type: none"> <li>• <a href="#">RestoreObject</a></li> </ul>	November 29, 2017

Change	Description	Release Date
SELECT Object Content (Preview)	<p>Amazon S3 now supports the SELECT Object Content functionality as part of a Preview program. This feature retrieves object content based on an SQL expression.</p> <p>The following API has been added:</p> <ul style="list-style-type: none"><li>• <a href="#">SelectObjectContent</a></li></ul>	November 29, 2017
Support for ORC-formatted Amazon S3 inventory files	<p>Amazon S3 now supports the <a href="#">Apache optimized row columnar (ORC)</a> format in addition to comma-separated values (CSV) file format for inventory output files. For more information, see <a href="#">Amazon S3 Inventory</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>The following APIs are updated accordingly:</p> <ul style="list-style-type: none"><li>• <a href="#">GetBucketInventoryConfiguration</a></li><li>• <a href="#">PutBucketInventoryConfiguration</a></li></ul>	November 17, 2017

Change	Description	Release Date
Default encryption for S3 buckets	<p>Amazon S3 default encryption provides a way to set the default encryption behavior for an S3 bucket. You can set default encryption on a bucket so that all objects are encrypted when they are stored in the bucket. The objects are encrypted using server-side encryption with either Amazon S3-managed keys (SSE-S3) or AWS KMS-managed keys (SSE-KMS). For more information, see <a href="#">Amazon S3 Default Encryption for S3 Buckets</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>The following APIs are updated accordingly:</p> <ul style="list-style-type: none"><li>• <a href="#">DeleteBucketEncryption</a></li><li>• <a href="#">GetBucketEncryption</a></li><li>• <a href="#">PutBucketEncryption</a></li></ul>	November 06, 2017
Encryption status in Amazon S3 inventory	<p>Amazon S3 now supports including encryption status in Amazon S3 inventory so you can see how your objects are encrypted at rest for compliance auditing or other purposes. You can also configure to encrypt Amazon S3 inventory with server-side encryption (SSE) or SSE-KMS so that all inventory files are encrypted accordingly. For more information, see <a href="#">Amazon S3 Inventory</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>The following APIs are updated accordingly:</p> <ul style="list-style-type: none"><li>• <a href="#">GetBucketInventoryConfiguration</a></li><li>• <a href="#">PutBucketInventoryConfiguration</a></li></ul>	November 06, 2017

Change	Description	Release Date
Cross-region replication (CRR) enhancements	<p>Cross-region replication (CRR) now supports the following:</p> <ul style="list-style-type: none"> <li>In a cross-account scenario, you can add a CRR configuration to change replica ownership to the AWS account that owns the destination bucket. For more information, see <a href="#">CRR: Change Replica Owner</a> in the <i>Amazon Simple Storage Service User Guide</i>.</li> <li>By default, Amazon S3 does not replicate objects in your source bucket that are created using server-side encryption using AWS KMS-managed keys. In your CRR configuration, you can now direct Amazon S3 to replicate these objects. For more information, see <a href="#">CRR: Replicating Objects Created with SSE Using AWS KMS-Managed Encryption Keys</a> in the <i>Amazon Simple Storage Service User Guide</i>.</li> </ul> <p>The following APIs are updated accordingly:</p> <ul style="list-style-type: none"> <li><a href="#">GetBucketReplication</a></li> <li><a href="#">PutBucketReplication</a></li> </ul>	November 06, 2017
Europe (London) Region	Amazon S3 is now available in the Europe (London) Region. For more information about Amazon S3 regions and endpoints, see <a href="#">Regions and Endpoints</a> in the <i>AWS General Reference</i> .	December 13, 2016
Canada (Central) Region	Amazon S3 is now available in the Canada (Central) Region. For more information about Amazon S3 regions and endpoints, see <a href="#">Regions and Endpoints</a> in the <i>AWS General Reference</i> .	December 8, 2016

Change	Description	Release Date
Object tagging support	<p>Amazon S3 now supports object tagging. The following new API operations support object tagging:</p> <ul style="list-style-type: none"><li>• <a href="#">PutObjectTagging</a></li><li>• <a href="#">GetObjectTagging</a></li><li>• <a href="#">DeleteObjectTagging</a></li></ul> <p>In addition, other API operations are updated to support object tagging. For more information, see <a href="#">Object Tagging</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p>	November 29, 2016
S3 lifecycle now supports object tag based filter	<p>Amazon S3 now supports tag-based filtering in lifecycle configuration. You can now specify a lifecycle rule, in which you can specify a key prefix, one or more object tags, or a combination of both, to select a subset of objects to which the lifecycle rule applies. For more information, see <a href="#">Object Lifecycle Management</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>Amazon S3 now supports Expedited and Bulk data retrievals in addition to Standard retrievals when restoring objects archived to S3 Glacier.</p>	November 29, 2016

Change	Description	Release Date
CloudWatch request metrics for buckets	<p>Amazon S3 now supports CloudWatch metrics for requests made on buckets. The following new API operations support configuring request metrics:</p> <ul style="list-style-type: none"><li>• <a href="#">DeleteBucketMetricsConfiguration</a></li><li>• <a href="#">GetBucketMetricsConfiguration</a></li><li>• <a href="#">PutBucketMetricsConfiguration</a></li><li>• <a href="#">ListBucketMetricsConfigurations</a></li></ul> <p>For more information, see <a href="#">Monitoring Metrics with Amazon CloudWatch</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p>	November 29, 2016
Amazon S3 Inventory	<p>Amazon S3 now supports storage inventory. Amazon S3 inventory provides a flat-file output of your objects and their corresponding metadata on a daily or weekly basis for an S3 bucket or a shared prefix (that is, objects that have names that begin with a common string).</p> <p>The following new API operations are for storage inventory:</p> <ul style="list-style-type: none"><li>• <a href="#">DeleteBucketInventoryConfiguration</a></li><li>• <a href="#">GetBucketInventoryConfiguration</a></li><li>• <a href="#">PutBucketInventoryConfiguration</a></li><li>• <a href="#">ListBucketInventoryConfigurations</a></li></ul> <p>For more information, see <a href="#">Amazon S3 Storage Inventory</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p>	November 29, 2016

Change	Description	Release Date
<p>Amazon S3 Analytics – Storage Class Analysis</p>	<p>The new Amazon S3 analytics – storage class analysis feature observes data access patterns to help you determine when to transition less frequently accessed STANDARD storage to the STANDARD_IA (IA, for infrequent access) storage class. After storage class analysis observes the infrequent access patterns of a filtered set of data over a period of time, you can use the analysis results to help you improve your lifecycle configurations. This feature also includes a detailed daily analysis of your storage usage at the specified bucket, prefix, or tag level that you can export to a S3 bucket.</p> <p>The following new API operations are for storage class analysis:</p> <ul style="list-style-type: none"> <li>• <a href="#">DeleteBucketAnalyticsConfiguration</a></li> <li>• <a href="#">GetBucketAnalyticsConfiguration</a></li> <li>• <a href="#">PutBucketAnalyticsConfiguration</a></li> <li>• <a href="#">ListBucketAnalyticsConfigurations</a></li> </ul> <p>For more information, see <a href="#">Amazon S3 Analytics – Storage Class Analysis</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p>	<p>November 29, 2016</p>
<p>Added S3 Glacier retrieval options to <a href="#">RestoreObject</a></p>	<p>Amazon S3 now supports Expedited and Bulk data retrievals in addition to Standard retrievals when restoring objects archived to S3 Glacier. For more information, see <a href="#">Restoring Archived Objects</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p>	<p>November 21, 2016</p>

Change	Description	Release Date
US East (Ohio) Region	Amazon S3 is now available in the US East (Ohio) Region. For more information about Amazon S3 regions and endpoints, see <a href="#">Regions and Endpoints</a> in the <i>AWS General Reference</i> .	October 17, 2016
Asia Pacific (Mumbai) region	Amazon S3 is now available in the Asia Pacific (Mumbai) region. For more information about Amazon S3 regions and endpoints, see <a href="#">Regions and Endpoints</a> in the <i>AWS General Reference</i> .	June 27, 2016
GET Bucket (List Objects) API revised	The GET Bucket (List Objects) API has been revised. We recommend that you use the new version, GET Bucket (List Objects) version 2. For more information, see <a href="#">ListObjectsV2</a> .	May 4, 2016
Amazon S3 Transfer Acceleration	<p>Amazon S3 Transfer Acceleration enables fast, easy, and secure transfers of files over long distances between your client and an S3 bucket. Transfer Acceleration takes advantage of Amazon CloudFront's globally distributed edge locations.</p> <p>For more information, see <a href="#">Transfer Acceleration</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>The following new API operations support Transfer Acceleration: <a href="#">GetBucketAccelerateConfiguration</a> and <a href="#">PutBucketAccelerateConfiguration</a>.</p>	April 19, 2016
Lifecycle support to remove expired object delete marker	Lifecycle configuration expiration action now allows you to direct Amazon S3 to remove expired object delete markers in versioned bucket. For more information, see <a href="#">Elements to Describe Lifecycle Actions</a> in the <i>Amazon Simple Storage Service User Guide</i> .	March 16, 2016

Change	Description	Release Date
Bucket lifecycle configuration now supports the action to cancel incomplete multipart uploads	<p>Bucket lifecycle configuration now supports the <code>AbortIncompleteMultipartUpload</code> action that you can use to direct Amazon S3 to cancel multipart uploads that don't complete within a specified number of days after being initiated. When a multipart upload becomes eligible for an abort operation, Amazon S3 deletes any uploaded parts and cancels the multipart upload.</p> <p>The following API operations have been updated to support the new action:</p> <ul style="list-style-type: none"><li>• <a href="#">PutBucketLifecycleConfiguration</a> – The XML configuration now allows you to specify the <code>AbortIncompleteMultipartUpload</code> action in a lifecycle configuration rule.</li><li>• <a href="#">ListParts</a> and <a href="#">CreateMultipartUpload</a> – Both of these API operations now return two additional response headers (<code>x-amz-abort-date</code>, and <code>x-amz-abort-rule-id</code>) if the bucket has a lifecycle rule that specifies the <code>AbortIncompleteMultipartUpload</code> action. These headers in the response indicate when the initiated multipart upload will become eligible for an abort operation and which lifecycle rule is applicable.</li></ul> <p>For conceptual information, see the following topics in the <i>Amazon Simple Storage Service User Guide</i>:</p> <ul style="list-style-type: none"><li>•</li></ul>	March 16, 2016

Change	Description	Release Date
	<p><a href="#">Aborting Incomplete Multipart Uploads Using a Bucket Lifecycle configuration</a></p> <ul style="list-style-type: none"> <li>• <a href="#">Elements to Describe Lifecycle Actions</a></li> </ul>	
Amazon S3 Signature Version 4 now supports unsigned payloads	Amazon S3 Signature Version 4 now supports unsigned payloads when authenticating requests using the <code>Authorization</code> header. Because you don't sign the payload, it does not provide the same security that comes with payload signing, but it provides similar performance characteristics as signature version 2. For more information, see <a href="#">Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (AWS Signature Version 4)</a> .	January 15, 2016
Asia Pacific (Seoul) region	Amazon S3 is now available in the Asia Pacific (Seoul) region. For more information about Amazon S3 regions and endpoints, see <a href="#">Regions and Endpoints</a> in the <i>AWS General Reference</i> .	January 6, 2016
Renamed the US Standard region	Changed the region name string from US Standard to US East (N. Virginia). This is only a region name update, there is no change in the functionality.	December 11, 2015

Change	Description	Release Date
New storage class	<p>Amazon S3 now offers a new storage class, STANDARD_IA (IA, for infrequent access) for storing objects. This storage class is optimized for long-lived and less frequently accessed data. For more information, see <a href="#">Storage Classes</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>Lifecycle configuration feature updates now allow you to transition objects to the STANDARD_IA storage class. For more information, see <a href="#">Object Lifecycle Management</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>Previously, the cross-region replication feature used the storage class of the source object for object replicas. Now, when you configure cross-region replication you can specify a storage class for the object replica created in the destination bucket. For more information, see <a href="#">Cross-Region Replication</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p>	September 16, 2015
Event notifications	<p>Amazon S3 event notifications have been updated to add notifications when objects are deleted and to add filtering on object names with prefix and suffix matching. For the relevant API operations, see <a href="#">PutBucketNotificationConfiguration</a>, and <a href="#">GetBucketNotificationConfiguration</a>. For more information, see <a href="#">Configuring Amazon S3 Event Notifications</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p>	July 28, 2015

Change	Description	Release Date
Cross-region replication	Amazon S3 now supports cross-region replication. Cross-region replication is the automatic, asynchronous copying of objects across buckets in different AWS Regions. For the relevant API operations, see <a href="#">PutBucketReplication</a> , <a href="#">GetBucketReplication</a> and <a href="#">DeleteBucketReplication</a> . For more information, see <a href="#">Enabling Cross-Region Replication</a> in the <i>Amazon Simple Storage Service User Guide</i> .	March 24, 2015
Event notifications	Amazon S3 now supports new event types and destinations in a bucket notification configuration. Prior to this release, Amazon S3 supported only the <code>s3:ReducedRedundancyLostObject</code> event type and an Amazon SNS topic as the destination. For more information about the new event types, go to <a href="#">Setting Up Notification of Bucket Events</a> in the <i>Amazon Simple Storage Service User Guide</i> . For the relevant API operations, see <a href="#">PutBucketNotificationConfiguration</a> and <a href="#">GetBucketNotificationConfiguration</a> .	November 13, 2014

Change	Description	Release Date
Server-side encryption with AWS Key Management Service (KMS)	<p>Amazon S3 now supports server-side encryption using AWS Key Management Service (KMS). With server-side encryption with KMS, you manage the envelope key through KMS, and Amazon S3 calls KMS to access the envelope key within the permissions you set.</p> <p>For more information about server-side encryption with KMS, see <a href="#">Protecting Data Using Server-Side Encryption with AWS Key Management Service</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>The following Amazon S3 REST API operations support headers related to KMS.</p> <ul style="list-style-type: none"><li>• <a href="#">PutObject</a></li><li>• <a href="#">CopyObject</a></li><li>• <a href="#">POST Object</a></li><li>• <a href="#">CreateMultipartUpload</a></li><li>• <a href="#">UploadPart</a></li></ul>	November 12, 2014
Europe (Frankfurt) Region	Amazon S3 is now available in the Europe (Frankfurt) Region region.	October 23, 2014

Change	Description	Release Date
Server-side encryption with customer-provided encryption keys	<p>Amazon S3 now supports server-side encryption using customer-provided encryption keys (SSE-C). Server-side encryption enables you to request Amazon S3 to encrypt your data at rest. When using SSE-C, Amazon S3 encrypts your objects with the custom encryption keys that you provide. Since Amazon S3 performs the encryption for you, you get the benefits of using your own encryption keys without the cost of writing or executing your own encryption code.</p> <p>For more information about SSE-C, go to <a href="#">Server-Side Encryption (Using Customer-Provided Encryption Keys)</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>The following Amazon S3 REST API operations support headers related to SSE-C.</p> <ul style="list-style-type: none"><li>• <a href="#">GetObject</a></li><li>• <a href="#">HeadObject</a></li><li>• <a href="#">PutObject</a></li><li>• <a href="#">CopyObject</a></li><li>• <a href="#">POST Object</a></li><li>• <a href="#">CreateMultipartUpload</a></li><li>• <a href="#">UploadPart</a></li><li>• <a href="#">UploadPartCopy</a></li></ul>	June 12, 2014

Change	Description	Release Date
Lifecycle support for versioning	<p>Prior to this release lifecycle configuration was supported only on nonversioned buckets. Now you can configure lifecycle on both the nonversioned and versioning-enabled buckets.</p> <p>For more information, go to <a href="#">Object Lifecycle Management</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>The related API operations, see <a href="#">PutBucketLifecycle Configuration</a>, <a href="#">GetBucketLifecycleConfiguration</a>, and <a href="#">DeleteBucketLifecycle</a>.</p>	May 20, 2014
Amazon S3 now supports Signature Version 4	<p>Amazon S3 now supports Signature Version 4 (SigV4) in all regions, the latest specification for how to sign and authenticate AWS requests.</p> <p>For more information, see <a href="#">Authenticating Requests (AWS Signature Version 4)</a>.</p>	January 30, 2014
Amazon S3 list actions now support encoding-type request parameter	<p>The following Amazon S3 list actions now support encoding-type optional request parameter.</p> <p><a href="#">ListObjects</a></p> <p><a href="#">ListObjectVersions</a></p> <p><a href="#">ListMultipartUploads</a></p> <p><a href="#">ListParts</a></p> <p>An object key can contain any Unicode character; however, the XML 1.0 parser cannot parse some characters, such as characters with an ASCII value from 0 to 10. For characters that are not supported in XML 1.0, you can add this parameter to request that Amazon S3 encode the keys in the response.</p>	November 1, 2013

Change	Description	Release Date
SOAP Support Over HTTP Deprecated	SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.	September 19, 2013
Root domain support for website hosting	<p>Amazon S3 now supports hosting static websites at the root domain. Visitors to your website can access your site from their browser without specifying "www" in the web address (e.g., "example.com"). Many customers already host static websites on Amazon S3 that are accessible from a "www" subdomain (e.g., "www.example.com"). Previously, to support root domain access, you needed to run your own web server to proxy root domain requests from browsers to your website on Amazon S3. Running a web server to proxy requests introduces additional costs, operational burden, and another potential point of failure. Now, you can take advantage of the high availability and durability of Amazon S3 for both "www" and root domain addresses.</p> <p>For an example walkthrough, go to <a href="#">Example: Setting Up a Static Website Using a Custom Domain</a> in the <i>Amazon Simple Storage Service User Guide</i>. For conceptual information, go to <a href="#">Hosting Static Websites on Amazon S3</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p>	December 27, 2012

Change	Description	Release Date
Support for Archiving Data to Amazon Glacier	<p>Amazon S3 now supports a storage option that enables you to utilize Amazon Glacier's low-cost storage service for data archival. To archive objects, you define archival rules identifying objects and a timeline when you want Amazon S3 to archive these objects to S3 Glacier. You can easily set the rules on a bucket using the Amazon S3 console or programmatically using the Amazon S3 API or AWS SDKs.</p> <p>To support data archival rules, Amazon S3 lifecycle management API has been updated. For more information, see <a href="#">PutBucketLifecycleConfiguration</a>.</p> <p>After you archive objects, you must first restore a copy before you can access the data. Amazon S3 offers a new API for you to initiate a restore. For more information, see <a href="#">RestoreObject</a>.</p> <p>For conceptual information, go to <a href="#">Object Lifecycle Management</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p>	November 13, 2012

Change	Description	Release Date
Support for Website Page Redirects	<p>For a bucket that is configured as a website, Amazon S3 now supports redirecting a request for an object to another object in the same bucket or to an external URL. You can configure redirect by adding the <code>x-amz-website-redirect-location</code> metadata to the object.</p> <p>The object upload API operations <a href="#">PutObject</a>, <a href="#">CreateMultipartUpload</a>, and <a href="#">POST Object</a> allow you to configure the <code>x-amz-website-redirect-location</code> object metadata.</p> <p>For conceptual information, go to <a href="#">How to Configure Website Page Redirects</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p>	October 4, 2012
Cross-Origin Resource Sharing (CORS) support	<p>Amazon S3 now supports Cross-Origin Resource Sharing (CORS). CORS defines a way in which client web applications that are loaded in one domain can interact with or access resources in a different domain. With CORS support in Amazon S3, you can build rich client-side web applications on top of Amazon S3 and selectively allow cross-domain access to your Amazon S3 resources. For more information, see <a href="#">Enabling Cross-Origin Resource Sharing</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p>	August 31, 2012
Cost Allocation Tagging support	<p>Amazon S3 now supports cost allocation tagging, which allows you to label S3 buckets so you can more easily track their cost against projects or other criteria. For more information, see <a href="#">Cost Allocation Tagging</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p>	August 21, 2012

Change	Description	Release Date
Object Expiration support	You can use Object Expiration to schedule automatic removal of data after a configured time period. You set object expiration by adding lifecycle configuration to a bucket. For more information, see <a href="#">Transitioning Objects: General Considerations</a> in the <i>Amazon Simple Storage Service User Guide</i> .	December 27, 2011
New Region supported	Amazon S3 now supports the South America (São Paulo) region. For more information, see <a href="#">Buckets and Regions</a> in the <i>Amazon Simple Storage Service User Guide</i> .	December 14, 2011
Multi-Object Delete	<p>Amazon S3 now supports Multi-Object Delete API that enables you to delete multiple objects in a single request. With this feature, you can remove large numbers of objects from Amazon S3 more quickly than using multiple individual DELETE requests.</p> <p>For more information about the API see, see <a href="#">DeleteObjects</a>.</p> <p>For conceptual information about the delete operation , see <a href="#">Deleting Objects</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p>	December 7, 2011
New region supported	Amazon S3 now supports the US West (Oregon) region. For more information, see <a href="#">Buckets and Regions</a> in the <i>Amazon Simple Storage Service User Guide</i> .	November 8, 2011

Change	Description	Release Date
Server-side encryption support	Amazon S3 now supports server-side encryption. It enables you to request Amazon S3 to encrypt your data at rest, that is, encrypt your object data when Amazon S3 writes your data to disks in its data centers. To request server-side encryption, you must add the <code>x-amz-server-side-encryption</code> header to your request. To learn more about data encryption, go to <a href="#">Using Data Encryption</a> in the <i>Amazon Simple Storage Service User Guide</i> .	October 17, 2011
Multipart Upload API extended to enable copying objects up to 5 TB	Prior to this release, Amazon S3 API supported copying objects (see <a href="#">CopyObject</a> ) of up to 5 GB in size. To enable copying objects larger than 5 GB, Amazon S3 extends the multipart upload API with a new operation, <code>UploadPart (Copy)</code> . You can use this multipart upload operation to copy objects up to 5 TB in size. For conceptual information about multipart upload, go to <a href="#">Uploading Objects Using Multipart Upload</a> in the <i>Amazon Simple Storage Service User Guide</i> . To learn more about the new API, see <a href="#">UploadPartCopy</a> .	June 21, 2011
SOAP API calls over HTTP disabled	To increase security, SOAP API calls over HTTP are disabled. Authenticated and anonymous SOAP requests must be sent to Amazon S3 using SSL.	June 6, 2011

