### Selection through on legend

You can able to select a point or series through on legend using [toggleVisibility](#) property. Also, use [enableHighlight](#) property for highlighting the series through legend.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-chart id="container" :title='title'
:primaryXAxis='primaryXAxis' :legendSettings='legendSettings'
selectionMode='Point'>
      <e-series-collection>
        <e-series :dataSource='seriesData' type='Column'
xName='country' yName='gold' name='Gold' :animation='animation'> </e-series>
        <e-series :dataSource='seriesData' type='Column'
xName='country' yName='silver' name='Silver' :animation='animation'> </e-
series>
        <e-series :dataSource='seriesData' type='Column'
xName='country' yName='bronze' name='Bronze' :animation='animation'> </e-
series>
      </e-series-collection>
    </ejs-chart>
  </div>

## Chart print in Vue Chart component

### Print

The rendered chart can be printed directly from the browser by calling the public method print. You can pass array of ID of elements or element to this method. By default it take element of the chart.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-button id='print' @click.native='print'>Print</ejs-button>
        <ejs-chart ref="chart" :title='title' :primaryXAxis='primaryXAxis'
:primaryYAxis='primaryYAxis' style="float: left">
            <e-series-collection>
                <e-series :dataSource='seriesData' type='Polar' xName='x'
yName='y' drawType='Area'> </e-series>
            </e-series-collection>
        </ejs-chart>
    </div>
</template>
<script>

```

```

import Vue from "vue";
import { ChartPlugin, PolarSeries, Category, AreaSeries } from
"@syncfusion/ej2-vue-charts";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(ChartPlugin);
Vue.use(ButtonPlugin);
export default {
  data() {
    return {
      seriesData:[
        { x: 'Jan', y: -1 }, { x: 'Feb', y: -1 }, { x: 'Mar', y: 2 },
        { x: 'Apr', y: 8 }, { x: 'May', y: 13 }, { x: 'Jun', y: 18 },
        { x: 'Jul', y: 21 }, { x: 'Aug', y: 20 }, { x: 'Sep', y: 16 },
        { x: 'Oct', y: 10 }, { x: 'Nov', y: 4 }, { x: 'Dec', y: 0 }
      ],
      primaryXAxis: {
        valueType: 'Category'
      },
      primaryYAxis: {
        minimum: -5, maximum: 35, interval: 10,
        title: 'Temperature in Celsius',
        labelFormat: '{value}C'
      },
      title: "Climate Graph-2012"
    };
  },
  provide: {
    chart: [PolarSeries, Category, AreaSeries]
  },
  methods: {
    print: function() {
      this.$refs.chart.print();
    }
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/chart/series/polar-cs1" %}

## Export

The rendered chart can be exported to **JPEG**, **PNG**, **SVG**, **PDF**, **XLSX**, or **CSV** format using the export method in chart. The input parameters for this method are **type** for format and **fileName** for result.

The optional parameters for this method are,

- **orientation** - either portrait or landscape mode during PDF export,
- **controls** - pass collections of controls for multiple export,
- **width** - width of chart export, and
- **height** - height of chart export.

## APP.VUE

```
<template>
```

```

<ejs-chart ref="chart" :title='title' :primaryXAxis='primaryXAxis'
:primaryYAxis='primaryYAxis' :loaded='loaded'>
  <e-series-collection>
    <e-series :dataSource='seriesData' type='Polar' xName='x'

### Multiple chart export

You can export the multiple charts in single page by passing the multiple chart objects in the export method of chart. To export multiple charts in a single page, follow the given steps:

Initially, render more than one chart to export, and then add button to export the multiple charts. In button click, call the export method in charts, and then pass the multiple chart objects in the export method.

### Exporting chart using base64 string

The chart can be exported as an image in the form of a basering by utilizing HTML canvas. This process involves rendering the chart onto a canvas element and then converting the canvas content to a base64 string.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-chart style='display:block' align='center' id='chartcontainer'

## Chart appearance in Vue Chart component

### Custom color palette

You can customize the default color of series or points by providing a custom color palette of your choice by

using the [palettes](#) property.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-chart id="container" :title='title'
:primaryXAxis='primaryXAxis' :primaryYAxis='primaryYAxis'
:palettes='palettes'>
      <e-series-collection>
        <e-series :dataSource='seriesData' type='Column'
xName='country' yName='gold' name='Gold'> </e-series>
        <e-series :dataSource='seriesData' type='Column'
xName='country' yName='silver' name='Silver'> </e-series>
        <e-series :dataSource='seriesData' type='Column'
xName='country' yName='bronze' name='Bronze'> </e-series>
      </e-series-collection>
    </ejs-chart>
  </div>
</template>
<script>
import Vue from "vue";
import { ChartPlugin, ColumnSeries, Category } from "@syncfusion/ej2-vue-
charts";
Vue.use(ChartPlugin);
export default {
  data() {
    return {
      seriesData: [
        { country: "USA", gold: 50, silver: 70, bronze: 45 },
        { country: "China", gold: 40, silver: 60, bronze: 55 },
        { country: "Japan", gold: 70, silver: 60, bronze: 50 },

```

```

        { country: "Australia", gold: 60, silver: 56, bronze: 40 },
        { country: "France", gold: 50, silver: 45, bronze: 35 },
        { country: "Germany", gold: 40, silver: 30, bronze: 22 },
        { country: "Italy", gold: 40, silver: 35, bronze: 37 },
        { country: "Sweden", gold: 30, silver: 25, bronze: 27 }
    ],
    primaryXAxis: {
        valueType: 'Category',
        title: 'Countries'
    },
    primaryYAxis:
    {
        minimum: 0, maximum: 80,
        interval: 20, title: 'Medals',
        labelFormat: '${value}K'
    },
    palettes: ["#E94649", "#F6B53F", "#6FAAB0", "#C4C24A"],
    title: "Olympic Medals"
};
},
provide: {
    chart: [ColumnSeries, Category]
}
};
</script>
<style>
    #container {
        height: 350px;
    }
</style>

```

{% previewsample "page.domainurl/code-snippet/chart/axis/category-cs24" %}

### Data point customization

The color of individual data point or data points within a range can be customized using the options below.

#### Point color mapping

You can bind the color for the points from [dataSource](#) for the series using [pointColorMapping](#) property.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-chart id='chartcontainer' :title='title'
        :primaryXAxis='primaryXAxis' :primaryYAxis='primaryYAxis'
        :chartArea='chartArea'>
            <e-series-collection>
                <e-series :pointColorMapping='pointColorMapping'
                :dataSource='seriesData' type='Column' xName='x' yName='y'
                :cornerRadius='cornerRadius'> </e-series>
            </e-series-collection>
        </ejs-chart>
    </div>
</template>
<script>

```

```

import Vue from "vue";
import { ChartPlugin, ColumnSeries, Category } from "@syncfusion/ej2-vue-charts";
Vue.use(ChartPlugin);
export default {
  data() {
    return {
      seriesData: [
        { x: 'Jan', y: 6.96, color: "red" },
        { x: 'Feb', y: 8.9, color: "blue" },
        { x: 'Mar', y: 12, color: "orange" },
        { x: 'Apr', y: 17.5, color: "aqua" },
        { x: 'May', y: 22.1, color: "grey" }
      ],
      primaryXAxis: {
        valueType: 'Category', majorGridLines: { width: 0 }
      },
      pointColorMapping: "color",
      primaryYAxis: {
        lineStyle: { width: 0 },
        majorTickLines: { width: 0 },
        minorTickLines: { width: 0 },
        labelFormat: '{value}°C',
      },
      chartArea: {
        border: {
          width: 0
        }
      },
      title: "USA CLIMATE - WEATHER BY MONTH",
      cornerRadius: {
        topLeft: 10, topRight: 10
      }
    };
  },
  provide: {
    chart: [ColumnSeries, Category]
  }
};
</script>
<style>
  #container {
    height: 350px;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/chart/axis/category-cs25" %}

#### Range color mapping

You can differentiate data points based on their y values using [rangeColorSettings](#) in the chart.

#### APP.VUE

```

<template>
  <div id="app">

```

```

    <ejs-chart id='chartcontainer' :title='title'
:primaryXAxis='primaryXAxis' :primaryYAxis='primaryYAxis'
      :chartArea='chartArea' :legendSettings='legendSettings'
      :selectionMode="selectionMode">
      <e-series-collection>
        <e-series :dataSource='seriesData' type='Column' xName='x'
yName='y' name='USA' :animation='animation' :cornerRadius='cornerRadius'>
      </e-series>
      </e-series-collection>
      <e-rangecolorsettings>

### Animation

You can customize animation for a particular series using [animation](#) property. You can enable or disable animation of the series using `enable` property, `duration` specifies the duration of an animation and `delay` allows us to start the animation at desire time.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-chart id="container" :title='title'
        :primaryXAxis='primaryXAxis' :primaryYAxis='primaryYAxis'
        background='skyblue'>
            <e-series-collection>
                <e-series :dataSource='seriesData' type='Column'
                xName='country' yName='gold' name='Gold'
                :border='border' :animation='animation'> </e-series>
            </e-series-collection>
        </ejs-chart>
    </div>
</template>
<script>
import Vue from "vue";

## Render methods in Vue Chart component

Chart uses following two rendering methods.

- SVG
- Canvas

### SVG

SVG is used to render Chart by default for all browsers except IE8 and old versions.

## Canvas

You can switch between SVG and Canvas rendering by using the `enableCanvas` option. The canvas mode rendering is used in the following scenarios,

- Plotting large number of data points.
- Performing high frequency live updates.

## Limitations

- Animation is not supported.

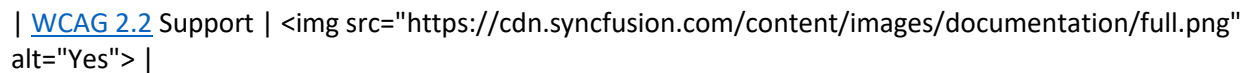

## Accessibility in Vue Chart component

The Chart component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Chart component is outlined below.

| Accessibility Criteria | Compatibility |

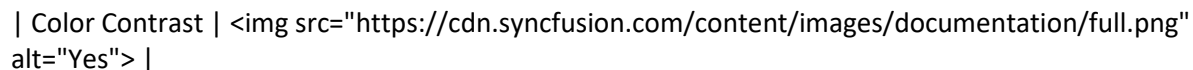

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

```
</style>
```

```
<div> - All features of the component meet the requirement.</div>
```

```
<div> - Some features of the component do not meet the requirement.</div>
```

```
<div> - The component does not meet the requirement.</div>
```

#### WAI-ARIA attributes

The Chart component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Chart component:

- `img` (role)
- `button` (role)
- `region` (role)
- `aria-label` (attribute)
- `aria-hidden` (attribute)
- `aria-pressed` (attribute)

#### Keyboard interaction

The Chart component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Chart component.

| **Press** | **To do this** |

| --- | --- |

| **Alt + J** | Moves the focus to the chart element. |

| **Tab** | Moves the focus to the next element in the chart. |

| **Shift + Tab** | Moves the focus to the previous element in the chart. |

| **Down Arrow** | Moves the focus to the data point left side from the selected point. |

| **Up Arrow** | Moves the focus to the data point right side from the selected point. |

| **Left Arrow** | Moves the focus to the next series in the chart. |

| **Right Arrow** | Moves the focus to the previous series in the chart. |

| **ESC** | Cancel the tooltip for the data point. |

| **Enter/Space** | Selects the data point in the series. |

| **Down/Left Arrow** | Moves the focus to the legend left side from the selected legend. |

| **Up/Right Arrow** | Moves the focus to the legend right side from the selected legend. |

| **Enter/Space** | Toggles the visibility of the corresponding series. |

| **Ctrl + +** | Zoom in the chart. |

| Ctrl + - | Zoom out the chart. |

| Down/Up Arrow | Pan the chart vertically. |

| Left/Right Arrow | Pan the chart horizontally. |

| R | Reset the zoomed chart. |

| Ctrl + P | Prints the Chart. |

### Ensuring accessibility

The Chart component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Chart component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Chart component with accessibility tools.

```
{% previewsample "https://ej2.syncfusion.com/accessibility/chart.html" %}
```

See also

- [Accessibility in Syncfusion Vue components](#)

### Internationalization in Vue Chart component

Chart provide supports for internationalization for below chart elements.

- Datalabel.
- Axis label.
- Tooltip.

For more information about number and date formatter you can refer [internationalization](#).

<!-- markdownlint-disable MD036 -->

### Globalization

Globalization is the process of designing and developing an component that works in different cultures/locales. Internationalization library is used to globalize number, date, time values in Chart component using `labelFormat` property in axis.

### Numeric Format

In the below example axis, point and tooltip labels are globalized to EUR.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-chart id="container" :title='title'
:primaryXAxis='primaryXAxis' :primaryYAxis='primaryYAxis'
:zoomSettings='zoom' :tooltip='tooltip'>
      <e-series-collection>
        <e-series :dataSource='seriesData' type='Column' xName='x'
yName='y' name='Product X' :marker='marker'> </e-series>
        <e-series :dataSource='seriesData' type='Column' xName='x'
yName='y1' name='Product Y' :marker='marker'> </e-series>
      </e-series-collection>
    </div>
  </template>
```

```

    </ejs-chart>
  </div>
</template>
<script>
import Vue from "vue";
import { ChartPlugin, ColumnSeries, Category, Tooltip, Zoom, DataLabel }
from "@syncfusion/ej2-vue-charts";

```

### Localization in Vue Chart component

Localization library allows to localize the default text content of Chart. In Chart component,

it has the static text on some features(like zooming toolbars)

and this can be changed to any other culture(Arabic, Deutsch, French, etc) by defining the locale value and translation object.

<!-- markdownlint-disable MD033 -->

Locale key words	Text to display
Zoom	Zoom
ZoomIn	ZoomIn
ZoomOut	ZoomOut
Reset	Reset
Pan	Pan
ResetZoom	Reset Zoom

To load translation object in an application use load function of L10n class.

For more information about localization, refer this

[localization](#)

### APP.VUE

```
<template>
  <div id="app">
    <ejs-chart id="container" :locale='locale' :title='title'
:primaryXAxis='primaryXAxis' :zoomSettings='zoom'>
      <e-series-collection>
        <e-series :dataSource='seriesData' type='Area' xName='x'
yName='y' name='Product X'> </e-series>
        <e-series :dataSource='seriesData' type='Area' xName='x'
yName='y1' name='Product Y'> </e-series>
      </e-series-collection>
    </ejs-chart>
  </div>
</template>
<script>
import Vue from "vue";
import { ChartPlugin, AreaSeries, Category, Zoom } from "@syncfusion/ej2-
vue-charts";
import { L10n } from '@syncfusion/ej2-base';
Vue.use(ChartPlugin);
L10n.load({
  'ar-AR': {
    'chart': {
```

```

        ZoomIn: 'تكبير',
        ZoomOut: 'تصغير',
        Zoom: 'زوم',
        Pan: 'مقللة',
        Reset: 'إعادة تعيين',
    },
  },
});
export default {
  data() {

```

## How To

```
<!-- markdownlint-disable MD036 -->
```

### Hide tool tip in Vue Chart component

By using the [tooltipRender](#) event, you can cancel the tooltip for unselected series in the chart.

To hide the tooltip value in unselected series, follow the given steps:

#### Step 1:

By using the [tooltipRender](#) event, you can get the series elements in the arguments. By using this argument we can compare whether `seriesElementclasslist` is deselected container or not. If it is true then we cancel the tooltip by setting the value for `args.cancel` as `true`.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-chart id="container" :title='title'
:primaryXAxis='primaryXAxis' :primaryYAxis='primaryYAxis'
selectionMode='Series'
:tooltipRender='tooltipRender' :tooltip='tooltip'>
      <e-series-collection>
        <e-series :dataSource='seriesData' type='Column'
xName='country' yName='gold' name='Gold'> </e-series>
        <e-series :dataSource='seriesData' type='Column'
xName='country' yName='silver' name='Silver'> </e-series>
      </e-series-collection>
    </ejs-chart>
  </div>
</template>
<script>
import Vue from "vue";
import { ChartPlugin, ColumnSeries, Category, Selection, Series, Tooltip }
from "@syncfusion/ej2-vue-charts";
Vue.use(ChartPlugin);
export default {
  data() {
    return {
      seriesData: [
        { country: "USA", gold: 50, silver: 60 },
        { country: "China", gold: 40, silver: 50 },
        { country: "Japan", gold: 70, silver: 80 },
        { country: "Australia", gold: 60, silver: 70 },
        { country: "France", gold: 50, silver: 60 },
        { country: "Germany", gold: 40, silver: 50 },
        { country: "Italy", gold: 40, silver: 50 },
        { country: "Sweden", gold: 30, silver: 70 }
      ],
      primaryXAxis: {
        valueType: 'Category',
        title: 'Countries'
      },
      primaryYAxis: {
        minimum: 0, maximum: 80,
        interval: 20, title: 'Medals'
      },
      title: "Olympic Medals",
      tooltip: { enable: true }
    };
  },
  provide: {
    chart: [ColumnSeries, Category, Selection, Tooltip]
  },
  methods: {
    tooltipRender: function(args) {
```

```

    var series = (args.series);
    if (series.seriesElement.classList[0] === 'container_ej2_deselected')
    {
        args.cancel = true;
    }
}
};
</script>
<style>
#container {
    height: 350px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/chart/axis/category-cs30" %}

<!-- markdownlint-disable MD036 -->

### Dotted line in Vue Chart component

By using **annotation**, you can add dotted lines in the chart.

To add dotted lines in the chart, follow the given steps:

#### Step 1:

Initialize the custom elements by using the **annotation** property.

By setting **coordinateUnits** value as **point** in annotation object you can placed dotted lines in the chart based on point x and y values.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-chart id="container" :title='title'
:primaryXAxis='primaryXAxis' :primaryYAxis='primaryYAxis'
:annotations='annotations'>
      <e-series-collection>
        <e-series :dataSource='seriesData' type='Line'
xName='country' yName='gold' name='Gold'> </e-series>
      </e-series-collection>
    </ejs-chart>
  </div>
</template>
<script>
import Vue from "vue";
import { ChartPlugin, LineSeries, Category, Selection, ChartAnnotation }
from "@syncfusion/ej2-vue-charts";
Vue.use(ChartPlugin);
export default {
  data() {
    return {
      seriesData: [
        { country: "USA", gold: 50, silver: 60 },
        { country: "China", gold: 40, silver: 50 },
        { country: "Japan", gold: 70, silver: 80 },

```

```

        { country: "Australia", gold: 60, silver: 70 },
        { country: "France", gold: 50, silver: 60 },
        { country: "Germany", gold: 40, silver: 50 },
        { country: "Italy", gold: 40, silver: 50 },
        { country: "Sweden", gold: 30, silver: 70 }
      ],
      primaryXAxis: {
        valueType: 'Category',
        title: 'Countries'
      },
      primaryYAxis:
      {
        minimum: 0, maximum: 80,
        interval: 20, title: 'Medals'
      },
      annotations:[{
        content: '<div style="border-top:3px dashed grey;border-top-width:
2px; width: 1000px"></div>',
        coordinateUnits: 'Point',
        x: 'France',
        y: 50
      }],
      title: "Olympic Medals"
    };
  },
  provide: {
    chart: [LineSeries, Category, Selection, ChartAnnotation]
  },
  methods: {
  }
};
</script>
<style>
  #container {
    height: 350px;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/chart/axis/category-cs28" %}

<!-- markdownlint-disable MD036 -->

### Dynamic chart in Vue Chart component

By using html button, you can add the chart dynamically when click the button.

To add the chart dynamically through button click, follow the given steps:

#### Step 1:

Initially create the html button.

Then create chart inside of button `onClick` function. Now click the button charts will render based on click count.

The following code sample demonstrates the output.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-button @click.native="addChart">Add Chart</ejs-button>
  </div>
</template>
<script>
import Vue from 'vue';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { Chart } from '@syncfusion/ej2-charts';
import { ChartPlugin, LineSeries, Category, Selection, Series, Tooltip }
from '@syncfusion/ej2-vue-charts';
Chart.Inject(LineSeries);
Vue.use(ChartPlugin);
Vue.use(ButtonPlugin);
var count = 1;
export default {
  data () {
    return {
      seriesData: [
        { x: 1, y: 21 }, { x: 2, y: 24 },
        { x: 3, y: 36 }, { x: 4, y: 38 },
        { x: 5, y: 54 }, { x: 6, y: 57 },
        { x: 7, y: 70 }
      ],
      title: "Inflation - Consumer Price"
    }
  },
  provide: {
    chart: [LineSeries]
  },
  methods: {
    addChart: function(e) {
      var chartEle = document.createElement('div');
      chartEle.id = 'container' + count;
      document.getElementsByTagName('body')[0].appendChild(chartEle);
      let chart = new Chart({
        series: [{
          type: 'Line', xName: 'x', width: 2, marker: { visible: true },
          yName: 'y', name: 'Germany',
          dataSource: [{ x: 1, y: 21 }, { x: 2, y: 24 }, { x: 3, y: 36 },
            { x: 4, y: 38 }, { x: 5, y: 54 }, { x: 6, y: 57 }, { x:
7, y: 70 } ],
          title: 'Inflation - Consumer Price', tooltip: { enable: true },
height: '400', width: '800'
        }
      ]
    }
  }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';

## CheckBox

### Getting Started with the Vue Checkbox Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLI](#) and integrating the Syncfusion Vue Checkbox component using the [Composition API](#) / [Options API](#).

#### Prerequisites

[System requirements for Syncfusion Vue UI components](#)

#### Dependencies

The list of dependencies required to use the Checkbox component in your application is given below:

```
`js
|-- @syncfusion/ej2-vue-buttons
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-vue-base
`,`
```

#### Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```
`bash
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
`,`

or

`bash
yarn global add @vue/cli
vue create quickstart
cd quickstart
yarn run serve
`,`
```

When creating a new project, choose the option **Default ([Vue 2] babel, eslint)** from the menu.

```
E:\samples>vue create quickstart

Vue CLI v5.0.8
? Please pick a preset:
  Default ([Vue 3] babel, eslint)
> Default ([Vue 2] babel, eslint)
  Manually select features
```

Once the `quickstart` project is set up with default settings, proceed to add Syncfusion components to the project.

### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.npmjs.com). To use Vue components, install the required npm package.

This article uses the [Vue Checkbox component](#) as an example. Install the `@syncfusion/ej2-vue-buttons` package by running the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-buttons --save
```

```
,
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-buttons
```

```
,
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the `Material` theme is applied using CSS styles, which are available in installed packages. The necessary `Material` CSS styles for the Checkbox component and its dependents were imported into the `<style>` section of `src/App.vue` file.

### ~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
```

### Add Syncfusion Vue component

Follow the below steps to add the Vue Checkbox component using `Composition API` or `Options API`:

1\ First, import and register the Checkbox component in the `script` section of the `src/App.vue` file. If you are using the `Composition API`, you should add the `setup` attribute to the `script` tag to indicate that Vue will be using the `Composition API`.

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<script setup>
import { CheckBoxComponent as EjsCheckbox } from "@syncfusion/ej2-vue-
buttons";
</script>
```

#### **OPTIONS API (~SRC/APP.VUE)**

```
<script>
import { CheckBoxComponent } from "@syncfusion/ej2-vue-buttons";
export default {
  components: {
    'ejs-checkbox': CheckBoxComponent
  }
}
</script>
```

2\ In the `template` section define the Checkbox component with the [label](#)

#### **~/SRC/APP.VUE**

```
<template>
<ejs-checkbox label='Default'></ejs-checkbox>
</template>
```

Here is the summarized code for the above steps in the `src/App.vue` file:

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<template>
<ejs-checkbox label='Default'></ejs-checkbox>
</template>
<script setup>
import { CheckBoxComponent as EjsCheckbox } from "@syncfusion/ej2-vue-
buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  .e-checkbox-wrapper {
    margin-top: 18px;
  }
</style>
```

#### **OPTIONS API (~SRC/APP.VUE)**

```
<template>
<ejs-checkbox label='Default'></ejs-checkbox>
```

```

</template>
<script>
import { CheckBoxComponent } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
  components: {
    'ejs-checkbox': CheckBoxComponent
  }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  .e-checkbox-wrapper {
    margin-top: 18px;
  }
</style>

```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run serve
```

```
,
```

or

```
`bash
```

```
yarn run serve
```

```
,
```

```
{% previewsample "page.domainurl/code-snippet/check-box/default-cs2" %}
```

### Change the Checkbox state

The Essential JS 2 Checkbox contains 3 different states visually, they are:

- Checked
- Unchecked
- Indeterminate

The Checkbox [checked](#) property is used to handle the checked and unchecked state. In checked state a tick mark will be added to the visualization of Checkbox.

#### Indeterminate

The Checkbox indeterminate state can be set through [indeterminate](#) property. Checkbox indeterminate state masks the real value of Checkbox visually. The Checkbox cannot be changed to indeterminate state through the user interface, this state can be achieved only through the property.

### COMPOSITION API (~SRC/APP.VUE)

```

<template>
<ul>

```

```
<li><ejs-checkbox label='Checked State' checked=true></ejs-checkbox></li>
<li><ejs-checkbox label='Unchecked State'></ejs-checkbox></li>
<li><ejs-checkbox label='Indeterminate State' indeterminate=true></ejs-
checkbox></li>
</ul>
</template>
<script setup>
import { CheckBoxComponent as EjsCheckbox } from "@syncfusion/ej2-vue-
buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  .e-checkbox-wrapper {
    margin-top: 18px;
  }
  li {
    list-style: none;
  }
</style>
```

#### **OPTIONS API (~SRC/APP.VUE)**

```
<template>
<ul>
<li><ejs-checkbox label='Checked State' checked=true></ejs-checkbox></li>
<li><ejs-checkbox label='Unchecked State'></ejs-checkbox></li>
<li><ejs-checkbox label='Indeterminate State' indeterminate=true></ejs-
checkbox></li>
</ul>
</template>
<script>
import { CheckBoxComponent } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
  components: {
    'ejs-checkbox': CheckBoxComponent
  }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  .e-checkbox-wrapper {
    margin-top: 18px;
  }
  li {
    list-style: none;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/check-box/default-cs3" %}

## Getting Started with the Vue CheckBox Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue CheckBox component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

### Prerequisites

#### [System requirements for Syncfusion Vue UI components](#)

#### Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm create vite@latest
```

```
`
```

or

```
`bash
```

```
yarn create vite
```

```
`
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as **my-project** for this article.

```
`bash
```

```
? Project name: » my-project
```

```
`
```

2. Select **Vue** as the framework. It will create a Vue 3 project.

```
`bash
```

```
? Select a framework: » - Use arrow-keys. Return to submit.
```

```
Vanilla
```

```
Vue
```

```
React
```

```
Preact
```

```
Lit
```

Svelte

Others

,

3. Choose **JavaScript** as the framework variant to build this Vite project using JavaScript and Vue.

```
`bash
```

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

,

4. Upon completing the aforementioned steps to create the **my-project**, run the following command to install its dependencies:

```
`bash
```

```
cd my-project
```

```
npm install
```

,

or

```
`bash
```

```
cd my-project
```

```
yarn install
```

,

Now that **my-project** is ready to run with default settings, let's add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue CheckBox component](#) as an example. To use the Vue Button component in the project, the **@syncfusion/ej2-vue-buttons** package needs to be installed using the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-buttons --save
```

,

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-buttons
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, **Material** theme is applied using CSS styles, which are available in installed packages. The necessary **Material** CSS styles for the CheckBox component and its dependents were imported into the `<style>` section of **src/App.vue** file.

#### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

### Add Syncfusion Vue component

Follow the below steps to add the Vue CheckBox component using **Composition API** or **Options API**:

1.First, import and register the CheckBox component and its child directives in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { CheckBoxComponent as EjsCheckBox } from "@syncfusion/ej2-vue-
buttons";
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { CheckBoxComponent } from "@syncfusion/ej2-vue-buttons";
//Component registration
export default {
  name: "App",
  components: {
    "ejs-checkbox": CheckBoxComponent
  }
}
</script>
```

2.In the **template** section, define the CheckBox component with the **label** property.

#### ~/SRC/APP.VUE

```
<template>
<ejs-checkbox label='Default'></ejs-checkbox>
```

```
</template>
```

3. Declare the label property in the script section.

### COMPOSITION API (~ /SRC/APP.VUE)

```
<template>
<ejs-checkbox label='Default'></ejs-checkbox>
</template>
<script setup>
import { CheckBoxComponent as EjsCheckBox } from "@syncfusion/ej2-vue-buttons";
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
</style>
```

### OPTIONS API (~ /SRC/APP.VUE)

```
<template>
<ejs-checkbox label='Default'></ejs-checkbox>
</template>
<script>
import { CheckBoxComponent } from "@syncfusion/ej2-vue-buttons";
//Component registration
export default {
name: "App",
components: {
"ejs-checkbox": CheckBoxComponent
}
}
</script>
```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
,
```

or

```
`bash
```

```
yarn run dev
```

```
,
```

The output will appear as follows:

☒ Default

**Sample:** [vue-3-checkbox-getting-started](#).

For migrating from Vue 2 to Vue 3, refer to the [migration](#) documentation.

## Label and size in Vue Check box component

This section explains the different sizes and labels.

### Label

The CheckBox caption can be defined by using the [label](#) property. This reduces the manual addition of label for CheckBox. You can customize the label position before or after the CheckBox through the [labelPosition](#) property.

#### APP.VUE

```
<template>
<ul>
<li><ejs-checkbox label='Left Side Label' labelPosition='Before'></ejs-
checkbox></li>
<li><ejs-checkbox label='Right Side Label' checked=true></ejs-checkbox></li>
</ul>
</template>
<script>
import Vue from 'vue';
import { CheckBoxPlugin } from '@syncfusion/ej2-vue-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(CheckBoxPlugin);
export default {}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  .e-checkbox-wrapper {
    margin-top: 18px;
  }
  li {
    list-style: none;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/check-box/default-cs9" %}

### Size

The different CheckBox sizes available are default and small. To reduce the size of default CheckBox to small, set the [cssClass](#) property to `e-small`.

#### APP.VUE

```
<template>
<ul>
<li><ejs-checkbox label='Small' cssClass='e-small'></ejs-checkbox></li>
<li><ejs-checkbox label='Default'></ejs-checkbox></li>
```

```

</ul>
</template>
<script>
import Vue from 'vue';
import { CheckBoxPlugin } from '@syncfusion/ej2-vue-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(CheckBoxPlugin);
export default {}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  .e-checkbox-wrapper {
    margin-top: 18px;
  }
  li {
    list-style: none;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/check-box/default-cs10" %}

## Accessibility in Vue Check box component

The Check box component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Check box component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The Check box component followed the [WAI-ARIA](https://www.w3.org/WAI/ARIA/apg/patterns/Check box/) patterns to meet the accessibility. The following ARIA attributes are used in the Check box component:

| Attributes | Purpose |

| --- | --- |

| **aria-disabled** | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |

### Keyboard interaction

The Check box component followed the [keyboard interaction](https://www.w3.org/WAI/ARIA/apg/patterns/Check box/#keyboardinteraction) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Check box component.

| **Press** | **To do this** |

| --- | --- |

| **Space** | When the Check box has focus, pressing the Space key changes the state of the Check box. |

### Ensuring accessibility

The Check box component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Check box component is shown in the following sample. Open the [sample](https://ej2.syncfusion.com/accessibility/Check box.html) in a new window to evaluate the accessibility of the Check box component with accessibility tools.

{% previewsample "page.domainurl/code-snippet/check-box/default-cs1" %}

- [Accessibility in Syncfusion Vue components](#)

### Two way binding in Vue Check box component

It can be achieved by using the `v-model` directive in Vue. In the following sample, when you check or uncheck a value in one CheckBox will automatically check or unchecks the value in the other CheckBox. It updates the other CheckBox using `value` property.

#### APP.VUE

```
<template>
<div>
<div id="wrapper1">
<ejs-checkbox label='Default' v-model="value" :checked="value"></ejs-
checkbox>
</div>
<div id="wrapper2">
<ejs-checkbox label='Default' v-model="value" :checked="value"></ejs-
checkbox>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { CheckBoxPlugin } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(CheckBoxPlugin);
export default {
  data() {
    return {
      value: true
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
.e-checkbox-wrapper {
  margin-top: 18px;
}
#wrapper1 {
  float: left;
  padding: 0 0 0 80px;
}
#wrapper2 {
  float: right;
```

```
padding: 0 460px 0 0;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/radio-button/default-cs1" %}

### Style and appearance in Vue Check box component

To modify the CheckBox appearance, you need to override the default CSS of CheckBox component. Please find the list of CSS classes and its corresponding section in CheckBox. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

#### CSS Class | Purpose of Class

- |.e-checkbox-wrapper .e-frame|To customize the checkbox frame.
- |.e-checkbox-wrapper:hover .e-frame|To customize the checkbox frame on hover.
- |.e-checkbox-wrapper .e-label|To customize the checkbox label.
- |.e-checkbox-wrapper:hover .e-label|To customize the checkbox label on hover.
- |.e-checkbox-wrapper .e-frame.e-check|To customize the checked checkbox.
- |.e-checkbox-wrapper:hover .e-frame.e-check|To customize the checked checkbox when hover

### How To

#### Customized checkbox in Vue Check box component

##### *Customize CheckBox Appearance*

You can customize the appearance of the CheckBox component using the CSS rules. Define own CSS rules according to your requirement and assign the class name to the [cssClass](#) property.

The background and border color of the CheckBox is customized through the custom classes to create primary, success, warning, and danger info type of checkbox.

#### **APP.VUE**

```
<template>
<ul>
<li><ejs-checkbox label='Primary' cssClass='e-primary' checked=true></ejs-
checkbox></li>
<li><ejs-checkbox label='Success' cssClass='e-success' checked=true></ejs-
checkbox></li>
<li><ejs-checkbox label='Info' cssClass='e-info' checked=true></ejs-
checkbox></li>
<li><ejs-checkbox label='Warning' cssClass='e-warning' checked=true></ejs-
checkbox></li>
<li><ejs-checkbox label='Danger' cssClass='e-danger' checked=true></ejs-
checkbox></li>
</ul>
</template>
<script>
import Vue from 'vue';
import { CheckBoxPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(CheckBoxPlugin);
export default {}
</script>
<style>
```

```

@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
li {
    list-style: none;
}
.e-checkbox-wrapper {
    margin-top: 18px;
}
.e-checkbox-wrapper.e-primary:hover .e-frame.e-check { /* csslint allow:
adjoining-classes */
    background-color: #e03872;
}
.e-checkbox-wrapper.e-success .e-frame.e-check,
.e-checkbox-wrapper.e-success .e-checkbox:focus + .e-frame.e-check { /*
csslint allow: adjoining-classes */
    background-color: #689f38;
}
.e-checkbox-wrapper.e-success:hover .e-frame.e-check { /* csslint allow:
adjoining-classes */
    background-color: #449d44;
}
.e-checkbox-wrapper.e-info .e-frame.e-check,
.e-checkbox-wrapper.e-info .e-checkbox:focus + .e-frame.e-check { /* csslint
allow: adjoining-classes */
    background-color: #2196f3;
}
.e-checkbox-wrapper.e-info:hover .e-frame.e-check { /* csslint allow:
adjoining-classes */
    background-color: #0b7dda;
}
.e-checkbox-wrapper.e-warning .e-frame.e-check,
.e-checkbox-wrapper.e-warning .e-checkbox:focus + .e-frame.e-check { /*
csslint allow: adjoining-classes */
    background-color: #ef6c00;
}
.e-checkbox-wrapper.e-warning:hover .e-frame.e-check { /* csslint allow:
adjoining-classes */
    background-color: #cc5c00;
}
.e-checkbox-wrapper.e-danger .e-frame.e-check,
.e-checkbox-wrapper.e-danger .e-checkbox:focus + .e-frame.e-check { /*
csslint allow: adjoining-classes */
    background-color: #d84315;
}
.e-checkbox-wrapper.e-danger:hover .e-frame.e-check { /* csslint allow:
adjoining-classes */
    background-color: #ba3912;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/check-box/default-cs4" %}

#### Custom Frame

CheckBox frame can be customized as per the requirement by adding CSS rules.

In the following example, to-do list is displayed with round checkbox by changing **border-radius** as **100%** by adding **e-custom** class.

### APP.VUE

```
<template>
<ul>
<li><ejs-checkbox label='Buy Groceries' cssClass='e-custom'
checked=true></ejs-checkbox></li>
<li><ejs-checkbox label='Pay Rent' cssClass='e-custom'></ejs-checkbox></li>
<li><ejs-checkbox label='Make Dinner' cssClass='e-custom'></ejs-
checkbox></li>
<li><ejs-checkbox label='Finish To-do List Article' cssClass='e-
custom'></ejs-checkbox></li>
</ul>
</template>
<script>
import Vue from 'vue';
import { CheckBoxPlugin } from '@syncfusion/ej2-vue-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(CheckBoxPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
li {
list-style: none;
}
.e-checkbox-wrapper {
margin-top: 18px;
}
.e-custom .e-frame {
border-radius: 100%;
}
.e-checkicon.e-checkbox-wrapper .e-frame.e-check::before {
content: '\e77d';
}
.e-checkicon.e-checkbox-wrapper .e-check {
font-size: 8.5px;
}
.e-checkicon.e-checkbox-wrapper .e-frame.e-check {
background-color: white;
border-color: grey;
color: grey;
}
.e-checkicon.e-checkbox-wrapper:hover .e-frame.e-check {
background-color: white;
border-color: grey;
color: grey;
}
.e-checkicon.e-checkbox-wrapper .e-checkbox:focus + .e-frame.e-check {
background-color: white;
border-color: grey;
box-shadow: none;
color: grey;
}
```

```
}
</style>
```

{% previewsample "page.domainurl/code-snippet/check-box/default-cs5" %}

### Custom Check Icon

CheckBox check icon can be customized as per the requirement by adding CSS rules.

In the following example, the check icon can be customized by changing check icon content, background and border color in focus and hovered states by adding `e-checkicon` class.

### APP.VUE

```
<template>
<ul>
<li><ejs-checkbox label='Buy Groceries' cssClass='e-checkicon'
checked=true></ejs-checkbox></li>
<li><ejs-checkbox label='Pay Rent' cssClass='e-checkicon'></ejs-
checkbox></li>
<li><ejs-checkbox label='Make Dinner' cssClass='e-checkicon'></ejs-
checkbox></li>
<li><ejs-checkbox label='Finish To-do List Article' cssClass='e-
checkicon'></ejs-checkbox></li>
</ul>
</template>
<script>
import Vue from 'vue';
import { CheckBoxPlugin } from '@syncfusion/ej2-vue-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(CheckBoxPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
li {
list-style: none;
}
@font-face {
font-family: 'btn-icon';
src:
url(data:application/x-font-ttf;charset=utf-

### Name and value in form submit in Vue Check box component

The [name](#) attribute of the CheckBox is used to group Checkboxes. When the Checkboxes are grouped in form, the checked items [value](#) attribute will post to the server on form submit that can be retrieved through the name. The disabled and unchecked CheckBox value will not be sent to the server on form submit.

In the following code snippet, Cricket and Hockey are in the [checked](#) state, Tennis is in [disabled](#) state and Basketball is in unchecked state. Now, the value that is in checked state only be sent on form submit.

### APP.VUE

```

<template>
<form>
<ul>
<li><ejs-checkbox name='Sport' value='Cricket' label='Cricket'
checked=true></ejs-checkbox></li>
<li><ejs-checkbox name='Sport' value='Hockey' label='Hockey'
checked=true></ejs-checkbox></li>
<li><ejs-checkbox name='Sport' value='Tennis' label='Tennis'
disabled=true></ejs-checkbox></li>
<li><ejs-checkbox name='Sport' value='Basketball' label='Basketball'></ejs-
checkbox></li>
<li><ejs-button isPrimary=true>Submit</ejs-button></li>
</ul>
</form>
</template>
<script>
import Vue from 'vue';
import { CheckBoxPlugin, ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(CheckBoxPlugin);
Vue.use(ButtonPlugin);
export default {}
</script>
<style>
    @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';

```

```
.e-checkbox-wrapper {
  margin-top: 18px;
}
button {
  margin: 20px 0 0 5px;
}
li {
  list-style: none;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/check-box/default-cs7" %}

### Right to left in Vue Check box component

CheckBox component has RTL support. This can be achieved by setting [enableRtl](#) as `true`.

The following example illustrates how to enable right-to-left support in CheckBox component.

#### APP.VUE

```
<template>
<ejs-checkbox label='Default' enableRtl=true></ejs-checkbox>
</template>
<script>
import Vue from 'vue';
import { CheckBoxPlugin } from '@syncfusion/ej2-vue-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(CheckBoxPlugin);
export default {}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  .e-checkbox-wrapper {
    margin-top: 18px;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/check-box/default-cs8" %}

## Chips

### Getting Started with the Vue Chips Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLI](#) and integrating the Syncfusion Vue Chips component using the [Composition API](#) / [Options API](#).

#### Prerequisites

##### [System requirements for Syncfusion Vue UI components](#)

#### Dependencies

The list of dependencies required to use the Chip component in your application is given below :

```
`js
```

```
|-- @syncfusion/ej2-vue-buttons  
|-- @syncfusion/ej2-base  
|-- @syncfusion/ej2-buttons  
|-- @syncfusion/ej2-vue-base  
,
```

### Setting up the Vue 2 project

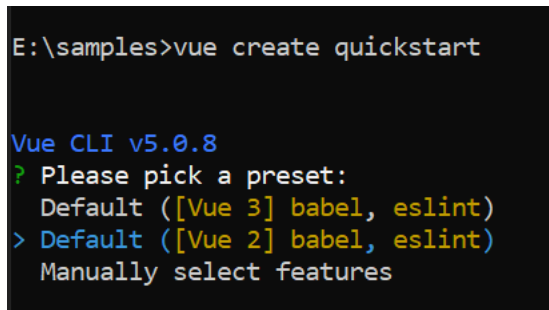

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```
`bash  
npm install -g @vue/cli  
vue create quickstart  
cd quickstart  
npm run serve  
,
```

or

```
`bash  
yarn global add @vue/cli  
vue create quickstart  
cd quickstart  
yarn run serve  
,
```

When creating a new project, choose the option **Default ([Vue 2] babel, eslint)** from the menu.

```
E:\samples>vue create quickstart  
  
Vue CLI v5.0.8  
? Please pick a preset:  
  Default ([Vue 3] babel, eslint)  
> Default ([Vue 2] babel, eslint)  
  Manually select features
```

Once the **quickstart** project is set up with default settings, proceed to add Syncfusion components to the project.

### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.syncfusion.com/). To use Vue components, install the required npm package.

This article uses the [Vue Chips component](#) as an example. Install the `@syncfusion/ej2-vue-buttons` package by running the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-buttons --save
```

```
,
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-buttons
```

```
,
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the `Material` theme is applied using CSS styles, which are available in installed packages. The necessary `Material` CSS styles for the Chips component and its dependents were imported into the `<style>` section of `src/App.vue` file.

#### ~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css';
</style>
```

### Add Syncfusion Vue component

Follow the below steps to add the Vue Chips component using `Composition API` or `Options API`:

1\ First, import and register the Chips component in the `script` section of the `src/App.vue` file. If you are using the `Composition API`, you should add the `setup` attribute to the `script` tag to indicate that Vue will be using the `Composition API`.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { ChipListComponent as EjsChiplist } from '@syncfusion/ej2-vue-buttons';
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { ChipListComponent } from '@syncfusion/ej2-vue-buttons';
export default {
  components: {
    'ejs-chiplist': ChipListComponent
  }
}
</script>
```

2\ In the `template` section, define the Chips component with the `text` property.

#### ~/SRC/APP.VUE

```
<template>
<ejs-chiplist id="chip" text="Janet Leverling"></ejs-chiplist>
</template>
```

Here is the summarized code for the above steps in the `src/App.vue` file:

#### COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <ejs-chiplist id="chip" text="Janet Leverling"></ejs-chiplist>
</template>
<script setup>
import { ChipListComponent as EjsChiplist } from '@syncfusion/ej2-vue-
buttons';
</script>
<style>
@import '../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css';
</style>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<template>
  <ejs-chiplist id="chip" text="Janet Leverling"></ejs-chiplist>
</template>
<script>
import { ChipListComponent } from '@syncfusion/ej2-vue-buttons';
export default {
  components: {
    'ejs-chiplist': ChipListComponent
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css';
</style>
```

#### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run serve
```

```
`
```

or

```
`bash
```

```
yarn run serve
```

```
{% previewsample "page.domainurl/code-snippet/chips/default-cs8" %}
```

## Getting Started with the Vue Chips Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue Chips component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

### Prerequisites

#### [System requirements for Syncfusion Vue UI components](#)

#### Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm create vite@latest
```

```
`
```

or

```
`bash
```

```
yarn create vite
```

```
`
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as **my-project** for this article.

```
`bash
```

```
? Project name: » my-project
```

```
`
```

2. Select **Vue** as the framework. It will create a Vue 3 project.

```
`bash
```

```
? Select a framework: » - Use arrow-keys. Return to submit.
```

```
Vanilla
```

```
Vue
```

```
React
```

Preact

Lit

Svelte

Others

,

3. Choose **JavaScript** as the framework variant to build this Vite project using JavaScript and Vue.

```
`bash
```

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

,

4. Upon completing the aforementioned steps to create the **my-project**, run the following command to install its dependencies:

```
`bash
```

```
cd my-project
```

```
npm install
```

,

or

```
`bash
```

```
cd my-project
```

```
yarn install
```

,

Now that **my-project** is ready to run with default settings, let's add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue Chips component](#) as an example. To use the Vue Chips component in the project, the **@syncfusion/ej2-vue-buttons** package needs to be installed using the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-buttons --save
```

,

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-buttons
```

```
,
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, **Material** theme is applied using CSS styles, which are available in installed packages. The necessary **Material** CSS styles for the Chips component and its dependents were imported into the `<style>` section of **src/App.vue** file.

#### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
</style>
```

### Add Syncfusion Vue component

Follow the below steps to add the Vue Chips component using **Composition API** or **Options API**:

1.First, import and register the Grid component and its child directives in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**. Find the list of child directives and the tag names that can be used in the Chips component in the following table.

Directive Name	Tag Name
-----	-----
ChipsDirective	e-chips
ChipDirective	e-chip

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { ChipListComponent as EjsChiplist, ChipsDirective as EChips,
ChipDirective as EChip } from '@syncfusion/ej2-vue-buttons';
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { ChipListComponent, ChipsDirective, ChipDirective } from
'@syncfusion/ej2-vue-buttons';
//Component registration
export default {
name: "App",
components: {
```

```
'ejs-chiplist': ChipListComponent,
"e-chips": ChipsDirective,
"e-chip": ChipDirective
}
}
</script>
```

2. Add the component definition in template section.

### ~/SRC/APP.VUE

```
<template>
<ejs-chiplist id="chip">
<e-chips>
<e-chip text="Andrew"></e-chip>
<e-chip text="Janet"></e-chip>
<e-chip text="Laura"></e-chip>
<e-chip text="Margaret"></e-chip>
</e-chips>
</ejs-chiplist>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

### COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-chiplist id="chip">
<e-chips>
<e-chip text="Andrew"></e-chip>
<e-chip text="Janet"></e-chip>
<e-chip text="Laura"></e-chip>
<e-chip text="Margaret"></e-chip>
</e-chips>
</ejs-chiplist>
</template>
<script setup>
import { ChipListComponent as EjsChiplist, ChipsDirective as EChips,
ChipDirective as EChip } from '@syncfusion/ej2-vue-buttons';
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
</style>
```

### OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-chiplist id="chip">
<e-chips>
<e-chip text="Andrew"></e-chip>
<e-chip text="Janet"></e-chip>
<e-chip text="Laura"></e-chip>
<e-chip text="Margaret"></e-chip>
</e-chips>
</ejs-chiplist>
```

```
</template>
<script>
import { ChipListComponent, ChipsDirective, ChipDirective } from
'@syncfusion/ej2-vue-buttons';
//Component registration
export default {
  name: "App",
  components: {
    'ejs-chiplist': ChipListComponent,
    "e-chips": ChipsDirective,
    "e-chip": ChipDirective
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
</style>
```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
,
```

or

```
`bash
```

```
yarn run dev
```

```
,
```

The output will appear as follows:

Andrew Janet Laura Margaret

For migrating from Vue 2 to Vue 3, refer to the [migration](#) documentation.

- [Getting Started with Vue UI Components using Options API and TypeScript](#)

### Types in Vue Chips component

The ChipList control has the following types.

- Input Chip
- Choice Chip

- Filter Chip
- Action Chip

### Input Chip

Input Chip holds information in compact form. It converts user input into chips.

#### APP.VUE

```
<template>
  <ejs-chiplist id="chip">
    <e-chips>
      <e-chip text="Andrew"></e-chip>
      <e-chip text="Janet"></e-chip>
      <e-chip text="Laura"></e-chip>
      <e-chip text="Margaret"></e-chip>
    </e-chips>
  </ejs-chiplist>
</template>
<script>
import Vue from 'vue';
import { ChipListPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(ChipListPlugin);
export default {}
</script>
```

{% previewsample "page.domainurl/code-snippet/chips/default-cs9" %}

### Choice Chip

Choice Chip allows you to select a single chip from the set of ChipList/ChipCollection. It can be enabled by setting the **selection** property to **Single**.

#### APP.VUE

```
<template>
  <ejs-chiplist id="chip" selection="Single">
    <e-chips>
      <e-chip text="Small"></e-chip>
      <e-chip text="Medium"></e-chip>
      <e-chip text="Large"></e-chip>
      <e-chip text="Extra Large"></e-chip>
    </e-chips>
  </ejs-chiplist>
</template>
<script>
import Vue from 'vue';
import { ChipListPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(ChipListPlugin);
export default {}
</script>
```

{% previewsample "page.domainurl/code-snippet/chips/default-cs10" %}

### Filter Chip

Filter Chip allows you to select a multiple chip from the set of ChipList/ChipCollection. It can be enabled by setting the **selection** property to **Multiple**.