Change	Description	Release Date
Support for hosting static websites in Amazon S3	<p>Amazon S3 introduces enhanced support for hosting static websites. This includes support for index documents and custom error documents. When using these features, requests to the root of your bucket or a subfolder (e.g., <code>http://mywebsite.com/subfolder</code>) returns your index document instead of the list of objects in your bucket. If an error is encountered, Amazon S3 returns your custom error message instead of an Amazon S3 error message. For API information to configure your bucket as a website, see the following sections:</p> <ul style="list-style-type: none"><li>• <a href="#">PutBucketWebsite</a></li><li>• <a href="#">GetBucketWebsite</a></li><li>• <a href="#">DeleteBucketWebsite</a></li></ul> <p>For conceptual overview, go to <a href="#">Hosting Websites on Amazon S3</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p>	February 17, 2011
Response Header API Support	<p>The GET Object REST API now allows you to change the response headers of the REST GET Object request for each request. That is, you can alter object metadata in the response, without altering the object itself. For more information, see <a href="#">GetObject</a>.</p>	January 14, 2011

Change	Description	Release Date
Large Object Support	Amazon S3 has increased the maximum size of an object you can store in an S3 bucket from 5 GB to 5 TB. If you are using the REST API you can upload objects of up to 5 GB size in a single PUT operation. For larger objects, you must use the Multipart Upload REST API to upload objects in parts. For conceptual information, go to <a href="#">Uploading Objects Using Multipart Upload</a> in the <i>Amazon Simple Storage Service User Guide</i> . For multipart upload API information, see <a href="#">CreateMultipartUpload</a> , <a href="#">UploadPart</a> , <a href="#">CompleteMultipartUpload</a> , <a href="#">ListParts</a> , and <a href="#">ListMultipartUploads</a>	December 9, 2010
Multipart upload	Multipart upload enables faster, more flexible uploads into Amazon S3. It allows you to upload a single object as a set of parts. For conceptual information, go to <a href="#">Uploading Objects Using Multipart Upload</a> in the <i>Amazon Simple Storage Service User Guide</i> . For multipart upload API information, see <a href="#">CreateMultipartUpload</a> , <a href="#">UploadPart</a> , <a href="#">CompleteMultipartUpload</a> , <a href="#">ListParts</a> , and <a href="#">ListMultipartUploads</a>	November 10, 2010
Notifications	The Amazon S3 notifications feature enables you to configure a bucket so that Amazon S3 publishes a message to an Amazon Simple Notification Service (SNS) topic when Amazon S3 detects a key event on a bucket. For more information, see <a href="#">GET Bucket notification</a> and <a href="#">PUT Bucket notification</a> .	July 14, 2010
Bucket policies	Bucket policies is an access management system you use to set access permissions on buckets, objects, and sets of objects. This functionality supplements and in many cases replaces access control lists.	July 6, 2010

Change	Description	Release Date
Reduced Redundancy	Amazon S3 now enables you to reduce your storage costs by storing objects in Amazon S3 with reduced redundancy. For more information, see <a href="#">PUT Object</a> .	May 12, 2010
New region supported	Amazon S3 now supports the Asia Pacific (Singapore) region and therefore new location constraints. For more information, see <a href="#">GET Bucket location</a> and <a href="#">PUT Bucket</a> .	April 28, 2010
Object Versioning	This release introduces object Versioning. All objects now have a key and a version. If you enable versioning for a bucket, Amazon S3 gives all objects added to a bucket a unique version ID. This feature enables you to recover from unintended overwrites and deletions. For more information, see <a href="#">GET Object</a> , <a href="#">DELETE Object</a> , <a href="#">PUT Object</a> , <a href="#">PUT Object Copy</a> , or <a href="#">POST Object</a> . The SOAP API does not support versioned objects.	February 8, 2010
New region supported	Amazon S3 now supports the US-West (Northern California) region. The new endpoint is <code>s3-us-west-1.amazonaws.com</code> . For more information, see <a href="#">How to Select a Region for Your Buckets</a> in the <i>Amazon Simple Storage Service User Guide</i> .	December 2, 2009
C# Library Support	AWS now provides Amazon S3 C# libraries, sample code, tutorials, and other resources for software developers who prefer to build applications using language-specific API operations instead of REST or SOAP. These libraries provide basic functions (not included in the REST or SOAP APIs), such as request authentication, request retries, and error handling so that it's easier to get started.	November 11, 2009

Change	Description	Release Date
Technical documents reorganized	The API reference has been split out of the <i>Amazon S3 Developer Guide</i> . Now, on the documentation landing page, <a href="#">Amazon Simple Storage Service Documentation</a> , you can select the document you want to view. When viewing the documents online, the links in one document will take you, when appropriate, to one of the other guides.	September 16, 2009

# Appendix

- [Appendix: SOAP API](#)
- [Appendix: Authenticating requests \(AWS signature version 2\)](#)
- [Appendix: Lifecycle Configuration APIs \(Deprecated\)](#)

# Appendix: SelectObjectContent Response

## Description

The Amazon S3 Select operation filters the contents of an Amazon S3 object based on a simple structured query language (SQL) statement. Given the response size of this operation is unknown, Amazon S3 Select streams the response as a series of messages and includes a `Transfer-Encoding` header with **chunked** as its value in the response.

For more information about Amazon S3 Select, see [Selecting Content from Objects](#) in the *Amazon Simple Storage Service User Guide*.

For more information about using SQL with Amazon S3 Select, see [SQL Reference for Amazon S3 Select and S3 Glacier Select](#) in the *Amazon Simple Storage Service User Guide*.

## Responses

A successful Amazon S3 Select Operation returns 200 OK status code.

## Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see [Common Response Headers](#).

## Response Body

Since the Amazon S3 Select response size is unknown, Amazon S3 streams the response as a series of messages and includes a `Transfer-Encoding` header with **chunked** as its value in the response. The following example shows the response format at the top level:

```
<Message 1>
<Message 2>
<Message 3>
.....
<Message n>
```

Each message consists of two sections: the prelude and the data. The prelude section consists of 1) the total byte-length of the message, and 2) the combined byte-length of all the headers. The data section consists of 1) the headers, and 2) a payload.

Each section ends with a 4-byte big-endian integer checksum (CRC). Amazon S3 Select uses CRC32 (often referred to as GZIP CRC32) to calculate both CRCs. For more information about CRC32, see [GZIP file format specification version 4.3](#).

Total message overhead including the prelude and both checksums is 16 bytes.

**Note**

All integer values within messages are in network byte order, or big-endian order.

The following diagram shows the components that make up a message and a header. Note that there are multiple headers per message.

Message:

Headers (multiple headers per message):

**Note**

For Amazon S3 Select, the header value type is always 7 (type=String). For this type, the header value consists of two components, a 2-byte big-endian integer length, and a UTF-8 string that is of that byte-length. The following diagram shows the components that make up Amazon S3 Select headers.

## Amazon S3 Select Headers (type=String):

Payload byte-length calculations (these two calculations are equivalent):

- $\text{payload\_length} = \text{total\_length} - \text{header\_length} - \text{sizeof}(\text{total\_length}) - \text{sizeof}(\text{header\_length}) - \text{sizeof}(\text{prelude\_crc}) - \text{sizeof}(\text{message\_crc})$
- $\text{payload\_length} = \text{total\_length} - \text{header\_length} - 16$

Each message contains the following components:

- **Prelude:** Always fixed size of 8 bytes (two fields of 4 bytes each):
  - *First four bytes:* Total byte-length: Big-endian integer byte-length of the entire message (including the 4-byte total length field itself).
  - *Second four bytes:* Headers byte-length: Big-endian integer byte-length of the headers portion of the message (excluding the headers length field itself).
- **Prelude CRC:** 4-byte big-endian integer checksum (CRC) for the prelude portion of the message (excluding the CRC itself). The prelude has a separate CRC from the message CRC (see below), to ensure that corrupted byte-length information can be detected immediately, without causing pathological buffering behavior.
- **Headers:** A set of metadata annotating the message, such as the message type, payload format, and so on. Messages can have multiple headers, so this portion of the message can have different byte-lengths depending on the message type. Headers are key-value pairs, where both the key and value are UTF-8 strings. Headers can appear in any order within the headers portion of the message, and any given header type can only appear once.

For Amazon S3 Select, following is a list of header names and the set of valid values depending on the message type.

- *MessageType Header:*

- **HeaderName** => ":message-type"
- **Valid HeaderValues** => "error", "event"
- **EventType Header:**
  - **HeaderName** => ":event-type"
  - **Valid HeaderValues** => "Records", "Cont", "Progress", "Stats", "End"
- **ErrorCode Header:**
  - **HeaderName** => ":error-code"
  - **Valid HeaderValues** => Error Code from the table in the [List of SELECT Object Content Error Codes](#) section.
- **ErrorMessage Header:**
  - **HeaderName** => ":error-message"
  - **Valid HeaderValues** => Error message returned by the service, to help diagnose request-level errors.
- **Payload:** Can be anything.
- **Message CRC:** 4-byte big-endian integer checksum (CRC) from the start of the message to the start of the checksum (that is, everything in the message excluding the message CRC itself).

Each header contains the following components. There can be multiple headers per message.

- **Header Name Byte-Length:** Byte-length of the header name.
- **Header Name:** Name of the header, indicating the header type. Valid values: ":message-type" ":event-type" ":error-code" ":error-message"
- **Header Value Type:** Enum indicating the header value type. For Amazon S3 Select, this is always 7.
- **Value String Byte-Length:** (For Amazon S3 Select) Byte-length of the header value string.
- **Header Value String:** (For Amazon S3 Select) Value of the header string. Valid values for this field vary based on the type of the header. See the sections below for valid values for each header type and message type.

For Amazon S3 Select, responses can be messages of the following types:

- **Records message:** Can contain a single record, partial records, or multiple records. Depending on the size of the result, a response can contain one or more of these messages.

- **Continuation message:** Amazon S3 periodically sends this message to keep the TCP connection open. These messages appear in responses at random. The client must detect the message type and process accordingly.
- **Progress message:** Amazon S3 periodically sends this message, if requested. It contains information about the progress of a query that has started but has not yet completed.
- **Stats message:** Amazon S3 sends this message at the end of the request. It contains statistics about the query.
- **End message:** Indicates that the request is complete, and no more messages will be sent. You should not assume that the request is complete until the client receives an End message.
- **RequestLevelError message:** Amazon S3 sends this message if the request failed for any reason. It contains the error code and error message for the failure. If Amazon S3 sends a `RequestLevelError` message, it doesn't send an End message.

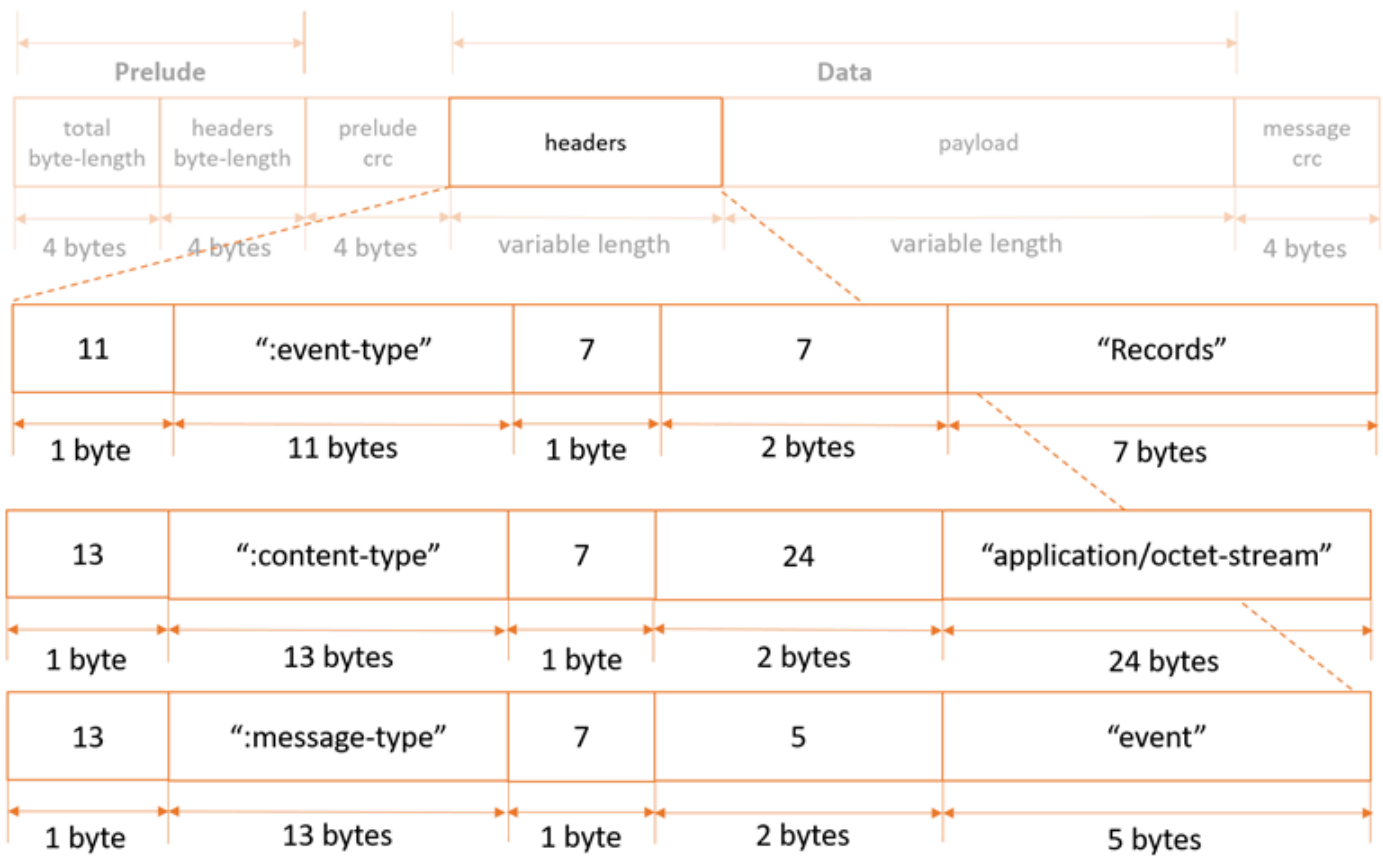

The following sections explain the structure of each message type in more detail.

For sample code and unit tests that use this protocol, see [AWS C Event Stream](#) on the GitHub website.

## Records Message

### Header specification

Records messages contain three headers, as follows:

### Payload specification

Records message payloads can contain a single record, partial records, or multiple records.

### Continuation Message

#### Header specification

Continuation messages contain two headers, as follows:

### Payload specification

Continuation messages have no payload.

### Progress Message

#### Header specification

Progress messages contain three headers, as follows:

## Payload specification

Progress message payload is an XML document containing information about the progress of a request.

- *BytesScanned* => Number of bytes that have been processed before being uncompressed (if the file is compressed).
- *BytesProcessed* => Number of bytes that have been processed after being uncompressed (if the file is compressed).
- *BytesReturned* => Current number of bytes of records payload data returned by Amazon S3.

For uncompressed files, *BytesScanned* and *BytesProcessed* are equal.

Example:

```
<?xml version="1.0" encoding="UTF-8"?>
```

```

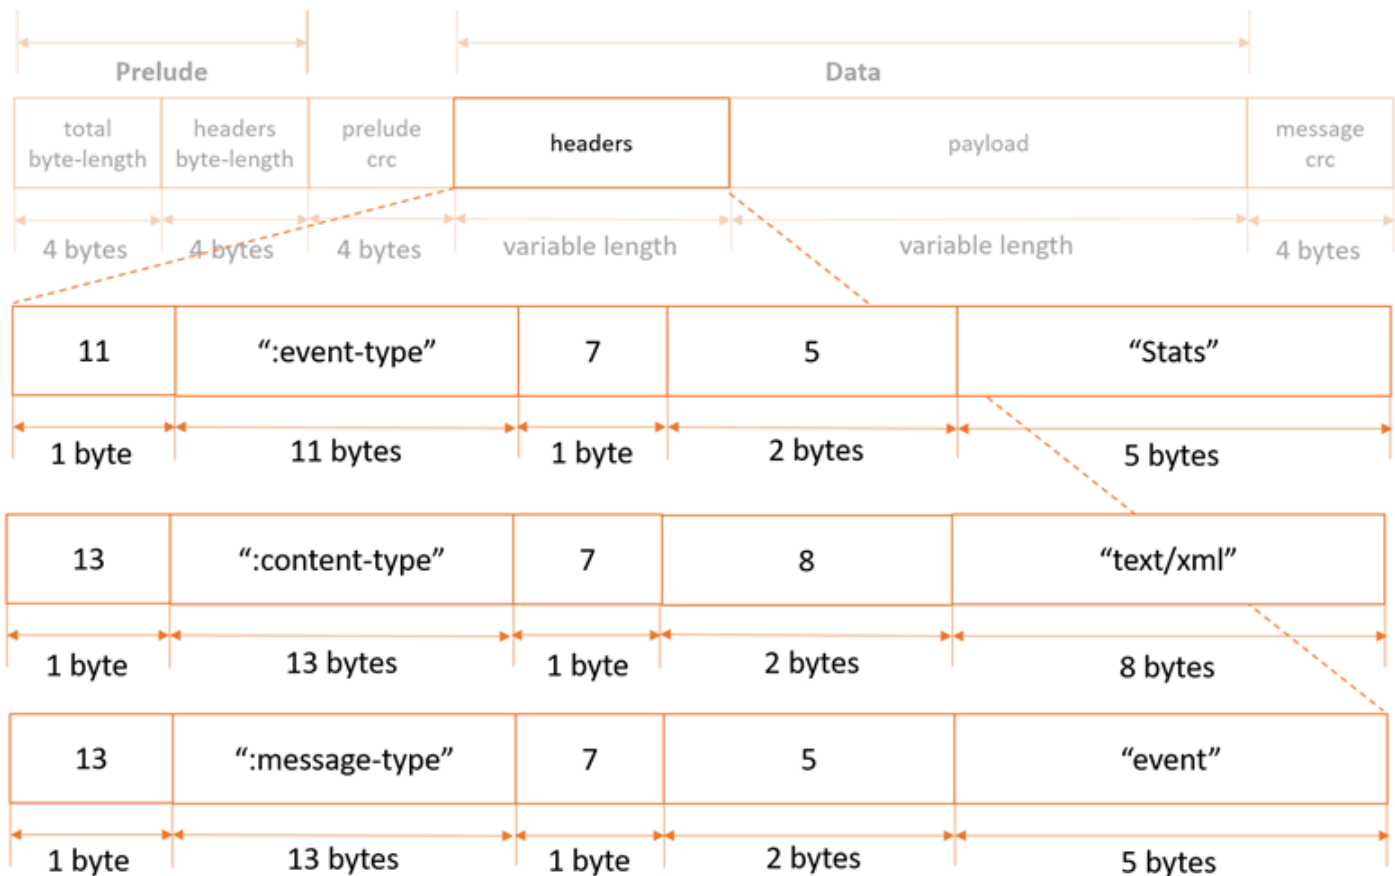

<Progress>
  <BytesScanned>512</BytesScanned>
  <BytesProcessed>1024</BytesProcessed>
  <BytesReturned>1024</BytesReturned>
</Progress>

```

## Stats Message

### Header specification

Stats messages contain three headers, as follows:

### Payload specification

Stats message payload is an XML document containing information about a request's stats when processing is complete.

- *BytesScanned* => Number of bytes that have been processed before being uncompressed (if the file is compressed).

- *BytesProcessed* => Number of bytes that have been processed after being uncompressed (if the file is compressed).
- *BytesReturned* => Total number of bytes of records payload data returned by Amazon S3.

For uncompressed files, BytesScanned and BytesProcessed are equal.

Example:

```
<?xml version="1.0" encoding="UTF-8"?>
<Stats>
  <BytesScanned>512</BytesScanned>
  <BytesProcessed>1024</BytesProcessed>
  <BytesReturned>1024</BytesReturned>
</Stats>
```

## End Message

### Header specification

End messages contain two headers, as follows:

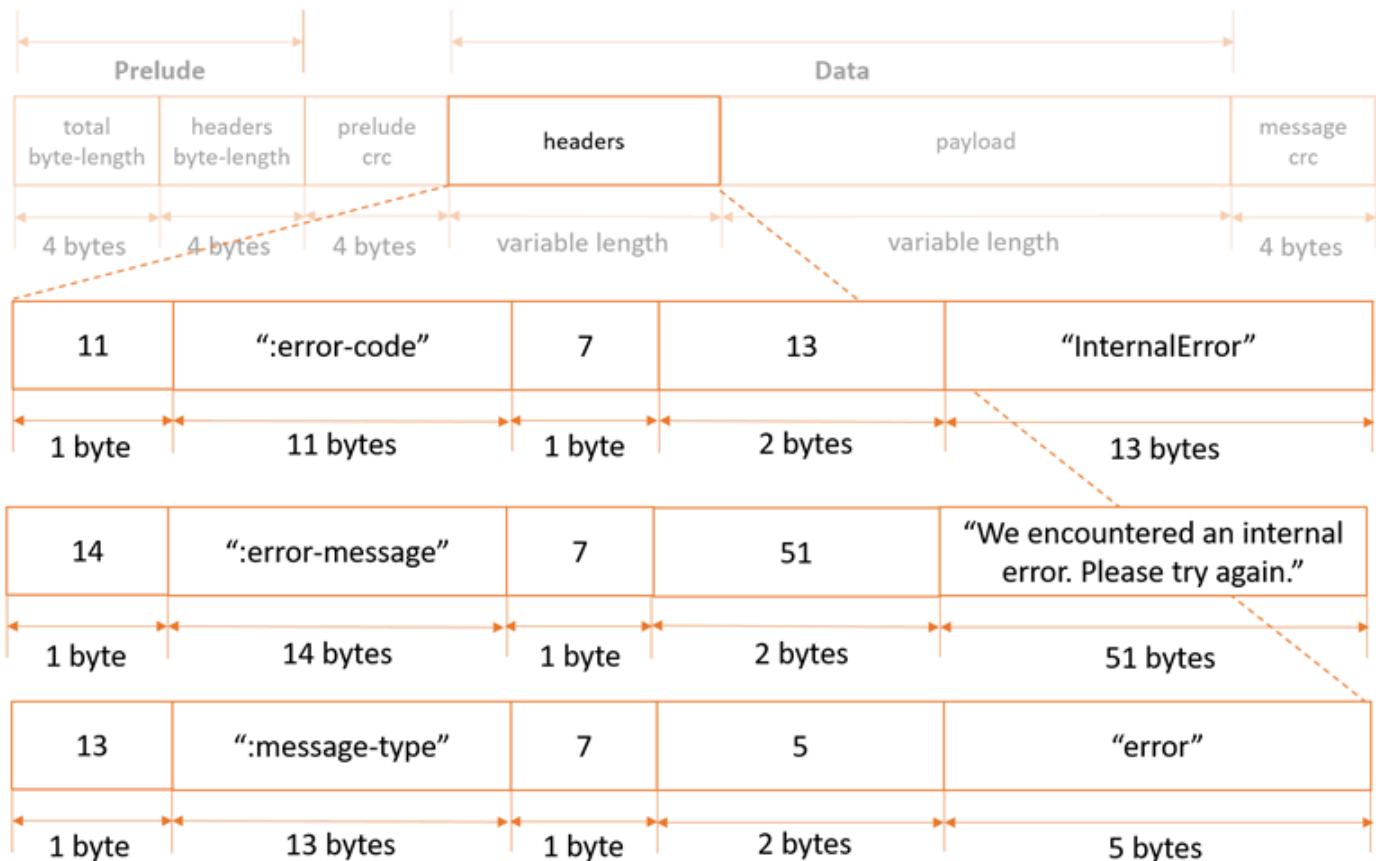

## Payload specification

End messages have no payload.