**APP.VUE**

```
<template>
  <ejs-chiplist id="chip" selection="Multiple">
    <e-chips>
      <e-chip text="Chai"></e-chip>
      <e-chip text="Chang"></e-chip>
      <e-chip text="Aniseed Syrup"></e-chip>
      <e-chip text="Ikura"></e-chip>
    </e-chips>
  </ejs-chiplist>
</template>
<script>
import Vue from 'vue';
import { ChipListPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(ChipListPlugin);
export default {}
</script>
```

{% previewsample "page.domainurl/code-snippet/chips/default-cs11" %}

**Action Chip**

The Action Chip triggers the event like click or delete, which helps doing action based on the event.

**APP.VUE**

```
<template>
  <ejs-chiplist id="chip" v-on:click.native="chipclick">
    <e-chips>
      <e-chip text="Send a text"></e-chip>
      <e-chip text="Set a remainder"></e-chip>
      <e-chip text="Read my emails"></e-chip>
      <e-chip text="Set alarm"></e-chip>
    </e-chips>
  </ejs-chiplist>
</template>
<script>
import Vue from 'vue';
import { ChipListPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(ChipListPlugin);
export default {
  methods: {
    chipclick: function(e) {
      alert('you have clicked ' + e.target.textContent);
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/chips/default-cs12" %}

**Deletable Chip**

Deletable Chip allows you to delete a chip from ChipList/ChipCollection. It can be enabled by setting the enableDelete property to true.

**APP.VUE**

```

<template>
  <ejs-chiplist id="chip" enableDelete="true">
    <e-chips>
      <e-chip text="Send a text"></e-chip>
      <e-chip text="Set a remainder"></e-chip>
      <e-chip text="Read my emails"></e-chip>
      <e-chip text="Set alarm"></e-chip>
    </e-chips>
  </ejs-chiplist>
</template>
<script>
import Vue from 'vue';
import { ChipListPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(ChipListPlugin);
export default {
  methods: {
    chipclick: function(e) {
      alert('you have clicked ' + e.target.textContent);
    }
  }
}
</script>

```

{% previewsample "page.domainurl/code-snippet/chips/default-cs13" %}

### Customization in Vue Chips component

This section explains the customization of styles, leading icons, avatar, and trailing icons in Chip control.

#### Styles

The Chip control has the following predefined styles that can be defined using the `cssClass` property.

Class	Description
-----	-----
e-primary	Represents a primary chip.
e-success	Represents a positive chip.
e-info	Represents an informative chip.
e-warning	Represents a chip with caution.
e-danger	Represents a negative chip.

#### APP.VUE

```

<template>
  <ejs-chiplist id="chip" enableDelete="true">
    <e-chips>
      <e-chip text="Primary" cssClass="e-primary"></e-chip>
      <e-chip text="Success" cssClass="e-success"></e-chip>
      <e-chip text="Info" cssClass="e-info"></e-chip>
      <e-chip text="Warning" cssClass="e-warning"></e-chip>
      <e-chip text="Danger" cssClass="e-danger"></e-chip>
    </e-chips>
  </ejs-chiplist>
</template>

```

```
<script>
import Vue from 'vue';
import { ChipListPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(ChipListPlugin);
export default {
}
</script>
```

{% previewsample "page.domainurl/code-snippet/chips/default-cs2" %}

### Leading Icon

You can add and customize the leading icon of chip using the `leadingIconCss` property.

#### APP.VUE

```
<template>
  <ejs-chiplist id="chip">
    <e-chips>
      <e-chip text="Andrew" leadingIconCss='andrew'></e-chip>
      <e-chip text="Janet" leadingIconCss='janet'></e-chip>
      <e-chip text="Laura" leadingIconCss='laura'></e-chip>
      <e-chip text="Margaret" leadingIconCss='margaret'></e-chip>
    </e-chips>
  </ejs-chiplist>
</template>
<script>
import Vue from 'vue';
import { ChipListPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(ChipListPlugin);
export default {
}
</script>
<style>
#chip .andrew {
  background-image: url('./andrew.png')
}
#chip .margaret {
  background-image: url('./margaret.png')
}
#chip .laura {
  background-image: url('./laura.png')
}
#chip .janet {
  background-image: url('./janet.png')
}
</style>
```

{% previewsample "page.domainurl/code-snippet/chips/default-cs3" %}

### Avatar

You can add and customize the avatar of chip using the `avatarIconCss` property.

#### APP.VUE

```
<template>
  <ejs-chiplist id="chip">
```

```

        <e-chips>
          <e-chip text="Andrew" avatarIconCss='andrew'></e-chip>
          <e-chip text="Janet" avatarIconCss='janet'></e-chip>
          <e-chip text="Laura" avatarIconCss='laura'></e-chip>
          <e-chip text="Margaret" avatarIconCss='margaret'></e-chip>
        </e-chips>
      </ejs-chiplist>
    </template>
    <script>
    import Vue from 'vue';
    import { ChipListPlugin } from '@syncfusion/ej2-vue-buttons';
    Vue.use(ChipListPlugin);
    export default {
    }
    </script>
    <style>
    #chip .andrew {
      background-image:
url('https://ej2.syncfusion.com/demos/src/chips/images/andrew.png')
    }
    #chip .margaret {
      background-image:
url('https://ej2.syncfusion.com/demos/src/chips/images/margaret.png')
    }
    #chip .laura {
      background-image:
url('https://ej2.syncfusion.com/demos/src/chips/images/laura.png')
    }
    #chip .janet {
      background-image:
url('https://ej2.syncfusion.com/demos/src/chips/images/janet.png')
    }
    </style>

```

{% previewsample "page.domainurl/code-snippet/chips/default-cs4" %}

### Avatar Content

You can add and customize the avatar content of chip using the `avatarText` property.

### APP.VUE

```

<template>
  <ejs-chiplist id="chip">
    <e-chips>
      <e-chip text="Andrew" avatarText= 'A'></e-chip>
      <e-chip text="Janet" avatarText= 'J'></e-chip>
      <e-chip text="Laura" avatarText= 'L'></e-chip>
      <e-chip text="Margaret" avatarText= 'M'></e-chip>
    </e-chips>
  </ejs-chiplist>
</template>
<script>
import Vue from 'vue';
import { ChipListPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(ChipListPlugin);
export default {

```

```
}
</script>
```

```
{% previewsample "page.domainurl/code-snippet/chips/default-cs5" %}
```

### Trailing Icon

You can add and customize the trailing icon of chip using the `trailingIconCss` property.

#### APP.VUE

```
<template>
  <ejs-chiplist id="chip">
    <e-chips>
      <e-chip text="Andrew" trailingIconCss= 'e-dlt-btn'></e-chip>
      <e-chip text="Janet" trailingIconCss= 'e-dlt-btn'></e-chip>
      <e-chip text="Laura" trailingIconCss= 'e-dlt-btn'></e-chip>
      <e-chip text="Margaret" trailingIconCss= 'e-dlt-btn'></e-chip>
    </e-chips>
  </ejs-chiplist>
</template>
<script>
import Vue from 'vue';
import { ChipListPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(ChipListPlugin);
export default {
}
</script>
```

```
{% previewsample "page.domainurl/code-snippet/chips/default-cs6" %}
```

### Outline Chip

Outline chip has the border with the background transparent. It can be set using the `cssClass` property.

#### APP.VUE

```
<template>
<div>
  <ejs-chiplist id="chip" cssClass="e-outline">
    <e-chips>
      <e-chip text="Chai"></e-chip>
      <e-chip text="Chang"></e-chip>
      <e-chip text="Aniseed Syrup"></e-chip>
      <e-chip text="Ikura"></e-chip>
    </e-chips>
  </ejs-chiplist>
  <ejs-chiplist id="chip" cssClass="e-outline" enableDelete="true">
    <e-chips>
      <e-chip text="Andrew"></e-chip>
      <e-chip text="Janet"></e-chip>
      <e-chip text="Laura"></e-chip>
      <e-chip text="Margaret"></e-chip>
    </e-chips>
  </ejs-chiplist>
</div>
</template>
<script>
```

```
import Vue from 'vue';
import { ChipListPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(ChipListPlugin);
export default {
}
</script>
```

{% previewsample "page.domainurl/code-snippet/chips/default-cs7" %}

### Style in Vue Chips component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the chip text

Use the following CSS to customize the chip text properties.

```
,
.e-chip .e-chip-text {
font-size: 20px;
color: black;
font-weight: normal;
}
,
```

#### Customizing the chip icon

Use the following CSS to customize the chip icon properties.

```
,
.e-chip .e-icon {
background-image: url('https://ej2.syncfusion.com/demos/src/chips/images/laura.png');
opacity: 0.8;
}
,
```

#### Customizing the chip delete button

Use the following CSS to customize the chip delete button.

```
,
.e-chip-list .e-chip .e-chip-delete.e-dlt-btn {
color: #e3165b;
font-size: 12px;
}
,
```

### Customizing the chip outline

Use the following CSS to customize the chip outline.

```
,  
  
.e-chip-list .e-chip.e-outline {  
  border-color: #e3165b;  
  border-width: 3px;  
}  
,
```

### Customizing the chip on selection

Use the following CSS to customize the chip on selection.

```
,  
  
/ To customize single chip on selection /  
.e-chip-list.e-selection .e-chip.e-active {  
  background-color: #ffca1c;  
  color: #e3165b;  
}  
  
/ To customize multiple chip on selection /  
.e-chip-list .e-chip.e-active {  
  background-color: #e3165b;  
  color: white;  
}  
,
```

### Customizing the chip avatar text

Use the following CSS to customize the chip avatar text properties.

```
,  
  
.e-chip-list .e-chip .e-chip-avatar {  
  background-color: #d51a1a;  
  color: #fafafa;  
}  
,
```

### Accessibility in Vue Chips component

The Chips component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Chips component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

#### [WAI-ARIA attributes](#)

The Chips component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Chips component:

| Attributes | Purpose |

| --- | --- |

- | `role=checkbox` | Indicates the ChipList component wrapper element as `checkbox`. |
- | `role=option` | Used to convey a significant and contextual message to the user(ChipList). |
- | `role=button` | Used to convey a significant and contextual message to the user(Single Chip). |
- | `aria-label` | Provides an accessible name for the Chip. |
- | `aria-selected` | Indicates the element is selected. |
- | `aria-disabled` | Indicates element is perceivable but disabled. |
- | `aria-multiselectable` | Indicates multiple items to be selected. |

### Keyboard interaction

The Chips component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Chips component.

| Keyboard shortcuts | Actions |

|-----|-----|

| Enter / Space | Selects the targeted chip from the ChipList/ChipCollection. |

| Delete / Backspace | Deletes the targeted chip from the ChipList/ChipCollection. |

### Ensuring accessibility

The Chips component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Chips component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Chips component with accessibility tools.

```
{% previewsample "https://ej2.syncfusion.com/accessibility/chips.html" %}
```

- [Accessibility in Syncfusion Vue components](#)

## Circular gauge

### Getting Started with the Vue Circular Gauge Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLI](#) and integrating the Syncfusion Vue Circular Gauge component.

#### Prerequisites

[System requirements for Syncfusion Vue UI components](#)

#### Dependencies

Below is the list of minimum dependencies required to use the Circular Gauge.

```
`javascript
```

```
|-- @syncfusion/ej2-vue-circulargauge
```

```
|-- @syncfusion/ej2-base
```

```
|-- @syncfusion/ej2-buttons  
|-- @syncfusion/ej2-popups  
|-- @syncfusion/ej2-splitbuttons  
|-- @syncfusion/ej2-vue-base  
|-- @syncfusion/ej2-svg-base  
|-- @syncfusion/ej2-circulargauge  
`
```

### Setting up the Vue 2 project

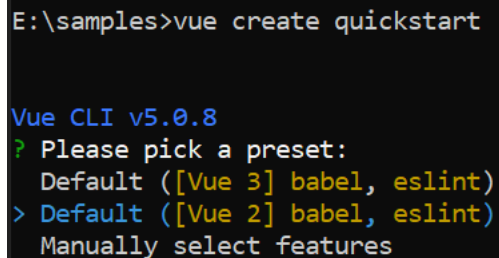

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```
`bash  
npm install -g @vue/cli  
vue create quickstart  
cd quickstart  
npm run serve  
`
```

or

```
`bash  
yarn global add @vue/cli  
vue create quickstart  
cd quickstart  
yarn run serve  
`
```

When creating a new project, choose the option **Default ([Vue 2] babel, eslint)** from the menu.

```
E:\samples>vue create quickstart  
  
Vue CLI v5.0.8  
? Please pick a preset:  
  Default ([Vue 3] babel, eslint)  
> Default ([Vue 2] babel, eslint)  
  Manually select features
```

Once the **quickstart** project is set up with default settings, proceed to add Syncfusion components to the project.

### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.npmjs.com). To use Vue components, install the required npm package.

This article uses the [Vue Circular gauge component](#) as an example. Install the `@syncfusion/ej2-vue-circulargauge` package by running the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-circulargauge --save
```

```
,
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-circulargauge
```

```
,
```

### Adding Syncfusion Vue Circular Gauge component

Follow the below steps to add the Vue Circular Gauge component:

1\ First, import and register the Circular Gauge component in the `script` section of the `src/App.vue` file.

#### ~/SRC/APP.VUE

```
<script>
import { CircularGaugeComponent } from '@syncfusion/ej2-vue-circulargauge';
export default {
  components: {
    'ejs-circulargauge': CircularGaugeComponent
  }
}
</script>
```

2\ In the `template` section, define the Circular Gauge component.

#### ~/SRC/APP.VUE

```
<template>
<div id="app">
<div class='wrapper'>
<ejs-circulargauge ></ejs-circulargauge>
</div>
</div>
</template>
```

Here is the summarized code for the above steps in the `src/App.vue` file:

#### ~/SRC/APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge ></ejs-circulargauge>
    </div>
  </div>
```

```
    </div>
  </template>
  <script>
  import { CircularGaugeComponent } from '@syncfusion/ej2-vue-circulargauge';
  export default {
    components: {
      'ejs-circulargauge': CircularGaugeComponent
    },
  }
  </script>
  <style>
    .wrapper {
      max-width: 300px;
      margin: 0 auto;
    }
  </style>
```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run serve
```

```
,
```

or

```
`bash
```

```
yarn run serve
```

```
,
```

```
{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs64" %}
```

### Set Pointer Value

You can change the pointer value in the above sample using [value](#) property in [pointers](#).

#### ~/SRC/APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge >
        <e-axes>
          <e-axis>
            <e-pointers>
              <e-pointer :value='val' />
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
```

```
import { CircularGaugeComponent, AxisDirective, AxesDirective,
PointerDirective, PointersDirective } from '@syncfusion/ej2-vue-
circulargauge';
export default {
  components: {
    'ejs-circulargauge': CircularGaugeComponent,
    'e-axis': AxisDirective,
    'e-axes': AxesDirective,
    'e-pointer': PointerDirective,
    'e-pointers': PointersDirective
  },
  data () {
    return {
      val : 35
    }
  }
}
</script>
<style>
  .wrapper {
    max-width: 300px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs65" %}

### Getting Started with the Vue Circular Gauge Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue Circular Gauge component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

#### Prerequisites

##### [System requirements for Syncfusion Vue UI components](#)

##### Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm create vite@latest
```

```
`
```

or

```
`bash
```

```
yarn create vite
```

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as `my-project` for this article.

`bash

? Project name: » my-project

`

2. Select `Vue` as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3. Choose `JavaScript` as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4. Upon completing the aforementioned steps to create the `my-project`, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

```
`bash
cd my-project
yarn install
`
```

Now that `my-project` is ready to run with default settings, let's add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.syncfusion.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue Circular Gauge component](#) as an example. To use the Vue Circular Gauge component in the project, the `@syncfusion/ej2-vue-circulargauge` package needs to be installed using the following command:

```
`bash
npm install @syncfusion/ej2-vue-circulargauge --save
`
```

or

```
`bash
yarn add @syncfusion/ej2-vue-circulargauge
`
```

#### Add Syncfusion Vue component

Follow the below steps to add the Vue Circular Gauge component using `Composition API` or `Options API`:

1. First, import and register the Circular Gauge component and its child directives in the `script` section of the `src/App.vue` file. If you are using the `Composition API`, you should add the `setup` attribute to the `script` tag to indicate that Vue will be using the `Composition API`.

##### COMPOSITION API (~SRC/APP.VUE)

```
<script setup>
import { CircularGaugeComponent as EjsCirculargauge, AxesDirective as EAxes,
AxisDirective as EAxis, PointersDirective as EPointers, PointerDirective as
EPointer, RangesDirective as ERanges, RangeDirective as ERRange } from
'@syncfusion/ej2-vue-circulargauge';
</script>
```

##### OPTIONS API (~SRC/APP.VUE)

```
<script>
import { CircularGaugeComponent, AxesDirective, AxisDirective,
PointersDirective, PointerDirective, RangesDirective, RangeDirective } from
'@syncfusion/ej2-vue-circulargauge';
//Component registration
export default {
```

```
name: "App",
components: {
  'ejs-circulargauge' : CircularGaugeComponent,
  'e-axes' : AxesDirective,
  'e-axis' : AxisDirective,
  'e-pointers' : PointersDirective,
  'e-pointer' : PointerDirective,
  'e-ranges' : RangesDirective,
  'e-range' : RangeDirective
}
}
</script>
```

2. In the **template** section, define the Circular Gauge component with the axis, pointer and range property definitions.

#### ~/SRC/APP.VUE

```
<template>
<ejs-circulargauge :title ='title' orientation='Horizontal'>
<e-axes>
<e-axis minimum=0 maximum=200>
<e-pointers>
<e-pointer value=140></e-pointer>
</e-pointers>
<e-ranges>
<e-range start=0 end=80 startWidth=15 endWidth=15></e-range>
<e-range start=80 end=120 startWidth=15 endWidth=15></e-range>
<e-range start=120 end=140 startWidth=15 endWidth=15></e-range>
<e-range start=140 end=200 startWidth=15 endWidth=15></e-range>
</e-ranges>
</e-axis>
</e-axes>
</ejs-circulargauge>
</template>
```

3. In the **script** section, declare the values for the properties defined in the **template** section.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const title = "Circular Gauge";
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
  return {
    title: 'Circular Gauge'
  };
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<template>
<ejs-circulargauge :title ='title' orientation='Horizontal'>
<e-axes>
<e-axis minimum=0 maximum=200>
<e-pointers>
<e-pointer value=140></e-pointer>
</e-pointers>
<e-ranges>
<e-range start=0 end=80 startWidth=15 endWidth=15></e-range>
<e-range start=80 end=120 startWidth=15 endWidth=15></e-range>
<e-range start=120 end=140 startWidth=15 endWidth=15></e-range>
<e-range start=140 end=200 startWidth=15 endWidth=15></e-range>
</e-ranges>
</e-axis>
</e-axes>
</ejs-circulargauge>
</template>
<script setup>
import { CircularGaugeComponent as EjsCirculargauge, AxesDirective as EAxes,
AxisDirective as EAxis, PointersDirective as EPointers, PointerDirective as
EPointer, RangesDirective as ERanges, RangeDirective as ERange } from
'@syncfusion/ej2-vue-circulargauge';
const title = "Circular Gauge";
</script>
```

#### **OPTIONS API (~SRC/APP.VUE)**

```
<template>
<ejs-circulargauge :title ='title' orientation='Horizontal'>
<e-axes>
<e-axis minimum=0 maximum=200>
<e-pointers>
<e-pointer value=140></e-pointer>
</e-pointers>
<e-ranges>
<e-range start=0 end=80 startWidth=15 endWidth=15></e-range>
<e-range start=80 end=120 startWidth=15 endWidth=15></e-range>
<e-range start=120 end=140 startWidth=15 endWidth=15></e-range>
<e-range start=140 end=200 startWidth=15 endWidth=15></e-range>
</e-ranges>
</e-axis>
</e-axes>
</ejs-circulargauge>
</template>
<script>
import { CircularGaugeComponent, AxesDirective, AxisDirective,
PointersDirective, PointerDirective, RangesDirective, RangeDirective } from
'@syncfusion/ej2-vue-circulargauge';
// Component registration
export default {
name: "App",
// Declaring component and its directives
components: {
```

```
'ejs-circulargauge' : CircularGaugeComponent,  
'e-axes' : AxesDirective,  
'e-axis' : AxisDirective,  
'e-pointers': PointersDirective,  
'e-pointer' : PointerDirective,  
'e-ranges' : RangesDirective,  
'e-range' : RangeDirective  
},  
// Bound properties declarations  
data() {  
  return {  
    title: 'Circular Gauge'  
  };  
}  
};  
</script>
```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
`
```

or

```
`bash
```

```
yarn run dev
```

```
`
```

The output will appear as follows:

**Sample:** [vue3-circulargauge-getting-started](#).

For migrating from Vue 2 to Vue 3, refer to the [migration](#) documentation.

- [Getting Started with Vue UI Components using Options API and TypeScript](#)

## Gauge dimensions in Vue Circular gauge component

### Size for Container

Circular gauge can render to its container size. You can set the size via inline or CSS as demonstrated below.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge ></ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from '@syncfusion/ej2-vue-circulargauge';
Vue.use(CircularGaugePlugin);
export default {}
</script>
<style>
.wrapper {
  max-width: 300px;
  margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs28" %}

### Size for Circular Gauge

<!-- markdownlint-disable MD036 -->

You can also set size for the gauge directly through [width](#) and [height](#) properties.

#### In Pixel

You can set the size of the gauge in pixel as demonstrated below.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge width='650' height='350' ></ejs-
circulargauge>
    </div>
  </div>
</template>
```

```

<script>
import Vue from 'vue';
import { CircularGaugePlugin } from '@syncfusion/ej2-vue-circulargauge';
Vue.use(CircularGaugePlugin);
export default {}
</script>
<style>
  .wrapper {
    max-width: 300px;
    margin: 0 auto;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs29" %}

### In Percentage

By setting value in percentage, gauge gets its dimension with respect to its container. For example, when

the height is '50%', gauge renders to half of the container height.

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge width='80%' height='50%'></ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from '@syncfusion/ej2-vue-circulargauge';
Vue.use(CircularGaugePlugin);
export default {}
</script>
<style>
  .wrapper {
    max-width: 300px;
    margin: 0 auto;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs30" %}

Note: When you do not specify the size, it takes 450px as the height and window size as its width.

### Gauge axes in Vue Circular gauge component

By default, gauge will be displayed with an axis. Each axis contains its own ranges, pointers and annotation.

### Axis Customization

You can customize the width and color of an axis line by using [lineStyle](#) property.

Background for an axis can be customized by using [background](#)

property.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis :lineStyle= 'lineStyle' background= 'rgba(0, 128,
128, 0.3)'>
        </e-axis>
      </e-axes>
    </ejs-circulargauge>
  </div>
</div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      lineStyle: {
        width: 2,
        color: 'red'
      }
    }
  }
};
</script>
<style>
  .wrapper {
    max-width: 300px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs10" %}

### Angles and Direction

Circular gauge axis can sweep from 0 to 360 degrees. By default start angle of an axis is 200 degree and end angle is 160 degree and you can customize this option by using

[startAngle](#) and [endAngle](#) property.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge :axes = 'axes'>
    </ejs-circulargauge>
    </div>
  </div>
</template>
```

```

<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      axes: [{
        startAngle: 270,
        endAngle: 90
      }]
    }
  };
};
</script>
<style>
.wrapper {
  max-width: 300px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs11" %}

#### *AntiClockWise Direction*

The [direction](#) property enables you to render the gauge axis either in

ClockWise or in AntiClockWise direction.

#### **APP.VUE**

```

<template>
<div id="app">
  <div class='wrapper'>
    <ejs-circulargauge >
      <e-axes>
        <e-axis direction= 'AntiClockWise'>
        </e-axis>
      </e-axes>
    </ejs-circulargauge>
  </div>
</div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default { };
</script>
<style>
.wrapper {
  max-width: 300px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs12" %}

### Axis Radius

By default, radius of an axis is calculated based on the available size.

You can customize this, by using [radius](#) property.

It takes value either in **percentage** or in **pixel**.

#### In Pixel

You can set the radius of the gauge in pixel as demonstrated below,

#### APP.VUE

```
<template>
<div id="app">
  <div class='wrapper'>
    <ejs-circulargauge >
      <e-axes>
        <e-axis radius= '150'>
        </e-axis>
      </e-axes>
    </ejs-circulargauge>
  </div>
</div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default { };
</script>
<style>
.wrapper {
  max-width: 300px;
  margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs13" %}

### In Percentage

By setting value in percentage, gauge gets its dimension with respect to its available size.

For example, when the radius is '50%', gauge renders to half of the available size.

#### APP.VUE

```
<template>
<div id="app">
  <div class='wrapper'>
    <ejs-circulargauge>
      <e-axes>
        <e-axis radius= '50%'>
        </e-axis>
      </e-axes>
    </ejs-circulargauge>
  </div>
```

```

</div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from '@syncfusion/ej2-vue-circulargauge';
Vue.use(CircularGaugePlugin);
export default { };
</script>
<style>
.wrapper {
  max-width: 300px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs14" %}

### Ticks

You can customize the [height](#),

[color](#) and

[width](#) of major and minor ticks by

using [majorTicks](#)

and [minorTicks](#) property.

By default, [interval](#) for

**majorTicks** will be calculated automatically

and also you can customize the interval for major and minor ticks using

**interval** property.

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge >
        <e-axes>
          <e-axis :majorTicks= 'majorTicks' :minorTicks=
'minorTicks' >
            </e-axis>
          </e-axes>
        </ejs-circulargauge>
      </div>
    </div>
  </template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from '@syncfusion/ej2-vue-circulargauge';
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {

```

```

        majorTicks: {
            interval: 10,
            color: 'red',
            height: 10,
            width: 3
        },
        minorTicks: {
            interval: 5,
            color: 'green',
            height: 5,
            width: 2
        }
    }
}
};
</script>
<style>
    .wrapper {
        max-width: 300px;
        margin: 0 auto;
    }
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs15" %}

#### Tick Position

Both minor and major ticks can be moved by using [offset](#) and [position](#) property. The [offset](#) defines the distance between the axis and ticks.

By default, offset value is 0. The [position](#) will place the ticks either inside or outside of the axis.

By default, ticks will be placed **inside** the axis.

#### APP.VUE

```

<template>
    <div id="app">
        <div class='wrapper'>
            <ejs-circulargauge>
                <e-axes>
                    <e-axis :majorTicks= 'majorTicks' :minorTicks=
'minorTicks'>
                        </e-axis>
                    </e-axes>
                </ejs-circulargauge>
            </div>
        </div>
    </template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
    data: function () {
        return {
            majorTicks: {
                interval: 10,

```

```

        color: 'red',
        height: 10,
        width: 3,
        position: 'Inside',
        offset: 5
    },
    minorTicks: {
        interval: 5,
        color: 'green',
        height: 5,
        width: 2,
        position: 'Inside',
        offset: 5
    }
}
};
</script>
<style>
    .wrapper {
        max-width: 300px;
        margin: 0 auto;
    }
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs16" %}

### Labels

Labels of an axis can be customized by using [font](#) property in [labelStyle](#) options.

### APP.VUE

```

<template>
    <div id="app">
        <div class='wrapper'>
            <ejs-circulargauge>
                <e-axes>
                    <e-axis :labelStyle ='labelStyle' >
                    </e-axis>
                </e-axes>
            </ejs-circulargauge>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
    data: function () {
        return {
            labelStyle: {
                font: {
                    color: 'red',
                    size: '20px',
                    fontWeight: 'Bold'
                }
            }
        }
    }
}

```

```

    }
  }
}
};
</script>
<style>
  .wrapper {
    max-width: 300px;
    margin: 0 auto;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs17" %}

### Label Position

Labels can be moved by using [offset](#) or [position](#) property.

The [offset](#) defines the distance between the labels and ticks.

By default, offset value is 0.

The [position](#) will place the labels either inside or outside of the axis.

By default, labels will be placed **inside** the axis.

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis :labelStyle ='labelStyle'>
        </e-axis>
        </e-axes>
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from '@syncfusion/ej2-vue-circulargauge';
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      labelStyle: {
        position: 'Outside',
        offset: 5
      }
    }
  }
};
</script>
<style>

```

```
.wrapper {
  max-width: 300px;
  margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs18" %}

*Display the last label, even if it isn't in the visible range\*\**

If the last label is not in the visible range, it will be hidden by default. If you want to show the last label, set the `showLastLabel` property to `true` in the `axes` API of circular gauge.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis showLastLabel="true" minimum= 0 maximum= 170
startAngle= 210 endAngle= 150>
        </e-axis>
      </e-axes>
    </ejs-circulargauge>
  </div>
</div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {}
  }
};
</script>
<style>
  .wrapper {
    max-width: 300px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs19" %}

*Display the last label, even if it isn't in the visible range\*\**

If the last label is not in the visible range, it will be hidden by default. If you want to show the last label, set the `showLastLabel` property to `true` in the `axes` API of circular gauge.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge >
```

```

    <e-axes>
      <e-axis showLastLabel="true" minimum= 0 maximum= 170 startAngle= 210
endAngle= 150 >
    </e-axis>
  </e-axes>
</ejs-circulargauge>

  max-width: 300px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs20" %}

#### Auto Angle

Labels can be swept along the axis angle by enabling [autoAngle](#) property.

#### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis :labelStyle ='labelStyle'>
          </e-axis>
        </e-axes>
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      labelStyle: {
        autoAngle: true
      }
    }
  }
};

```

```

    }
  }
};
</script>
<style>
  .wrapper {
    max-width: 300px;
    margin: 0 auto;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs21" %}

### Smart Labels

When an axis makes a complete circle, then the first and last label of the axis will get overlap with each other.

In this scenario, you can either hide 1st or last label using [hiddenLabel](#) property.

When **hiddenLabel** value is **First**,

then the 1st label will be hidden and when the

**hiddenLabel** value is 'Last',

then the last label will be hidden.

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis minimum= 0 maximum= 12 startAngle= 0 endAngle=
360 :labelStyle = 'labelStyle' :minorTicks= 'minorTicks' :majorTicks=
'majorTicks' >
            </e-axis>
          </e-axes>
        </ejs-circulargauge>
      </div>
    </div>
  </template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      majorTicks: {
        interval: 1,
        position: 'Inside',
        height: 10
      },
      minorTicks: {
        interval: 0.2,

```

```

        position: 'Inside',
        height: 5
      },
      labelStyle: {
        position: 'Inside',
        hiddenLabel: 'First'
      }
    }
  }
};
</script>
<style>
  .wrapper {
    max-width: 300px;
    margin: 0 auto;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs22" %}

### Label Format

Axis labels can be formatted by using [format](#) property in [labelStyle](#) and its supports all globalize format.

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis :labelStyle ='labelStyle'>
          </e-axis>
        </e-axes>
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      labelStyle: {
        format: 'p1'
      }
    }
  }
};
</script>
<style>
  .wrapper {
    max-width: 300px;
    margin: 0 auto;
  }

```

```
</style>
```

```
{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs23" %}
```

The following table describes the result of applying some commonly used label formats on numeric values.

```
<!-- markdownlint-disable MD033 -->
```

Label Value	Label Format property value	Result	Description
1000	n1	1000.0	The Number is rounded to 1 decimal place
1000	n2	1000.00	The Number is rounded to 2 decimal place
1000	n3	1000.000	The Number is rounded to 3 decimal place
0.01	p1	1.0%	The Number is converted to percentage with 1 decimal place
0.01	p2	1.00%	The Number is converted to percentage with 2 decimal place
0.01	p3	1.000%	The Number is converted to percentage with 3 decimal place
1000	c1	\$1,000.0	The Currency symbol is appended to number and number is rounded to 1 decimal place
1000	c2	\$1,000.00	The Currency symbol is appended to number and number is rounded to 2 decimal place

### Custom Label Format

Axis labels support custom label format using placeholder like {value}°C, in which the value represent the axis label e.g 20°C.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis :labelStyle ='labelStyle'>
            </e-axis>
          </e-axes>
        </ejs-circulargauge>
      </div>
    </div>
  </template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
```

```

    data: function () {
      return {
        labelStyle: {
          format: '{value}°C'
        }
      }
    }
  };
</script>
<style>
  .wrapper {
    max-width: 300px;
    margin: 0 auto;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs24" %}

#### *Hide intersecting axis labels*

When the axis labels overlap with each other, you can hide the intersected labels by setting the `hideIntersectingLabel` property to true in the axis.

#### **APP.VUE**

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis :startAngle='startAngle'
:hideIntersectingLabel='hideIntersectingLabel' :endAngle='endAngle'
:majorTicks='majorTicks' :minorTicks='minorTicks' minimum=0 maximum=200>
        </e-axis>
      </e-axes>
    </ejs-circulargauge>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      startAngle: 270,
      endAngle: 90,
      hideIntersectingLabel: true,
      majorTicks: {
        interval: 4
      },
      minorTicks: {
        interval: 2
      }
    }
  }
}

```

```
};
</script>
<style>
  .wrapper {
    max-width: 300px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs25" %}

### Minimum and Maximum

The [minimum](#) and [maximum](#) properties

enables you to customize the start and end values of an axis.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis minimum= 50 maximum= 250>
        </e-axis>
        </e-axes>
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default { };
</script>
<style>
  .wrapper {
    max-width: 300px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs26" %}

### Multiple Axes

In addition to the default axis, you can add n number of axis to a gauge.

Each axis will have its own ranges, pointers, annotations and customization options.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge :axes= 'axes'>
    </ejs-circulargauge>
```

```

        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from '@syncfusion/ej2-vue-circulargauge';
Vue.use(CircularGaugePlugin);
export default {
    data: function () {
        return {
            axes: [{
                majorTicks: {
                    interval: 10,
                    position: 'Inside',
                    height: 10,
                },
                pointers: [],
                minorTicks: {
                    interval: 5,
                    position: 'Inside',
                    height: 5,
                }
            },
            {
                pointers: [],
                majorTicks: {
                    interval: 10,
                    position: 'Inside',
                    height: 10,
                    color: '#27d5ff'
                },
                minorTicks: {
                    interval: 5,
                    position: 'Inside',
                    height: 5,
                    color: '#27d5ff'
                }
            }
        ]
    }
};
</script>
<style>
    .wrapper {
        max-width: 300px;
        margin: 0 auto;
    }
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs27" %}

### Gauge ranges in Vue Circular gauge component

You can categories certain interval on gauge axis using [ranges](#) property.

#### Start and End

Start and end value of a range in an axis can be customized by using [start](#) and [end](#) properties.

**APP.VUE**

```

<template>
<div id="app">
  <div class='wrapper'>
    <ejs-circulargauge>
      <e-axes>
        <e-axis :ranges='ranges'></e-axis>
      </e-axes>
    </ejs-circulargauge>
  </div>
</div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      ranges: [{
        start: 40,
        end: 80
      }]
    }
  }
};
</script>
<style>
.wrapper {
  max-width: 300px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs51" %}

**Customization**

Color and thickness of the range can be customized by using [color](#), [startWidth](#) and [endWidth](#) property.

**APP.VUE**

```

<template>
<div id="app">
  <div class='wrapper'>
    <ejs-circulargauge>
      <e-axes>
        <e-axis :ranges='ranges'></e-axis>
      </e-axes>
    </ejs-circulargauge>
  </div>
</div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);

```

```

export default {
  data: function () {
    return {
      ranges: [{
        start: 40,
        end: 80, endWidth: 15,
        startWidth: 15,
        color: '#ff5985'
      }]
    }
  }
};
</script>
<style>
.wrapper {
  max-width: 300px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs52" %}

### Rounded Corner Ranges

The corners of the ranges can be rounded by specifying desired values to the `roundedCornerRadius` property.

### APP.VUE

```

<template>
<div id="app">
  <div class='wrapper'>
    <ejs-circulargauge >
      <e-axes>
        <e-axis minimum= 0 maximum= 120 :majorTicks= 'majorTicks' :ranges
        ='ranges'>
          <e-pointers>
            <e-pointer value=70 radius= '60%' :animation='animation' ></e-
            pointer>
          </e-pointers>
        </e-axis>
      </e-axes>
    </ejs-circulargauge>
  </div>
</div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      animation: { enable: false },
      majorTicks: {
        height: 5
      },

```

```

    ranges: [{
      start: 0,
      end: 40,
      startWidth: 15,
      endWidth: 15,
      roundedCornerRadius: 10,
      radius: '110%'
    }, {
      start: 40,
      end: 80,
      startWidth: 15,
      endWidth: 15,
      roundedCornerRadius: 10,
      radius: '110%'
    }, {
      start: 80,
      end: 120,
      startWidth: 15,
      endWidth: 15,
      roundedCornerRadius: 10,
      radius: '110%'
    }
  ]
}
}
};
</script>
<style>
.wrapper {
  max-width: 300px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs53" %}

### Radius

You can place the range inside or outside of the axis by using [radius](#) property. The radius of the range can takes value either in percentage or in pixels. By default, ranges take 100% of the axis radius.

### In Pixel

You can set the radius of the range in pixel as demonstrated below,

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis :ranges='ranges'></e-axis>
        </e-axes>
      </ejs-circulargauge>
    </div>
  </div>

```

```

</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from '@syncfusion/ej2-vue-circulargauge';
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      ranges: [{
        start: 40,
        end: 80,
        radius: '100'
      }]
    }
  }
};
</script>
<style>
.wrapper {
  max-width: 300px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs54" %}

#### *In Percentage*

By setting value in percentage, range gets its dimension with respect to its axis radius.

For example, when the radius is '50%', range renders to half of the axis radius.

#### **APP.VUE**

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis minimum= 0 maximum= 100 :ranges='ranges'></e-axis>
        </e-axes>
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from '@syncfusion/ej2-vue-circulargauge';
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      ranges: [{
        start: 40,
        end: 80,
        radius: '50%'
      }]
    }
  }
}

```

```

    }
  };
</script>
<style>
  .wrapper {
    max-width: 300px;
    margin: 0 auto;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs55" %}

### Dragging Range

The ranges can be dragged on the axis line by clicking and dragging the same. To enable or disable the range drag, use the [enableRangeDrag](#) property.

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge enableRangeDrag='true' height='250px' width='250px'>
        <e-axes>
          <e-axis :ranges='ranges'>
            <e-pointers>
              <e-pointer value=50></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from '@syncfusion/ej2-vue-circulargauge';
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      ranges: [{
        start: 0,
        end: 100,
        startWidth: 8, endWidth: 8,
        radius: '108%',
        color: '#30B32D'
      }]
    }
  }
};
</script>
<style>
  .wrapper {
    max-width: 300px;
    margin: 0 auto;
  }

```

```
</style>
```

```
{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs56" %}
```

### Multiple Ranges

You can add multiple ranges to an axis with the above customization as demonstrated below.

Note: You can set the range color to axis ticks and labels by enabling `useRangeColor` property in [majorTicks](#),

[minorTicks](#) and [labelStyle](#) object.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge >
        <e-axes>
          <e-axis :majorTicks= 'majorTicks' :minorTicks= 'minorTicks'
:labelStyle= 'labelStyle' :ranges='ranges'></e-axis>
        </e-axes>
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      majorTicks: {
        useRangeColor: true
      },
      minorTicks: {
        useRangeColor: true
      },
      labelStyle: {
        useRangeColor: true
      },
      ranges: [{
        start: 0,
        end: 25,
        radius: '108%'
      }, {
        start: 25,
        end: 50,
        radius: '70%'
      }, {
        start: 50,
        end: 75,
        radius: '70%'
      }, {
        start: 75,
        end: 100,
```

```

        radius: '108%'
      }
    }
  }
};
</script>
<style>
  .wrapper {
    max-width: 300px;
    margin: 0 auto;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs57" %}

### Gradient Color

Gradient support allows to add multiple colors in the ranges and pointers of the circular gauge. The following gradient types are supported in the circular gauge.

- Linear Gradient
- Radial Gradient

#### Linear Gradient

Using linear gradient, colors will be applied in a linear progression. The start value of the linear gradient can be set using the [startValue](#) property. The end value of the linear gradient will be set using the [endValue](#) property. The color stop values such as color, opacity and offset are set using [colorStop](#) property.

To apply linear gradient to the range, follow the below code sample.

#### APP.VUE

```

<template>
  <div id="app">
    <div class="wrapper">
      <ejs-circulargauge style='display:block' align='center' :title='title'
      :titleStyle='titleStyle' :centerY='centerY'>
        <e-axes>
          <e-axis :radius='gaugeRadius' :startAngle='startAngle' minimum=0
          maximum=14 :endAngle='endAngle' :majorTicks='majorTicks'
          :lineStyle='lineStyle' :minorTicks='minorTicks' :labelStyle='labelStyle'
          :annotations='annotations' :ranges='ranges'>
            <e-pointers>
              <e-pointer :type='type1' :value='value1' :radius='pointerRadius1'
              :markerShape='markerShape1' :imageUrl='imageUrl1'
              :markerWidth='markerWidth1' :markerHeight='markerHeight1'
              :animation='animation1'>
            </e-pointer>

    }
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs58" %}

### Radial Gradient

Using radial gradient, colors will be applied in circular progression. The inner circle position of the radial gradient will be set using the [innerPosition](#) property. The outer circle position of the radial gradient can be set using the [outerPosition](#) property. The color stop values such as color, opacity and offset are set using [colorStop](#) property.

To apply radial gradient to the range, follow the below code sample.

### APP.VUE

```

## Gauge pointers in Vue Circular gauge component

Pointers are used to indicate values on the axis. Value of the pointer can be modified using the [value](#) property.

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis>
            <e-pointers>
              <e-pointer value=90 ></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';

```

```
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default { };
</script>
<style>
    .wrapper {
        max-width: 300px;
        margin: 0 auto;
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs35" %}

### Needle Pointers

A needle pointer contains three parts, a needle, a cap / knob and a tail. The length of the needle can be customized by using [radius](#) property. The length of the tail can be customized by using [length](#) property. The radius of the cap can be customized by using [radius](#) in cap object. The needle and tail length takes value either in [percentage](#) or [pixel](#).

### APP.VUE

```
<template>
    <div id="app">
        <div class='wrapper'>
            <ejs-circulargauge>
                <e-axes>
                    <e-axis>
                        <e-pointers>
                            <e-pointer value=90 radius= '50%' :needleTail=
'needleTail' :cap = 'cap'></e-pointer>
                        </e-pointers>
                    </e-axis>
                </e-axes>
            </ejs-circulargauge>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
    data: function () {
        return {
            cap: {
                radius: 10
            },
            needleTail: {
                length: '25%'
            }
        }
    }
}
```

```
};
</script>
<style>

    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs36" %}

### Customization

Needle color and width can be customized by using [color](#) and [pointerWidth](#) property.

Cap and tails can be customized by using [cap](#) and

[needleTail](#) object.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis>
            <e-pointers>
              <e-pointer value=90 color= '#007DD1'
pointerWidth= 25 radius= '50%' :needleTail= 'needleTail' :cap = 'cap'></e-
pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      cap: {
        radius: 15,
        color: 'white',
        border: {
          color: '#007DD1',
          width: 5
        }
      },
      needleTail: {
        length: '22%',
        color: '#007DD1'
      }
    }
  }
}
```

```

    }
  };
</script>
<style>
  .wrapper {
    max-width: 300px;
    margin: 0 auto;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs37" %}

The appearance of the needle pointer can be customized by using [needleStartWidth](#) and [needleEndWidth](#).

### APP.VUE

</style>
```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs38" %}

### RangeBar Pointer

RangeBar pointer is like ranges in an axis, that can be placed on gauge to mark the pointer value.

RangeBar starts from the beginning of the gauge and ends at the pointer value.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis>
            <e-pointers>
              <e-pointer value=50 type= 'RangeBar' radius=
'60%'></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default { };
</script>
<style>
.wrapper {
  max-width: 300px;
  margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs39" %}

### RangeBar Pointer with rounded corners

The corners of the range bar pointer can be rounded by specifying desired values to the `roundedCornerRadius` property.

#### APP.VUE

```
<template>
<div id="app">
  <div class='wrapper'>
    <ejs-circulargauge>
      <e-axes>
        <e-axis>
          <e-pointers>
            <e-pointer value=60 type= 'RangeBar' radius= '60%'
roundedCornerRadius= 10 :animation = 'animation'></e-pointer>
          </e-pointers>
        </e-axis>
      </e-axes>
    </ejs-circulargauge>
  </div>
</div>
</template>
```

```

        </e-pointers>
      </e-axis>
    </e-axes>
  </ejs-circulargauge>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from '@syncfusion/ej2-vue-circulargauge';
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      animation: { enable: false }
    }
  }
};
</script>
<style>
.wrapper {
  max-width: 300px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs40" %}

#### [RangeBar Customization](#)

RangeBar can be customized in terms of color, border and thickness by using

[color](#), [border](#) and [pointerWidth](#) property.

#### **APP.VUE**

```

<template>
<div id="app">
  <div class='wrapper'>
    <ejs-circulargauge>
      <e-axes>
        <e-axis>
          <e-pointers>
            <e-pointer value=50 type= 'RangeBar' radius= '60%'
color= '#007DD1' pointerWidth: 15 :border= 'border'></e-pointer>
          </e-pointers>
        </e-axis>
      </e-axes>
    </ejs-circulargauge>
  </div>
</div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from '@syncfusion/ej2-vue-circulargauge';
Vue.use(CircularGaugePlugin);
export default {
  data: function () {

```

```

        return {
            border: {
                color: 'grey',
                width: 2
            }
        }
    };
</script>
<style>
.wrapper {
    max-width: 300px;
    margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs41" %}

### Marker Pointer

Different type of marker shape can be used to mark the pointer value in axis. You can change the marker shape using [markerShape](#) property in pointer. Gauge supports the below marker shape.

- Circle
- Rectangle
- Triangle
- InvertedTriangle
- Diamond

We can use image instead of rendering marker shape to denote the pointer value. It can be achieved by setting [markerShape](#) to Image and assigning image path to [imageUrl](#) in pointer.

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis :pointers ='pointers'>
          </e-axis>
        </e-axes>
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from '@syncfusion/ej2-vue-circulargauge';
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      pointers: [{
        value: 90,

```

```

        type: 'Marker',
        markerShape: 'InvertedTriangle',
        radius: '100%',
        markerHeight: 15,
        markerWidth: 15
      }
    ]
  }
};
</script>
<style>
.wrapper {
  max-width: 300px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs42" %}

### Marker Customization

The marker can be customized in terms of color, border, width and height by using

[color](#),

[border](#),

[markerWidth](#) and

[markerHeight](#) property in

[pointer](#).

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis>
            <e-pointers>
              <e-pointer value=90 :border= 'border' type=
'Marker' markerWidth= 15 markerHeight= 15 markerShape= 'Triangle' radius=
'100%' color= 'white' ></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {

```

```

        border: {
            color: '#007DD1',
            width: 2
        }
    }
}
};
</script>
<style>
.wrapper {
    max-width: 300px;
    margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs43" %}

### Dragging pointer

The pointers can be dragged over the axis line by clicking and dragging the same. To enable or disable the pointer drag, use the [enablePointerDrag](#) property.

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge enablePointerDrag='true' height='250px'
width='250px'>
        <e-axes>
          <e-axis>
            <e-pointers>
              <e-pointer value=50></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
    }
  }
};
</script>
<style>
.wrapper {
    max-width: 300px;
    margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs44" %}

### Multiple Pointers

In addition to the default pointer, you can add n number of pointer to an axis by using **pointers** property.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>

### Animation

Pointer will get animate on loading the gauge, this can be handled by using

[animation](#) property in pointer.

The [enable](#) property in animation allows you to enable or disable the animation.

The [duration](#) property specify the duration of the animation in milliseconds.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis>
            <e-pointers>
              <e-pointer value=90 :animation= 'animation'
            >>/e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-circulargauge>
    </div>
  </div>
</template>

.wrapper {
  max-width: 300px;
  margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs46" %}

### Gradient Color

Gradient support allows to add multiple colors in the ranges and pointers of the circular gauge. The following gradient types are supported in the circular gauge.

- Linear Gradient
- Radial Gradient

#### Linear Gradient

Using linear gradient, colors will be applied in a linear progression. The start value of the linear gradient can be set using the [startValue](#) property. The end value of the linear gradient will be set using the [endValue](#) property. The color stop values such as color, opacity and offset are set using [colorStop](#) property.

The linear gradient can be applied to all pointer types like marker, range bar and needle. To do so, follow the below code sample.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis :startAngle = 270 :endAngle= 90 :lineStyle=
'lineStyle' :labelStyle= 'labelStyle' :majorTicks= 'majorTicks' :minorTicks=
'minorTicks' :radius= 'radius' :minimum= 0 :maximum= 100
:pointers='pointers' >
          </e-axis>
        </e-axes>
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin, Gradient } from "@syncfusion/ej2-vue-
circulargauge";
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    var pointerLinearGradient = {
      startValue: '0%',
      endValue: '100%',
      colorStop: [
        { color: '#FEF3F9', offset: '0%', opacity: 0.9 },
        { color: '#E63B86', offset: '70%', opacity: 0.9 } ]
    }
    return {
      lineStyle: { width: 3, color: '#E63B86' },
      labelStyle: {
        font: { size: '0px' }
      }, majorTicks: {
        height: 0
      }, minorTicks: {
        height: 0
      }
    }
  }
}
```

```

    },
    radius: '90%',
    pointers: [{
      radius: '80%',
      value: 80,
      animation: { enable: true, duration: 1000 },
      pointerWidth: 10,
      linearGradient: pointerLinearGradient,
      cap: {
        radius: 8,
        color: 'white',
        border: {
          color: '#E63B86',
          width: 1
        }
      }
    },
    needleTail: {
      length: '20%',
      linearGradient: pointerLinearGradient
    }
  ], {
    radius: '60%', value: 40,
    animation: { duration: 1000 },
    pointerWidth: 10,
    linearGradient: pointerLinearGradient,
    cap: {
      radius: 8, color: 'white',
      border: { color: '#E63B86', width: 1 }
    },
    needleTail: {
      length: '20%',
      linearGradient: pointerLinearGradient
    }
  }
  ]
}
},
provide: {
  circulargauge: [Gradient]
}
};
</script>
<style>
  .wrapper {
    max-width: 500px;
    margin: 0 auto;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs47" %}

### Radial Gradient

Using radial gradient, colors will be applied in circular progression. The inner circle position of the radial gradient will be set using the [innerPosition](#) property. The outer circle position of the radial gradient can be set using the [outerPosition](#) property. The color stop values such as color, opacity and offset are set using [colorStop](#) property.