## Request Level Error Message

### Header specification

Request-level error messages contain three headers, as follows:

For a list of possible error codes and error messages, see the [List of SELECT Object Content Error Codes](#).

## Payload specification

Request-level error messages have no payload.

- [the section called "PutBucketLifecycleConfiguration"](#)

# Appendix: OPTIONS object

## Description

A browser can send this preflight request to Amazon S3 to determine if it can send an actual request with the specific origin, HTTP method, and headers.

Amazon S3 supports cross-origin resource sharing (CORS) by enabling you to add a `cors` subresource on a bucket. When a browser sends this preflight request, Amazon S3 responds by evaluating the rules that are defined in the `cors` configuration.

If `cors` is not enabled on the bucket, then Amazon S3 returns a `403 Forbidden` response.

For more information about CORS, go to [Enabling Cross-Origin Resource Sharing](#) in the *Amazon Simple Storage Service User Guide*.

## Requests

### Syntax

```
OPTIONS /ObjectName HTTP/1.1
Host: BucketName.s3.amazonaws.com
Origin: Origin
Access-Control-Request-Method: HTTPMethod
Access-Control-Request-Headers: RequestHeader
```

## Request Parameters

This operation does not introduce any specific request parameters, but it may contain any request parameters that are required by the actual request.

## Request Headers

Name	Description	Required
Origin	Identifies the origin of the cross-origin request to Amazon S3. For example, <code>http://www.example.com</code> .  Type: String	Yes

Name	Description	Required
	Default: None	
Access-Control-Request-Method	<p>Identifies what HTTP method will be used in the actual request.</p> <p>Type: String</p> <p>Default: None</p>	Yes
Access-Control-Request-Headers	<p>A comma-delimited list of HTTP headers that will be sent in the actual request.</p> <p>For example, to put an object with server-side encryption, this preflight request will determine if it can include the <code>x-amz-server-side-encryption</code> header with the request.</p> <p>Type: String</p> <p>Default: None</p>	No

## Request Elements

This implementation of the operation does not use request elements.

## Responses

### Response Headers

Header	Description
Access-Control-Allow-Origin	The origin you sent in your request. If the origin in your request is not allowed, Amazon S3 will not include this header in the response.

Header	Description
	Type: String
Access-Control-Max-Age	How long, in seconds, the results of the preflight request can be cached.  Type: String
Access-Control-Allow-Methods	The HTTP method that was sent in the original request. If the method in the request is not allowed, Amazon S3 will not include this header in the response.  Type: String
Access-Control-Allow-Headers	A comma-delimited list of HTTP headers that the browser can send in the actual request. If any of the requested headers is not allowed, Amazon S3 will not include that header in the response, nor will the response contain any of the headers with the Access-Control prefix.  Type: String
Access-Control-Expose-Headers	A comma-delimited list of HTTP headers. This header provides the JavaScript client with access to these headers in the response to the actual request.  Type: String

## Response Elements

This implementation of the operation does not return response elements.

## Examples

### Example : Send a preflight OPTIONS request to a cors enabled bucket

A browser can send this preflight request to Amazon S3 to determine if it can send the actual PUT request from `http://www.example.com` origin to the Amazon S3 bucket named `examplebucket`.

#### Sample Request

```
OPTIONS /exampleobject HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Origin: http://www.example.com
Access-Control-Request-Method: PUT
```

#### Sample Response

```
HTTP/1.1 200 OK
x-amz-id-2: 6SvaESv3VULYPLik5LL171SPPtSnBvDdGmnk1X1HfU17uS2m1DF6td6KWKNjYMXZ
x-amz-request-id: BDC4B83DF5096BBE
Date: Wed, 21 Aug 2012 23:09:55 GMT
Etag: "1f1a1af1f11111111111111111c11aed1da1"
Access-Control-Allow-Origin: http://www.example.com
Access-Control-Allow-Methods: PUT
Access-Control-Expose-Headers: x-amz-request-id
Content-Length: 0
Server: AmazonS3
```

# Appendix: SOAP API

## Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

This section describes the SOAP API with respect to service, bucket, and object operations. Note that SOAP requests, both authenticated and anonymous, must be sent to Amazon S3 using SSL. Amazon S3 returns an error when you send a SOAP request over HTTP.

The latest Amazon S3 WSDL is available at [docs.aws.amazon.com/2006-03-01/AmazonS3.wSDL](https://docs.aws.amazon.com/2006-03-01/AmazonS3.wSDL).

## Topics

## Operations on the Service (SOAP API)

## Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

This section describes operations you can perform on the Amazon S3 service.

## Topics

- [ListAllMyBuckets \(SOAP API\)](#)

## ListAllMyBuckets (SOAP API)

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

The `ListAllMyBuckets` operation returns a list of all buckets owned by the sender of the request.

### Example

#### Sample Request

```
<ListAllMyBuckets xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</ListAllMyBuckets>
```

#### Sample Response

```
<ListAllMyBucketsResult xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <Owner>
    <ID>bcaf1ffd86f41161ca5fb16fd081034f</ID>
    <DisplayName>webfile</DisplayName>
  </Owner>
  <Buckets>
    <Bucket>
      <Name>quotes</Name>
      <CreationDate>2006-02-03T16:45:09.000Z</CreationDate>
    </Bucket>
    <Bucket>
      <Name>samples</Name>
      <CreationDate>2006-02-03T16:41:58.000Z</CreationDate>
    </Bucket>
  </Buckets>
</ListAllMyBucketsResult>
```

```
</Buckets>  
</ListAllMyBucketsResult>
```

## Response Body

- **Owner:**

This provides information that Amazon S3 uses to represent your identity for purposes of authentication and access control. ID is a unique and permanent identifier for the developer who made the request. DisplayName is a human-readable name representing the developer who made the request. It is not unique, and might change over time. We recommend that you match your DisplayName to your Forum name.

- **Name:**

The name of a bucket. Note that if one of your buckets was recently deleted, the name of the deleted bucket might still be present in this list for a period of time.

- **CreationDate:**

The time that the bucket was created.

## Access Control

You must authenticate with a valid AWS Access Key ID. Anonymous requests are never allowed to list buckets, and you can only list buckets for which you are the owner.

## Operations on Buckets (SOAP API)

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

This section describes operations you can perform on Amazon S3 buckets.

## Topics

- [CreateBucket \(SOAP API\)](#)

- [DeleteBucket \(SOAP API\)](#)
- [ListBucket \(SOAP API\)](#)
- [GetBucketAccessControlPolicy \(SOAP API\)](#)
- [SetBucketAccessControlPolicy \(SOAP API\)](#)
- [GetBucketLoggingStatus \(SOAP API\)](#)
- [SetBucketLoggingStatus \(SOAP API\)](#)

## CreateBucket (SOAP API)

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

The `CreateBucket` operation creates a bucket. Not every string is an acceptable bucket name. For information on bucket naming restrictions, see [Working with Amazon S3 Buckets](#).

### Note

To determine whether a bucket name exists, use `ListBucket` and set `MaxKeys` to 0. A `NoSuchBucket` response indicates that the bucket is available, an `AccessDenied` response indicates that someone else owns the bucket, and a `Success` response indicates that you own the bucket or have permission to access it.

## Example Create a bucket named "quotes"

### Sample Request

```
<CreateBucket xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
```

```
</CreateBucket>
```

## Sample Response

```
<CreateBucketResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <CreateBucketResponse>
    <Bucket>quotes</Bucket>
  </CreateBucketResponse>
</CreateBucketResponse>
```

## Elements

- **Bucket**: The name of the bucket you are trying to create.
- **AccessControlList**: The access control list for the new bucket. This element is optional. If not provided, the bucket is created with an access policy that give the requester FULL\_CONTROL access.

## Access Control

You must authenticate with a valid AWS Access Key ID. Anonymous requests are never allowed to create buckets.

## Related Resources

- [ListBucket \(SOAP API\)](#)

## DeleteBucket (SOAP API)

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

The `DeleteBucket` operation deletes a bucket. All objects in the bucket must be deleted before the bucket itself can be deleted.

## Example

This example deletes the "quotes" bucket.

### Sample Request

```
<DeleteBucket xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <AWSAccessKeyId> AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</DeleteBucket>
```

### Sample Response

```
<DeleteBucketResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <DeleteBucketResponse>
    <Code>204</Code>
    <Description>No Content</Description>
  </DeleteBucketResponse>
</DeleteBucketResponse>
```

## Elements

- **Bucket**: The name of the bucket you want to delete.

## Access Control

Only the owner of a bucket is allowed to delete it, regardless the access control policy on the bucket.

## ListBucket (SOAP API)

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

The ListBucket operation returns information about some of the items in the bucket.

For a general introduction to the list operation, see the [Listing Object Keys](#).

## Requests

This example lists up to 1000 keys in the "quotes" bucket that have the prefix "notes."

## Syntax

```
<ListBucket xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Prefix>notes</Prefix>
  <Delimiter></Delimiter>
  <MaxKeys>1000</MaxKeys>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</ListBucket>
```

## Parameters

Name	Description	Required
prefix	<p>Limits the response to keys which begin with the indicated prefix. You can use prefixes to separate a bucket into different sets of keys in a way similar to how a file system uses folders.</p> <div data-bbox="354 1255 1269 1570" style="border: 1px solid #f08080; border-radius: 10px; padding: 10px; margin: 10px 0;"> <p><b>⚠ Important</b></p> <p>Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see <a href="#">XML related object key constraints</a>.</p> </div> <p>Type: String</p> <p>Default: None</p>	No
marker	Indicates where in the bucket to begin listing. The list will only include keys that occur lexicographically after marker. This is	No

Name	Description	Required
	<p>convenient for pagination: To get the next page of results use the last key of the current page as the marker.</p> <p>Type: String</p> <p>Default: None</p>	
max-keys	<p>The maximum number of keys you'd like to see in the response body. The server might return fewer than this many keys, but will not return more.</p> <p>Type: String</p> <p>Default: None</p>	No
delimiter	<p>Causes keys that contain the same string between the prefix and the first occurrence of the delimiter to be rolled up into a single result element in the CommonPrefixes collection. These rolled-up keys are not returned elsewhere in the response.</p> <p>Type: String</p> <p>Default: None</p>	No

## Success Response

This response assumes the bucket contains the following keys:

```
notes/todos.txt
notes/2005-05-23/customer_mtg_notes.txt
notes/2005-05-23/phone_notes.txt
notes/2005-05-28/sales_notes.txt
```

## Syntax

```
<?xml version="1.0" encoding="UTF-8"?>
<ListBucketResult xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Name>backups</Name>
  <Prefix>notes/</Prefix>
```

```

<MaxKeys>1000</MaxKeys>
<Delimiter>/</Delimiter>
<IsTruncated>>false</IsTruncated>
<Contents>
  <Key>notes/todos.txt</Key>
  <LastModified>2006-01-01T12:00:00.000Z</LastModified>
  <ETag>"828ef3fdfa96f00ad9f27c383fc9ac7f"</ETag>
  <Size>5126</Size>
  <StorageClass>STANDARD</StorageClass>
  <Owner>
    <ID>75aa57f09aa0c8caeab4f8c24e99d10f8e7faeebf76c078efc7c6caea54ba06a</ID>
    <DisplayName>webfile</DisplayName>
  </Owner>
  <StorageClass>STANDARD</StorageClass>
</Contents>
<CommonPrefixes>
  <Prefix>notes/2005-05-23/</Prefix>
</CommonPrefixes>
<CommonPrefixes>
  <Prefix>notes/2005-05-28/</Prefix>
</CommonPrefixes>
</ListBucketResult>

```

As you can see, many of the fields in the response echo the request parameters. `IsTruncated`, `Contents`, and `CommonPrefixes` are the only response elements that can contain new information.

## Response Elements

Name	Description
Contents	<p>Metadata about each object returned.</p> <p>Type: XML metadata</p> <p>Ancestor: ListBucketResult</p>
CommonPrefixes	<p>A response can contain <code>CommonPrefixes</code> only if you specify a <code>delimiter</code>. When you do, <code>CommonPrefixes</code> contains all (if there are any) keys between <code>Prefix</code> and the next occurrence of the string specified by <code>delimiter</code>. In effect, <code>CommonPrefixes</code> lists keys that act like subdirectories in the directory specified by <code>Prefix</code>. For example, if <code>prefix</code> is</p>

Name	Description
	<p>notes/ and delimiter is a slash (/), in notes/summer/july , the common prefix is notes/summer/ .</p> <p>Type: String</p> <p>Ancestor: ListBucketResult</p>
Delimiter	<p>Causes keys that contain the same string between the prefix and the first occurrence of the delimiter to be rolled up into a single result element in the CommonPrefixes collection. These rolled-up keys are not returned elsewhere in the response.</p> <p>Type: String</p> <p>Ancestor: ListBucketResult</p>
IsTruncated	<p>Specifies whether (true) or not (false) all of the results were returned. All of the results may not be returned if the number of results exceeds that specified by MaxKeys.</p> <p>Type: String</p> <p>Ancestor: boolean</p>
Marker	<p>Indicates where in the bucket to begin listing.</p> <p>Type: String</p> <p>Ancestor: ListBucketResult</p>
MaxKeys	<p>The maximum number of keys returned in the response body.</p> <p>Type: String</p> <p>Ancestor: ListBucketResult</p>

Name	Description
Name	Name of the bucket.  Type: String  Ancestor: ListBucketResult
Prefix	Keys that begin with the indicated prefix.  Type: String  Ancestor: ListBucketResult

## Response Body

For information about the list response, see [Listing Keys Response](#).

## Access Control

To list the keys of a bucket you need to have been granted READ access on the bucket.

## GetBucketAccessControlPolicy (SOAP API)

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

The `GetBucketAccessControlPolicy` operation fetches the access control policy for a bucket.

## Example

This example retrieves the access control policy for the "quotes" bucket.

## Sample Request

```
<GetBucketAccessControlPolicy xmlns="http://doc.s3.amazonaws.com/2006-03-01">
```

```
<Bucket>quotes</Bucket>
<AWSSignature>AKIAIOSFODNN7EXAMPLE</AWSSignature>
<Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
<Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</GetBucketAccessControlPolicy>
```

## Sample Response

```
<AccessControlPolicy>
  <Owner>
    <ID>a9a7b886d6fd2441bf9b1c61be666e9</ID>
    <DisplayName>chriscustomer</DisplayName>
  </Owner>
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="CanonicalUser">
        <ID>a9a7b886d6f41bf9b1c61be666e9</ID>
        <DisplayName>chriscustomer</DisplayName>
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
    <Grant>
      <Grantee xsi:type="Group">
        <URI>http://acs.amazonaws.com/groups/global/AllUsers</URI>
      </Grantee>
      <Permission>READ</Permission>
    </Grant>
  </AccessControlList>
</AccessControlPolicy>
```

## Response Body

The response contains the access control policy for the bucket. For an explanation of this response, see [SOAP Access Policy](#).

## Access Control

You must have READ\_ACP rights to the bucket in order to retrieve the access control policy for a bucket.

## SetBucketAccessControlPolicy (SOAP API)

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

The `SetBucketAccessControlPolicy` operation sets the Access Control Policy for an existing bucket. If successful, the previous Access Control Policy for the bucket is entirely replaced with the specified Access Control Policy.

### Example

Give the specified user (usually the owner) `FULL_CONTROL` access to the "quotes" bucket.

### Sample Request

```
<SetBucketAccessControlPolicy xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="CanonicalUser">
        <ID>a9a7b8863000e241bf9b1c61be666e9</ID>
        <DisplayName>chriscustomer</DisplayName>
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
  </AccessControlList>
  <AWSSessionToken>AKIAIOSFODNN7EXAMPLE</AWSSessionToken>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</SetBucketAccessControlPolicy >
```

### Sample Response

```
<GetBucketAccessControlPolicyResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <GetBucketAccessControlPolicyResponse>
    <Code>200</Code>
  </GetBucketAccessControlPolicyResponse>
</GetBucketAccessControlPolicyResponse >
```

```
<Description>OK</Description>
</GetBucketAccessControlPolicyResponse>
</GetBucketAccessControlPolicyResponse>
```

## Access Control

You must have WRITE\_ACP rights to the bucket in order to set the access control policy for a bucket.

## GetBucketLoggingStatus (SOAP API)

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

The GetBucketLoggingStatus retrieves the logging status for an existing bucket.

For a general introduction to this feature, see [Server Logs](#).

## Example

### Sample Request

```
<?xml version="1.0" encoding="utf-8"?>
  <soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xmlns:xsd="http://
www.w3.org/2001/XMLSchema">
    <soap:Body>
      <GetBucketLoggingStatus xmlns="http://doc.s3.amazonaws.com/2006-03-01">
        <Bucket>mybucket</Bucket>
        <AWSAccessKeyId>YOUR_AWS_ACCESS_KEY_ID</AWSAccessKeyId>
        <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
        <Signature>YOUR_SIGNATURE_HERE</Signature>
      </GetBucketLoggingStatus>
    </soap:Body>
  </soap:Envelope>
```

## Sample Response

```
<?xml version="1.0" encoding="utf-8"?>
  <soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xsi="http://www.w3.org/2001/
XMLSchema-instance" >
    <soapenv:Header>
    </soapenv:Header>
    <soapenv:Body>
      <GetBucketLoggingStatusResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
        <GetBucketLoggingStatusResponse>
          <LoggingEnabled>
            <TargetBucket>mylogs</TargetBucket>
            <TargetPrefix>mybucket-access_log-</TargetPrefix>
          </LoggingEnabled>
        </GetBucketLoggingStatusResponse>
      </GetBucketLoggingStatusResponse>
    </soapenv:Body>
  </soapenv:Envelope>
```

## Access Control

Only the owner of a bucket is permitted to invoke this operation.

## SetBucketLoggingStatus (SOAP API)

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

The `SetBucketLoggingStatus` operation updates the logging status for an existing bucket.

For a general introduction to this feature, see [Server Logs](#).

## Example

This sample request enables server access logging for the 'mybucket' bucket, and configures the logs to be delivered to 'mylogs' under prefix 'access\_log-'

## Sample Request

```
<?xml version="1.0" encoding="utf-8"?>
  <soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xmlns:xsd="http://
www.w3.org/2001/XMLSchema">
    <soap:Body>
      <SetBucketLoggingStatus xmlns="http://doc.s3.amazonaws.com/2006-03-01">
        <Bucket>myBucket</Bucket>
        <AWSAccessKeyId>YOUR_AWS_ACCESS_KEY_ID</AWSAccessKeyId>
        <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
        <Signature>YOUR_SIGNATURE_HERE</Signature>
        <BucketLoggingStatus>
          <LoggingEnabled>
            <TargetBucket>mylogs</TargetBucket>
            <TargetPrefix>mybucket-access_log-</TargetPrefix>
          </LoggingEnabled>
        </BucketLoggingStatus>
      </SetBucketLoggingStatus>
    </soap:Body>
  </soap:Envelope>
```

## Sample Response

```
<?xml version="1.0" encoding="utf-8"?>
  <soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xsi="http://www.w3.org/2001/
XMLSchema-instance" >
    <soapenv:Header>
    </soapenv:Header>
    <soapenv:Body>
      <SetBucketLoggingStatusResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01"/
>
      </soapenv:Body>
    </soapenv:Envelope>
```

## Access Control

Only the owner of a bucket is permitted to invoke this operation.

## Operations on Objects (SOAP API)

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

This section describes operations you can perform on Amazon S3 objects.

### Topics

- [PutObjectInline \(SOAP API\)](#)
- [PutObject \(SOAP API\)](#)
- [CopyObject \(SOAP API\)](#)
- [GetObject \(SOAP API\)](#)
- [GetObjectExtended \(SOAP API\)](#)
- [DeleteObject \(SOAP API\)](#)
- [GetObjectAccessControlPolicy \(SOAP API\)](#)
- [SetObjectAccessControlPolicy \(SOAP API\)](#)

### PutObjectInline (SOAP API)

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

The `PutObjectInline` operation adds an object to a bucket. The data for the object is provided in the body of the SOAP message.

If an object already exists in a bucket, the new object will overwrite it because Amazon S3 stores the last write request. However, Amazon S3 is a distributed system. If Amazon S3 receives multiple

write requests for the same object nearly simultaneously, all of the objects might be stored, even though only one wins in the end. Amazon S3 does not provide object locking; if you need this, make sure to build it into your application layer.

To ensure an object is not corrupted over the network, you can calculate the MD5 of an object, PUT it to Amazon S3, and compare the returned Etag to the calculated MD5 value.

PutObjectInline is not suitable for use with large objects. The system limits this operation to working with objects 1MB or smaller. PutObjectInline will fail with the `InlineDataTooLargeError` status code if the Data parameter encodes an object larger than 1MB. To upload large objects, consider using the non-inline PutObject API, or the REST API instead.

## Example

This example writes some text and metadata into the "Nelson" object in the "quotes" bucket, give a user (usually the owner) FULL\_CONTROL access to the object, and make the object readable by anonymous parties.

### Sample Request

```
<PutObjectInline xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <Metadata>
    <Name>Content-Type</Name>
    <Value>text/plain</Value>
  </Metadata>
  <Metadata>
    <Name>family</Name>
    <Value>Muntz</Value>
  </Metadata>
  <Data>aGEtaGE=</Data>
  <ContentLength>5</ContentLength>
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="CanonicalUser">
        <ID>a9a7b886d6fde241bf9b1c61be666e9</ID>
        <DisplayName>chriscustomer</DisplayName>
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
    <Grant>
```

```
<Grantee xsi:type="Group">
  <URI>http://acs.amazonaws.com/groups/global/AllUsers</URI>
</Grantee>
<Permission>READ</Permission>
</Grant>
</AccessControlList>
<AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
<Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
<Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</PutObjectInline>
```

## Sample Response

```
<PutObjectInlineResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <PutObjectInlineResponse>
    <ETag>&quot;828ef3fdfa96f00ad9f27c383fc9ac7f&quot;</ETag>
    <LastModified>2006-01-01T12:00:00.000Z</lastModified>
  </PutObjectInlineResponse>
</PutObjectInlineResponse>
```

## Elements

- **Bucket**: The bucket in which to add the object.
- **Key**: The key to assign to the object.

### Important

Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see [XML related object key constraints](#).