The radial gradient can be applied to all pointer types like marker, range bar and needle. To do so, follow the below code sample.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs48" %}

## Gauge annotations in Vue Circular gauge component

Annotations are used to mark a specific area of interest in the gauge with texts, shapes or images.

### Content

You can place any custom element on the axis area by assigning the id of the element to

[content](#) property of [annotation](#) object.

Note: To use annotation feature, we need to inject **Annotations** module using **CircularGauge.Inject(Annotations)** method.

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis :annotations='annotations'>
            <e-pointers>

```

```

        <e-pointer value=50 ></e-pointer>
      </e-pointers>
    </e-axis>
  </e-axes>
</ejs-circulargauge>
</div>
</div>
</template>
<script>
import Vue from "vue";
import { CircularGaugePlugin, Annotations } from "@syncfusion/ej2-vue-circulargauge";
let contentVue = Vue.component("contentTemplate", {
  template: '<div><span style="font-size:10px; color:#424242; font-family:Regular">pointer Value: 50</span></div>',
  data() {
    return {
      data: {}
    };
  }
});
let contentTemplate = function() {
  return { template: contentVue };
};
Vue.use(CircularGaugePlugin);
export default {
  data: function() {
    return {
      annotations: [{
        content: contentTemplate,
        zIndex: '1'
      }]
    },
    provide: {
      circulargauge: [Annotations]
    }
  };
</script>
<style>
  .wrapper {
    max-width: 300px;
    margin: 0 auto;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs1" %}

### Position

Annotation can be placed around the axis by using [radius](#)

and [angle](#) property.

For example, if the angle is 90 degree and the radius is 110%, then the annotation, will be placed at the right side of the axis.

Radius of the annotation takes value either in pixel or percentage. By setting value in percentage, annotation gets its position with respect to its axis radius.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis :annotations='annotations'>
            <e-pointers>
              <e-pointer value=50 ></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { CircularGaugePlugin, Annotations } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
let contentVue = Vue.component("contentTemplate", {
  template: '<div><span style="font-size:10px; color:#424242; font-family:Regular">pointer Value: 50</span></div>',
  data() {
    return {
      data: {}
    };
  }
});
let contentTemplate = function() {
  return { template: contentVue };
};
export default {
  data:function(){
    return {
      annotations: [{
        content: contentTemplate,
        angle: 90,
        radius: '150%',
        zIndex: '1'
      }]
    }
  },
  provide: {
    circulargauge: [Annotations]
  }
};
</script>
<style>
  .wrapper {
    max-width: 300px;
    margin: 0 auto;
  }
</style>
```

```
}
</style>
```

```
{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs2" %}
```

### Sub Gauge

As the annotation allows you to place any custom element, we can initialize a gauge to the element and can

be used to place that in another gauge.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge :axes='axes'>
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { CircularGaugePlugin, Annotations } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
  data: function() {
    return {
      axes: [{
        minimum: 0,
        maximum: 12,
        startAngle: 0,
        endAngle: 360,
        lineStyle: { width: 0 },
        ranges: [{
          start: 0, end: 3,

### Animation in Vue Circular Gauge component

All of the elements in the Circular Gauge, such as the axis lines, ticks, labels, ranges, pointers, and annotations, can be animated sequentially by using the [animationDuration](#) property. The animation for the Circular Gauge is enabled when the `animationDuration` property is set to an appropriate value in milliseconds, providing a smooth rendering effect for the component. If the `animationDuration` property is set to `0`, which is the default value, the animation effect is disabled. If the animation is enabled, the component will behave in the following order.

1. The axis line will be animated in the rendering direction (clockwise or anticlockwise).
2. Each tick line and label will then be animated.
3. If available, ranges will be animated.
4. If available, pointers will be animated in the same way as [pointer animation](#).
5. If available, annotations will be animated.

The animation of the Circular Gauge is demonstrated in the following example.

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs70" %}

Only the pointer of the Circular Gauge can be animated individually, not the axis lines, ticks, labels, ranges, and annotations. You can refer this [link](#) to enable only pointer animation.

### Gauge legend in Vue Circular gauge component

Legend provides valuable information for interpreting what the circular gauge axis range displays, and they can be represented in various colors, shapes, and other identifiers based on the data. It gives a breakdown of what each symbol represents in the axis range of circular gauge.

You can add the legend for circular gauge ranges by setting the visible property of `legendSettings` to true.

#### Legend customization

Customization option is also provided for the legend shape, alignment, and position.

##### Position and alignment

The position of the legend is used to place legend in various positions. You can use the `position` property in `legendSettings`. Based on the position, the legend item will be aligned. The following options are available to customize the legend position:

- Top
- Bottom
- Left
- Right
- Custom
- Auto

The legend alignment is used to align the legend items in specific location. You can use the alignment property in `legendSettings` to align the legend items. The following options are available to customize the legend alignment:

- Near
- Center
- Far

The legends can also be positioned to absolute position using the `location.x` and `location.y` properties available in `legendSettings`.

#### *Legend size*

The legend size can be modified using the height and width properties in `legendSettings`.

#### *Legend opacity*

To specify the transparency for legend shape, set the opacity property in `legendSettings`.

#### *Legend shape*

To change the legend item shape, specify the desired shape in the shape property of the legend. By default, the shape of the legend is circle.

It also supports the following shapes:

- Rectangle
- Diamond
- Triangle
- InvertedTriangle
- Image
- Circle

You can customize a shape using the `shapeWidth` and `shapeHeight` properties.

#### *Legend padding*

You can control the spacing between the legend items using the padding option of the legend. The default value of padding is 5.

#### *Legend border*

You can customize the legend border using the border option in the legend. The legend border can be customized using the border color and width properties.

<!-- markdownlint-disable MD009 -->

#### *Font of the legend text*

The font of the legend item text can be customized using the following properties:

- fontFamily
- fontStyle
- fontWeight
- opacity
- color
- size

The following code example shows how to add legend in the gauge.

#### **APP.VUE**

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge :legendSettings= 'legendSettings'>
        <e-axes>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs34" %}

**legendRendering** event will be triggered before rendering each legend item, using this event you can customize needed legend items using following arguments.

Argument name	Description
fill	Specifies the legend shape color
text	Specifies the current legend text
shape	Customize the shape of the legends
name	Specifies the name of the event
cancel	Set to true, to cancel the event status

## Gauge user interaction in Vue Circular gauge component

### Tooltip for pointer

Circular gauge will displays the pointer details through [tooltip](#),

when the mouse is moved over the pointer.

<!-- markdownlint-disable MD036 -->

### Tooltip for ranges

Circular gauge displays the information about the ranges through tooltip when hovering the mouse over the ranges. You can enable this feature by setting the type property of tooltip to 'Range' in the array collection.

### Tooltip customization for ranges

To customize the range tooltip, use the `rangeSettings` property in tooltip. The following options are available to customize the range tooltip:

- `fill` - Specifies the range tooltip fill color.
- `textStyle` - Specifies the range tooltip text style.
- `format` - Specifies the range content format.
- `template` - Specifies the custom template for tooltip.
- `enableAnimation` - Animates as it moves from one point to another.
- `border` - Specifies the tooltip border.
- `showMouseAtPosition` - Displays the position of the tooltip on the cursor position.

### Tooltip for annotation

Circular gauge displays the information about the annotations through tooltip when hovering the mouse over the annotation. You can enable this feature by setting the type property of tooltip to 'Annotation' in the array collection.

### Tooltip customization for annotation

To customize the annotation tooltip, use the `annotationSettings` property in tooltip. The following options are available to customize the annotation tooltip:

- `fill` - Specifies the annotation tooltip fill color.
- `textStyle` - Specifies the annotation tooltip text style.
- `format` - Specifies the annotation content format.
- `template` - Specifies the tooltip content with custom template.
- `enableAnimation` - Animates as it moves from one point to another.
- `border` - Specifies the tooltip border.

The following code example shows the tooltip for the pointer, ranges and annotation.

### APP.VUE

## Print and export in Vue Circular Gauge component

### Print

The Circular Gauge can be printed directly from the browser by calling the [print](#) method. More information on the arguments for this method can be found [here](#).

To use the print functionality, inject the **Print** module using the **provide** option and set the property **allowPrint** in the Circular Gauge to **true**.

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-button id='print' isToggle="true" v-on:click.native='clickPrint'>
Print
      </ejs-button>
      <ejs-circulargauge id="gauge" ref="gauge" allowPrint="true">
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin, Print } from "@syncfusion/ej2-vue-
circulargauge";
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(CircularGaugePlugin);
Vue.use(ButtonPlugin);
export default {
  data() {
    return {
    },
  },
  methods: {
    clickPrint: function (args) {
      this.$refs.gauge.ej2Instances.print();
    }
  },
  provide: {
    circulargauge: [Print],
  }
};
</script>
<style>
.wrapper {
  max-width: 300px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs49" %}

## Export

### Image Export

The Circular Gauge can be exported as an image in **JPEG**, **PNG** and **SVG** formats. To use the image export functionality, inject the **ImageExport** module using the **provide** option and set the Circular Gauge's [allowImageExport](#) property to **true**. When the [export](#) method is used, the Circular Gauge will be exported as an image. The **export** method requires the following parameters for image export.

Parameter	Description
type	Specifies the export type, which accepts values such as <b>JPEG</b> , <b>PNG</b> and <b>SVG</b> for image export.

- | fileName | Specifies the file name of the exported image. |
- | orientation | This parameter is not required for image export. So, the value must be **null**. |
- | allowDownload | Specifies whether the exported image file should be downloaded or not. When the value is set to **true**, the file will be downloaded. When set to **false**, the base64 string of the file will be returned. This is an optional parameter, with the default value set to **true**. |

**APP.VUE**

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-button id='export' isToggle="true" v-
on:click.native='clickExport'> Export </ejs-button>
      <ejs-circulargauge id="gauge" ref="gauge" allowImageExport="true">
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin, ImageExport } from "@syncfusion/ej2-vue-
circulargauge";
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(CircularGaugePlugin);
Vue.use(ButtonPlugin);
export default {
  data() {
    return {
    },
    methods: {
      clickExport: function (args) {
        this.$refs.gauge.ej2Instances.export('PNG', 'Gauge');
      }
    },
    provide: {
      circulargauge: [ImageExport],
    }
  };
</script>
<style>
.wrapper {
  max-width: 300px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs50" %}

The base64 string of the exported image files can only be received using the **export** method for JPEG and PNG formats. The **allowDownload** parameter in the **export** method must be set to **false**, as explained in the table above.

**APP.VUE**

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-button id='export' isToggle="true" v-
on:click.native='clickExport'> Export </ejs-button>
      <ejs-circulargauge id="gauge" ref="gauge" allowImageExport="true">
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin, ImageExport } from "@syncfusion/ej2-vue-
circulargauge";
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { PdfPageOrientation } from '@syncfusion/ej2-pdf-export';
Vue.use(CircularGaugePlugin);
Vue.use(ButtonPlugin);
export default {
  data() {
    return {
    },
  },
  methods: {
    clickExport: function (args) {
      this.$refs.gauge.ej2Instances.export('PNG', 'Gauge',
PdfPageOrientation.Landscape, false).then((data) => {
        document.writeln(data);
      })
    },
  },
  provide: {
    circulargauge: [ImageExport]
  }
};
</script>
<style>
.wrapper {
  max-width: 300px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs68" %}

#### PDF Export

The Circular Gauge can be exported as a PDF document using [export](#) method. To use the PDF export functionality, inject the PdfExport module using the [provide](#) option and set the Circular Gauge's [allowPdfExport](#) property to **true**. The [export](#) method requires the following parameters for PDF export.

Parameter	Description
type	Specifies the export type, which accepts values such as <b>PDF</b> for pdf export.

- | **fileName** | Specifies the file name of the exported PDF document. |
- | **orientation** | Specifies the orientation of the exported PDF document which accepts the values such as **Portrait** and **Landscape**. The default value is **Portrait**. |
- | **allowDownload** | This is an optional parameter, with the default value set to **true**. This parameter is supported only for the image export. The exported PDF document cannot be returned as base64 string. |

**APP.VUE**

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-button id='export' isToggle="true" v-
on:click.native='clickExport'> Export </ejs-button>
      <ejs-circulargauge id="gauge" ref="gauge" allowPdfExport="true">
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin, PdfExport } from "@syncfusion/ej2-vue-
circulargauge";
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { PdfPageOrientation } from '@syncfusion/ej2-pdf-export';
Vue.use(CircularGaugePlugin);
Vue.use(ButtonPlugin);
export default {
  data() {
    return {
    },
  },
  methods: {
    clickExport: function (args) {
      this.$refs.gauge.ej2Instances.export('PDF', 'Gauge',
PdfPageOrientation.Portrait);
    }
  },
  provide: {
    circulargauge: [PdfExport],
  }
};
</script>
<style>
.wrapper {
  max-width: 300px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs69" %}

## Gauge appearance in Vue Circular gauge component

### Gauge Title

Circular gauge can be given a title by using [title](#) property, to show the information about the gauge.

Title can be customized by using [titleStyle](#) property in gauge.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge title= 'Speedometer' :titleStyle=
'titleStyle'>
    </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      titleStyle: {
        color: '#27d5ff'
      }
    }
  };
};
</script>
<style>
.wrapper {
  max-width: 300px;
  margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs4" %}

### Gauge Position

<!-- markdownlint-disable MD036 -->

Gauge can be positioned anywhere in the container with the help of

[centerX](#) and

[centerY](#)

property and it accepts values either in percentage or in pixels.

The default value of the [centerX](#) and

[centerY](#) property is 50%, which means gauge will get rendered to the centre of the container.

#### In Pixel

You can set the mid point of the gauge in pixel as demonstrated below,

**APP.VUE**

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis startAngle= 90 endAngle= 180 :lineStyle=
'lineStyle'>
            </e-axis>
          </e-axes>
        </ejs-circulargauge>
      </div>
    </div>
  </template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      lineStyle: {
        width: 2,
        color: '#F8F8F8'
      }
    }
  }
};
</script>
<style>
  .wrapper {
    max-width: 200px;
    max-height: 100px;
    margin: 0px;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs5" %}

*In Percentage*

By setting the value in percentage, gauge gets its mid point with respect to its plot area.

For example, when the [centerX](#)

value as '0%' and [centerY](#) value is '50%', gauge will get positioned at the top left corner of the plot area.

**APP.VUE**

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis startAngle= 0 endAngle= 180 :lineStyle=
'lineStyle'>
            </e-axis>

```

```

        </e-axes>
      </ejs-circulargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from '@syncfusion/ej2-vue-circulargauge';
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      lineStyle: {
        width: 2,
        color: '#F8F8F8'
      }
    }
  }
};
</script>
<style>
.wrapper {
  max-width: 300px;
  max-height: 100px;
  margin: 0px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs6" %}

## Area Customization

*Customize the gauge background*

Using [background](#) and

[border](#) properties, you can change the background color and border of the circular gauge.

## APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis startAngle= 230 endAngle= 130 maximum= 120
radius= '90%':pointers = 'pointers' :ranges='ranges' :lineStyle= 'lineStyle'
:minorTicks= 'minorTicks' :majorTicks = 'majorTicks'>
            </e-axis>
          </e-axes>
        </ejs-circulargauge>
      </div>
    </div>
  </template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from '@syncfusion/ej2-vue-circulargauge';
Vue.use(CircularGaugePlugin);

```

```

export default {
  data: function () {
    return {
      majorTicks: {
        width: 1, color: '#8c8c8c'
      },
      lineStyle: { width: 2 },
      minorTicks: {
        width: 1, color: '#8c8c8c'
      },
      pointers: [{
        value: 60,
        radius: '60%'
      }],
      ranges: [{
        start: 0,
        end: 70,
        radius: '110%',
        strokeWidth: 10
      }, {
        start: 70,
        end: 110,
        radius: '110%',
        strokeWidth: 10
      }, {
        start: 110,
        end: 120,
        radius: '110%',
        strokeWidth: 10
      }
    ]
  }
};
</script>
<style>
  .wrapper {
    max-width: 300px;
    margin: 0 auto;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs7" %}

### Gauge Margin

You can set margin for gauge from its container through

[margin](#) property.

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge background= 'skyblue' :border= 'border'
      :margin= 'margin' >
        <e-axes>

```

```

        <e-axis startAngle= 230 endAngle= 130 maximum= 120
radius= '90%':pointers = 'pointers' :ranges='ranges' :lineStyle= 'lineStyle'
:minorTicks= 'minorTicks' :majorTicks = 'majorTicks'>
        </e-axis>
    </e-axes>
</ejs-circulargauge>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
    data: function () {
        return {
            border: {color: "#FF0000", width: 2},
            margin: { left: 40, right: 40, top: 40, bottom: 40 },
            majorTicks: {
                width: 1, color: '#8c8c8c'
            },
            lineStyle: { width: 2 },
            minorTicks: {
                width: 1, color: '#8c8c8c'
            },
            pointers: [{
                value: 60,
                radius: '60%'
            }],
            ranges: [{
                start: 0,
                end: 70,
                radius: '110%',
                strokeWidth: 10
            }, {
                start: 70,
                end: 110,
                radius: '110%',
                strokeWidth: 10
            }, {
                start: 110,
                end: 120,
                radius: '110%',
                strokeWidth: 10
            }
        ]
    }
};
</script>
<style>
    .wrapper {
        max-width: 400px;
        max-height:100px;
        margin: 0 auto;
    }
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs8" %}

### Radius calculation based on angles

Render semi or quarter circular gauges by modifying the start and end angles. By enabling the radius based on angle option, the radius of circular gauge will be calculated based on the start and end angles to avoid excess white space.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-circulargauge>
        <e-axes>
          <e-axis startAngle= 270 endAngle= 90 radius= '80%'
:lineStyle= 'lineStyle'>
            </e-axis>
          </e-axes>
        </ejs-circulargauge>
      </div>
    </div>
  </template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      lineStyle: {
        width: 2,
        color: '#F8F8F8'
      },
    }
  }
};
</script>
<style>
.wrapper {
  max-width: 300px;
  max-height: 100px;
  margin: 0px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs9" %}

### Accessibility in Vue Circular gauge component

Circular Gauge has built-in accessibility features like screen reading and WAI-ARIA attributes.

#### WAI-ARIA attributes

The Circular Gauge component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Circular Gauge component:

| Attributes | Purpose |

| --- | --- |

| **role=region** | It is specified in the pointer where the interactive drag and drop function is supported to update the pointer value. |

| **aria-label** | Provides an accessible name for the axis labels, legend title, legend item label, text pointer and annotation. |

### Screen reading in Circular Gauge

Accessibility in the Circular Gauge component ensures that all users, regardless of ability or disability, can use screen reading. The following Circular Gauge elements will be read aloud using screen reading software, such as Narrator for Windows.

| Elements | Description |

| --- | --- |

| Axis labels | Reads the axis labels of the Circular Gauge. |

| Legend title | Reads the title of the legend in the Circular Gauge. |

| Legend item label | Reads the label of the legend item in the Circular Gauge. |

| Text pointer | Reads the text content shown as a pointer in Circular Gauge. |

| Annotation | Reads the content specified in the annotation. |

### Ensuring accessibility

The Circular Gauge component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Circular Gauge component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Circular Gauge component with accessibility tools.

```
{% previewsample "https://ej2.syncfusion.com/accessibility/circular-gauge.html" %}
```

- [Accessibility in Syncfusion Vue components](#)

### Internationalization in Vue Circular Gauge component

Circular Gauge provides internationalization support for below elements.

- Axis Labels
- Tooltip

For more information about number formatter, you can refer [internationalization](#).

### Globalization

Globalization is the process of designing and developing a component that works in different cultures/locales.

Internationalization library is used to globalize number in Circular Gauge component using [format](#) property in [labelStyle](#).

#### Numeric Format

In the below example, axis labels are globalized to **EUR**.

#### APP.VUE

```
<template>
<div id="app">
  <div class='wrapper'>
    <ejs-circulargauge :axes='axes'>
    </ejs-circulargauge>
  </div>
</div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin } from "@syncfusion/ej2-vue-circulargauge";
import { loadCldr, L10n, setCulture, setCurrencyCode } from
'@syncfusion/ej2-base';
setCulture('de');
setCurrencyCode('EUR');
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      axes: [{
        labelStyle: {
          position: 'Inside',
          //Label format set as currency.
          format: 'c'
        }
      }]
    }
  }
};
</script>
<style>
.wrapper {
  max-width: 300px;
  margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs66" %}

#### Right-to-left

Circular Gauge can render its elements from right to left, which improves the user experience for certain language users. To do so, set the [enableRtl](#) property to **true**. When this property is enabled, elements such as the tooltip and legend will be rendered from right to left. Meanwhile, the axis can be rendered from right to left by setting the [direction](#) property to **AntiClockWise**. For more information on axis, click [here](#).

The following example illustrates the right to left rendering of the Circular Gauge.

**APP.VUE**

```

<template>
<div id="app">
  <div class='wrapper'>
    <ejs-circulargauge :axes='axes' :legendSettings='legendSettings'
:tooltip='tooltip' :enableRtl='enableRtl'>
    </ejs-circulargauge>
  </div>
</div>
</template>
<script>
import Vue from 'vue';
import { CircularGaugePlugin, GaugeTooltip, Legend } from "@syncfusion/ej2-
vue-circulargauge";
Vue.use(CircularGaugePlugin);
export default {
  data: function () {
    return {
      enableRtl: true,
      tooltip: {
        type: ['Pointer', 'Range'],
        format: 'Pointer : {value} ',
        enable: true,
        enableAnimation: false
      },
      legendSettings:{
        visible:true,
        position:'Right'
      },
      axes: [{
        direction: 'AntiClockWise',
        lineStyle: { width: 10, color: 'transparent' },
        labelStyle: {
          position: 'Inside', useRangeColor: false,
          font: {
            size: '12px',
            color: '#424242',
            fontFamily: 'Roboto',
            fontStyle: 'Regular'
          }
        },
      },
      majorTicks: {
        height: 10,
        offset: 5,
        color: '#9E9E9E'
      },
      minorTicks: { height: 0 },
      startAngle: 210,
      endAngle: 150,
      minimum: 0,
      maximum: 120,
      radius: '80%',
      ranges: [{
        start: 0,
        end: 40,
        color: '#30B32D'
      }
    ]
  }
}

```

```

    },
    {
      start: 40,
      end: 80,
      color: '#FFDD00'
    },
    {
      start: 80,
      end: 120,
      color: '#F03E3E'
    }
  ],
  pointers: [{
    animation: { enable: false },
    value: 65,
    radius: '60%',
    color: '#757575',
    pointerWidth: 8,
    cap: {
      radius: 7,
      color: '#757575'
    },
    needleTail: {
      length: '18%'
    }
  }
  ]
},
provide: {
  circulargauge: [GaugeTooltip, Legend]
}
};
</script>
<style>
  .wrapper {
    max-width: 300px;
    margin: 0 auto;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/circular-gauge/getting-started-cs67" %}

## ColorPicker

### Getting Started with the Vue Color picker Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLI](#) and integrating the Syncfusion Vue Color picker component using the [Composition API](#) / [Options API](#).

#### Prerequisites

[System requirements for Syncfusion Vue UI components](#)

#### Dependencies

The list of dependencies required to use the ColorPicker component in your application is given below:

```
`javascript`
```

```
|-- @syncfusion/ej2-vue-inputs
|-- @syncfusion/ej2-vue-base
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-splitbuttons
`
```

### Setting up the Vue 2 project

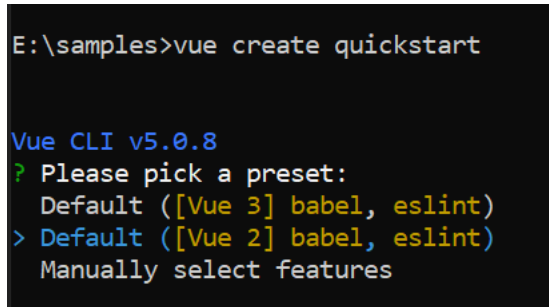

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```
`bash
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
`
```

or

```
`bash
yarn global add @vue/cli
vue create quickstart
cd quickstart
yarn run serve
`
```

When creating a new project, choose the option **Default ([Vue 2] babel, eslint)** from the menu.

```
E:\samples>vue create quickstart

Vue CLI v5.0.8
? Please pick a preset:
  Default ([Vue 3] babel, eslint)
> Default ([Vue 2] babel, eslint)
  Manually select features
```

Once the **quickstart** project is set up with default settings, proceed to add Syncfusion components to the project.

### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.npmjs.com). To use Vue components, install the required npm package.

This article uses the [Vue Color picker component](#) as an example. Install the `@syncfusion/ej2-vue-inputs` package by running the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-inputs --save
```

```
,
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-inputs
```

```
,
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the `Material` theme is applied using CSS styles, which are available in installed packages. The necessary `Material` CSS styles for the Color picker component and its dependents were imported into the `<style>` section of `src/App.vue` file.

#### ~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
</style>
```

### Add Syncfusion Vue component

Follow the below steps to add the Vue Color picker component using `Composition API` or `Options API`:

1\ First, import and register the Color picker component in the `script` section of the `src/App.vue` file. If you are using the `Composition API`, you should add the `setup` attribute to the `script` tag to indicate that Vue will be using the `Composition API`.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script>
import { ColorPickerComponent as EjsColorpicker } from '@syncfusion/ej2-vue-inputs';
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { ColorPickerComponent } from '@syncfusion/ej2-vue-inputs';
export default {
  components: {
    'ejs-colorpicker': ColorPickerComponent
  }
}
</script>
```

2\ In the **template** section, define the Color picker component.

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<template>
<div class='wrap'>
<h4>Choose Color</h4>
<ejs-colorpicker></ejs-colorpicker>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<template>
<div class='wrap'>
  <h4>Choose Color</h4>
  <ejs-colorpicker></ejs-colorpicker>
</div>
</template>
<script setup>
import { ColorPickerComponent as EjsColorpicker } from '@syncfusion/ej2-vue-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
.wrap {
  margin: 0 auto;
  width: 300px;
  text-align: center;
}
</style>
```

#### **OPTIONS API (~SRC/APP.VUE)**

```
<template>
<div class='wrap'>
  <h4>Choose Color</h4>
  <ejs-colorpicker></ejs-colorpicker>
</div>
```

```

</template>
<script>
import { ColorPickerComponent } from '@syncfusion/ej2-vue-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
  components: {
    'ejs-colorpicker': ColorPickerComponent
  },
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
.wrap {
  margin: 0 auto;
  width: 300px;
  text-align: center;
}
</style>

```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run serve
```

```
,
```

or

```
`bash
```

```
yarn run serve
```

```
,
```

```
{% previewsample "page.domainurl/code-snippet/color-picker/default-cs2" %}
```

### Inline type

By default, the ColorPicker will be rendered using SplitButton and open the pop-up to access the ColorPicker. To render the ColorPicker container alone and to access it directly, render it as inline. It can be achieved by setting the [inline](#) property to `true`.

The following sample shows the inline type rendering of ColorPicker.

### COMPOSITION API (~SRC/APP.VUE)

```

<template>
  <div class='wrap'>
    <h4>Choose Color</h4>
    <ejs-colorpicker :inline="true" :showButtons="false"></ejs-colorpicker>
  </div>
</template>

```

```

<script setup>
import { ColorPickerComponent as EjsColorpicker } from '@syncfusion/ej2-vue-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
.wrap {
  margin: 0 auto;
  width: 300px;
  text-align: center;
}
</style>

```

### OPTIONS API (~SRC/APP.VUE)

```

<template>
  <div class='wrap'>
    <h4>Choose Color</h4>
    <ejs-colorpicker :inline="true" :showButtons="false"></ejs-colorpicker>
  </div>
</template>
<script>
import { ColorPickerComponent } from '@syncfusion/ej2-vue-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
  components: {
    'ejs-colorpicker': ColorPickerComponent
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
.wrap {
  margin: 0 auto;
  width: 300px;
  text-align: center;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/color-picker/default-cs3" %}

> The `showButtons` property is disabled in this sample because the control buttons are not needed for inline type. To know about the control buttons functionality, refer to the [showButtons](#) sample.

## Getting Started with the Vue ColorPicker Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue ColorPicker component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

### Prerequisites

#### [System requirements for Syncfusion Vue UI components](#)

#### Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
npm create vite@latest
```

```
,
```

or

```
`bash
yarn create vite
```

```
,
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as **my-project** for this article.

```
`bash
? Project name: » my-project
```

```
,
```

2. Select **Vue** as the framework. It will create a Vue 3 project.

```
`bash
? Select a framework: » - Use arrow-keys. Return to submit.
```

Vanilla

Vue

React

Preact

Lit

Svelte

Others

,

3. Choose **JavaScript** as the framework variant to build this Vite project using JavaScript and Vue.

```
`bash
```

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

,

4. Upon completing the aforementioned steps to create the **my-project**, run the following command to install its dependencies:

```
`bash
```

```
cd my-project
```

```
npm install
```

,

or

```
`bash
```

```
cd my-project
```

```
yarn install
```

,

Now that **my-project** is ready to run with default settings, let's add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue ColorPicker component](#) as an example. To use the Vue ColorPicker component in the project, the **@syncfusion/ej2-vue-inputs** package needs to be installed using the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-inputs --save
```

```
,
```

```
or
```

```
`bash
```

```
yarn add @syncfusion/ej2-vue-inputs
```

```
,
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, **Material** theme is applied using CSS styles, which are available in installed packages. The necessary **Material** CSS styles for the ColorPicker component and its dependents were imported into the `<style>` section of **src/App.vue** file.

#### ~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

### Add Syncfusion Vue component

Follow the below steps to add the Vue ColorPicker component using **Composition API** or **Options API**:

1.First, import and register the ColorPicker component and its child directives in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { ColorPickerComponent as EjsColorpicker } from "@syncfusion/ej2-vue-inputs";
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { ColorPickerComponent } from "@syncfusion/ej2-vue-inputs";
//Component registration
export default {
  name: "App",
  components: {
    "ejs-colorpicker": ColorPickerComponent
  }
}
```

```
}  
}  
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

### **COMPOSITION API (~SRC/APP.VUE)**

```
<template>  
<ejs-colorpicker></ejs-colorpicker>  
</template>  
<script setup>  
import { ColorPickerComponent as EjsColorpicker } from "@syncfusion/ej2-vue-inputs";  
</script>  
<style>  
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';  
</style>
```

### **OPTIONS API (~SRC/APP.VUE)**

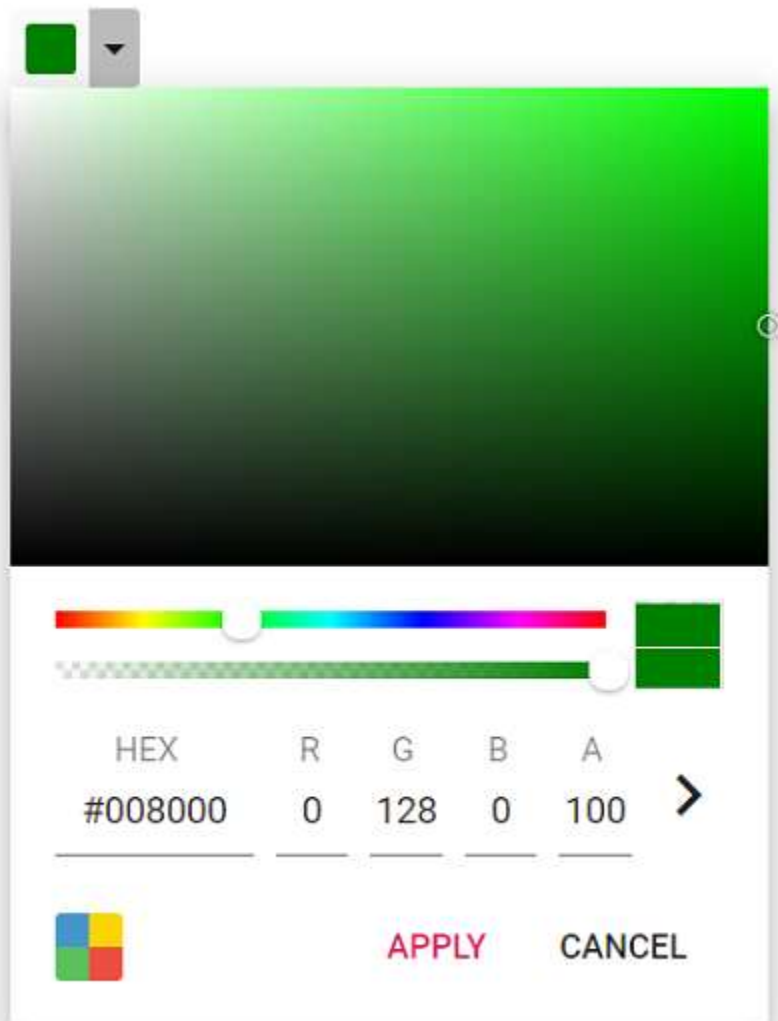

```
<template>  
<ejs-colorpicker></ejs-colorpicker>  
</template>  
<script>  
import { ColorPickerComponent } from "@syncfusion/ej2-vue-inputs";  
// Component registration  
export default {  
  name: "App",  
  // Declaring component and its directives  
  components: {  
    "ejs-colorpicker": ColorPickerComponent  
  },  
  // Bound properties declarations  
  data() {  
    return {  
    };  
  }  
};  
</script>  
<style>  
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';  
</style>
```

### Run the project

To run the project, use the following command:

```
`bash
npm run dev
`
or
`bash
yarn run dev
`
```

The output will appear as follows:

For migrating from Vue 2 to Vue 3, refer to the [migration](#) documentation.

See also

- [Getting Started with Vue UI Components using Composition API and TypeScript](#)
- [Getting Started with Vue UI Components using Options API and TypeScript](#)

## Mode and value in Vue Color picker component

### Rendering palette at initial load

By default, the **Picker** area will be rendered at initial load. To render the **Palette** area while opening the ColorPicker pop-up, and specify the [mode](#) property as **Palette**.

In the following sample, it will render the **Palette** at initial load.

#### APP.VUE

```
<template>
<div class='wrap'>
  <h4>Choose Color</h4>
  <ejs-colorpicker mode="Palette"></ejs-colorpicker>
</div>
</template>
<script>
import Vue from 'vue';
import { ColorPickerPlugin } from '@syncfusion/ej2-vue-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ColorPickerPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
.wrap {
  margin: 0 auto;
  width: 300px;
  text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/color-picker/default-cs18" %}

### Color value

The [value](#) property can be used to specify the color value to the ColorPicker. It supports either **three** or **six** digit hex codes. To include **opacity**, set the color value as **four** or **eight** digit hex code.

In the following sample, the color value sets as **four** digit hex code, the last digit represents the **opacity** value.

#### APP.VUE

```
<template>
<div class='wrap'>
  <h4>Choose Color</h4>
  <ejs-colorpicker value="035a" :modeSwitcher="false"></ejs-colorpicker>
</div>
</template>
<script>
import Vue from 'vue';
```

```

import { ColorPickerPlugin } from '@syncfusion/ej2-vue-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ColorPickerPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
.wrap {
  margin: 0 auto;
  width: 300px;
  text-align: center;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/color-picker/default-cs19" %}

> The [value](#) property supports hex code with or without # prefix.

- [How to render palette alone](#)
- [Custom palette](#)
- [No color support in palette](#)

## Localization in Vue Color picker component

### Localization

The **Localization** library allows you to localize default text content of the ColorPicker. The ColorPicker component has static text for **control buttons (apply / cancel)** and **mode switcher** that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [locale](#) value and translation object.

The following list of properties and its values are used in the ColorPicker.

Locale key words | Text

Apply | Apply

Cancel | Cancel

ModeSwitcher | Switch Mode

### Loading translations

To load translation object in an application use **load** function of **L10n** class.

The below example demonstrates the ColorPicker in **Deutsch** culture.

### APP.VUE

```

<template>
<div class='wrap'>

```

```

    <h4>Choose Color</h4>
    <ejs-colorpicker locale='de-DE'></ejs-colorpicker>
</div>
</template>
<script>
import Vue from 'vue';
import { ColorPickerPlugin } from '@syncfusion/ej2-vue-inputs';
import { enableRipple, L10n } from '@syncfusion/ej2-base';
enableRipple(true);
L10n.load({
  'de-DE': {
    'colorpicker': {
      'Apply': 'Anwenden',
      'Cancel': 'Abbrechen',
      'ModeSwitcher': 'Modus wechseln'
    }
  }
});
Vue.use(ColorPickerPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
.wrap {
  margin: 0 auto;
  width: 300px;
  text-align: center;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/color-picker/default-cs16" %}

### Right to Left - RTL

ColorPicker component has **RTL** support. It helps to render the ColorPicker from right-to-left direction.

It improves the user experiences and accessibility for users who use right-to-left languages(Arabic, Farsi, Urdu, etc). This can be achieved by setting the [enableRtl](#) property to **true**.

The following example illustrates how to enable right-to-left support in ColorPicker component.

### APP.VUE

```

<template>
<div class='wrap'>
  <h4>Choose Color</h4>
  <ejs-colorpicker :enableRtl="true" locale='ar-AE'></ejs-colorpicker>
</div>
</template>
<script>
import Vue from 'vue';
import { ColorPickerPlugin } from '@syncfusion/ej2-vue-inputs';
import { enableRipple, L10n } from '@syncfusion/ej2-base';
enableRipple(true);

```

```

L10n.load({
  'ar-AE': {
    'colorpicker': {
      'Apply': 'تطبيق',
      'Cancel': 'إلغاء',
      'ModeSwitcher': 'مفتاح كهربائي الوضع'
    }
  }
});
Vue.use(ColorPickerPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
.wrap {
  margin: 0 auto;
  width: 300px;
  text-align: center;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/color-picker/default-cs17" %}

### Accessibility in Vue Color picker component

The Color picker component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Color picker component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

```
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
```

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The Color picker component followed the WAI-ARIA patterns to meet the accessibility. The following ARIA attributes are used in the Color picker component:

| Attributes | Purpose |

| --- | --- |

| **role** | Indicates the Color picker component as **color** and the tiles as **gridcell** in the color palette. |

| **aria-label** | Indicates the accessible name for the tiles. |

| **aria-selected** | Indicates the current selected state of the tile. |

| **aria-haspopup** | Indicates the availability of the popup element. |

| **aria-expanded** | Indicates whether the popup can be expanded or collapsed, as well as indicates whether its current state is expanded or collapsed. |

| **aria-owns** | Identifies an elements in order to define a visual, functional, or contextual parent/child relationship between DOM elements where the DOM hierarchy cannot be used to represent the relationship. |

| **aria-disabled** | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |

### Keyboard interaction

The Color picker component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Color picker component.

| **Press** | **To do this** |

| --- | --- |

| **Up Arrow** | Moves the handler/tile up from the current position. |

| **Down Arrow** | Moves the handler/tile down from the current position. |

| **Left Arrow** | Moves the handler/tile left from the current position. |

| **Right Arrow** | Moves the handler/tile right from the current position. |

| **Enter** | Apply the selected color value. |

| **Tab** | To focus the next focusable element in the Color picker popup. |

### Ensuring accessibility

The Color picker component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Color picker component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Color picker component with accessibility tools.

```
{% previewsample "page.domainurl/code-snippet/color-picker/default-cs1" %}
```

### Two way binding in Vue Color picker component

It can be achieved by using the `v-model` directive in vue. In the following sample the color value is selected in one ColorPicker will automatically changes in the other ColorPicker. It will update in the other ColorPicker using value property.

#### APP.VUE

```
<template>
<div>
<div class='wrapper1'>
  <h4>Choose Color</h4>
  <ejs-colorpicker v-model="value"></ejs-colorpicker>
</div>
<div class="wrapper2">
  <h4>Choose Color</h4>
  <ejs-colorpicker v-model="value"></ejs-colorpicker>
</template>
</div>
</div>
<script>
import Vue from 'vue';
import { ColorPickerPlugin } from '@syncfusion/ej2-vue-inputs';
```

```

import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ColorPickerPlugin);
export default {
  data() {
    return {
      value: null
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
.wrapper1 {
  /* margin: 0 auto;
  width: 300px;
  text-align: center; */
  float: left;
  padding: 10px 0 0 160px;
}
.wrapper2 {
  float: right;
  padding: 10px 330px 0 0;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/color-picker/default-cs20" %}

### Style and appearance in Vue Color picker component

To modify the ColorPicker appearance, you need to override the default CSS of ColorPicker component. Please find the list of CSS classes and its corresponding section in ColorPicker component. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

#### CSS Class | Purpose of Class

- |.e-custom-picker .e-container .e-handler|To customized Color Picker selection handler
- |.color-picker.e-dropdown-popup ul .e-container|To customize the Color Picker container
- |.color-picker.e-dropdown-popup ul .e-item.e-palette-item|To customize the Color Picker palette item
- |.color-picker.e-dropdown-popup .e-container .e-switch|To customize the Color Picker switch control
- |.color-picker.e-dropdown-popup .e-container .e-slider-preview|To customize the Color Picker slider control

### How To

#### Hide control buttons in Vue Color picker component

ColorPicker can be rendered without control buttons (Apply/Cancel). In this case, while selecting a color, the

ColorPicker pop-up is closed and selected colors can be applied directly. To hide control buttons, set the [showButtons](#) property to `false`.

#### APP.VUE

```
<template>
<div class='wrap'>
  <h4>Choose Color</h4>
  <ejs-colorpicker :showButtons="false"></ejs-colorpicker>
</div>
</template>
<script>
import Vue from 'vue';
import { ColorPickerPlugin } from '@syncfusion/ej2-vue-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ColorPickerPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
.wrap {
  margin: 0 auto;
  width: 300px;
  text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/color-picker/default-cs14" %}

Render palette alone in Vue Color picker component

To render the **Palette** alone in ColorPicker, specify the [mode](#) property as **Palette**, and set the [modeSwitcher](#) property to `false`.

In the following sample, the [showButtons](#) property is disabled to hide the control buttons and it renders only the **Palette** area.

#### APP.VUE

```
<template>
<div class='wrap'>
  <h4>Choose Color</h4>
  <ejs-colorpicker mode="Palette" :showButtons="false"
:modeSwitcher="false"></ejs-colorpicker>
</div>
</template>
<script>
import Vue from 'vue';
import { ColorPickerPlugin } from '@syncfusion/ej2-vue-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ColorPickerPlugin);
```

```

export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
.wrap {
  margin: 0 auto;
  width: 300px;
  text-align: center;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/color-picker/default-cs15" %}

> To render Picker alone specify the [mode](#) property as 'Picker'.

### Colorpicker in dropdownbutton in Vue Color picker component

This section explains about how to render the ColorPicker in DropDownButton. The [target](#) property of the DropDownButton helps to achieve this scenario. To know about the usage of [target](#) property refer to [Popup templating](#) section.

In the below sample, the color picker is rendered as inline type by setting [inline](#) property as `true` and the rendered color picker wrapper is passed as a [target](#) to the DropDownButton to achieve the above scenario.

### APP.VUE

```

<template>
<div class='wrap'>
  <h4>Choose Color</h4>
  <ejs-colorpicker :inline="true" :modeSwitcher="false"
:change="onChange"></ejs-colorpicker>
  <ejs-dropdownbutton id="dropdownbtn" ref="ddb" target=".e-colorpicker-
wrapper" iconCss="e-dropdownbtn-preview" :beforeClose="beforeDdbClose"
:open="ddbOpen"></ejs-dropdownbutton>
</div>
</template>
<script>
import Vue from 'vue';
import { ColorPickerPlugin } from '@syncfusion/ej2-vue-inputs';
import { DropDownButtonPlugin } from '@syncfusion/ej2-vue-splitbuttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ColorPickerPlugin);
Vue.use(DropDownButtonPlugin);
export default {
  methods: {
    onChange: function(args) {

this.$refs.ddb.ej2Instances.element.children[0].style.backgroundColor =
args.currentValue.rgba;
      this.closePopup();
    },
  },

```

```

        ddbOpen: function(args) {
            args.element.querySelector('.e-cancel').addEventListener('click',
this.closePopup);
            this.tooltip();
        },
        beforeDdbClose: function(args) {
            args.element.querySelector('.e-
cancel').removeEventListener('click', this.closePopup);
        },
        closePopup: function() {
            this.$refs.ddb.ej2Instances.toggle()
        },
        tooltip: function() {
            var zindex = (document.getElementsByClassName('e-color-picker-
tooltip')[0]).style.zIndex;
            var zindexIntValue = parseInt(zindex) + 2;
            (document.getElementsByClassName('e-color-picker-
tooltip')[0]).style.zIndex = zindexIntValue.toString();
        }
    }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
.wrap {
    margin: 0 auto;
    width: 300px;
    text-align: center;
}
/* DropDownButton preview customization */
#dropdownbtn .e-btn-icon.e-dropdownbtn-preview {
    background-color: #008000;
    height: 18px;
    width: 18px;
    margin-top: 0;
}
#dropdownbtn {
    padding: 4px;
}
</style>

```

```
{% previewsample "page.domainurl/code-snippet/color-picker/default-cs4" %}
```

## Customize colorpicker in Vue Color picker component

### Custom palette

By default, the Palette will be rendered with default colors. To load custom colors in the palette, specify the colors in the [presetColors](#) property. To customize the color palette, add a custom class to palette tiles using [BeforeTileRender](#) event.

The following sample demonstrates the above functionalities.

### APP.VUE

```

<template>
<div class='wrap'>
  <div id="preview"></div>
  <h4>Choose Color</h4>
  <ejs-colorpicker mode="Palette" value="#ba68c8" :columns="4"
:inline="true" :showButtons="false" :modeSwitcher="false"
:presetColors="customColors" :beforeTileRender="tileRender"
:change="onChange"></ejs-colorpicker>
</div>
</template>
<script>
import Vue from 'vue';
import { ColorPickerPlugin } from '@syncfusion/ej2-vue-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ColorPickerPlugin);
export default {
data() {
  return {
    customColors: {
      'custom1': ['#ef9a9a', '#e57373', '#ef5350', '#f44336',
'#f48fb1', '#f06292',
'#ec407a', '#e91e63', '#ce93d8', '#ba68c8', '#ab47bc',
'#9c27b0', '#b39ddb',
'#9575cd', '#7e57c2', '#673ab7'],
      'custom2': ['#9fa8da', '#7986cb', '#5c6bc0', '#3f51b5',
'#90caf9', '#64b5f6',
'#42a5f5', '#2196f3', '#81d4fa', '#4fc3f7', '#29b6f6',
'#03a9f4',
'#80ddea', '#4dd0e1', '#26c6da', '#00bcd4'],
      'custom3': ['#80cbc4', '#4db6ac', '#26a69a', '#009688',
'#a5d6a7', '#81c784',
'#66bb6a', '#4caf50', '#c5e1a5', '#aed581', '#9ccc65',
'#8bc34a', '#e6ee9c',
'#dce775', '#d4e157', '#cddc39']
    },
  };
},
methods: {
  onChange: function(args) {
    document.getElementById("preview").style.backgroundColor =
args.currentValue.hex;
  },
  tileRender: function(args) {
    args.element.classList.add("e-icons");
    args.element.classList.add("e-custom-tile");
  }
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
.e-container {

```

```

    background-color: transparent;
    border-color: transparent;
    box-shadow: none;
  }
  /* Tile customization styles */
  .e-container .e-palette .e-custom-tile {
    border: 0;
    color: #fff;
    height: 36px;
    font-size: 18px;
    width: 36px;
    line-height: 36px;
    border-radius: 50%;
    margin: 2px 5px;
  }
  .e-container .e-custom-palette.e-palette-group {
    height: 182px;
  }
  /* Selected state icon */
  .e-container .e-palette .e-custom-tile.e-selected::before {
    content: '\e933';
  }
  .e-container .e-palette .e-custom-tile.e-selected {
    outline: none;
  }
  .wrap {
    margin: 0 auto;
    width: 300px;
    text-align: center;
  }
  #preview {
    background-color: #ba68c8;
    height: 50px;
    width: 100%;
  }
</style>

```

```
{% previewsample "page.domainurl/code-snippet/color-picker/default-cs5" %}
```

#### Hide input area from picker

By default, the input area will be rendered in ColorPicker. To hide the input area from it, add `e-hide-value` class to ColorPicker using the [cssClass](#) property.

In the following sample, the ColorPicker is rendered without input area.