- **Metadata**: You can provide name-value metadata pairs in the metadata element. These will be stored with the object.
- **Data**: The base 64 encoded form of the data.
- **ContentLength**: The length of the data in bytes.

- **AccessControlList**: An Access Control List for the resource. This element is optional. If omitted, the requester is given FULL\_CONTROL access to the object. If the object already exists, the preexisting access control policy is replaced.

## Responses

- **ETag**: The entity tag is an MD5 hash of the object that you can use to do conditional fetches of the object using `GetObjectExtended`. The ETag only reflects changes to the contents of an object, not its metadata.
- **LastModified**: The Amazon S3 timestamp for the saved object.

## Access Control

You must have WRITE access to the bucket in order to put objects into the bucket.

## Related Resources

- [CopyObject \(SOAP API\)](#)

## PutObject (SOAP API)

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

The `PutObject` operation adds an object to a bucket. The data for the object is attached as a DIME attachment.

To ensure an object is not corrupted over the network, you can calculate the MD5 of an object, PUT it to Amazon S3, and compare the returned Etag to the calculated MD5 value.

If an object already exists in a bucket, the new object will overwrite it because Amazon S3 stores the last write request. However, Amazon S3 is a distributed system. If Amazon S3 receives multiple

write requests for the same object nearly simultaneously, all of the objects might be stored, even though only one wins in the end. Amazon S3 does not provide object locking; if you need this, make sure to build it into your application layer.

## Example

This example puts some data and metadata in the "Nelson" object of the "quotes" bucket, give a user (usually the owner) FULL\_CONTROL access to the object, and make the object readable by anonymous parties. In this sample, the actual attachment is not shown.

## Sample Request

```
<PutObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <Metadata>
    <Name>Content-Type</Name>
    <Value>text/plain</Value>
  </Metadata>
  <Metadata>
    <Name>family</Name>
    <Value>Muntz</Value>
  </Metadata>
  <ContentLength>5</ContentLength>
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="CanonicalUser">
        <ID>a9a7b886d6241bf9b1c61be666e9</ID>
        <DisplayName>chriscustomer</DisplayName>
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
    <Grant>
      <Grantee xsi:type="Group">
        <URI>http://acs.amazonaws.com/groups/global/AllUsers<URI>
      </Grantee>
      <Permission>READ</Permission>
    </Grant>
  </AccessControlList>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2007-05-11T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</PutObject>
```

## Sample Response

```
<PutObjectResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <PutObjectResponse>
    <ETag>"828ef3fdfa96f00ad9f27c383fc9ac7f"</ETag>

  </PutObjectResponse>
</PutObjectResponse>
```

## Elements

- **Bucket**: The bucket in which to add the object.
- **Key**: The key to assign to the object.

### Important

Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see [XML related object key constraints](#).

- **Metadata**: You can provide name-value metadata pairs in the metadata element. These will be stored with the object.
- **ContentLength**: The length of the data in bytes.
- **AccessControlList**: An Access Control List for the resource. This element is optional. If omitted, the requester is given FULL\_CONTROL access to the object. If the object already exists, the preexisting Access Control Policy is replaced.

## Responses

- **ETag**: The entity tag is an MD5 hash of the object that you can use to do conditional fetches of the object using GetObjectExtended. The ETag only reflects changes to the contents of an object, not its metadata.
- **LastModified**: The Amazon S3 timestamp for the saved object.

## Access Control

To put objects into a bucket, you must have WRITE access to the bucket.

## Related Resources

- [CopyObject \(SOAP API\)](#)

## CopyObject (SOAP API)

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

## Description

The CopyObject operation creates a copy of an object when you specify the key and bucket of a source object and the key and bucket of a target destination.

When copying an object, you can preserve all metadata (default) or specify new metadata. However, the ACL is not preserved and is set to `private` for the user making the request. To override the default ACL setting, specify a new ACL when generating a copy request. For more information, see [Using ACLs](#).

All copy requests must be authenticated. Additionally, you must have *read* access to the source object and *write* access to the destination bucket. For more information, see [Using Auth Access](#).

To only copy an object under certain conditions, such as whether the Etag matches or whether the object was modified before or after a specified date, use the request parameters CopySourceIfUnmodifiedSince, CopyIfUnmodifiedSince, CopySourceIfMatch, or CopySourceIfNoneMatch.

### Note

You might need to configure the SOAP stack socket timeout for copying large objects.

## Request Syntax

```
<CopyObject xmlns="http://bucket_name.s3.amazonaws.com/2006-03-01">
```

```

<SourceBucket>source_bucket</SourceBucket>
<SourceObject>source_object</SourceObject>
<DestinationBucket>destination_bucket</DestinationBucket>
<DestinationObject>destination_object</DestinationObject>
<MetadataDirective>{REPLACE | COPY}</MetadataDirective>
<Metadata>
  <Name>metadata_name</Name>
  <Value>metadata_value</Value>
</Metadata>
...
<AccessControlList>
  <Grant>
    <Grantee xsi:type="user_type">
      <ID>user_id</ID>
      <DisplayName>display_name</DisplayName>
    </Grantee>
    <Permission>permission</Permission>
  </Grant>
  ...
</AccessControlList>
<CopySourceIfMatch>etag</CopySourceIfMatch>
<CopySourceIfNoneMatch>etag</CopySourceIfNoneMatch>
<CopySourceIfModifiedSince>date_time</CopySourceIfModifiedSince>
<CopySourceIfUnmodifiedSince>date_time</CopySourceIfUnmodifiedSince>
<AWSAccessKeyId>AWSAccessKeyId</AWSAccessKeyId>
<Timestamp>TimeStamp</Timestamp>
<Signature>Signature</Signature>
</CopyObject>

```

## Request Parameters

Name	Description	Required
SourceBucket	The name of the source bucket.  Type: String  Default: None  Constraints: A valid source bucket.	Yes
SourceKey	The key name of the source object.	Yes

Name	Description	Required
	<p>Type: String</p> <p>Default: None</p> <p>Constraints: The key for a valid source object to which you have READ access.</p> <div data-bbox="678 495 1284 953" style="border: 1px solid #f08080; padding: 10px; margin: 10px 0;"> <p><b> Important</b></p> <p>Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see <a href="#">XML related object key constraints</a>.</p> </div>	
DestinationBucket	<p>The name of the destination bucket.</p> <p>Type: String</p> <p>Default: None</p> <p>Constraints: You must have WRITE access to the destination bucket.</p>	Yes
DestinationKey	<p>The key of the destination object.</p> <p>Type: String</p> <p>Default: None</p> <p>Constraints: You must have WRITE access to the destination bucket.</p>	Yes

Name	Description	Required
MetadataDirective	<p>Specifies whether the metadata is copied from the source object or replaced with metadata provided in the request.</p> <p>Type: String</p> <p>Default: COPY</p> <p>Valid values: COPY   REPLACE</p> <p>Constraints: Values other than COPY or REPLACE will result in an immediate error. You cannot copy an object to itself unless the MetadataDirective header is specified and its value set to REPLACE.</p>	No
Metadata	<p>Specifies metadata name-value pairs to set for the object.If MetadataDirective is set to COPY, all metadata is ignored.</p> <p>Type: String</p> <p>Default: None</p> <p>Constraints: None.</p>	No
AccessControlList	<p>Grants access to users by e-mail addresses or canonical user ID.</p> <p>Type: String</p> <p>Default: None</p> <p>Constraints: None</p>	No

Name	Description	Required
CopySourceIfMatch	<p data-bbox="678 226 1247 352">Copies the object if its entity tag (ETag) matches the specified tag; otherwise return a PreconditionFailed.</p> <p data-bbox="678 405 852 436">Type: String</p> <p data-bbox="678 485 878 516">Default: None</p> <p data-bbox="678 564 1239 638">Constraints: None. If the Etag does not match, the object is not copied.</p>	No
CopySourceIfNoneMatch	<p data-bbox="678 688 1247 814">Copies the object if its entity tag (ETag) is different than the specified Etag; otherwise returns an error.</p> <p data-bbox="678 867 852 898">Type: String</p> <p data-bbox="678 947 878 978">Default: None</p> <p data-bbox="678 1026 943 1058">Constraints: None.</p>	No
CopySourceIfUnmodifiedSince	<p data-bbox="678 1104 1247 1230">Copies the object if it hasn't been modified since the specified time; otherwise returns a PreconditionFailed.</p> <p data-bbox="678 1283 902 1314">Type: dateTime</p> <p data-bbox="678 1362 878 1394">Default: None</p>	No
CopySourceIfModifiedSince	<p data-bbox="678 1436 1260 1562">Copies the object if it has been modified since the specified time; otherwise returns an error.</p> <p data-bbox="678 1614 902 1646">Type: dateTime</p> <p data-bbox="678 1694 878 1726">Default: None</p>	No

## Response Syntax

```
<CopyObjectResponse xmlns="http://bucket_name.s3.amazonaws.com/2006-03-01">
  <CopyObjectResponse>
    <ETag>"etag"</ETag>
    <LastModified>timestamp</LastModified>
  </CopyObjectResponse>
</CopyObjectResponse>
```

## Response Elements

Following is a list of response elements.

### Note

The SOAP API does not return extra whitespace. Extra whitespace is only returned by the REST API.

Name	Description
Etag	Returns the etag of the new object. The ETag only reflects changes to the contents of an object, not its metadata.  Type: String  Ancestor: CopyObjectResult
LastModified	Returns the date the object was last modified.  Type: String  Ancestor: CopyObjectResult

For information about general response elements, see [Using REST Error Response Headers](#).

## Special Errors

There are no special errors for this operation. For information about general Amazon S3 errors, see [List of error codes](#).

## Examples

This example copies the `flotsam` object from the `pacific` bucket to the `jetsam` object of the `atlantic` bucket, preserving its metadata.

### Sample Request

```
<CopyObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <SourceBucket>pacific</SourceBucket>
  <SourceObject>flotsam</SourceObject>
  <DestinationBucket>atlantic</DestinationBucket>
  <DestinationObject>jetsam</DestinationObject>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2008-02-18T13:54:10.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbq7RrtSFmw=</Signature>
</CopyObject>
```

### Sample Response

```
<CopyObjectResponse xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <CopyObjectResponse>
    <ETag>"828ef3fdfa96f00ad9f27c383fc9ac7f"</ETag>
    <LastModified>2008-02-18T13:54:10.183Z</LastModified>
  </CopyObjectResponse>
</CopyObjectResponse>
```

This example copies the `"tweedledee"` object from the `wonderland` bucket to the `"tweedledum"` object of the `wonderland` bucket, replacing its metadata.

### Sample Request

```
<CopyObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <SourceBucket>wonderland</SourceBucket>
  <SourceObject>tweedledee</SourceObject>
  <DestinationBucket>wonderland</DestinationBucket>
  <DestinationObject>tweedledum</DestinationObject>
  <MetadataDirective >REPLACE</MetadataDirective >
</CopyObject>
```

```
<Metadata>
  <Name>Content-Type</Name>
  <Value>text/plain</Value>
</Metadata>
<Metadata>
  <Name>relationship</Name>
  <Value>twins</Value>
</Metadata>
<AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
<Timestamp>2008-02-18T13:54:10.183Z</Timestamp>
<Signature>Iuyz3d3P0aTou39dzbq7RrtSFmw=</Signature>
</CopyObject>
```

## Sample Response

```
<CopyObjectResponse xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <CopyObjectResponse>
    <ETag>"828ef3fdfa96f00ad9f27c383fc9ac7f"</ETag>
    <LastModified>2008-02-18T13:54:10.183Z</LastModified>
  </CopyObjectResponse>
</CopyObjectResponse>
```

- [PutObjectInline \(SOAP API\)](#)

## GetObject (SOAP API)

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

The `GetObject` operation returns the current version of an object. If you try to `GetObject` an object that has a delete marker as its current version, S3 returns a 404 error. You cannot use the SOAP API to retrieve a specified version of an object. To do that, use the REST API. For more information, see [Versioning](#). For more options, use the [GetObjectExtended \(SOAP API\)](#) operation.

**Note**

Object key names with the value "soap" aren't supported for [virtual-hosted-style requests](#). For object key name values where "soap" is used, a [path-style URL](#) must be used instead.

**Example**

This example gets the "Nelson" object from the "quotes" bucket.

**Sample Request**

```
<GetObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <GetMetadata>true</GetMetadata>
  <GetData>true</GetData>
  <InlineData>true</InlineData>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</GetObject>
```

**Sample Response**

```
<GetObjectResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <GetObjectResponse>
    <Status>
      <Code>200</Code>
      <Description>OK</Description>
    </Status>
    <Metadata>
      <Name>Content-Type</Name>
      <Value>text/plain</Value>
    </Metadata>
    <Metadata>
      <Name>family</Name>
      <Value>Muntz</Value>
    </Metadata>
    <Data>aGEtaGE=</Data>
    <LastModified>2006-01-01T12:00:00.000Z</LastModified>
    <ETag>&quot;828ef3fdfa96f00ad9f27c383fc9ac7f&quot;</ETag>
```

```
</GetObjectResponse>
</GetObjectResponse>
```

## Elements

- **Bucket**: The bucket from which to retrieve the object.
- **Key**: The key that identifies the object.

### Important

Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see [XML related object key constraints](#).

- **GetMetadata**: The metadata is returned with the object if this is true.
- **GetData**: The object data is returned if this is true.
- **InlineData**: If this is true, then the data is returned, base 64-encoded, as part of the SOAP body of the response. If false, then the data is returned as a SOAP attachment. The InlineData option is not suitable for use with large objects. The system limits this operation to working with 1MB of data or less. A GetObject request with the InlineData flag set will fail with the `InlineDataTooLargeError` status code if the resulting Data parameter would have encoded more than 1MB. To download large objects, consider calling GetObject without setting the InlineData flag, or use the REST API instead.

## Returned Elements

- **Metadata**: The name-value paired metadata stored with the object.
- **Data**: If InlineData was true in the request, this contains the base 64 encoded object data.
- **LastModified**: The time that the object was stored in Amazon S3.
- **ETag**: The object's entity tag. This is a hash of the object that can be used to do conditional gets. The ETag only reflects changes to the contents of an object, not its metadata.

## Access Control

You can read an object only if you have been granted READ access to the object.

## SOAP Chunked and Resumable Downloads

To provide GET flexibility, Amazon S3 supports chunked and resumable downloads.

Select from the following:

- For large object downloads, you might want to break them into smaller chunks. For more information, see [Range GETs](#)
- For GET operations that fail, you can design your application to download the remainder instead of the entire file. For more information, see [REST GET Error Recovery](#)

### Range GETs

For some clients, you might want to break large downloads into smaller downloads. To break a GET into smaller units, use Range.

Before you can break a GET into smaller units, you must determine its size. For example, the following request gets the size of the bigfile object.

```
<ListBucket xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>bigbucket</Bucket>
  <Prefix>bigfile</Prefix>
  <MaxKeys>1</MaxKeys>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</ListBucket>
```

Amazon S3 returns the following response.

```
<ListBucketResult xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <Name>quotes</Name>
  <Prefix>N</Prefix>
  <MaxKeys>1</MaxKeys>
  <IsTruncated>>false</IsTruncated>
  <Contents>
    <Key>bigfile</Key>
    <LastModified>2006-01-01T12:00:00.000Z</LastModified>
    <ETag>&quot;828ef3fdfa96f00ad9f27c383fc9ac7f&quot;</ETag>
    <Size>2023276</Size>
```

```

<StorageClass>STANDARD</StorageClass>
<Owner>
  <ID>bcaf1ffd86f41161ca5fb16fd081034f</ID>
  <DisplayName>bigfile</DisplayName>
</Owner>
</Contents>
</ListBucketResult>

```

Following is a request that downloads the first megabyte from the bigfile object.

```

<GetObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>bigbucket</Bucket>
  <Key>bigfile</Key>
  <GetMetadata>true</GetMetadata>
  <GetData>true</GetData>
  <InlineData>true</InlineData>
  <ByteRangeStart>0</ByteRangeStart>
  <ByteRangeEnd>1048576</ByteRangeEnd>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</GetObject>

```

Amazon S3 returns the first megabyte of the file and the Etag of the file.

```

<GetObjectResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <GetObjectResponse>
    <Status>
      <Code>200</Code>
      <Description>OK</Description>
    </Status>
    <Metadata>
      <Name>Content-Type</Name>
      <Value>text/plain</Value>
    </Metadata>
    <Metadata>
      <Name>family</Name>
      <Value>Muntz</Value>
    </Metadata>
    <Data>--first megabyte of bigfile--</Data>
    <LastModified>2006-01-01T12:00:00.000Z</LastModified>
    <ETag>"828ef3fdfa96f00ad9f27c383fc9ac7f"</ETag>
  </GetObjectResponse>

```

```
</GetObjectResponse>
```

To ensure the file did not change since the previous portion was downloaded, specify the `IfMatch` element. Although the `IfMatch` element is not required, it is recommended for content that is likely to change.

The following is a request that gets the remainder of the file, using the `IfMatch` request header.

```
<GetObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>bigbucket</Bucket>
  <Key>bigfile</Key>
  <GetMetadata>true</GetMetadata>
  <GetData>true</GetData>
  <InlineData>true</InlineData>
  <ByteRangeStart>10485761</ByteRangeStart>
  <ByteRangeEnd>2023276</ByteRangeEnd>
  <IfMatch>"828ef3fdfa96f00ad9f27c383fc9ac7f"</IfMatch>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</GetObject>
```

Amazon S3 returns the following response and the remainder of the file.

```
<GetObjectResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <GetObjectResponse>
    <Status>
      <Code>200</Code>
      <Description>OK</Description>
    </Status>
    <Metadata>
      <Name>Content-Type</Name>
      <Value>text/plain</Value>
    </Metadata>
    <Metadata>
      <Name>family</Name>
      <Value>>Muntz</Value>
    </Metadata>
    <Data>--remainder of bigfile--</Data>
    <LastModified>2006-01-01T12:00:00.000Z</LastModified>
    <ETag>"828ef3fdfa96f00ad9f27c383fc9ac7f"</ETag>
  </GetObjectResponse>
```

```
</GetObjectResponse>
```

## Versioned GetObject

The following request returns the specified version of the object in the bucket.

```
<GetObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <GetMetadata>true</GetMetadata>
  <GetData>true</GetData>
  <InlineData>true</InlineData>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</GetObject>
```

## Sample Response

```
<GetObjectResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <GetObjectResponse>
    <Status>
      <Code>200</Code>
      <Description>OK</Description>
    </Status>
    <Metadata>
      <Name>Content-Type</Name>
      <Value>text/plain</Value>
    </Metadata>
    <Metadata>
      <Name>family</Name>
      <Value>Muntz</Value>
    </Metadata>
    <Data>aGEtaGE=</Data>
    <LastModified>2006-01-01T12:00:00.000Z</LastModified>
    <ETag>"828ef3fdfa96f00ad9f27c383fc9ac7f"</ETag>
  </GetObjectResponse>
</GetObjectResponse>
```

## REST GET Error Recovery

If an object GET fails, you can get the rest of the file by specifying the range to download. To do so, you must get the size of the object using `ListBucket` and perform a range GET on the remainder of the file. For more information, see [GetObjectExtended \(SOAP API\)](#).

### Related Resources

[Operations on Objects \(SOAP API\)](#)

## GetObjectExtended (SOAP API)

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

`GetObjectExtended` is exactly like [GetObject \(SOAP API\)](#), except that it supports the following additional elements that can be used to accomplish much of the same functionality provided by HTTP GET headers (go to <http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html>).

`GetObjectExtended` supports the following elements in addition to those supported by `GetObject`:

- `ByteRangeStart`, `ByteRangeEnd`: These elements specify that only a portion of the object data should be retrieved. They follow the behavior of the HTTP byte ranges (go to <http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.35>).
- `IfModifiedSince`: Return the object only if the object's timestamp is later than the specified timestamp. (<http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.25>)
- `IfUnmodifiedSince`: Return the object only if the object's timestamp is earlier than or equal to the specified timestamp. (go to <http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.28>)
- `IfMatch`: Return the object only if its ETag matches the supplied tag(s). (go to <http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.24>)
- `IfNoneMatch`: Return the object only if its ETag does not match the supplied tag(s). (go to <http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.26>)

- `ReturnCompleteObjectOnConditionFailure:ReturnCompleteObjectOnConditionFailure`: If true, then if the request includes a range element and one or both of `IfUnmodifiedSince/IfMatch` elements, and the condition fails, return the entire object rather than a fault. This enables the If-Range functionality (go to <http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.27>).

## DeleteObject (SOAP API)

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

The `DeleteObject` operation removes the specified object from Amazon S3. Once deleted, there is no method to restore or undelete an object.

### Note

If you delete an object that does not exist, Amazon S3 will return a success (not an error message).

## Example

This example deletes the "Nelson" object from the "quotes" bucket.

### Sample Request

```
<DeleteObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <AWSAccessKeyId> AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</DeleteObject>
```

### Sample Response

```
<DeleteObjectResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <DeleteObjectResponse>
    <Code>200</Code>
    <Description>OK</Description>
  </DeleteObjectResponse>
</DeleteObjectResponse>
```

## Elements

- **Bucket**: The bucket that holds the object.
- **Key**: The key that identifies the object.

### Important

Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see [XML related object key constraints](#).

## Access Control

You can delete an object only if you have WRITE access to the bucket, regardless of who owns the object or what rights are granted to it.

## GetObjectAccessControlPolicy (SOAP API)

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

The `GetObjectAccessControlPolicy` operation fetches the access control policy for an object.

**⚠ Important**

Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see [XML related object key constraints](#).

**Example**

This example retrieves the access control policy for the "Nelson" object from the "quotes" bucket.

**Sample Request**

```
<GetObjectAccessControlPolicy xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</GetObjectAccessControlPolicy>
```

**Sample Response**

```
<AccessControlPolicy>
  <Owner>
    <ID>a9a7b886d6fd24a541bf9b1c61be666e9</ID>
    <DisplayName>chriscustomer</DisplayName>
  </Owner>
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="CanonicalUser">
        <ID>a9a7b841bf9b1c61be666e9</ID>
        <DisplayName>chriscustomer</DisplayName>
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
    <Grant>
      <Grantee xsi:type="Group">
        <URI>http://acs.amazonaws.com/groups/global/AllUsers<URI>
      </Grantee>
      <Permission>READ</Permission>
    </Grant>
```

```
</AccessControlList>
</AccessControlPolicy>
```

## Response Body

The response contains the access control policy for the bucket. For an explanation of this response, see [SOAP Access Policy](#).

## Access Control

You must have READ\_ACP rights to the object in order to retrieve the access control policy for an object.

## SetObjectAccessControlPolicy (SOAP API)

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

The `SetObjectAccessControlPolicy` operation sets the access control policy for an existing object. If successful, the previous access control policy for the object is entirely replaced with the specified access control policy.

## Example

This example gives the specified user (usually the owner) FULL\_CONTROL access to the "Nelson" object from the "quotes" bucket.

## Sample Request

```
<SetObjectAccessControlPolicy xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="CanonicalUser">
        <ID>a9a7b886d6fd24a52fe8ca5bef65f89a64e0193f23000e241bf9b1c61be666e9</ID>
        <DisplayName>chriscustomer</DisplayName>
```

```
</Grantee>
  <Permission>FULL_CONTROL</Permission>
</Grant>
</AccessControlList>
<AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
<Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
<Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</SetObjectAccessControlPolicy>
```

## Sample Response

```
<SetObjectAccessControlPolicyResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <SetObjectAccessControlPolicyResponse>
    <Code>200</Code>
    <Description>OK</Description>
  </SetObjectAccessControlPolicyResponse>
</SetObjectAccessControlPolicyResponse>
```

## Key

### Important

Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see [XML related object key constraints](#).

## Access Control

You must have WRITE\_ACP rights to the object in order to set the access control policy for a bucket.

## Authenticating SOAP requests

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

Every non-anonymous request must contain authentication information to establish the identity of the principal making the request. In SOAP, the authentication information is put into the following elements of the SOAP request:

- Your AWS Access Key ID

### Note

When making authenticated SOAP requests, temporary security credentials are not supported. For more information about types of credentials, see [Making requests](#).

- **Timestamp:** This must be a dateTime (go to <http://www.w3.org/TR/xmlschema-2/#dateTime>) in the Coordinated Universal Time (Greenwich Mean Time) time zone, such as 2009-01-01T12:00:00.000Z. Authorization will fail if this timestamp is more than 15 minutes away from the clock on Amazon S3 servers.
- **Signature:** The RFC 2104 HMAC-SHA1 digest (go to <http://www.ietf.org/rfc/rfc2104.txt>) of the concatenation of "AmazonS3" + OPERATION + Timestamp, using your AWS Secret Access Key as the key. For example, in the following CreateBucket sample request, the signature element would contain the HMAC-SHA1 digest of the value "AmazonS3CreateBucket2009-01-01T12:00:00.000Z":

For example, in the following CreateBucket sample request, the signature element would contain the HMAC-SHA1 digest of the value "AmazonS3CreateBucket2009-01-01T12:00:00.000Z":

### Example

```
<CreateBucket xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Acl>private</Acl>
  <AWSSecretAccessKey>AKIAIOSFODNN7EXAMPLE</AWSSecretAccessKey>
  <Timestamp>2009-01-01T12:00:00.000Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</CreateBucket>
```

### Note

SOAP requests, both authenticated and anonymous, must be sent to Amazon S3 using SSL. Amazon S3 returns an error when you send a SOAP request over HTTP.

**⚠ Important**

Due to different interpretations regarding how extra time precision should be dropped, .NET users should take care not to send Amazon S3 overly specific time stamps. This can be accomplished by manually constructing `DateTime` objects with only millisecond precision.

## Setting access policy with SOAP

**📌 Note**

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

Access control can be set at the time a bucket or object is written by including the "AccessControlList" element with the request to `CreateBucket`, `PutObjectInline`, or `PutObject`. The `AccessControlList` element is described in [Identity and Access Management for Amazon S3](#). If no access control list is specified with these operations, the resource is created with a default access policy that gives the requester `FULL_CONTROL` access (this is the case even if the request is a `PutObjectInline` or `PutObject` request for an object that already exists).

Following is a request that writes data to an object, makes the object readable by anonymous principals, and gives the specified user `FULL_CONTROL` rights to the bucket (Most developers will want to give themselves `FULL_CONTROL` access to their own bucket).

### Example

Following is a request that writes data to an object and makes the object readable by anonymous principals.

#### Sample Request

```
<PutObjectInline xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <Metadata>
```

```

    <Name>Content-Type</Name>
    <Value>text/plain</Value>
  </Metadata>
  <Data>aGEtaGE=</Data>
  <ContentLength>5</ContentLength>
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="CanonicalUser">
        <ID>75cc57f09aa0c8caeab4f8c24e99d10f8e7faeebf76c078efc7c6caea54ba06a</ID>
        <DisplayName>chriscustomer</DisplayName>
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
    <Grant>
      <Grantee xsi:type="Group">
        <URI>http://acs.amazonaws.com/groups/global/AllUsers<URI>
      </Grantee>
      <Permission>READ</Permission>
    </Grant>
  </AccessControlList>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2009-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</PutObjectInline>

```

## Sample Response

```

<PutObjectInlineResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <PutObjectInlineResponse>
    <ETag>&quot;828ef3fdfa96f00ad9f27c383fc9ac7f&quot;</ETag>
    <LastModified>2009-01-01T12:00:00.000Z</LastModified>
  </PutObjectInlineResponse>
</PutObjectInlineResponse>

```

The access control policy can be read or set for an existing bucket or object using the `GetBucketAccessControlPolicy`, `GetObjectAccessControlPolicy`, `SetBucketAccessControlPolicy`, and `SetObjectAccessControlPolicy` methods. For more information, see the detailed explanation of these methods.

## Common elements

You can include the following authorization-related elements with any SOAP request:

- **AWSSessionToken**: The AWS Access Key ID of the requester
- **Timestamp**: The current time on your system
- **Signature**: The signature for the request

## SOAP Error Responses

### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

In SOAP, an error result is returned to the client as a SOAP fault, with the HTTP response code 500. If you do not receive a SOAP fault, then your request was successful. The Amazon S3 SOAP fault code is comprised of a standard SOAP 1.1 fault code (either "Server" or "Client") concatenated with the Amazon S3-specific error code. For example: "Server.InternalError" or "Client.NoSuchBucket". The SOAP fault string element contains a generic, human readable error message in English. Finally, the SOAP fault detail element contains miscellaneous information relevant to the error.

For example, if you attempt to delete the object "Fred", which does not exist, the body of the SOAP response contains a "NoSuchKey" SOAP fault.

The following example shows a sample SOAP error response.

```
<soapenv:Body>
  <soapenv:Fault>
    <Faultcode>soapenv:Client.NoSuchKey</Faultcode>
    <Faultstring>The specified key does not exist.</Faultstring>
    <Detail>
      <Key>Fred</Key>
    </Detail>
  </soapenv:Fault>
</soapenv:Body>
```

The following table explains the SOAP error response elements

Name	Description
Detail	<p>Container for the key involved in the error</p> <p>Type: Container</p> <p>Ancestor: Body.Fault</p>
Fault	<p>Container for error information.</p> <p>Type: Container</p> <p>Ancestor: Body</p>
Faultcode	<p>The fault code is a string that uniquely identifies an error condition. It is meant to be read and understood by programs that detect and handle errors by type. For more information, see <a href="#">List of Error Codes</a>.</p> <p>Type: String</p> <p>Ancestor: Body.Fault</p>
Faultstring	<p>The fault string contains a generic description of the error condition in English. It is intended for a human audience. Simple programs display the message directly to the end user if they encounter an error condition they don't know how or don't care to handle. Sophisticated programs with more exhaustive error handling and proper internationalization are more likely to ignore the fault string.</p> <p>Type: String</p> <p>Ancestor: Body.Fault</p>
Key	<p>Identifies the key involved in the error</p> <p>Type: String</p> <p>Ancestor: Body.Fault</p>

## Appendix: Authenticating requests (AWS signature version 2)

### Important

This section describes how to authenticate requests using AWS Signature Version 2. Signature Version 2 is being turned off (deprecated), Amazon S3 will only accept API requests that are signed using Signature Version 4. For more information, see [AWS Signature Version 2 turned off \(deprecated\) for Amazon S3](#)

Signature Version 4 is supported in all AWS Regions, and it is the only version that is supported for new Regions. For more information, see [Authenticating Requests \(AWS Signature Version 4\)](#) in the *Amazon Simple Storage Service API Reference*.

Amazon S3 offers you the ability to identify what API signature version was used to sign a request. It is important to identify if any of your workflows are utilizing Signature Version 2 signing and upgrading them to use Signature Version 4 to prevent impact to your business.

- If you are using CloudTrail event logs (recommended option), please see [Identifying Amazon S3 Signature Version 2 requests by using CloudTrail](#) on how to query and identify such requests.
- If you are using the Amazon S3 Server Access logs, see [Using Amazon S3 server access logs to identify requests](#)

### Topics

- [Signing and authenticating REST requests \(AWS signature version 2\)](#)
- [Browser-based uploads using POST \(AWS signature version 2\)](#)

## Authenticating requests using the REST API (AWS signature version 2)

When accessing Amazon S3 using REST, you must provide the following items in your request so the request can be authenticated:

### Request elements

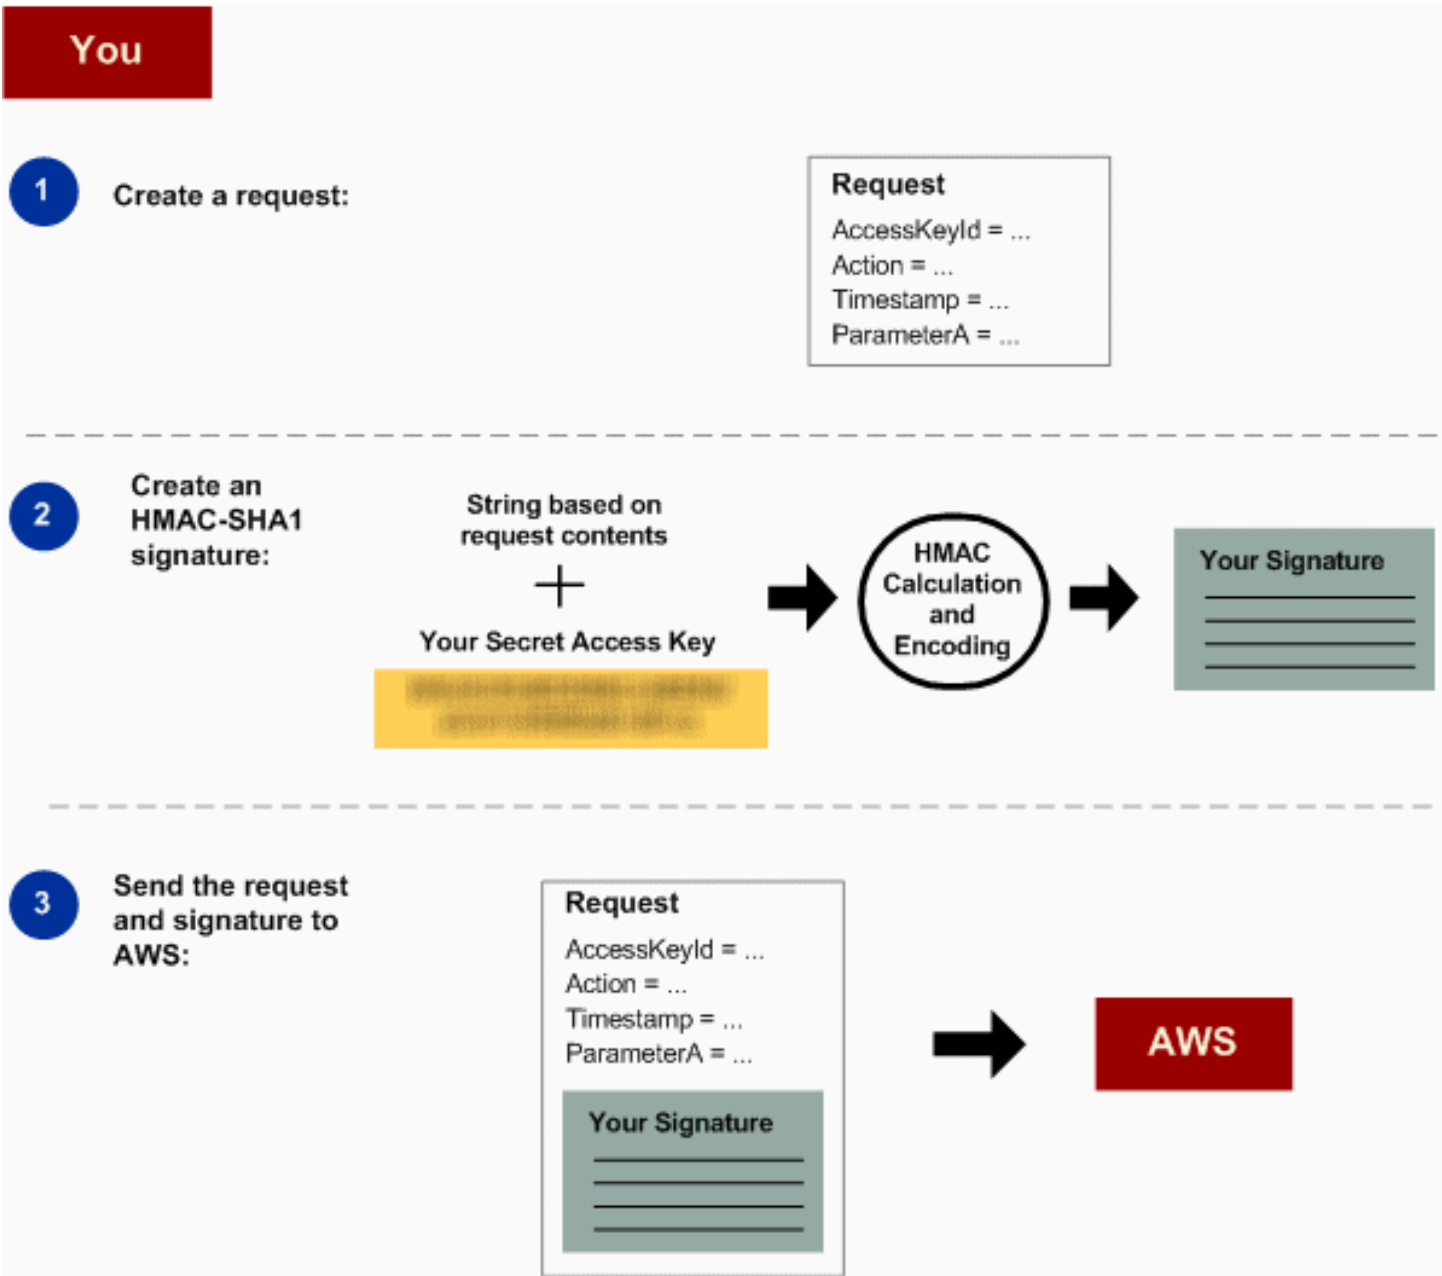

- **AWS access key Id** – Each request must contain the access key ID of the identity you are using to send your request.
- **Signature** – Each request must contain a valid request signature, or the request is rejected.

A request signature is calculated using your secret access key, which is a shared secret known only to you and AWS.

- **Time stamp** – Each request must contain the date and time the request was created, represented as a string in UTC.
- **Date** – Each request must contain the time stamp of the request.

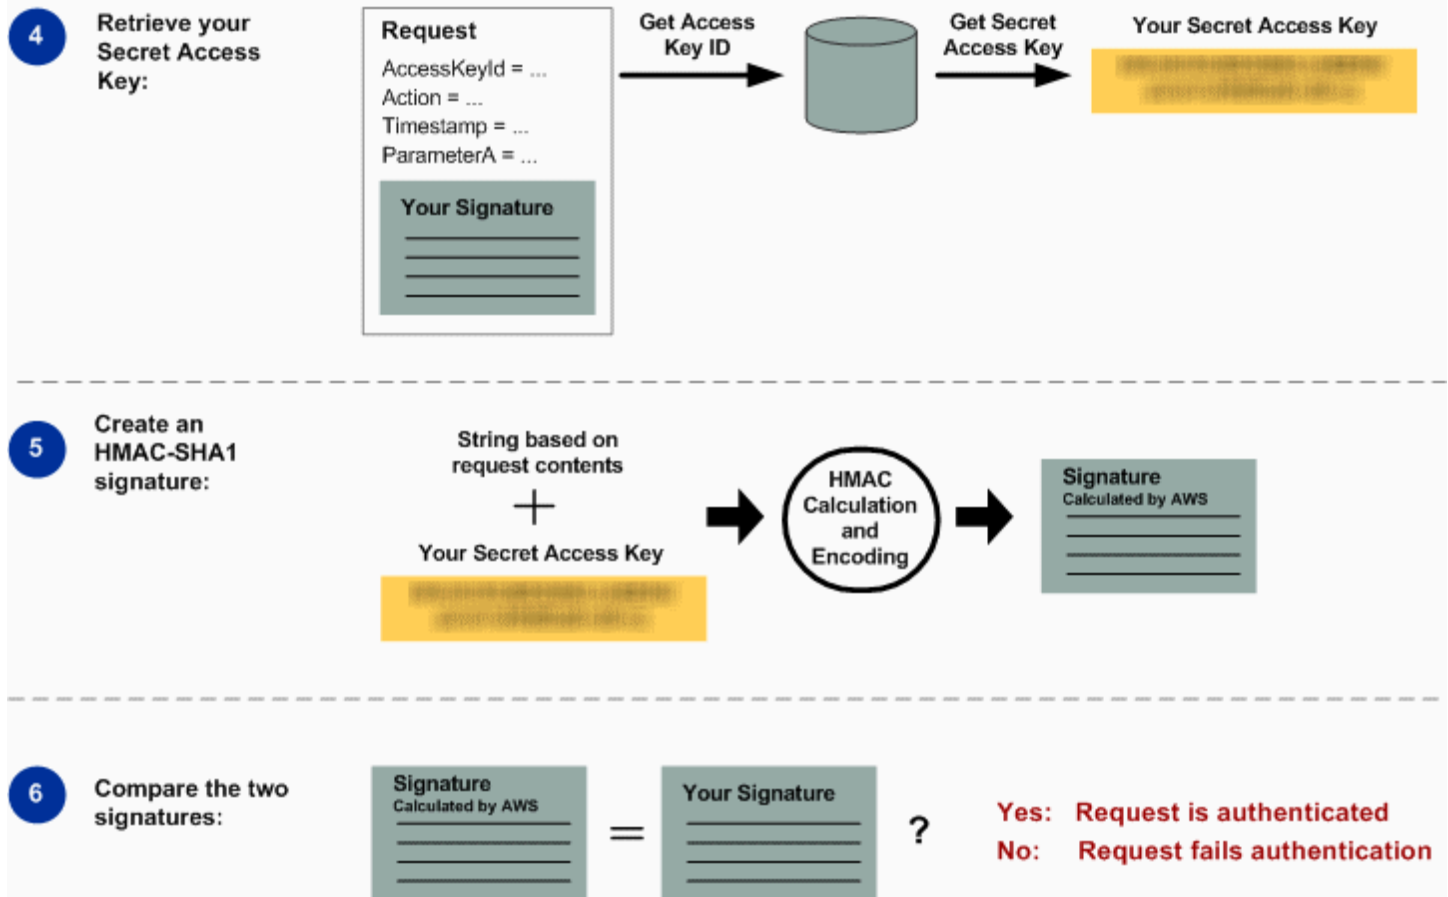

Depending on the API action you're using, you can provide an expiration date and time for the request instead of or in addition to the time stamp. See the authentication topic for the particular action to determine what it requires.

Following are the general steps for authenticating requests to Amazon S3. It is assumed you have the necessary security credentials, access key ID and secret access key.

- 1 Construct a request to AWS.
- 2 Calculate the signature using your secret access key.
- 3 Send the request to Amazon S3. Include your access key ID and the signature in your request. Amazon S3 performs the next three steps.

## AWS

4 Amazon S3 uses the access key ID to look up your secret access key.

5 Amazon S3 calculates a signature from the request data and the secret access key using the same algorithm that you used to calculate the signature you sent in the request.

6 If the signature generated by Amazon S3 matches the one you sent in the request, the request is considered authentic. If the comparison fails, the request is discarded, and Amazon S3 returns an error response.

## Detailed authentication information

For detailed information about REST authentication, see [Signing and authenticating REST requests \(AWS signature version 2\)](#).

## Signing and authenticating REST requests (AWS signature version 2)

- [REST request signing problems](#)
- [Query string request authentication alternative](#)

### Note

This topic explains authenticating requests using Signature Version 2. Amazon S3 now supports the latest Signature Version 4. This latest signature version is supported in all regions and any new regions after January 30, 2014 will support only Signature Version 4. For more information, go to [Authenticating Requests \(AWS Signature Version 4\)](#) in the *Amazon Simple Storage Service API Reference*.

Authentication is the process of proving your identity to the system. Identity is an important factor in Amazon S3 access control decisions. Requests are allowed or denied in part based on the identity of the requester. For example, the right to create buckets is reserved for registered developers and (by default) the right to create objects in a bucket is reserved for the owner of the bucket in question. As a developer, you'll be making requests that invoke these privileges, so you'll need to prove your identity to the system by authenticating your requests. This section shows you how.

**Note**

The content in this section does not apply to HTTP POST. For more information, see [Browser-based uploads using POST \(AWS signature version 2\)](#).

The Amazon S3 REST API uses a custom HTTP scheme based on a keyed-HMAC (Hash Message Authentication Code) for authentication. To authenticate a request, you first concatenate selected elements of the request to form a string. You then use your AWS secret access key to calculate the HMAC of that string. Informally, we call this process "signing the request," and we call the output of the HMAC algorithm the signature, because it simulates the security properties of a real signature. Finally, you add this signature as a parameter of the request by using the syntax described in this section.

When the system receives an authenticated request, it fetches the AWS secret access key that you claim to have and uses it in the same way to compute a signature for the message it received. It then compares the signature it calculated against the signature presented by the requester. If the two signatures match, the system concludes that the requester must have access to the AWS secret access key and therefore acts with the authority of the principal to whom the key was issued. If the two signatures do not match, the request is dropped and the system responds with an error message.

**Example Authenticated Amazon S3 REST request**

```
GET /photos/puppy.jpg HTTP/1.1
Host: awsexamplebucket1.us-west-1.s3.amazonaws.com
Date: Tue, 27 Mar 2007 19:36:42 +0000
```

```
Authorization: AWS AKIAIOSFODNN7EXAMPLE:
qgk2+6Sv9/oM7G3qLEjTH1a1l1g=
```

**Using temporary security credentials**

If you are signing your request using temporary security credentials (see [Making requests](#)), you must include the corresponding security token in your request by adding the `x-amz-security-token` header.

When you obtain temporary security credentials using the AWS Security Token Service API, the response includes temporary security credentials and a session token. You provide the session

token value in the `x-amz-security-token` header when you send requests to Amazon S3. For information about the AWS Security Token Service API provided by IAM, go to [Action](#) in the *AWS Security Token Service API Reference Guide*.

## The authentication header

The Amazon S3 REST API uses the standard HTTP `Authorization` header to pass authentication information. (The name of the standard header is unfortunate because it carries authentication information, not authorization.) Under the Amazon S3 authentication scheme, the `Authorization` header has the following form:

```
Authorization: AWS AWSAccessKeyId:Signature
```

Developers are issued an AWS access key ID and AWS secret access key when they register. For request authentication, the `AWSAccessKeyId` element identifies the access key ID that was used to compute the signature and, indirectly, the developer making the request.