#### APP.VUE

```

<template>
<div class='wrap'>
  <h4>Choose Color</h4>
  <ejs-colorpicker cssClass="e-hide-value" :modeSwitcher="false"></ejs-
colorpicker>
</div>
</template>
<script>
import Vue from 'vue';

```

```

import { ColorPickerPlugin } from '@syncfusion/ej2-vue-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ColorPickerPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
.wrap {
  margin: 0 auto;
  width: 300px;
  text-align: center;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/color-picker/default-cs6" %}

#### Custom handle

Color picker handle shape and UI can be customized. Here, we have customized the handle as **svg icon**. The same way you can customize the handle based on your requirement.

The following sample show the customized color picker handle.

#### APP.VUE

```

<template>
<div class='wrap'>
  <h4>Choose Color</h4>
  <ejs-colorpicker cssClass="e-custom-picker" value="#344aee"
:modeSwitcher="false" :open="onOpen"></ejs-colorpicker>
</div>
</template>
<script>
import Vue from 'vue';
import { ColorPickerPlugin } from '@syncfusion/ej2-vue-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ColorPickerPlugin);
export default {
  methods: {
    onOpen: function(args) {
      args.element.querySelector('.e-handler').classList.add('e-icons');
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';

```

```

.wrap {
  margin: 0 auto;
  width: 300px;
  text-align: center;
}
/* To hide the handle balloon preview */
.e-color-picker-tooltip.e-popup.e-popup-open {
  display: none;
}
/* Handle customization styles */
.e-custom-picker .e-container .e-hsv-container .e-handler {
  background: transparent
url('data:image/svg+xml;base64,PD94bWwgdmVyc2lvbj0iMS4wIiBlbmNvZGluZz0idXRmLTgiPz4KPCFetLSBHZW51cmF0b3I6IEFkb2JlIElsbHVzdHJhdG9yIDIyLjEuMCwgU1ZHIEV4cG9ydCBQbHVnLUluIC4gU1ZHIFZlcnNpb246IDYyMDAgQnVpbGQgMCkgIC0tPgo8c3ZnIHZlcnNpb249IjEuMSIgaWQ9IkkxeWVyXzEiIHhtbG5zPSJodHRwOi8vd3d3LnczLm9yZy8yMDAwL3N2ZyIgeG1sbmM6eGxpbnMs9Imh0dHA6Ly93d3d3cudzMub3JnLzE5OTkveGxpbnMsIiHg9IjBweCIgeT0iMHB4IgoJIHZpZXh0c3g9IjAgMCAxNiAxNiIgc3R5bGU9ImVuYWJsZS1iYWNRZ3JvdW5kOm5ldyAwIDAgMTYgMTY7IiB4bWw6c3BhY2U9InByZXNlcnZlIj4KPHN0eWxlIHR5cGU9InRleHQvY3NzIj4KCS5zdDB7ZmlsbDojRkZGRkZGO30KPC9zdHlsZT4KPGC+Cgk8cG9seWdvbiBjbGFzcz0ic3QwIiBwb2ludHM9IjE2LDYgMTAsNiAxMCwwIDYsMCA2LDYgMCw2IDAsMTAgNiwxMCA2LDE2IDEwLDE2IDEwLDEwIDE2LDEwIAkiLz4KPC9nPgo8cGF0aCBkPSJNMTAsNlYwSDZ2NkgwdjRoNnY2aDR2LTZoNlY2SDEweibNMtUsOUg5djZINlY5SDFWN2g2VjFoMnY2aDZWOXoiLz4KPC9zdmc+Cg==');
  font-size: 16px;
  height: 16px;
  line-height: 16px;
  margin-left: -8px;
  margin-top: -8px;
  border: none;
  box-shadow: none;
  width: 16px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/color-picker/default-cs7" %}

#### Custom primary button

By default, the applied color will be updated in primary button of the color picker. You can customize that as **icon**.

In the following sample, the **picker** icon is added to primary button and using [change](#) event the selected color will be updated in bottom portion of the icon.

#### APP.VUE

```

<template>
<div class='wrap'>
  <h4>Choose Color</h4>
  <ejs-colorpicker id="element" :change="onChange"></ejs-colorpicker>
</div>
</template>
<script>
import Vue from 'vue';
import { ColorPickerPlugin } from '@syncfusion/ej2-vue-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);

```

```

Vue.use(ColorPickerPlugin);
export default {
  methods: {
    onChange: function(args) {
      document.querySelector('.e-colorpicker-wrapper .e-selected-color').style.borderBottomColor = args.currentValue.rgba;
    }
  },
  mounted: function() {
    var previewIcon = document.querySelector('.e-colorpicker-wrapper .e-selected-color');
    previewIcon.classList.add("e-icons");
  }
};
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
.wrap {
  margin: 0 auto;
  width: 300px;
  text-align: center;
}
/* Icon customization */
.e-colorpicker-wrapper #element+.e-split-btn-wrapper .e-split-btn .e-selected-color {
  background: none;
  border-bottom-style: solid;
  border-bottom-width: 3px;
  width: 14px;
  margin: 0px 2px;
  border-bottom-color: #008000;
}
.e-colorpicker-wrapper #element+.e-split-btn-wrapper .e-split-btn .e-selected-color .e-split-preview {
  display: none;
}
.e-colorpicker-wrapper #element+.e-split-btn-wrapper .e-split-btn .e-selected-color::before {
  content: '\e35c';
}
</style>

```

{% previewsample "page.domainurl/code-snippet/color-picker/default-cs8" %}

> The Essential JS 2 provides a set of icons that can be loaded by applying **e-icons** class name to the element. You can also use third party icon to customize the primary button.

#### Display hex code in input

The color picker input element can be showcased in the place of primary button. The applied color hex code will be updated in the primary button input.

The following sample shows the color picker with input.

**APP.VUE**

```

<template>
<div class='wrap'>
  <h4>Choose Color</h4>
  <ejs-colorpicker id="element" type="text" class="e-input"></ejs-
colorpicker>
</div>
</template>
<script>
import Vue from 'vue';
import { ColorPickerPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(ColorPickerPlugin);
export default {
  mounted: function() {
    var target = document.getElementById("element");
    target.nextElementSibling.insertBefore(target,
target.nextElementSibling.children[1]);
  }
};
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';

```

### Custom UI

The color picker UI can be customized in all possible ways. The following sample shows the excel like UI customization with help of SplitButton and Dialog component. In that by clicking the more colors option from color palette, the dialog contains color picker will open.

### APP.VUE

```

<template>
<div class='wrap'>
  <ul id="target" tabindex="0">
    <li class="e-item e-palette-item">
      <ejs-colorpicker ref="palette" id="palette" mode="Palette"
:inline="true" :showButtons="false" :modeSwitcher="false"
:change="onPaletteChange"></ejs-colorpicker>
    </li>
    <li class="e-item" tabindex="-1">
      <span class="e-menu-icon"></span>
      More colors...
    </li>

### Handle no color support in Vue Color picker component

The ColorPicker component supports no color functionality. By clicking the no color tile from palette, the selected color becomes **empty** and considered as no color has been selected from color picker.

#### Default no color

To achieve this, set [noColor](#) property as **true**.

In the following sample, the first tile of the color palette represents the no color tile. By clicking the no color tile you can achieve the above functionalities.

**APP.VUE**

```

<template>
<div class='wrap'>
  <div id='preview'></div>
  <h4>Select Color</h4>
  <ejs-colorpicker id="element" value="#ba68c8" mode="Palette"
:noColor="true" :showButtons="false" :modeSwitcher="false"
:change="onChange"></ejs-colorpicker>
</div>
</template>
<script>
import Vue from 'vue';
import { ColorPickerPlugin } from '@syncfusion/ej2-vue-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ColorPickerPlugin);
export default {
  methods: {
    onChange: function(args) {
      var preview = document.getElementById('preview');
      preview.style.backgroundColor = args.currentValue.hex;
      preview.textContent = args.currentValue.hex ? args.currentValue.hex :
'No color';
    }
  },
  mounted: function() {
    var preview = document.getElementById('preview');
    preview.style.backgroundColor = '#ba68c8';
    preview.textContent = '#ba68c8';
  }
};
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
.wrap {
  margin: 0 auto;
  width: 300px;
  text-align: center;
}
#preview {
  border: 1px solid;
  height: 40px;
  line-height: 40px;
}
h4, #preview {
  font-family: 'Helvetica Neue', 'Helvetica', 'Arial', 'sans-serif';
  font-size: 14px;
}
</style>

```

```
{% previewsample "page.domainurl/code-snippet/color-picker/default-cs12" %}
```

If the [noColor](#) property is enabled, make sure to disable the [modeswitcher](#) property.

#### Custom no color

The following sample show the color palette with custom no color option.

#### APP.VUE

```
<template>
<div class='wrap'>
  <ul id="target" tabindex="0">
    <li class="e-item e-palette-item">
      <ejs-colorpicker id="element" ref="colorPicker" value="#f44336"

### Disabled in Vue Color picker component

To achieve disabled state in ColorPicker, set the [disabled](#) property to `true`. The ColorPicker pop-up cannot be accessed in disabled state.

The following example shows the `disabled` state of ColorPicker component.

### APP.VUE

```

<template>
<div class='wrap'>
  <h4>Choose Color</h4>
  <ejs-colorpicker :disabled="true"></ejs-colorpicker>
</div>
</template>
<script>
import Vue from 'vue';
import { ColorPickerPlugin } from '@syncfusion/ej2-vue-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ColorPickerPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
.wrap {
  margin: 0 auto;
  width: 300px;
  text-align: center;
}
</style>

```

```
{% previewsample "page.domainurl/code-snippet/color-picker/default-cs11" %}
```

## ComboBox

### Getting Started with the Vue Combo box Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLI](#) and integrating the Syncfusion Vue Combo box component using the [Composition API](#) / [Options API](#)[Link to the Video](#).

To get start quickly with ComboBox component using Vue CLI, you can check on this video:

Prerequisites

[System requirements for Syncfusion Vue UI components](#)

#### Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```
`bash
```

```
npm install -g @vue/cli
```

```
vue create quickstart
```

```
cd quickstart
```

```
npm run serve
```

```
,
```

or

```
`bash
```

```
yarn global add @vue/cli
```

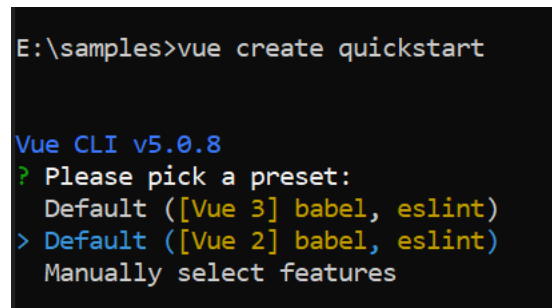

```
vue create quickstart
```

```
cd quickstart
```

```
yarn run serve
```

```
,
```

When creating a new project, choose the option **Default ([Vue 2] babel, eslint)** from the menu.

```
E:\samples>vue create quickstart

Vue CLI v5.0.8
? Please pick a preset:
  Default ([Vue 3] babel, eslint)
> Default ([Vue 2] babel, eslint)
  Manually select features
```

Once the **quickstart** project is set up with default settings, proceed to add Syncfusion components to the project

### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.npmjs.com). To use Vue components, install the required npm package.

This article uses the [Vue Combo box component](#) as an example. Install the `@syncfusion/ej2-vue-dropdowns` package by running the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-dropdowns --save
```

```
,
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-dropdowns
```

```
,
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the `Material` theme is applied using CSS styles, which are available in installed packages. The necessary `Material` CSS styles for the Combo box component and its dependents were imported into the `<style>` section of `src/App.vue` file.

#### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

### Add Syncfusion Vue component

Follow the below steps to add the Vue Combo box component using `Composition API` or `Options API`:

1\ First, import and register the Combo box component in the `script` section of the `src/App.vue` file. If you are using the `Composition API`, you should add the `setup` attribute to the `script` tag to indicate that Vue will be using the `Composition API`.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { ComboBoxComponent as EjsCombobox } from "@syncfusion/ej2-vue-
dropdowns";
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { ComboBoxComponent } from "@syncfusion/ej2-vue-dropdowns";
```

```
export default {
  components: {
    'ejs-combobox': ComboBoxComponent
  }
}
</script>
```

2\ In the **template** section, define the Combo box component with the [dataSource](#) and [placeholder](#) property.

### ~/SRC/APP.VUE

```
<template>
<div id="app">
<div id='container' style="margin:50px auto 0; width:250px;">
<br>
<ejs-combobox id='combobox' :dataSource='sportsData' placeholder='Select a
game'></ejs-combobox>
</div>
</div>
</template>
```

### Binding data source

After initialization, populate the ComboBox with data using the **dataSource** property. Here, an array of string values is passed to the ComboBox component.

### COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div id='container' style="margin:50px auto 0; width:250px;">
<br>
<ejs-combobox id='combobox' :dataSource='sportsData' placeholder='Select a
game'></ejs-combobox>
</div>
</div>
</template>
<script setup>
import { ComboBoxComponent as EjsCombobox } from "@syncfusion/ej2-vue-
dropdowns";
const sportsData = ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'];
</script>
```

### OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div id='container' style="margin:50px auto 0; width:250px;">
<br>
<ejs-combobox id='combobox' :dataSource='sportsData' placeholder='Select a
game'></ejs-combobox>
</div>
</div>
</template>
<script>
```

```
import { ComboBoxComponent } from "@syncfusion/ej2-vue-dropdowns";
export default {
  components: {
    'ejs-combobox': ComboBoxComponent
  },
  data () {
    return {
      sportsData: ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis']
    }
  }
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

### **COMPOSITION API (~SRC/APP.VUE)**

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' :dataSource='sportsData'
placeholder='Select a game'></ejs-combobox>
    </div>
  </div>
</template>
<script setup>
import { ComboBoxComponent as EjsCombobox } from "@syncfusion/ej2-vue-
dropdowns";
const sportsData = ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'];
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

### **OPTIONS API (~SRC/APP.VUE)**

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' :dataSource='sportsData'
placeholder='Select a game'></ejs-combobox>
    </div>
  </div>
</template>
<script>
import { ComboBoxComponent } from "@syncfusion/ej2-vue-dropdowns";
export default {
  components: {
    'ejs-combobox': ComboBoxComponent
  },
  data () {
    return {
```

```

        sportsData: ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis']
      }
    }
  }
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>

```

### Run the application

To run the application, use the following command:

```
`bash
```

```
npm run serve
```

```
,
```

or

```
`bash
```

```
yarn run serve
```

```
,
```

```
{% previewsample "page.domainurl/code-snippet/combobox/getting-started/getting-started-cs1" %}
```

### Custom values

The ComboBox allows the user to give input as custom value which is not required to present in predefined set of values. By default, this support is enabled by [allowCustom](#) property. In this case, both text field and value field considered as same. The custom value will be sent to post back handler when a form is about to be submitted.

### COMPOSITION API (~SRC/APP.VUE)

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' :dataSource='sportsData'
:fields='fields' :allowCustom='allowCustom' placeholder='Select a
game'></ejs-combobox>
    </div>
  </div>
</template>
<script setup>
import { ComboBoxComponent as EjsCombobox } from "@syncfusion/ej2-vue-
dropdowns";
const sportsData = [
  { Id: 'game1', Game: 'Badminton' },
  { Id: 'game2', Game: 'Football' },
  { Id: 'game3', Game: 'Tennis' }];
const fields = { text: 'Game', value: 'Id' };
const allowCustom = true;

```

```
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

### OPTIONS API (~SRC/APP.VUE)

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' :dataSource='sportsData'
:fields='fields' :allowCustom='allowCustom' placeholder='Select a
game'></ejs-combobox>
    </div>
  </div>
</template>
<script>
import { ComboBoxComponent } from "@syncfusion/ej2-vue-dropdowns";
export default {
  components: {
    'ejs-combobox': ComboBoxComponent
  },
  data () {
    return {
      sportsData: [
        { Id: 'game1', Game: 'Badminton' },
        { Id: 'game2', Game: 'Football' },
        { Id: 'game3', Game: 'Tennis' }
      ],
      fields: { text: 'Game', value: 'Id' },
      allowCustom: true
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/combobox/getting-started/custom-cs1" %}

### Configure the popup list

By default, the width of the popup list automatically adjusts according to the ComboBox input element's width, and the height of the popup list has '300px'.

The height and width of the popup list can also be customized using the [popupHeight](#) and [popupWidth](#) property respectively.

In the following sample, popup list's width and height have configured.

### COMPOSITION API (~SRC/APP.VUE)

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' :dataSource='sportsData'
popupHeight="200px" popupWidth="250px" placeholder="select a game"></ejs-
combobox>
    </div>
  </div>
</template>
<script setup>
import { ComboBoxComponent as EjsCombobox } from "@syncfusion/ej2-vue-
dropdowns";
const sportsData = ['Badminton', 'Basketball', 'Cricket', 'Football',
'Golf', 'Hockey', 'Rugby', 'Snooker', 'Tennis'];
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

### OPTIONS API (~SRC/APP.VUE)

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' :dataSource='sportsData'
popupHeight="200px" popupWidth="250px" placeholder="select a game"></ejs-
combobox>
    </div>
  </div>
</template>
<script>
import { ComboBoxComponent } from "@syncfusion/ej2-vue-dropdowns";
export default {
  components: {
    'ejs-combobox': ComboBoxComponent
  },
  data () {
    return {
      sportsData: ['Badminton', 'Basketball', 'Cricket', 'Football', 'Golf',
'Hockey', 'Rugby', 'Snooker', 'Tennis']
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/combobox/getting-started/popup-cs2" %}

You can refer to our [Vue ComboBox](#) feature tour page for its groundbreaking feature representations.

- [How to bind the data](#)

## Getting Started with the Vue ComboBox Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue ComboBox component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

### Prerequisites

#### [System requirements for Syncfusion Vue UI components](#)

#### Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm create vite@latest
```

```
,
```

or

```
`bash
```

```
yarn create vite
```

```
,
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as **my-project** for this article.

```
`bash
```

```
? Project name: » my-project
```

```
,
```

2. Select **Vue** as the framework. It will create a Vue 3 project.

```
`bash
```

```
? Select a framework: » - Use arrow-keys. Return to submit.
```

Vanilla

Vue

React

Preact

Lit

Svelte

Others

,

3. Choose **JavaScript** as the framework variant to build this Vite project using JavaScript and Vue.

``bash`

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

,

4. Upon completing the aforementioned steps to create the **my-project**, run the following command to install its dependencies:

``bash`

`cd my-project`

`npm install`

,

or

``bash`

`cd my-project`

`yarn install`

,

Now that **my-project** is ready to run with default settings, let's add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue ComboBox component](#) as an example. To use the Vue ComboBox component in the project, the `@syncfusion/ej2-vue-dropdowns` package needs to be installed using the following command:

``bash`

```
npm install @syncfusion/ej2-vue-dropdowns --save
```

```
,
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-dropdowns
```

```
,
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, **Material** theme is applied using CSS styles, which are available in installed packages. The necessary **Material** CSS styles for the ComboBox component and its dependents were imported into the `<style>` section of **src/App.vue** file.

#### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

### Add Syncfusion Vue component

Follow the below steps to add the Vue ComboBox component using **Composition API** or **Options API**:

1.First, import and register the ComboBox component in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { ComboBoxComponent as EjsCombobox } from "@syncfusion/ej2-vue-
dropdowns";
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { ComboBoxComponent } from "@syncfusion/ej2-vue-dropdowns";
//Component registration
export default {
  name: "App",
  components: {
    'ejs-combobox' : ComboBoxComponent,
  }
}
```

```
</script>
```

2. In the **template** section, define the ComboBox component with the [dataSource](#) property and column definitions.

### ~/SRC/APP.VUE

```
<template>
<div class="control_wrapper">
<ejs-combobox id='combobox' :dataSource='sportsData' placeholder='Select a
game'></ejs-combobox>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

### COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<ejs-combobox id='combobox' :dataSource='data[0].sportsData'
placeholder='Select a game'></ejs-combobox>
</div>
</template>
<script setup>
import { ComboBoxComponent as EjsCombobox } from "@syncfusion/ej2-vue-
dropdowns";
const data = [{ waterMark : 'e.g. Basketball',
sportsData: ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'] }]
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

### OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<ejs-combobox id='combobox' :dataSource='sportsData' placeholder='Select a
game'></ejs-combobox>
</div>
</template>
<script>
import { ComboBoxComponent } from "@syncfusion/ej2-vue-dropdowns";
//Component registration
export default {
name: 'App',
components: {
"ejs-combobox": ComboBoxComponent
},
data () {
return {
waterMark : 'e.g. Basketball',
```

```
sportsData: ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis']
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
,
```

or

```
`bash
```

```
yarn run dev
```

```
,
```

### Custom values

The ComboBox allows the user to give input as custom value which is not required to present in predefined set of values. By default, this support is enabled by [allowCustom](#) property. In this case, both text field and value field considered as same.

The custom value will be sent to post back handler when a form is about to be submitted.

### COMPOSITION API (~SRC/APP.VUE)

```
<template>
<div id="app">
<div id='container' style="margin:50px auto 0; width:250px;">
<br>
<ejs-combobox id='combobox' :dataSource='data[0].sportsData'
:fields='data[0].fields' :allowCustom='data[0].allowCustom'
placeholder='Select a game'></ejs-combobox>
</div>
</div>
</template>
<script setup>
import { ComboBoxComponent as EjsCombobox } from "@syncfusion/ej2-vue-
dropdowns";
const data = [{ sportsData: [{ Id: 'game1', Game: 'Badminton' },
{ Id: 'game2', Game: 'Football' },
{ Id: 'game3', Game: 'Tennis' } ]},
fields: { text: 'Game', value: 'Id' },
allowCustom: true}]
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
```

```
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

### OPTIONS API (~SRC/APP.VUE)

```
<template>
<div id="app">
<div id='container' style="margin:50px auto 0; width:250px;">
<br>
<ejs-combobox id='combobox' :dataSource='sportsData' :fields='fields'
:allowCustom='allowCustom' placeholder='Select a game'></ejs-combobox>
</div>
</div>
</template>
<script>
import { ComboBoxComponent } from "@syncfusion/ej2-vue-dropdowns";
//Component registration
export default {
name: 'App',
components: {
"ejs-combobox": ComboBoxComponent
},
data () {
return {
sportsData: [
{ Id: 'game1', Game: 'Badminton' },
{ Id: 'game2', Game: 'Football' },
{ Id: 'game3', Game: 'Tennis' }
],
fields: { text: 'Game', value: 'Id' },
allowCustom: true
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

### Configure the popup list

By default, the width of the popup list automatically adjusts according to the ComboBox input element's width, and the height of the popup list has '300px'.

The height and width of the popup list can also be customized using the [popupHeight](#) and [popupWidth](#) property respectively.

In the following sample, popup list's width and height have configured.

### APP.VUE

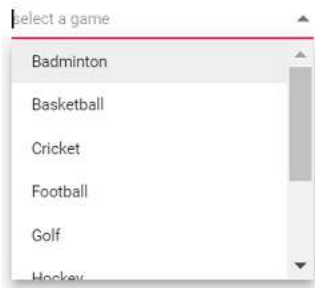

```
<template>
<div id="app">
<div id='container' style="margin:50px auto 0; width:250px;">
```

```

        <br>
        <ejs-combobox id='combobox' :dataSource='sportsData'
popupHeight="200px" popupWidth="250px" placeholder="select a game"></ejs-
combobox>
    </div>
</div>
</template>
<script>
    import { ComboBoxComponent } from "@syncfusion/ej2-vue-dropdowns";
    //Component registration
    export default {
        name: 'App',
        components: {
            "ejs-combobox": ComboBoxComponent
        },
        data () {
            return {
                sportsData: ['Badminton', 'Basketball', 'Cricket',
'Football', 'Golf', 'Hockey', 'Rugby', 'Snooker', 'Tennis']
            }
        }
    }
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>

```

Output be like the below.

See Also

- [How to bind the data](#)

## Data binding in Vue Combo box component

The ComboBox loads the data either from local data sources or remote data services using the [dataSource](#) property. It supports the data type of [array](#) or [DataManager](#).

The ComboBox also supports different kinds of data services such as OData, OData V4, and Web API, and data formats such as XML, JSON, and JSONP with the help of [DataManager](#) adaptors.

| Fields | Type | Description |

|-----|-----|-----|

| text | **string** | Specifies the display text of each list item. |

| value | **number or string** | Specifies the hidden data value which mapped to each list item that should be unique. |

| groupBy | **string** | Specifies the category under which the list item needs to be grouped. |

| iconCss | **string** | Specifies the icon class of each list item. |

When binding complex data to the ComboBox, fields should be mapped correctly. Otherwise, the selected item remains undefined.

### Binding local data

Local data can be represented in two ways as described below.

#### 1. Array of simple data

The ComboBox has support to load array of primitive data such as strings and numbers. Here, both value and text field act the same.

### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' :dataSource='sportsData'
placeholder="Select a game"></ejs-combobox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ComboBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ComboBoxPlugin);
export default {
  data () {
    return {
      sportsData: ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis']
    }
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/combobox/data-binding/simple-cs1" %}

## 2. Array of JSON data

The ComboBox can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, **Id** column and **Game** column from complex data have been mapped to the **value** field and **text** field, respectively.

### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' :dataSource='sportsData'
:fields='fields' placeholder="Select a game"></ejs-combobox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ComboBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ComboBoxPlugin);
export default {
  data () {
    return {
      sportsData: [
        { Id: 'game1', Game: 'Badminton' },
        { Id: 'game2', Game: 'Football' },
        { Id: 'game3', Game: 'Tennis' }
      ],
      fields : { text: 'Game', value: 'Id' }
    }
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/../../node_modules/@syncfusion/ej
2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/combobox/data-binding/json-cs1" %}

## 3. Array of Complex data

The ComboBox can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, **Code.Id** column and **Country.Name** column from complex data have been mapped to the **value** field and **text** field, respectively.