The `Signature` element is the RFC 2104 HMAC-SHA1 of selected elements from the request, and so the `Signature` part of the `Authorization` header will vary from request to request. If the request signature calculated by the system matches the `Signature` included with the request, the requester will have demonstrated possession of the AWS secret access key. The request will then be processed under the identity, and with the authority, of the developer to whom the key was issued.

Following is pseudogrammar that illustrates the construction of the `Authorization` request header. (In the example, `\n` means the Unicode code point U+000A, commonly called newline).

```
Authorization = "AWS" + " " + AWSAccessKeyId + ":" + Signature;

Signature = Base64( HMAC-SHA1( UTF-8-Encoding-Of(YourSecretAccessKey), UTF-8-Encoding-Of( StringToSign ) ) );

StringToSign = HTTP-Verb + "\n" +
  Content-MD5 + "\n" +
  Content-Type + "\n" +
  Date + "\n" +
  CanonicalizedAmzHeaders +
  CanonicalizedResource;

CanonicalizedResource = [ "/" + Bucket ] +
  <HTTP-Request-URI, from the protocol name up to the query string> +
```

```
[ subresource, if present. For example "?acl", "?location", or "?logging"];
```

```
CanonicalizedAmzHeaders = <described below>
```

HMAC-SHA1 is an algorithm defined by [RFC 2104 - Keyed-Hashing for Message Authentication](#). The algorithm takes as input two byte-strings, a key and a message. For Amazon S3 request authentication, use your AWS secret access key (`YourSecretAccessKey`) as the key, and the UTF-8 encoding of the `StringToSign` as the message. The output of HMAC-SHA1 is also a byte string, called the digest. The `Signature` request parameter is constructed by Base64 encoding this digest.

## Request canonicalization for signing

Recall that when the system receives an authenticated request, it compares the computed request signature with the signature provided in the request in `StringToSign`. For that reason, you must compute the signature by using the same method used by Amazon S3. We call the process of putting a request in an agreed-upon form for signing *canonicalization*.

## Constructing the CanonicalizedResource element

`CanonicalizedResource` represents the Amazon S3 resource targeted by the request. Construct it for a REST request as follows:

1. Start with an empty string ("").
2. If the request specifies a bucket using the HTTP Host header (virtual hosted-style), append the bucket name preceded by a "/" (e.g., `"/bucketname"`). For path-style requests and requests that don't address a bucket, do nothing. For more information about virtual hosted-style requests, see [Virtual hosting of buckets](#).

For a virtual hosted-style request `"https://awsexamplebucket1.s3.us-west-1.amazonaws.com/photos/puppy.jpg"`, the `CanonicalizedResource` is `"/awsexamplebucket1"`.

For the path-style request, `"https://s3.us-west-1.amazonaws.com/awsexamplebucket1/photos/puppy.jpg"`, the `CanonicalizedResource` is "".

3. Append the path part of the un-decoded HTTP Request-URI, up-to but not including the query string.

For a virtual hosted-style request `"https://awsexamplebucket1.s3.us-west-1.amazonaws.com/photos/puppy.jpg"`, the `CanonicalizedResource` is `"/awsexamplebucket1/photos/puppy.jpg"`.

For a path-style request, "https://s3.us-west-1.amazonaws.com/awsexamplebucket1/photos/puppy.jpg", the CanonicalizedResource is "/awsexamplebucket1/photos/puppy.jpg". At this point, the CanonicalizedResource is the same for both the virtual hosted-style and path-style request.

For a request that does not address a bucket, such as [GET Service](#), append "/".

4. If the request addresses a subresource, such as ?versioning, ?location, ?acl, ?lifecycle, or ?versionid, append the subresource, its value if it has one, and the question mark. Note that in case of multiple subresources, subresources must be lexicographically sorted by subresource name and separated by '&', e.g., ?acl&versionId=*value*.

The subresources that must be included when constructing the CanonicalizedResource Element are acl, lifecycle, location, logging, notification, partNumber, policy, requestPayment, uploadId, uploads, versionId, versioning, versions, and website.

If the request specifies query string parameters overriding the response header values (see [Get Object](#)), append the query string parameters and their values. When signing, you do not encode these values; however, when making the request, you must encode these parameter values. The query string parameters in a GET request include response-content-type, response-content-language, response-expires, response-cache-control, response-content-disposition, and response-content-encoding.

The delete query string parameter must be included when you create the CanonicalizedResource for a multi-object Delete request.

Elements of the CanonicalizedResource that come from the HTTP Request-URI should be signed literally as they appear in the HTTP request, including URL-Encoding meta characters.

The CanonicalizedResource might be different than the HTTP Request-URI. In particular, if your request uses the HTTP Host header to specify a bucket, the bucket does not appear in the HTTP Request-URI. However, the CanonicalizedResource continues to include the bucket. Query string parameters might also appear in the Request-URI but are not included in CanonicalizedResource. For more information, see [Virtual hosting of buckets](#).

## Constructing the CanonicalizedAmzHeaders element

To construct the CanonicalizedAmzHeaders part of `StringToSign`, select all HTTP request headers that start with 'x-amz-' (using a case-insensitive comparison), and use the following process.

1. Convert each HTTP header name to lowercase. For example, 'X-Amz-Date' becomes 'x-amz-date'.
2. Sort the collection of headers lexicographically by header name.
3. Combine header fields with the same name into one "header-name:comma-separated-value-list" pair as prescribed by RFC 2616, section 4.2, without any spaces between values. For example, the two metadata headers 'x-amz-meta-username: fred' and 'x-amz-meta-username: barney' would be combined into the single header 'x-amz-meta-username: fred,barney'.
4. "Unfold" long headers that span multiple lines (as allowed by RFC 2616, section 4.2) by replacing the folding spaces (including new-line) by a single space.
5. Trim any spaces around the colon in the header. For example, the header 'x-amz-meta-username: fred,barney' would become 'x-amz-meta-username:fred,barney'.
6. Finally, append a newline character (U+000A) to each canonicalized header in the resulting list. Construct the CanonicalizedResource element by concatenating all headers in this list into a single string.

## Positional versus named HTTP header StringToSign elements

The first few header elements of `StringToSign` (Content-Type, Date, and Content-MD5) are positional in nature. `StringToSign` does not include the names of these headers, only their values from the request. In contrast, the 'x-amz-' elements are named. Both the header names and the header values appear in `StringToSign`.

If a positional header called for in the definition of `StringToSign` is not present in your request (for example, Content-Type or Content-MD5 are optional for PUT requests and meaningless for GET requests), substitute the empty string ("") for that position.

## Time stamp requirement

A valid time stamp (using either the HTTP Date header or an x-amz-date alternative) is mandatory for authenticated requests. Furthermore, the client timestamp included with an authenticated request must be within 15 minutes of the Amazon S3 system time when the

request is received. If not, the request will fail with the `RequestTimeTooSkewed` error code. The intention of these restrictions is to limit the possibility that intercepted requests could be replayed by an adversary. For stronger protection against eavesdropping, use the HTTPS transport for authenticated requests.

### Note

The validation constraint on request date applies only to authenticated requests that do not use query string authentication. For more information, see [Query string request authentication alternative](#).

Some HTTP client libraries do not expose the ability to set the `Date` header for a request. If you have trouble including the value of the 'Date' header in the canonicalized headers, you can set the timestamp for the request by using an 'x-amz-date' header instead. The value of the `x-amz-date` header must be in one of the RFC 2616 formats (<http://www.ietf.org/rfc/rfc2616.txt>). When an `x-amz-date` header is present in a request, the system will ignore any `Date` header when computing the request signature. Therefore, if you include the `x-amz-date` header, use the empty string for the `Date` when constructing the `StringToSign`. See the next section for an example.

## Authentication examples

The examples in this section use the (non-working) credentials in the following table.

Parameter	Value
<code>AWSSecretAccessKey</code>	<code>wJalrXUtnFEMI/K7MDENG/bPxrFiCYEXAMPLEKEY</code>
<code>AWSSecretAccessKey</code>	<code>wJalrXUtnFEMI/K7MDENG/bPxrFiCYEXAMPLEKEY</code>

In the example `StringToSign`, formatting is not significant, and `\n` means the Unicode code point U+000A, commonly called newline. Also, the examples use "+0000" to designate the time zone. You can use "GMT" to designate timezone instead, but the signatures shown in the examples will be different.

### Object GET

This example gets an object from the `awsexamplebucket1` bucket.

Request	StringToSign
<pre>GET /photos/puppy.jpg HTTP/1.1 Host: awsexamplebucket1.us- west-1.s3.amazonaws.com Date: Tue, 27 Mar 2007 19:36:42 +0000  Authorization: AWS AKIAIOSF0 DNN7EXAMPLE: qgk2+6Sv9/oM7G3qLEjTH1a11lg=</pre>	<pre>GET\n \n \n Tue, 27 Mar 2007 19:36:42 +0000\n /awsexamplebucket1/photos/puppy.jpg</pre>

Note that the CanonicalizedResource includes the bucket name, but the HTTP Request-URI does not. (The bucket is specified by the Host header.)

### Note

The following Python script calculates the preceding signature, using the provided parameters. You can use this script to construct your own signatures, replacing the keys and StringToSign as appropriate.

```
import base64
import hmac
from hashlib import sha1

access_key = 'AKIAIOSFODNN7EXAMPLE'.encode("UTF-8")
secret_key = 'wJalrXUtnFEMI/K7MDENG/bPxrFiCYEXAMPLEKEY'.encode("UTF-8")

string_to_sign = 'GET\n\n\nTue, 27 Mar 2007 19:36:42 +0000\n/awsexamplebucket1/
photos/puppy.jpg'.encode("UTF-8")
signature = base64.b64encode(
    hmac.new(
        secret_key, string_to_sign, sha1
    ).digest()
).strip()

print(f"AWS {access_key.decode()}:{signature.decode()}")
```

## Object PUT

This example puts an object into the `awsexamplebucket1` bucket.

Request	StringToSign
<pre>PUT /photos/puppy.jpg HTTP/1.1 Content-Type: image/jpeg Content-Length: 94328 Host: awsexamplebucket1.s3.us-west-1.amazonaws.com Date: Tue, 27 Mar 2007 21:15:45 +0000  Authorization: AWS AKIAIOSFODNN7EXAMPLE: iqRzw+ileNPu1fhspnRs8n0jjIA=</pre>	<pre>PUT\n \n image/jpeg\n Tue, 27 Mar 2007 21:15:45 +0000\n /awsexamplebucket1/photos/puppy.jpg</pre>

Note the Content-Type header in the request and in the StringToSign. Also note that the Content-MD5 is left blank in the StringToSign, because it is not present in the request.

## List

This example lists the content of the `awsexamplebucket1` bucket.

Request	StringToSign
<pre>GET /?prefix=photos&amp;max-keys=50&amp;marker=puppy HTTP/1.1 User-Agent: Mozilla/5.0 Host: awsexamplebucket1.s3.us-west-1.amazonaws.com Date: Tue, 27 Mar 2007 19:42:41 +0000  Authorization: AWS AKIAIOSFODNN7EXAMPLE: m0WP8eCtspQ15Ahe6L1SozdX9YA=</pre>	<pre>GET\n \n \n Tue, 27 Mar 2007 19:42:41 +0000\n /awsexamplebucket1/</pre>

Note the trailing slash on the CanonicalizedResource and the absence of query string parameters.

## Fetch

This example fetches the access control policy subresource for the 'awsexamplebucket1' bucket.

Request	StringToSign
<pre>GET /?acl HTTP/1.1 Host: awsexamplebucket1.s3.us-west-1.amazonaws.com Date: Tue, 27 Mar 2007 19:44:46 +0000  Authorization: AWS AKIAIOSFODNN7EXAMPLE: 82ZHiFIjc+WbcwFKGUVEQspPn+0=</pre>	<pre>GET\n \n \n Tue, 27 Mar 2007 19:44:46 +0000\n /awsexamplebucket1/?acl</pre>

Notice how the subresource query string parameter is included in the CanonicalizedResource.

## Delete

This example deletes an object from the 'awsexamplebucket1' bucket using the path-style and Date alternative.

Request	StringToSign
<pre>DELETE /awsexamplebucket1/photos/puppy.jpg HTTP/1.1 User-Agent: dotnet Host: s3.us-west-1.amazonaws.com Date: Tue, 27 Mar 2007 21:20:27 +0000  x-amz-date: Tue, 27 Mar 2007 21:20:26 +0000  Authorization: AWS AKIAIOSFODNN7EXAMPLE: LE:XbyTlbQdu9Xw5o8P4iMwPktxQd8=</pre>	<pre>DELETE\n \n \n Tue, 27 Mar 2007 21:20:26 +0000\n /awsexamplebucket1/photos/puppy.jpg</pre>

Note how we used the alternate 'x-amz-date' method of specifying the date (because our client library prevented us from setting the date, say). In this case, the x-amz-date takes precedence over the Date header. Therefore, date entry in the signature must contain the value of the x-amz-date header.

## Upload

This example uploads an object to a CNAME style virtual hosted bucket with metadata.

Request	StringToSign
<pre>PUT /db-backup.dat.gz HTTP/1.1 User-Agent: curl/7.15.5 Host: static.example.com:8080 Date: Tue, 27 Mar 2007 21:06:08 +0000  x-amz-acl: public-read content-type: application/x-download Content-MD5: 4gJE4saaMU4BqNR0kLY+lw== X-Amz-Meta-ReviewedBy: joe@example.com X-Amz-Meta-ReviewedBy: jane@exam ple.com X-Amz-Meta-FileChecksum: 0x02661779 X-Amz-Meta-ChecksumAlgorithm: crc32 Content-Disposition: attachment;   filename=database.dat Content-Encoding: gzip Content-Length: 5913339  <i>Authorization: AWS AKIAIOSFODNN7EXAMP LE: jtBQa0Aq+DkULFI8qrpwIjGEx0E=</i></pre>	<pre>PUT\n 4gJE4saaMU4BqNR0kLY+lw==\n application/x-download\n Tue, 27 Mar 2007 21:06:08 +0000\n  x-amz-acl:public-read\n x-amz-meta-checksumalgorithm:c rc32\n x-amz-meta-filechecksum:0x026 61779\n x-amz-meta-reviewedby: joe@example.com,jane@example.com \n /static.example.com/db-backup.dat .gz</pre>

Notice how the 'x-amz-' headers are sorted, trimmed of extra spaces, and converted to lowercase. Note also that multiple headers with the same name have been joined using commas to separate values.

Note how only the Content-Type and Content-MD5 HTTP entity headers appear in the StringToSign. The other Content-\* entity headers do not.

Again, note that the CanonicalizedResource includes the bucket name, but the HTTP Request-URI does not. (The bucket is specified by the Host header.)

## List all my buckets

Request	StringToSign
<pre>GET / HTTP/1.1 Host: s3.us-west-1.amazonaws.com Date: Wed, 28 Mar 2007 01:29:59 +0000  Authorization: AWS AKIAIOSFODNN7EXAMPLE:qGdzdE RIC03wnaRNKh60qZehG9s=</pre>	<pre>GET\n \n \n Wed, 28 Mar 2007 01:29:59 +0000\n /</pre>

## Unicode keys

Request	StringToSign
<pre>GET /dictionary/fran%C3%A7ais/pr %c3%a9f%c3%a8re HTTP/1.1 Host: s3.us-west-1.amazonaws.com Date: Wed, 28 Mar 2007 01:49:49 +0000 Authorization: AWS AKIAIOSFODNN7EXAMP LE:DNEZGsoieTZ92F3bUFSPQcbGmLM=</pre>	<pre>GET\n \n \n Wed, 28 Mar 2007 01:49:49 +0000\n /dictionary/fran%C3%A7ais/pr %c3%a9f%c3%a8re</pre>

### Note

The elements in `StringToSign` that were derived from the Request-URI are taken literally, including URL-Encoding and capitalization.

## REST request signing problems

When REST request authentication fails, the system responds to the request with an XML error document. The information contained in this error document is meant to help developers diagnose the problem. In particular, the `StringToSign` element of the `SignatureDoesNotMatch` error document tells you exactly what request canonicalization the system is using.

Some toolkits silently insert headers that you do not know about beforehand, such as adding the header `Content-Type` during a PUT. In most of these cases, the value of the inserted header remains constant, allowing you to discover the missing headers by using tools such as `Ethereal` or `tcpmon`.

## Query string request authentication alternative

You can authenticate certain types of requests by passing the required information as query-string parameters instead of using the `Authorization` HTTP header. This is useful for enabling direct third-party browser access to your private Amazon S3 data without proxying the request. The idea is to construct a "presigned" request and encode it as a URL that an end-user's browser can retrieve. Additionally, you can limit a presigned request by specifying an expiration time.

For more information on using query parameters to authenticate requests, see [Authenticating Requests: Using Query Parameters \(AWS Signature Version 4\)](#) in the *Amazon Simple Storage Service API Reference*. For examples of using the AWS SDKs to generating presigned URLs, see [Sharing objects with presigned URLs](#).

### Creating a signature

Following is an example query string authenticated Amazon S3 REST request.

```
GET /photos/puppy.jpg
?AWSAccessKeyId=AKIAIOSFODNN7EXAMPLE&Expires=1141889120&Signature=vjbyPxybdZaNmGa%2ByT272YEAiv4%3D HTTP/1.1
Host: awsexamplebucket1.s3.us-west-1.amazonaws.com
Date: Mon, 26 Mar 2007 19:37:58 +0000
```

The query string request authentication method doesn't require any special HTTP headers. Instead, the required authentication elements are specified as query string parameters:

Query string parameter name	Example value	Description
<code>AWSAccessKeyId</code>	<code>AKIAIOSFODNN7EXAMPLE</code>	Your AWS access key ID. Specifies the AWS secret access key used to sign the request and, indirectly, the

Query string parameter name	Example value	Description
		identity of the developer making the request.
Expires	1141889120	The time when the signature expires, specified as the number of seconds since the epoch (00:00:00 UTC on January 1, 1970). A request received after this time (according to the server) will be rejected.
Signature	vjbyPxybdZaNmGa%2B yT272YEAiv4%3D	The URL encoding of the Base64 encoding of the HMAC-SHA1 of StringToSign.

The query string request authentication method differs slightly from the ordinary method but only in the format of the `Signature` request parameter and the `StringToSign` element. Following is pseudo-grammar that illustrates the query string request authentication method.

```
Signature = URL-Encode( Base64( HMAC-SHA1( YourSecretAccessKey, UTF-8-Encoding-Of( StringToSign ) ) ) );
```

```
StringToSign = HTTP-VERB + "\n" +
  Content-MD5 + "\n" +
  Content-Type + "\n" +
  Expires + "\n" +
  CanonicalizedAmzHeaders +
  CanonicalizedResource;
```

`YourSecretAccessKey` is the AWS secret access key ID that Amazon assigns to you when you sign up to be an Amazon Web Service developer. Notice how the `Signature` is URL-Encoded to make it suitable for placement in the query string. Note also that in `StringToSign`, the HTTP Date positional element has been replaced with `Expires`. The `CanonicalizedAmzHeaders` and `CanonicalizedResource` are the same.

**Note**

In the query string authentication method, you do not use the Date or the x-amz-date request header when calculating the string to sign.

**Query string request authentication**

Request	StringToSign
<pre>GET /photos/puppy.jpg?AWSAccess KeyId=AKIAIOSFODNN7EXAMPLE&amp; Signature=NpgCjnDzrM%2BWFzo ENXmpNDUsSn8%3D&amp; Expires=1175139620 HTTP/1.1  Host: awsexamplebucket1.s3.us-wes t-1.amazonaws.com</pre>	<pre>GET\n \n \n 1175139620\n  /awsexamplebucket1/photos/puppy.jpg</pre>

We assume that when a browser makes the GET request, it won't provide a Content-MD5 or a Content-Type header, nor will it set any x-amz- headers, so those parts of the StringToSign are left blank.

**Using Base64 encoding**

HMAC request signatures must be Base64 encoded. Base64 encoding converts the signature into a simple ASCII string that can be attached to the request. Characters that could appear in the signature string like plus (+), forward slash (/), and equals (=) must be encoded if used in a URI. For example, if the authentication code includes a plus (+) sign, encode it as %2B in the request. Encode a forward slash as %2F and equals as %3D.

For examples of Base64 encoding, refer to the Amazon S3 [Authentication examples](#).

**Browser-based uploads using POST (AWS signature version 2)**

Amazon S3 supports POST, which allows your users to upload content directly to Amazon S3. POST is designed to simplify uploads, reduce upload latency, and save you money on applications where users upload data to store in Amazon S3.

**Note**

The request authentication discussed in this section is based on AWS Signature Version 2, a protocol for authenticating inbound API requests to AWS services.

Amazon S3 now supports Signature Version 4, a protocol for authenticating inbound API requests to AWS services, in all AWS Regions. At this time, AWS Regions created before January 30, 2014 will continue to support the previous protocol, Signature Version 2. Any new regions after January 30, 2014 will support only Signature Version 4 and therefore all requests to those regions must be made with Signature Version 4. For more information, see [Authenticating Requests in Browser-Based Uploads Using POST \(AWS Signature Version 4\)](#) in the *Amazon Simple Storage Service API Reference*.

The following figure shows an upload using Amazon S3 POST.

## Uploading using POST

- 1 The user opens a web browser and accesses your web page.
- 2 Your web page contains an HTTP form that contains all the information necessary for the user to upload content to Amazon S3.
- 3 The user uploads content directly to Amazon S3.

### **Note**

Query string authentication is not supported for POST.

## HTML forms (AWS signature version 2)

### Topics

- [HTML form encoding](#)
- [HTML form declaration](#)
- [HTML form fields](#)
- [Policy construction](#)
- [Constructing a signature](#)
- [Redirection](#)

When you communicate with Amazon S3, you normally use the REST or SOAP API to perform put, get, delete, and other operations. With POST, users upload data directly to Amazon S3 through their browsers, which cannot process the SOAP API or create a REST PUT request.

#### Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the AWS SDKs.

To allow users to upload content to Amazon S3 by using their browsers, you use HTML forms. HTML forms consist of a form declaration and form fields. The form declaration contains high-level information about the request. The form fields contain detailed information about the request, as well as the policy that is used to authenticate it and ensure that it meets the conditions that you specify.

#### Note

The form data and boundaries (excluding the contents of the file) cannot exceed 20 KB.

This section explains how to use HTML forms.

## HTML form encoding

The form and policy must be UTF-8 encoded. You can apply UTF-8 encoding to the form by specifying it in the HTML heading or as a request header.

### Note

The HTML form declaration does not accept query string authentication parameters.

The following is an example of UTF-8 encoding in the HTML heading:

```
<html>
  <head>
    ...
    <meta http-equiv="Content-Type" content="text/html; charset=UTF-8" />
    ...
  </head>
  <body>
```

The following is an example of UTF-8 encoding in a request header:

```
Content-Type: text/html; charset=UTF-8
```

## HTML form declaration

The form declaration has three components: the action, the method, and the enclosure type. If any of these values is improperly set, the request fails.

The action specifies the URL that processes the request, which must be set to the URL of the bucket. For example, if the name of your bucket is `awsexamplebucket1` and the Region is US West (N. California), the URL is `https://awsexamplebucket1.s3.us-west-1.amazonaws.com/`.

### Note

The key name is specified in a form field.

The method must be POST.

The enclosure type (enctype) must be specified and must be set to multipart/form-data for both file uploads and text area uploads. For more information, go to [RFC 1867](#).

## Example

The following example is a form declaration for the bucket "awsexamplebucket1".

```
<form action="https://awsexamplebucket1.s3.us-west-1.amazonaws.com/" method="post"
enctype="multipart/form-data">
```

## HTML form fields

The following table describes fields that can be used within an HTML form.

### Note

The variable `${filename}` is automatically replaced with the name of the file provided by the user and is recognized by all form fields. If the browser or client provides a full or partial path to the file, only the text following the last slash (/) or backslash (\) will be used. For example, "C:\Program Files\directory1\file.txt" will be interpreted as "file.txt". If no file or file name is provided, the variable is replaced with an empty string.

Field name	Description	Required
AWSAccessKeyId	The AWS Access Key ID of the owner of the bucket who grants an anonymous user access for a request that satisfies the set of constraints in the policy. This field is required if the request includes a policy document.	Conditional
acl	An Amazon S3 access control list (ACL). If an invalid access control list is specified, an error is generated.	No

Field name	Description	Required
	<p>Type: String</p> <p>Default: private</p> <p>Valid Values: private   public-read   public-read-write   aws-exec-read   authenticated-read   bucket-owner-read   bucket-owner-full-control</p>	
Cache-Control, Content-Type, Content-Disposition, Content-Encoding, Expires	REST-specific headers. For more information, see <a href="#">PUT Object</a> .	No
key	<p>The name of the uploaded key.</p> <p>To use the filename provided by the user, use the <code>\${filename}</code> variable. For example, if user Betty uploads the file <code>lolcatz.jpg</code> and you specify <code>/user/betty/\${filename}</code>, the file is stored as <code>/user/betty/lolcatz.jpg</code>.</p> <p>For more information, see <a href="#">Working with object metadata</a> .</p>	Yes
policy	Security policy describing what is permitted in the request. Requests without a security policy are considered anonymous and will succeed only on publicly writable buckets.	No

Field name	Description	Required
success_action_redirect, redirect	<p>The URL to which the client is redirected upon successful upload. Amazon S3 appends the bucket, key, and etag values as query string parameters to the URL.</p> <p>If success_action_redirect is not specified, Amazon S3 returns the empty document type specified in the success_action_status field.</p> <p>If Amazon S3 cannot interpret the URL, it ignores the field.</p> <p>If the upload fails, Amazon S3 displays an error and does not redirect the user to a URL.</p> <p>For more information, see <a href="#">Redirection</a>.</p> <div data-bbox="607 1035 1268 1304"><p> <b>Note</b></p><p>The redirect field name is deprecated and support for the redirect field name will be removed in the future.</p></div>	No

Field name	Description	Required
success_action_status	<p>The status code returned to the client upon successful upload if success_action_redirect is not specified.</p> <p>Valid values are 200, 201, or 204 (default).</p> <p>If the value is set to 200 or 204, Amazon S3 returns an empty document with a 200 or 204 status code.</p> <p>If the value is set to 201, Amazon S3 returns an XML document with a 201 status code. For information about the content of the XML document, see <a href="#">POST Object</a>.</p> <p>If the value is not set or if it is set to an invalid value, Amazon S3 returns an empty document with a 204 status code.</p> <div data-bbox="604 1081 1269 1541" style="border: 1px solid #add8e6; border-radius: 10px; padding: 10px;"><p><b>Note</b></p><p>Some versions of the Adobe Flash player do not properly handle HTTP responses with an empty body. To support uploads through Adobe Flash, we recommend setting success_action_status to 201.</p></div>	No

Field name	Description	Required
signature	<p>The HMAC signature constructed by using the secret access key that corresponds to the provided <code>AWSAccessKeyId</code>. This field is required if a policy document is included with the request.</p> <p>For more information, see <a href="#">Identity and Access Management for Amazon S3</a>.</p>	Conditional
Other field names prefixed with <code>x-amz-meta-</code>	<p>User-specified metadata.</p> <p>Amazon S3 does not validate or use this data.</p> <p>For more information, see <a href="#">PUT Object</a>.</p>	No
file	<p>File or text content.</p> <p>The file or content must be the last field in the form. Any fields below it are ignored.</p> <p>You cannot upload more than one file at a time.</p>	Yes

## Policy construction

### Topics

- [Expiration](#)
- [Conditions](#)
- [Condition matching](#)
- [Character escaping](#)

The policy is a UTF-8 and Base64-encoded JSON document that specifies conditions that the request must meet and is used to authenticate the content. Depending on how you design your

policy documents, you can use them per upload, per user, for all uploads, or according to other designs that meet your needs.

**Note**

Although the policy document is optional, we highly recommend it over making a bucket publicly writable.

The following is an example of a policy document:

```
{ "expiration": "2007-12-01T12:00:00.000Z",
  "conditions": [
    {"acl": "public-read" },
    {"bucket": "awsexamplebucket1" },
    ["starts-with", "$key", "user/eric/"],
  ]
}
```

The policy document contains the expiration and conditions.

**Expiration**

The expiration element specifies the expiration date of the policy in ISO 8601 UTC date format. For example, "2007-12-01T12:00:00.000Z" specifies that the policy is not valid after midnight UTC on 2007-12-01. Expiration is required in a policy.

**Conditions**

The conditions in the policy document validate the contents of the uploaded object. Each form field that you specify in the form (except `AWSSignatureVersion`, `Signature`, `File`, `Policy`, and field names that have an `x-ignore-` prefix) must be included in the list of conditions.

**Note**

If you have multiple fields with the same name, the values must be separated by commas. For example, if you have two fields named "x-amz-meta-tag" and the first one has a value of "Ninja" and second has a value of "Stallman", you would set the policy document to `Ninja, Stallman`.

All variables within the form are expanded before the policy is validated. Therefore, all condition matching should be performed against the expanded fields. For example, if you set the key field to `user/betty/${filename}`, your policy might be `[ "starts-with", "$key", "user/betty/" ]`. Do not enter `[ "starts-with", "$key", "user/betty/${filename}" ]`. For more information, see [Condition matching](#).

The following table describes policy document conditions.

Element name	Description
acl	Specifies conditions that the ACL must meet.  Supports exact matching and <code>starts-with</code> .
content-length-range	Specifies the minimum and maximum allowable size for the uploaded content.  Supports range matching.
Cache-Control, Content-Type, Content-Disposition, Content-Encoding, Expires	REST-specific headers.  Supports exact matching and <code>starts-with</code> .
key	The name of the uploaded key.  Supports exact matching and <code>starts-with</code> .
success_action_redirect, redirect	The URL to which the client is redirected upon successful upload.

Element name	Description
	Supports exact matching and <code>starts-with</code> .
<code>success_action_status</code>	The status code returned to the client upon successful upload if <code>success_action_redirect</code> is not specified.  Supports exact matching.
Other field names prefixed with <code>x-amz-meta-</code>	User-specified metadata.  Supports exact matching and <code>starts-with</code> .

### Note

If your toolkit adds additional fields (e.g., Flash adds filename), you must add them to the policy document. If you can control this functionality, prefix `x-ignore-` to the field so Amazon S3 ignores the feature and it won't affect future versions of this feature.

## Condition matching

The following table describes condition matching types. Although you must specify one condition for each form field that you specify in the form, you can create more complex matching criteria by specifying multiple conditions for a form field.

Condition	Description
Exact Matches	Exact matches verify that fields match specific values. This example indicates that the ACL must be set to <code>public-read</code> :  <pre>{"acl": "public-read" }</pre> This example is an alternate way to indicate that the ACL must be set to <code>public-read</code> :

Condition	Description
	<pre>[ "eq", "\$acl", "public-read" ]</pre>
Starts With	<p>If the value must start with a certain value, use <code>starts-with</code>. This example indicates that the key must start with <code>user/betty/</code>:</p> <pre>["starts-with", "\$key", "user/betty/"]</pre>
Matching Any Content	<p>To configure the policy to allow any content within a field, use <code>starts-with</code> with an empty value. This example allows any <code>success_action_redirect</code>:</p> <pre>["starts-with", "\$success_action_redirect", ""]</pre>
Specifying Ranges	<p>For fields that accept ranges, separate the upper and lower ranges with a comma. This example allows a file size from 1 to 10 megabytes:</p> <pre>["content-length-range", 1048579, 10485760]</pre>

## Character escaping

The following table describes characters that must be escaped within a policy document.

Escape sequence	Description
<code>\\</code>	Backslash
<code>\\$</code>	Dollar sign

Escape sequence	Description
<code>\b</code>	Backspace
<code>\f</code>	Form feed
<code>\n</code>	New line
<code>\r</code>	Carriage return
<code>\t</code>	Horizontal tab
<code>\v</code>	Vertical tab
<code>\uXXXX</code>	All Unicode characters

## Constructing a signature

Step	Description
1	Encode the policy by using UTF-8.
2	Encode those UTF-8 bytes by using Base64.
3	Sign the policy with your secret access key by using HMAC SHA-1.
4	Encode the SHA-1 signature by using Base64.

For general information about authentication, see [Identity and Access Management for Amazon S3](#).

## Redirection

This section describes how to handle redirects.

### General redirection

On completion of the POST request, the user is redirected to the location that you specified in the `success_action_redirect` field. If Amazon S3 cannot interpret the URL, it ignores the `success_action_redirect` field.

If `success_action_redirect` is not specified, Amazon S3 returns the empty document type specified in the `success_action_status` field.

If the POST request fails, Amazon S3 displays an error and does not provide a redirect.

### Pre-upload redirection

If your bucket was created using `<CreateBucketConfiguration>`, your end users might require a redirect. If this occurs, some browsers might handle the redirect incorrectly. This is relatively rare but is most likely to occur right after a bucket is created.

## Upload examples (AWS signature version 2)

### Topics

- [File upload](#)
- [Text area upload](#)

#### Note

The request authentication discussed in this section is based on AWS Signature Version 2, a protocol for authenticating inbound API requests to AWS services.

Amazon S3 now supports Signature Version 4, a protocol for authenticating inbound API requests to AWS services, in all AWS Regions. At this time, AWS Regions created before January 30, 2014 will continue to support the previous protocol, Signature Version 2. Any new regions after January 30, 2014 will support only Signature Version 4 and therefore all requests to those regions must be made with Signature Version 4. For more information, see [Examples: Browser-Based Upload using HTTP POST \(Using AWS Signature Version 4\)](#) in the *Amazon Simple Storage Service API Reference*.

## File upload

This example shows the complete process for constructing a policy and form that can be used to upload a file attachment.

### Policy and form construction

The following policy supports uploads to Amazon S3 for the `awsexamplebucket1` bucket.

```
{ "expiration": "2007-12-01T12:00:00.000Z",
  "conditions": [
    {"bucket": "awsexamplebucket1"},
    ["starts-with", "$key", "user/eric/"],
    {"acl": "public-read"},
    {"success_action_redirect": "https://awsexamplebucket1.s3.us-west-1.amazonaws.com/successful_upload.html"},
    ["starts-with", "$Content-Type", "image/"],
    {"x-amz-meta-uuid": "14365123651274"},
    ["starts-with", "$x-amz-meta-tag", ""]
  ]
}
```

This policy requires the following:

- The upload must occur before 12:00 UTC on December 1, 2007.
- The content must be uploaded to the `awsexamplebucket1` bucket.
- The key must start with `user/eric/`.
- The ACL is set to `public-read`.
- The `success_action_redirect` is set to `https://awsexamplebucket1.s3.us-west-1.amazonaws.com/successful_upload.html`.
- The object is an image file.
- The `x-amz-meta-uuid` tag must be set to `14365123651274`.
- The `x-amz-meta-tag` can contain any value.

The following is a Base64-encoded version of this policy.

```
eyJhZmVudC907-12-01T12:00:00.000Z\",
```

Using your credentials create a signature, for example `0RavWzkygo6QX9caELEqKi9kDbU=` is the signature for the preceding policy document.

The following form supports a POST request to the `amzn-s3-demo-bucket` bucket that uses this policy.

```
<html>
  <head>
    ...
    <meta http-equiv="Content-Type" content="text/html; charset=UTF-8" />
    ...
  </head>
  <body>
    ...
    <form action="https://amzn-s3-demo-bucket.s3.us-west-1.amazonaws.com/" method="post"
    enctype="multipart/form-data">
      Key to upload: <input type="input" name="key" value="user/eric/" /><br />
      <input type="hidden" name="acl" value="public-read" />
      <input type="hidden" name="success_action_redirect" value="https://
awsexamplebucket1.s3.us-west-1.amazonaws.com/successful_upload.html" />

## Text area upload

### Topics

- [Policy and form construction](#)
- [Sample request](#)
- [Sample response](#)

The following example shows the complete process for constructing a policy and form to upload a text area. Uploading a text area is useful for submitting user-created content, such as blog postings.

### Policy and form construction

The following policy supports text area uploads to Amazon S3 for the awsexamplebucket1 bucket.

```
{ "expiration": "2007-12-01T12:00:00.000Z",
  "conditions": [
```

```

<head>
  ...
  <meta http-equiv="Content-Type" content="text/html; charset=UTF-8" />
  ...
</head>
<body>
  ...
  <form action="https://amzn-s3-demo-bucket.s3.us-west-1.amazonaws.com/" method="post"
enctype="multipart/form-data">
  Key to upload: <input type="input" name="key" value="user/eric/" /><br />
  <input type="hidden" name="acl" value="public-read" />
  <input type="hidden" name="success_action_redirect" value="https://
awsexamplebucket1.s3.us-west-1.amazonaws.com/new_post.html" />
  <input type="hidden" name="Content-Type" value="text/html" />
  <input type="hidden" name="x-amz-meta-uuid" value="14365123651274" />
  Tags for File: <input type="input" name="x-amz-meta-tag" value="" /><br />
  <input type="hidden" name="AWSAccessKeyId" value="AKIAIOSFODNN7EXAMPLE" />
  <input type="hidden" name="Policy" value="POLICY" />
  <input type="hidden" name="Signature" value="SIGNATURE" />
  Entry: <textarea name="file" cols="60" rows="10">

Your blog post goes here.

  </textarea><br />
  <!-- The elements after this will be ignored -->
  <input type="submit" name="submit" value="Upload to Amazon S3" />
</form>
  ...
</html>

```

## Sample request

This request assumes that the image uploaded is 117,108 bytes; the image data is not included.

```

## POST with adobe flash (AWS signature version 2)

This section describes how to use POST with Adobe Flash.

### Adobe flash player security

By default, the Adobe Flash Player security model prohibits Adobe Flash Players from making network connections to servers outside the domain that serves the SWF file.

To override the default, you must upload a publicly readable `crossdomain.xml` file to the bucket that will accept POST uploads. The following is a sample `crossdomain.xml` file.

```
<?xml version="1.0"?>
<!DOCTYPE cross-domain-policy SYSTEM
"http://www.macromedia.com/xml/dtds/cross-domain-policy.dtd">
<cross-domain-policy>
<allow-access-from domain="*" secure="false" />
</cross-domain-policy>
```

### Note

For more information about the Adobe Flash security model, go to the Adobe website.

Adding the `crossdomain.xml` file to your bucket allows any Adobe Flash Player to connect to the `crossdomain.xml` file within your bucket; however, it does not grant access to the actual Amazon S3 bucket.

## Adobe flash considerations

The FileReference API in Adobe Flash adds the `Filename` form field to the POST request. When you build Adobe Flash applications that upload to Amazon S3 by using the FileReference API action, include the following condition in your policy:

```
['starts-with', '$Filename', '']
```

Some versions of the Adobe Flash Player do not properly handle HTTP responses that have an empty body. To configure POST to return a response that does not have an empty body, set `success_action_status` to 201. Amazon S3 will then return an XML document with a 201 status code. For information about the content of the XML document, see [POST Object](#). For information about form fields, see [HTML form fields](#).

## Appendix: Lifecycle Configuration APIs (Deprecated)

Bucket lifecycle configuration is updated to support filters based on object tags. That is, you can now specify a rule that specifies key name prefix, one or more object tags, or both to select a subset of objects to which the rule applies. The APIs have been updated accordingly. The following topics describes the prior version of the PUT and GET bucket lifecycle operations for backward compatibility.

### Topics

- [PUT Bucket lifecycle \(Deprecated\)](#)
- [GET Bucket lifecycle \(Deprecated\)](#)

# PUT Bucket lifecycle (Deprecated)

## Description

### Important

For an updated version of this API, see [PutBucketLifecycleConfiguration](#). This version has been deprecated. Existing lifecycle configurations will work. For new lifecycle configurations, use the updated API.

Creates a new lifecycle configuration for the bucket or replaces an existing lifecycle configuration. For information about lifecycle configuration, see [Object Lifecycle Management](#) in the *Amazon Simple Storage Service User Guide*.

## Permissions

By default, all Amazon S3 resources, including buckets, objects, and related subresources (for example, lifecycle configuration and website configuration) are private. Only the resource owner, the AWS account that created the resource, can access it. The resource owner can optionally grant access permissions to others by writing an access policy. For this operation, users must get the `s3:PutLifecycleConfiguration` permission.

You can also explicitly deny permissions. Explicit denial also supersedes any other permissions. If you want to prevent users or accounts from removing or deleting objects from your bucket, you must deny them permissions for the following actions:

- `s3:DeleteObject`
- `s3:DeleteObjectVersion`
- `s3:PutLifecycleConfiguration`

For more information about permissions, see [Managing Access Permissions to Your Amazon S3 Resources](#) in the *Amazon Simple Storage Service User Guide*.

## Requests

### Syntax

```
PUT /?lifecycle HTTP/1.1
Host: bucketname.s3.amazonaws.com
Content-Length: length
Date: date
Authorization: authorization string
Content-MD5: MD5
```

*Lifecycle configuration in the request body*

For details about authorization strings, see [Authenticating Requests \(AWS Signature Version 4\)](#).

### Request Parameters

This implementation of the operation does not use request parameters.

### Request Headers

Name	Description	Required
Content-MD5	The base64-encoded 128-bit MD5 digest of the data. You must use this header as a message integrity check to verify that the request body was not corrupted in transit. For more information, see <a href="#">RFC 1864</a> .  Type: String  Default: None	Yes

### Request Body

In the request, you specify the lifecycle configuration in the request body. The lifecycle configuration is specified as XML. The following is an example of a basic lifecycle configuration. It specifies one rule. The `Prefix` in the rule identifies objects to which the rule applies. The rule also specifies two actions (`Transition` and `Expiration`). Each action specifies a timeline when

Amazon S3 should perform the action. The Status indicates whether the rule is enabled or disabled.

```
<LifecycleConfiguration>
  <Rule>
    <ID>sample-rule</ID>
    <Prefix>key-prefix</Prefix>
    <Status>rule-status</Status>
    <Transition>
      <Date>value</Date>
      <StorageClass>storage class</StorageClass>
    </Transition>
    <Expiration>
      <Days>value</Days>
    </Expiration>
  </Rule>
</LifecycleConfiguration>
```

If the state of your bucket is versioning-enabled or versioning-suspended, you can have many versions of the same object: one current version and zero or more noncurrent versions. The following lifecycle configuration specifies the actions (NoncurrentVersionTransition, NoncurrentVersionExpiration) that are specific to noncurrent object versions.

```
<LifecycleConfiguration>
  <Rule>
    <ID>sample-rule</ID>
    <Prefix>key-prefix</Prefix>
    <Status>rule-status</Status>
    <NoncurrentVersionTransition>
      <NoncurrentDays>value</NoncurrentDays>
      <StorageClass>storage class</StorageClass>
    </NoncurrentVersionTransition>
    <NoncurrentVersionExpiration>
      <NoncurrentDays>value</NoncurrentDays>
    </NoncurrentVersionExpiration>
  </Rule>
</LifecycleConfiguration>
```

You can use the multipart upload API to upload large objects in parts. For more information about multipart uploads, see [Multipart Upload Overview](#) in the *Amazon Simple Storage Service User Guide*. With lifecycle configuration, you can tell Amazon S3 to cancel incomplete multipart

uploads, which are identified by the key name prefix specified in the rule, if they don't complete within a specified number of days. When Amazon S3 cancels a multipart upload, it deletes all parts associated with the upload. This ensures that you don't have incomplete multipart uploads that have left parts stored in Amazon S3, so you don't have to pay storage costs for them. The following is an example lifecycle configuration that specifies a rule with the `AbortIncompleteMultipartUpload` action. This action tells Amazon S3 to cancel incomplete multipart uploads seven days after initiation.

```
<LifecycleConfiguration>
  <Rule>
    <ID>sample-rule</ID>
    <Prefix>SomeKeyPrefix</Prefix>
    <Status>rule-status</Status>
    <AbortIncompleteMultipartUpload>
      <DaysAfterInitiation>7</DaysAfterInitiation>
    </AbortIncompleteMultipartUpload>
  </Rule>
</LifecycleConfiguration>
```

The following table describes the XML elements in the lifecycle configuration.

Name	Description	Required
<code>AbortIncompleteMultipartUpload</code>	<p>Container for specifying when an incomplete multipart upload becomes eligible for an abort operation.</p> <p>Child: <code>DaysAfterInitiation</code></p> <p>Type: Container</p> <p>Ancestor: <code>Rule</code></p>	Yes, if no other action is specified for the rule
<code>Date</code>	<p>Date when you want Amazon S3 to take the action. For more information, see <a href="#">Lifecycle Rules: Based on a Specific Date</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p>	Yes, if <code>Days and ExpiredObjectDelete</code>

Name	Description	Required
	<p>The date value must conform to ISO 8601 format. The time is always midnight UTC.</p> <p>Type: String</p> <p>Ancestor: <code>Expiration</code> or <code>Transition</code></p>	<p><code>eMarker</code> are absent</p>
<p>Days</p>	<p>Specifies the number of days after object creation when the specific rule action takes effect.</p> <p>Type: Nonnegative Integer when used with <code>Transition</code> , Positive Integer when used with <code>Expiration</code></p> <p>Ancestor: <code>Expiration</code> , <code>Transition</code></p>	<p>Yes, if <code>Date</code> and <code>ExpiredObjectDeleteMarker</code> are absent</p>
<p>DaysAfterInitiation</p>	<p>Specifies the number of days after initiating a multipart upload when the multipart upload must be completed. If it does not complete by the specified number of days, it becomes eligible for an abort operation and Amazon S3 cancels the incomplete multipart upload.</p> <p>Type: Positive Integer</p> <p>Ancestor: <code>AbortIncompleteMultipartUpload</code></p>	<p>Yes, if a parent tag is specified</p>

Name	Description	Required
Expiration	<p>This action specifies a period in an object's lifetime when Amazon S3 should take the appropriate expiration action. The action Amazon S3 takes depends on whether the bucket is versioning-enabled.</p> <ul style="list-style-type: none"><li>• If versioning has never been enabled on the bucket, Amazon S3 deletes the only copy of the object permanently.</li><li>• If the bucket is versioning-enabled (or versioning is suspended), the action applies only to the current version of the object. A versioning-enabled bucket can have many versions of the same object: one current version and zero or more noncurrent versions.</li></ul> <p>Instead of deleting the current version, Amazon S3 makes it a noncurrent version by adding a delete marker as the new current version.</p> <div data-bbox="662 1360 1302 1776" style="border: 1px solid #f08080; border-radius: 10px; padding: 10px;"><p> <b>Important</b></p><p>If a bucket's state is versioning-suspended, Amazon S3 creates a delete marker with version ID null. If you have a version with version ID null, Amazon S3 overwrites that version.</p></div>	Yes, if no other action is present in the Rule.

Name	Description	Required
	<div data-bbox="662 210 1302 478" style="border: 1px solid #add8e6; border-radius: 10px; padding: 10px; margin-bottom: 10px;"> <p> <b>Note</b></p> <p>To set the expiration for noncurrent objects, use the <code>NoncurrentVersionExpiration</code> action.</p> </div> <p>Type: Container</p> <p>Children: Days or Date</p> <p>Ancestor: Rule</p>	
ID	<p>Unique identifier for the rule. The value cannot be longer than 255 characters.</p> <p>Type: String</p> <p>Ancestor: Rule</p>	No
LifecycleConfiguration	<p>Container for lifecycle rules. You can add as many as 1000 rules.</p> <p>Type: Container</p> <p>Children: Rule</p> <p>Ancestor: None</p>	Yes

Name	Description	Required
ExpiredObjectDeleteMarker	<p>On a versioned bucket (a versioning-enabled or versioning-suspended bucket), you can add this element in the lifecycle configuration to tell Amazon S3 to delete expired object delete markers. For an example, see <a href="#">Example 8: Removing Expired Object Delete Markers</a> in the <i>Amazon Simple Storage Service User Guide</i>. Don't add it to a non-versioned bucket, because that type of bucket cannot include delete markers.</p> <p>Type: String</p> <p>Valid values: true   false (the value false is allowed, but it is no-op, which means that Amazon S3 will not take action)</p> <p>Ancestor: Expiration</p>	Yes, if Date and Days are absent
NoncurrentDays	<p>Specifies the number of days an object is noncurrent before Amazon S3 can perform the associated action. For information about the noncurrent days calculations, see <a href="#">How Amazon S3 Calculates When an Object Became Noncurrent</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>Type: Nonnegative Integer when used with NoncurrentVersionTransition , Positive Integer when used with NoncurrentVersionExpiration</p> <p>Ancestor: NoncurrentVersionExpiration or NoncurrentVersionTransition</p>	Yes

Name	Description	Required
NoncurrentVersionExpiration	<p>Specifies when noncurrent object versions expire. Upon expiration, Amazon S3 permanently deletes the noncurrent object versions.</p> <p>Set this lifecycle configuration action on a bucket that has versioning enabled (or suspended) to tell Amazon S3 to delete noncurrent object versions at a specific period in the object's lifetime.</p> <p>Type: Container</p> <p>Children: NoncurrentDays</p> <p>Ancestor: Rule</p>	Yes, if no other action is present in the Rule
NoncurrentVersionTransition	<p>Container for the transition rule that describes when noncurrent objects transition to the STANDARD_IA, ONEZONE_IA, or GLACIER storage class.</p> <p>If your bucket is versioning-enabled (or if versioning is suspended), you can set this action to tell Amazon S3 to transition noncurrent object versions at a specific period in the object's lifetime.</p> <p>Type: Container</p> <p>Children: NoncurrentDays and StorageClass</p> <p>Ancestor: Rule</p>	Yes, if no other action is present in the Rule

Name	Description	Required
Prefix	<p>Object key prefix that identifies one or more objects to which the rule applies.</p> <p>Type: String</p> <p>Ancestor: Rule</p>	Yes
Rule	<p>Container for a lifecycle rule. A lifecycle configuration can contain as many as 1000 rules.</p> <p>Type: Container</p> <p>Ancestor: LifecycleConfiguration</p>	Yes
Status	<p>If enabled, Amazon S3 executes the rule as scheduled. If it is disabled, Amazon S3 ignores the rule.</p> <p>Type: String</p> <p>Ancestor: Rule</p> <p>Valid values: Enabled, Disabled</p>	Yes
StorageClass	<p>Specifies the Amazon S3 storage class to which you want the object to transition.</p> <p>Type: String</p> <p>Ancestor: Transition and NoncurrentVersionTransition</p> <p>Valid values: STANDARD_IA   ONEZONE_IA   GLACIER</p>	<p>Yes</p> <p>This element is required only if you specify one or both its ancestors.</p>

Name	Description	Required
Transition	<p>This action specifies a period in the objects' lifetime when Amazon S3 should transition them to the <code>STANDARD_IA</code> , <code>ONEZONE_IA</code> , or <code>GLACIER</code> storage class. When this action is in effect, what Amazon S3 does depends on whether the bucket is versioning-enabled.</p> <ul style="list-style-type: none"><li>• If versioning has never been enabled on the bucket, Amazon S3 transitions the only copy of the object to the specified storage class.</li><li>• If your bucket is versioning-enabled (or versioning is suspended), Amazon S3 transitions only the current versions of objects identified in the rule.</li></ul> <div data-bbox="662 1094 1300 1549" style="border: 1px solid #ccc; border-radius: 10px; padding: 10px;"><p> <b>Note</b></p><p>A versioning-enabled bucket can have many versions of an object. This action has no effect on noncurrent object versions. To transition noncurrent objects, you must use the <code>NoncurrentVersionTransition</code> action.</p></div> <p>Type: Container</p> <p>Children: Days or Date, and StorageClass</p>	Yes, if no other action is present in the Rule

Name	Description	Required
	Ancestor: Rule	

## Responses

### Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see [Common Response Headers](#).

### Response Elements

This implementation of the operation does not return response elements.

### Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see [Error Responses](#).

## Examples

### Example 1: Add Lifecycle Configuration to a Bucket That Is Not Versioning-enabled

The following lifecycle configuration specifies two rules, each with one action.

- The Transition action tells Amazon S3 to transition objects with the "documents/" prefix to the GLACIER storage class 30 days after creation.
- The Expiration action tells Amazon S3 to delete objects with the "logs/" prefix 365 days after creation.

```
<LifecycleConfiguration>
  <Rule>
    <ID>id1</ID>
    <Prefix>documents/</Prefix>
    <Status>Enabled</Status>
    <Transition>
      <Days>30</Days>
      <StorageClass>GLACIER</StorageClass>
    </Transition>
```

```

</Rule>
<Rule>
  <ID>id2</ID>
  <Prefix>logs/</Prefix>
  <Status>Enabled</Status>
  <Expiration>
    <Days>365</Days>
  </Expiration>
</Rule>
</LifecycleConfiguration>

```

The following is a sample PUT `/?lifecycle` request that adds the preceding lifecycle configuration to the `examplebucket` bucket.

```

PUT /?lifecycle HTTP/1.1
Host: examplebucket.s3.amazonaws.com
x-amz-date: Wed, 14 May 2014 02:11:21 GMT
Content-MD5: q6yJD1IkBaGGfb3QLY69A==
Authorization: authorization string
Content-Length: 415

<LifecycleConfiguration>
  <Rule>
    <ID>id1</ID>
    <Prefix>documents/</Prefix>
    <Status>Enabled</Status>
    <Transition>
      <Days>30</Days>
      <StorageClass>GLACIER</StorageClass>
    </Transition>
  </Rule>
  <Rule>
    <ID>id2</ID>
    <Prefix>logs/</Prefix>
    <Status>Enabled</Status>
    <Expiration>
      <Days>365</Days>
    </Expiration>
  </Rule>
</LifecycleConfiguration>

```

The following is a sample response.

```
HTTP/1.1 200 OK
x-amz-id-2: r+qR7+nhXtJDDIJ0JJYcd+1j5nM/rUFiiiZ/fNbD0sd3JUE8NWMLNHXmvPfwMpdC
x-amz-request-id: 9E26D08072A8EF9E
Date: Wed, 14 May 2014 02:11:22 GMT
Content-Length: 0
Server: AmazonS3
```

## Example 2: Add Lifecycle Configuration to a Versioning-enabled Bucket

The following lifecycle configuration specifies two rules, each with one action for Amazon S3 to perform. You specify these actions when your bucket is versioning-enabled or versioning is suspended:

- The `NoncurrentVersionExpiration` action tells Amazon S3 to expire noncurrent versions of objects with the "logs/" prefix 100 days after the objects become noncurrent.
- The `NoncurrentVersionTransition` action tells Amazon S3 to transition noncurrent versions of objects with the "documents/" prefix to the GLACIER storage class 30 days after they become noncurrent.

```
<LifecycleConfiguration>
  <Rule>
    <ID>DeleteAfterBecomingNonCurrent</ID>
    <Prefix>logs/</Prefix>
    <Status>Enabled</Status>
    <NoncurrentVersionExpiration>
      <NoncurrentDays>100</NoncurrentDays>
    </NoncurrentVersionExpiration>
  </Rule>
  <Rule>
    <ID>TransitionAfterBecomingNonCurrent</ID>

    </NoncurrentVersionTransition>
  </Rule>
</LifecycleConfiguration>
```

The following is a sample PUT `/?lifecycle` request that adds the preceding lifecycle configuration to the `examplebucket` bucket.

```
PUT /?lifecycle HTTP/1.1
Host: examplebucket.s3.amazonaws.com
x-amz-date: Wed, 14 May 2014 02:21:48 GMT
Content-MD5: 96rxH9mDqVnKkaZDddgnw==
Authorization: authorization string
Content-Length: 598

<LifecycleConfiguration>
  <Rule>
    <ID>DeleteAfterBecomingNonCurrent</ID>
    <Prefix>logs/</Prefix>
    <Status>Enabled</Status>
    <NoncurrentVersionExpiration>
      <NoncurrentDays>1</NoncurrentDays>
    </NoncurrentVersionExpiration>
  </Rule>
  <Rule>
    <ID>TransitionSoonAfterBecomingNonCurrent</ID>
    <Prefix>documents/</Prefix>
    <Status>Enabled</Status>
    <NoncurrentVersionTransition>
      <NoncurrentDays>0</NoncurrentDays>
      <StorageClass>GLACIER</StorageClass>
    </NoncurrentVersionTransition>
  </Rule>
</LifecycleConfiguration>
```

The following is a sample response.

```
HTTP/1.1 200 OK
x-amz-id-2: aXQ+KbIrmMmo0//3bMdDTw/CnjArwje+J49Hf+j44yRb/VmbIkgI05A+PT98Cp/6k07hf

x-amz-request-id: 02D7EC4C10381EB1
Date: Wed, 14 May 2014 02:21:50 GMT
Content-Length: 0
Server: AmazonS3
```

## Additional Examples

For more examples of transitioning objects to storage classes such as STANDARD\_IA or ONEZONE\_IA, see [Examples of Lifecycle Configuration](#).

## Related Resources

- [GetBucketLifecycleConfiguration](#)
- [POST Object restore](#)
- By default, a resource owner—in this case, a bucket owner, which is the AWS account that created the bucket—can perform any of the operations. A resource owner can also grant others permission to perform the operation. For more information, see the following topics in the *Amazon Simple Storage Service User Guide*:
  - [Specifying Permissions in a Policy](#)
  - [Managing Access Permissions to Your Amazon S3 Resources](#)

# GET Bucket lifecycle (Deprecated)

## Description

### Important

For an updated version of this API, see [GetBucketLifecycleConfiguration](#). If you configured a bucket lifecycle using the <filter> element, you should see an updated version of this topic. This topic is provided for backward compatibility.

Returns the `lifecycle` configuration information set on the bucket. For information about lifecycle configuration, go to [Object Lifecycle Management](#) in the *Amazon Simple Storage Service User Guide*.

To use this operation, you must have permission to perform the `s3:GetLifecycleConfiguration` action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see [Managing Access Permissions to Your Amazon S3 Resources](#) in the *Amazon Simple Storage Service User Guide*.

## Requests

### Syntax

```
GET /?lifecycle HTTP/1.1
Host: bucketname.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests \(AWS Signature Version 4\))
```

### Request Parameters

This implementation of the operation does not use request parameters.

### Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see [Common Request Headers](#).

## Request Elements

This implementation of the operation does not use request elements.

## Responses

### Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see [Common Response Headers](#).

### Response Elements

This implementation of GET returns the following response elements.

Name	Description	Required
AbortIncompleteMultipartUpload	<p>Container for specifying when an incomplete multipart upload becomes eligible for an abort operation.</p> <p>Child: DaysAfterInitiation</p> <p>Type: Container</p> <p>Ancestor: Rule</p>	Yes, if no other action is specified for the rule
Date	<p>Date when you want Amazon S3 to take the action. For more information, see <a href="#">Lifecycle Rules: Based on a Specific Date</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>The date value must conform to the ISO 8601 format. The time is always midnight UTC.</p> <p>Type: String</p> <p>Ancestor: Expiration or Transition</p>	Yes, if Days and ExpiredObjectDeleteMarker are absent

Name	Description	Required
Days	<p>Specifies the number of days after object creation when the specific rule action takes effect. The object's eligibility time is calculated as creation time + the number of days with the resulting time rounded to midnight UTC of the next day.</p> <p>Type: Non-negative Integer when used with <code>Transition</code> , Positive Integer when used with <code>Expiration</code> .</p> <p>Ancestor: <code>Transition</code> or <code>Expiration</code></p>	Yes, if <code>Date</code> and <code>ExpiredObjectDeleteMarker</code> are absent
DaysAfterInitiation	<p>Specifies the number of days after initiating a multipart upload when the multipart upload must be completed. If it does not complete by the specified number of days, it becomes eligible for an abort operation and Amazon S3 cancels the incomplete multipart upload.</p> <p>Type: Positive Integer</p> <p>Ancestor: <code>AbortIncompleteMultipartUpload</code></p>	Yes, if <code>Date</code> is absent

Name	Description	Required
Expiration	<p>This action specifies a period in the object's lifetime when Amazon S3 should take the appropriate expiration action. The expiration action occurs only on objects that are eligible according to the period specified in the child <code>Date</code> or <code>Days</code> element. The action Amazon S3 takes depends on whether the bucket is versioning enabled.</p> <ul style="list-style-type: none"><li>• If versioning has never been enabled on the bucket, Amazon S3 deletes the only copy of the object permanently.</li><li>• Otherwise, if your bucket is versioning-enabled (or versioning is suspended), the action applies only to the current version of the object. Buckets that are versioning-enabled or versioning-suspended can have many versions of the same object: one current version, and zero or more noncurrent versions.</li></ul> <p>Instead of deleting the current version, Amazon S3 makes it a noncurrent version by adding a delete marker as the new current version.</p> <div data-bbox="667 1583 1305 1864" style="border: 1px solid #f08080; border-radius: 10px; padding: 10px;"><p><b> Important</b></p><p>If the state of a bucket is versioning-suspended, Amazon S3 creates a delete marker with version ID <code>null</code>. If you have a version with</p></div>	Yes, if the parent tag is specified

Name	Description	Required
	<p data-bbox="667 205 1305 331">version ID null, then Amazon S3 overwrites that version.</p> <div data-bbox="667 464 1305 779" style="border: 1px solid #add8e6; border-radius: 10px; padding: 10px; margin: 10px 0;"> <p data-bbox="699 499 818 533"> <b>Note</b></p> <p data-bbox="743 558 1252 737">To set the expiration for noncurrent objects, you must use the <code>NoncurrentVersionExpiration</code> action.</p> </div> <p data-bbox="634 947 862 980">Type: Container</p> <p data-bbox="634 1024 954 1058">Children: Days or Date</p> <p data-bbox="634 1102 841 1136">Ancestor: Rule</p>	
ID	<p data-bbox="634 1213 1203 1297">Unique identifier for the rule. The value cannot be longer than 255 characters.</p> <p data-bbox="634 1346 808 1379">Type: String</p> <p data-bbox="634 1423 841 1457">Ancestor: Rule</p>	No
LifecycleConfiguration	<p data-bbox="634 1535 1263 1619">Container for lifecycle rules. You can add as many as 1000 rules.</p> <p data-bbox="634 1665 862 1698">Type: Container</p> <p data-bbox="634 1743 834 1776">Children: Rule</p> <p data-bbox="634 1820 857 1854">Ancestor: None</p>	Yes

Name	Description	Required
ExpiredObjectDeleteMarker	<p>On a versioned bucket (versioning-enabled or versioning-suspended bucket), this element indicates whether Amazon S3 will delete any expired object delete markers in the bucket. For an example, go to <a href="#">Example 8: Specify Expiration Action to Remove Expired Object Delete Markers</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>Type: String</p> <p>Valid values: true   false (the value false is allowed but it is no-op, Amazon S3 doesn't take action if the value is false)</p> <p>Ancestor: Expiration</p>	Yes, if Date and Days are absent
NoncurrentDays	<p>Specifies the number of days that an object is noncurrent before Amazon S3 can perform the associated action. For information about calculating noncurrent days, see <a href="#">Lifecycle Rules Based on the Number of Days</a> in the <i>Amazon Simple Storage Service User Guide</i>.</p> <p>Type: Nonnegative Integer when used with NoncurrentVersionTransition , Positive Integer when used with NoncurrentVersionExpiration</p> <p>Ancestor: NoncurrentVersionExpiration or NoncurrentVersionTransition</p>	Yes, only if the ancestor is present

Name	Description	Required
NoncurrentVersionExpiration	<p>Specifies when noncurrent object versions expire. Upon expiration, Amazon S3 permanently deletes the noncurrent object versions.</p> <p>Set this lifecycle configuration action on a bucket that has versioning enabled (or suspended) to request that Amazon S3 delete noncurrent object versions at a specific period in the object's lifetime.</p> <p>Type: Container</p> <p>Children: NoncurrentDays</p> <p>Ancestor: Rule</p>	Yes, if no other action is present in the Rule
NoncurrentVersionTransition	<p>Container for the transition rule that describes when noncurrent objects transition to the STANDARD_IA , ONEZONE_IA , or the GLACIER storage class.</p> <p>If your bucket is versioning-enabled (or versioning is suspended), you can set this action to request Amazon S3 to transition noncurrent object versions to the GLACIER storage class at a specific period in the object's lifetime.</p> <p>Type: Container</p> <p>Children: NoncurrentDays and StorageClass</p> <p>Ancestor: Rule</p>	Yes, if no other action is present in the Rule

Name	Description	Required
Prefix	<p>Object key prefix identifying one or more objects to which the rule applies.</p> <p>Type: String</p> <p>Ancestor: Rule</p>	Yes
Rule	<p>Container for a lifecycle rule.</p> <p>Type: Container</p> <p>Ancestor: LifecycleConfiguration</p>	Yes
Status	<p>If Enabled, Amazon S3 executes the rule as scheduled. If Disabled, Amazon S3 ignores the rule.</p> <p>Type: String</p> <p>Ancestor: Rule</p> <p>Valid values: Enabled or Disabled</p>	Yes
StorageClass	<p>Specifies the Amazon S3 storage class to which you want to transition the object.</p> <p>Type: String</p> <p>Ancestor: Transition and NoncurrentVersionTransition</p> <p>Valid values: STANDARD_IA   ONEZONE_IA   GLACIER</p>	Yes

Name	Description	Required
Transition	<p>This action specifies a period in the objects' lifetime when Amazon S3 should transition them to the <code>STANDARD_IA</code> , <code>ONEZONE_IA</code> , or <code>GLACIER</code> storage class. When this action is in effect, what Amazon S3 does depends on whether the bucket is versioning-enabled.</p> <ul style="list-style-type: none"><li>• If versioning has never been enabled on the bucket, Amazon S3 transitions the only copy of the object to the specified storage class.</li><li>• When your bucket is versioning-enabled (or versioning is suspended), Amazon S3 transitions only the current versions of the objects identified in the rule.</li></ul> <div data-bbox="667 1125 1305 1629" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px;"><p> <b>Note</b></p><p>A versioning-enabled or versioning-suspended bucket can contain many versions of an object. This action has no effect on the noncurrent object versions. To transition noncurrent objects, you must use the <code>NoncurrentVersionTransition</code> action.</p></div> <p>Type: Container</p>	Yes, if no other action is present in the Rule

Name	Description	Required
	Children: Days or Date, and StorageClass	
	Ancestor: Rule	

## Special Errors

Error Code	Description	HTTP Status Code	SOAP Fault Code Prefix
NoSuchLifecycleConfiguration	The lifecycle configuration does not exist.	404 Not Found	Client

For general information about Amazon S3 errors and a list of error codes, see [Error responses](#).

## Examples

### Example 1: Retrieve a Lifecycle Subresource

This example is a GET request to retrieve the `lifecycle` subresource from the specified bucket, and an example response with the returned lifecycle configuration.

### Sample Request

```
GET /?lifecycle HTTP/1.1
Host: examplebucket.s3.amazonaws.com
x-amz-date: Thu, 15 Nov 2012 00:17:21 GMT
Authorization: signatureValue
```

### Sample Response

```
HTTP/1.1 200 OK
x-amz-id-2: ITnGT1y4RyTmXa3rPi4hk1TXouTf0hccUjo0iCPjz6FnfIutBj3M7fPG1W02SEWp
x-amz-request-id: 51991C342C575321
Date: Thu, 15 Nov 2012 00:17:23 GMT
Server: AmazonS3
Content-Length: 358
```

```
<?xml version="1.0" encoding="UTF-8"?>
<LifecycleConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Rule>
    <ID>Archive and then delete rule</ID>
    <Prefix>projectdocs</Prefix>
    <Status>Enabled</Status>
    <Transition>
      <Days>30</Days>
      <StorageClass>STANDARD_IA</StorageClass>
    </Transition>
    <Transition>
      <Days>365</Days>
      <StorageClass>GLACIER</StorageClass>
    </Transition>
    <Expiration>
      <Days>3650</Days>
    </Expiration>
  </Rule>
</LifecycleConfiguration>
```