### APP.VUE

```
<template>
```

```

<div id="app">
  <div id='container' style="margin:50px auto 0; width:250px;">
    <br>
    <ejs-combobox id='combobox' :dataSource='countriesData'
:fields='fields' placeholder="Select a Country"></ejs-combobox>
  </div>
</div>
</template>
<script>
import Vue from 'vue';
import { ComboBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ComboBoxPlugin);
export default {
  data () {
    return {
      countriesData: [
        { Country: { Name: 'Australia' }, Code: { Id: 'AU' } },
        { Country: { Name: 'Bermuda' }, Code: { Id: 'BM' } },
        { Country: { Name: 'Canada' }, Code: { Id: 'CA' } },
        { Country: { Name: 'Cameroon' }, Code: { Id: 'CM' } },
        { Country: { Name: 'Denmark' }, Code: { Id: 'DK' } },
        { Country: { Name: 'France' }, Code: { Id: 'FR' } }
      ],
      fields : { text: 'Country.Name', value: 'Code.Id' }
    }
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/combobox/data-binding/complex-cs1" %}

### Binding remote data

The ComboBox supports retrieval of data from remote data services with the help of **DataManager** component. The [Query](#) property is used to fetch data from the database and bind it to the ComboBox.

The following sample displays the first 6 contacts from “Customers” table of the **Northwind** Data Service.

### APP.VUE

```

<template>
  <div id="app">

## Templates in Vue Combo box component

The ComboBox has been provided with several options to customize each list items, group title, header, and footer elements.

To customize vue ComboBox items Using templates, you can check on this video:

### Item template

The content of each list item within the ComboBox can be customized with the help of [itemTemplate](#) property.

In the following sample, each list item is split into two columns to display relevant data's.

### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">

```

```

        <br>
        <ejs-dropdownlist id='dropdownlist' placeholder='Select an employee'
sortOrder='Ascending' :itemTemplate='itemTemplate' :dataSource='dataSource'
:query='query' :fields='fields'></ejs-dropdownlist>
    </div>
</div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
import { DataManager, Query, ODataV4Adaptor } from "@syncfusion/ej2-data";
var itemVue = Vue.component("itemTemplate", {
    template: `<span><span class='name'>{{data.FirstName}}</span><span class
='city'>{{data.City}}</span></span>`,
    data() {
        return {
            data: {}
        };
    }
});
export default {
    data () {
        return {
            itemTemplate : function(e) {
                return {
                    template: itemVue
                };
            },
            query : new Query().from('Employees').select(['FirstName', 'City',
'EmployeeID']).take(6),
            dataSource : new DataManager({
                url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
                adaptor: new ODataV4Adaptor,
                crossDomain: true
            }),
            fields: { text: 'FirstName', value: 'EmployeeID' }
        }
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
.city {
    right: 15px;
    position: absolute;
}
.combobox {
    width: 30%;
    margin: 0 auto;
}
#app {
    color: #008cff;
    height: 40px;

```

```
position: absolute;
top: 10%;
width: 90%;
}
```

{% previewsample "page.domainurl/code-snippet/combobox/templates/item-cs1" %}

### Group template

The group header title under which appropriate sub-items are categorized can also be customize with the help of [groupTemplate](#) property. This template is common for both inline and floating group header template.

In the following sample, employees are grouped according to their city.

### APP.VUE

```
<template>
  <div id="app">
    <div class='combobox'>
      <ejs-combobox id='combobox' sortOrder="Ascending"
:dataSource='employeeData' :groupTemplate='groupTemplate' :fields='fields'
:query='query' placeholder="Select an employee"></ejs-combobox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ComboBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ComboBoxPlugin);
import { Query, DataManager, Predicate, ODataV4Adaptor } from
'@syncfusion/ej2-data';
var groupVue = Vue.component("groupTemplate", {
  template: `<strong>{{data.City}}</strong>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data () {
    return {
      employeeData : new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      }),
      query : new Query().from('Employees').select(['FirstName', 'City',
'EmployeeID']).take(6).where(new Predicate('City', 'equal',
'London').or('City', 'equal', 'Seattle')),
      fields : { text: 'FirstName', value: 'EmployeeID', groupBy: 'City'
    },
    groupTemplate : function(e) {
      return {
        template: groupVue
      }
    }
  }
};
```

```

        },
    },
}
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
#app {
    color: #008cff;
    height: 40px;
    position: absolute;
    top: 10%;
    width: 90%;
}
.combobox {
    width: 30%;
    margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/combobox/templates/group-cs1" %}

### Header template

The header element is shown statically at the top of the popup list items within the ComboBox, and any custom element can be placed as a header element using the [headerTemplate](#) property.

In the following sample, the list items and its headers are designed and displayed as two columns similar to multiple columns of the grid.

### APP.VUE

```

<template>
  <div id="app">
    <div class='combobox'>
      <br>
      <ejs-combobox id='combobox' sortOrder="Ascending"
:dataSource='employeeData' :itemTemplate='itemTemplate'
:headerTemplate='headerTemplate' :fields='fields' :query='query'
placeholder="Select an employee"></ejs-combobox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ComboBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ComboBoxPlugin);
import { Query, DataManager, Predicate, ODataV4Adaptor } from
'@syncfusion/ej2-data';
export default {
  data () {
    return {
      employeeData : new DataManager({

```

```

        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
    )),
    query : new Query().from('Employees').select(['FirstName', 'City',
'EmployeeID']).take(6),
    fields : { text: 'FirstName', value: 'EmployeeID' },
    headerTemplate : "<span class='head'><span
class='name'>Name</span><span class='city'>City</span></span>"
    itemTemplate : "<span class='item' ><span
class='name'>${FirstName}</span><span class='city'>${City}</span></span>"
    }
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
.head,
.item {
    display: table;
    width: 100%;
    margin: auto;
}
.head {
    height: 40px;
    font-size: 15px;
    font-weight: 600;
    text-indent: 1.067em;
}
.name,
.city {
    display: table-cell;
    vertical-align: middle;
    width: 50%;
}
#app {
    color: #008cff;
    height: 40px;
    position: absolute;
    top: 10%;
    width: 90%;
}
.combobox {
    width: 30%;
    margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/combobox/templates/header-cs1" %}

### Footer template

The ComboBox has options to show a footer element at the bottom of the list items in the popup list. Here, you can place any custom element as a footer element using the [footerTemplate](#) property.

In the following sample, footer element displays the total number of list items present in the ComboBox.

### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' :dataSource='sportsData'
:footerTemplate='footerTemplate' placeholder="Select a game"></ejs-combobox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ComboBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ComboBoxPlugin);
var footerVue = Vue.component("footerTemplate", {
  template: `<span class='foot'> Total list item: 4</span>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data () {
    var data = ["BasketBall", "Cricket", "Football", "Golf"];
    return {
      sportsData: data,
      footerTemplate : function(e) {
        return {
          template: footerVue
        }
      }
    }
  }
}
</script>
<style>
@import ".../node_modules/@syncfusion/ej2-base/styles/material.css";
@import ".../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import ".../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
.foot {
  text-indent: 1.2em;
  display: block;
  font-size: 15px;
  line-height: 40px;
  border-top: 1px solid #e0e0e0;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/combobox/templates/footer-cs1" %}

### No records template

The ComboBox is provided with support to custom design the popup list content when no data is found and no matches found on search with the help of [noRecordsTemplate](#) property.

In the following sample, popup list content displays the notification of no data available.

#### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' :dataSource='sportsData'
:noRecordsTemplate='noRecordsTemplate' placeholder="Select an item"></ejs-
combobox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ComboBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ComboBoxPlugin);
var footerVue = Vue.component("noRecordsTemplate", {
  template: `<span class='norecord'> NO DATA AVAILABLE</span>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data () {
    var data = [];
    return {
      sportsData: data,
      noRecordsTemplate : function(e) {
        return {
          template: footerVue
        }
      }
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/combobox/templates/empty-cs1" %}

### Action failure template

There is also an option to custom design the popup list content when the data fetch request fails at the remote server. This can be achieved using the [actionFailureTemplate](#) property.

In the following sample, when the data fetch request fails, the ComboBox displays the notification.

### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' :dataSource='customerData'
      :actionFailureTemplate='actionFailureTemplate' :fields='fields'
      :query='query' placeholder="Select a customer"></ejs-combobox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ComboBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ComboBoxPlugin);
import { Query, DataManager, Predicate, ODataV4Adaptor } from
'syncfusion/ej2-data';
var footerVue = Vue.component("actionFailureTemplate", {
  template: `<span class='action-failure'> Data fetch get fails</span>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data () {
    return {
      customerData : new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svcs/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      }),
      query : new Query().from('Customers').select(['ContactName',
'CustomerID']).take(6),
      fields : { text: 'ContactName', value: 'CustomerID' },
      actionFailureTemplate : function(e) {
        return {
          template: footerVue
        }
      }
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/combobox/templates/action-failure-cs1" %}

## Virtualization in ComboBox Component

ComboBox virtualization is a technique used to efficiently render extensive lists of items while minimizing the impact on performance. This method is particularly advantageous when dealing with large datasets because it ensures that only a fixed number of DOM (Document Object Model) elements are created. When scrolling through the list, existing DOM elements are reused to display relevant data instead of generating new elements for each item. This recycling process is managed internally.

During virtual scrolling, the data retrieved from the data source depends on the popup height and the calculation of the list item height. Enabling the [enableVirtualization](#) option in a ComboBox activates this virtualization technique.

When fetching data from the data source, the [actionBegin](#) event is triggered before data retrieval begins. Then, the [actionComplete](#) event is triggered once the data is successfully fetched.

Furthermore, Incremental Search is supported with virtualization in the Combobox component. When a key is typed, the focus is moved to the respective element in the open popup state. In the closed popup state, the popup opens, and focus is moved to the respective element in the popup list based on the typed key. The Incremental Search functionality is well-suited for scenarios involving remote data binding.

When the `enableVirtualization` property is enabled, the `skip` and `take` properties provided by the user within the Query class at the initial state or during the `actionBegin` or `actionComplete` events will not be considered, since it is internally managed and calculated based on certain dimensions with respect to the popup height.

### Binding local data

The Combobox can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property. When using virtual scrolling, the list updates based on the scroll offset value, triggering a request to fetch more data from the server. As the data is being fetched, the `actionBegin` event occurs before the data retrieval starts. Once the data retrieval is successful, the `actionComplete` event is triggered, indicating that the data fetch process is complete.

In the following example, `id` column and `text` column from complex data have been mapped to the `value` field and `text` field, respectively.

### APP.VUE

```
<template>
<div id="app">
  <div id="wrapper1">
    <ejs-combobox id='combobox' :dataSource='itemData'
placeholder='e.g Item 1' :fields='fields' :enableVirtualization='true'
:allowFiltering='false' popupHeight="200px"></ejs-combobox>
  </div>
</div>
</template>
</script>
```

```
import { ComboBoxComponent, VirtualScroll } from "@syncfusion/ej2-vue-
dropdowns";
let records = [];
function dataSource() {
    for (let i = 1; i <= 150; i++) {
        let item = {
            id: 'id' + i,
            text: "Item " + i,
        };
        records.push(item);
    }
}
dataSource();
//Component registration
export default {
    name: 'App',
    components: {
        "ejs-combobox": ComboBoxComponent
    },
    data () {
        return {
            itemData: records,
            fields: { value: 'id', text: 'text' },
            allowFiltering: true,
        }
    },
    provide: {
        combobox: [VirtualScroll]
    }
}
</script>
<style>
@import ".../node_modules/@syncfusion/ej2-base/styles/material.css";
@import ".../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import ".../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
@import ".../node_modules/@syncfusion/ej2-
notifications/styles/material.css";
#wrapper1{
    min-width: 250px;
    float: left;
    margin-left: 350px;
}
#wrapper2{
    min-width: 250px;
    float: right;
    margin-right: 100px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/combobox/virtual-scroll" %}

### Binding remote data

The Combobox supports retrieval of data from remote data services with the help of **DataManager** component. When using remote data, it initially fetches all the data from the server, triggering the

`actionBegin` and `actionComplete` events, and then stores the data locally. During virtual scrolling, additional data is retrieved from the locally stored data, triggering the `actionBegin` and `actionComplete` events at that time as well.

The following sample displays the OrderId from the `Orders` Data Service.

#### APP.VUE

```
<template>
<div id="app">
  <div id="wrapper1">
    <ejs-combobox id='combobox' :dataSource='itemData'
placeholder='e.g Item 1' :fields='fields' :enableVirtualization='true'
:allowFiltering='true' popupHeight="200px"></ejs-combobox>
  </div>
</div>
</template>
<script>
import { ComboBoxComponent, VirtualScroll } from "@syncfusion/ej2-vue-
dropdowns";
import { Query, DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
var remoteData = new DataManager({
  url: 'https://services.syncfusion.com/js/production/api/orders',
  adaptor: new WebApiAdaptor,
  crossDomain: true
});
//Component registration
export default {
  name: 'App',
  components: {
    "ejs-combobox": ComboBoxComponent
  },
  data () {
    return {
      itemData: remoteData,
      fields: { text: 'OrderID', value: 'OrderID' },
      allowFiltering: true,
    }
  },
  provide: {
    combobox: [VirtualScroll]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-
notifications/styles/material.css";
#wrapper1{
  min-width: 250px;
  float: left;
  margin-left: 350px;
}
#wrapper2{
```

```
min-width: 250px;
float: right;
margin-right: 100px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/combobox/virtual-scroll-remote" %}

## Grouping

The Combobox component supports grouping with Virtualization. It allows you to organize elements into groups based on different categories. Each item in the list can be classified using the [groupBy](#) field in the data table. After grouping, virtualization works similarly to local data binding, providing a seamless user experience. When the data source is bound to remote data, an initial request is made to retrieve all data for the purpose of grouping. Subsequently, the grouped data works in the same way as local data binding virtualization, enhancing performance and responsiveness.

The following sample shows the example for Grouping with Virtualization.

### APP.VUE

```
<template>
<div id="app">
  <div id="wrapper1">
    <ejs-combobox id='combobox' :dataSource='itemData'
placeholder='e.g Item 1' :fields='fields' :enableVirtualization='true'
:allowFiltering='true' popupHeight="200px"></ejs-combobox>
  </div>
</div>
</template>
<script>
import { ComboBoxComponent, VirtualScroll } from "@syncfusion/ej2-vue-
dropdowns";
let records = [];
function dataSource() {
  for (var i = 1; i <= 150; i++) {
    var item = {};
    item.id = 'id' + i;
    item.text = "Item ".concat(i);
    var randomGroup = Math.floor(Math.random() * 4) + 1;
    switch (randomGroup) {
      case 1:
        item.group = 'Group A';
        break;
      case 2:
        item.group = 'Group B';
        break;
      case 3:
        item.group = 'Group C';
        break;
      case 4:
        item.group = 'Group D';
        break;
      default:
        break;
    }
    records.push(item);
  }
}
```

```

    }
  }
  dataSource();
  //Component registration
  export default {
    name: 'App',
    components: {
      "ejs-combobox": ComboBoxComponent
    },
    data () {
      return {
        itemData: records,
        fields: { groupBy: 'group', value: 'id', text: 'text' },
        allowFiltering: true,
      }
    },
    provide: {
      combobox: [VirtualScroll]
    }
  }
</script>
<style>

  margin-right: 100px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/combobox/virtual-scroll-group" %}

### Filtering with Virtualization

The ComboBox component supports Filtering with Virtualization. The ComboBox includes a built-in feature that enables data filtering when the [allowFiltering](#) option is enabled. In the context of Virtual Scrolling, the filtering process operates in response to the typed characters. Specifically, the DropDownList sends a request to the server, utilizing the full data source, to achieve filtering. Before initiating the request, an action event is triggered. Upon successful retrieval of data from the server, an action complete event is triggered. The initial data is loaded when the popup is opened. Whether the filter list has a selection or not, the popup closes.

The following sample shows the example for Filtering with Virtualization.

### APP.VUE

```
<template>
```

```

<div id="app">
  <div id="wrapper1">

## Grouping in Vue Combo box component

The ComboBox supports wrapping nested elements into a group based on different categories. The category of each list item can be mapped through the [groupByLink to the Video](#) field in the data table. The group header is displayed both as inline and fixed headers. The fixed group header content is updated dynamically on scrolling the popup list with its category value.

To group the Vue ComboBox items, you can check on this video:

In the following sample, the vegetables are grouped according on its category using `groupBy` field.

### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' :dataSource='vegetableData'
:fields='fields' popupHeight="200px" placeholder="select a vegetable"></ejs-
combobox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ComboBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ComboBoxPlugin);
export default {
  data () {
    return {
      vegetableData: [
        { Vegetable: 'Cabbage', Category: 'Leafy and Salad', Id: 'item1' },
        { Vegetable: 'Spinach', Category: 'Leafy and Salad', Id: 'item2' },
        { Vegetable: 'Wheat grass', Category: 'Leafy and Salad', Id: 'item3' },
        { Vegetable: 'Yarrow', Category: 'Leafy and Salad', Id: 'item4' },
        { Vegetable: 'Pumpkins', Category: 'Leafy and Salad', Id: 'item5' },
        { Vegetable: 'Chickpea', Category: 'Beans', Id: 'item6' },
        { Vegetable: 'Green bean', Category: 'Beans', Id: 'item7' },
        { Vegetable: 'Horse gram', Category: 'Beans', Id: 'item8' },
        { Vegetable: 'Garlic', Category: 'Bulb and Stem', Id: 'item9' },
        { Vegetable: 'Nopal', Category: 'Bulb and Stem', Id: 'item10' },
        { Vegetable: 'Onion', Category: 'Bulb and Stem', Id: 'item11' }
      ],
      fields : { groupBy: 'Category', text: 'Vegetable', value: 'Id' }
    }
  }
}</script>
```

```
<style>

dropdowns/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/combobox/grouping-cs1" %}

### Customization

The grouping header is also provided with customization option. This allows custom designing using the [groupTemplate](#) property for both inline and fixed headers.

See Also

- [Group Template support to ComboBox.](#)

### Filtering in Vue Combo box component

The ComboBox has built-in support to filter data items when `allowFiltering` is enabled. The filter operation starts as soon as you start typing characters in the component.

To display filtered items in the popup, filter the required data and return it to the ComboBox via [updateData](#) method by using the [filteringLink to the Video](#) event.

To filter the Vue ComboBox items, you can check on this video:

The following sample illustrates how to query the data source and pass the data to the ComboBox through the `updateData` method in `filtering` event.

### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' sortOrder='Ascending'
popupHeight="250px" :allowFiltering='allowFiltering' :filtering='filtering'
:dataSource='searchData' :fields='fields' placeholder="Select a
country"></ejs-combobox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ComboBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ComboBoxPlugin);
import { Query } from '@syncfusion/ej2-data';
export default {
  data () {
    return {
      searchData : [
        { Index: "s1", Country: "California" }, { Index: "s2", Country:
"Florida" },
```

```

        { Index: "s3", Country: "Alaska" }, { Index: "s4", Country:
"Georgia" }
    ],
    fields : { text: "Country", value: "Index" },
    allowFiltering : true
  }
},
methods: {
  filtering: function(args) {
    var searchData = [
      { Index: "s1", Country: "California" }, { Index: "s2",
Country: "Florida" },
      { Index: "s3", Country: "Alaska" }, { Index: "s4", Country:
"Georgia" }
    ];
    var query = new Query();
    //frame the query based on search string with filter type.
    query = (args.text != "") ? query.where("Country", "startswith",
args.text, true) : query;
    //pass the filter data source, filter query to updateData
method.
    args.updateData(searchData, query);
  }
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/combobox/filtering/default-cs1" %}

### Limit the minimum filter character

When filtering the list items, you can set the limit for character count to raise remote request and fetch filtered data on the ComboBox. This can be done by manual validation within the filter event handler.

In the following example, the remote request does not fetch the search data until the search key contains three characters.

### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' sortOrder='Ascending'
popupHeight="250px" :allowFiltering='allowFiltering' :filtering='filtering'
:dataSource='searchData' :fields='fields' placeholder="Select a
customer"></ejs-combobox>
    </div>
  </div>
</template>
<script>

```

```
import Vue from 'vue';
import { ComboBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ComboBoxPlugin);
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
export default {
  data () {
    return {
      searchData : new DataManager({
        url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      }),
      fields : { text: 'ContactName', value: 'CustomerID' },
      query : new Query().select(['ContactName', 'CustomerID']).take(6),
      allowFiltering : true
    }
  },
  methods: {
    filtering: function(e) {
      var searchData = new DataManager({
        url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      });
      // load overall data when search key empty.
      if (e.text == '') e.updateData(searchData);
      else {
        // restrict the remote request until search key contains 3
characters.
        if (e.text.length < 3) { return; }
        var query = new Query().select(['ContactName',
'CustomerID']);
        query = (e.text !== '') ? query.where('ContactName',
'startswith', e.text, true) : query;
        e.updateData(searchData, query);
      }
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/combobox/filtering/min-char-cs1" %}

### Change the filter type

While filtering, you can change the filter type to `contains`, `startsWith`, or `endsWith` for string type within the filter event handler.

In the following examples, data filtering is done with `endsWith` type.

## APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' sortOrder='Ascending'
popupHeight="250px" :allowFiltering='allowFiltering' :filtering='filtering'
:dataSource='searchData' :query='query' :fields='fields' placeholder="Select
a customer"></ejs-combobox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ComboBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ComboBoxPlugin);
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
export default {
  data () {
    return {
      searchData : new DataManager({
        url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      }),
      fields : { text: 'ContactName', value: 'CustomerID' },
      query : new Query().select(['ContactName', 'CustomerID']).take(6),
      allowFiltering : true
    }
  },
  methods: {
    filtering: function(e) {
      var searchData = new DataManager({
        url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      });
      if (e.text == '') e.updateData(searchData);
      else {
        var query = new Query().select(['ContactName',
'CustomerID']);
        query = (e.text !== '') ? query.where('ContactName',
'startswith', e.text, true) : query;
        e.updateData(searchData, query);
      }
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";

```

```
</style>
```

```
{% previewsample "page.domainurl/code-snippet/combobox/filtering/type-cs1" %}
```

### Case sensitive filtering

Data items can be filtered either with or without case sensitivity using the DataManager. This can be done by passing the fourth optional parameter of the `where` clause.

The following example shows how to perform case-sensitive filter.

#### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' sortOrder='Ascending'
popupHeight="250px" :allowFiltering='allowFiltering' :filtering='filtering'
:dataSource='searchData' :query='query' :fields='fields' placeholder="Select
a customer"></ejs-combobox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ComboBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ComboBoxPlugin);
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
export default {
  data () {
    return {
      searchData : new DataManager({
        url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      }),
      fields : { text: 'ContactName', value: 'CustomerID' },
      query : new Query().select(['ContactName', 'CustomerID']).take(6),
      allowFiltering : true
    }
  },
  methods: {
    filtering: function(e) {
      var searchData = new DataManager({
        url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      });
      if (e.text == '') e.updateData(searchData);
      else {
        var query = new Query().select(['ContactName',
'CustomerID']);
        query = (e.text !== '') ? query.where('ContactName',
'startswith', e.text, true) : query;
```

```

        e.updateData(searchData, query);
    }
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";

dropdowns/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/combobox/filtering/case-cs1" %}

### Diacritics Filtering

ComboBox supports diacritics filtering which will ignore the [diacritics](#) and makes it easier to filter the results in international characters lists when the [ignoreAccent](#) is enabled.

In the following sample, data with diacritics are bound as dataSource for ComboBox.

#### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' :dataSource='diacriticsData'
:ignoreAccent="ignoreAccent" :allowFiltering='allowFiltering'
placeholder="e.g: aero"></ejs-combobox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ComboBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ComboBoxPlugin);
export default {
  data () {
    return {
      diacriticsData : [
        'Aeróbics',
        'Aeróbics en Agua',
        'Aerografía',
        'Aeromodelaje',
        'Águilas',
        'Ajedrez',
        'Ala Delta',
        'Álbumes de Música',
        'Alusivos',
        'Análisis de Escritura a Mano'
      ],
      ignoreAccent : true,
      allowFiltering : true
    }
  }
}

```

```

}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>

```

## Localization in Vue Combo box component

The Localization library allows you to localize static text content of the [noRecordsTemplate](#) and [actionFailureTemplate](#) property according to the culture currently assigned to the ComboBox.

| Locale key | en-US (default) |

|-----|-----|

| noRecordsTemplate | No records found |

| actionFailureTemplate | The request failed |

## Loading translations

To load translation object to your application, use load function of the **L10n** class.

In the following sample, French culture is set to the ComboBox and no data is loaded. Hence, the **noRecordsTemplate** property displays its text in French culture initially, and if the sample is run offline, the **actionFailureTemplate** property displays its text appropriately.

## APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' locale='fr-BE' :fields='fields'
:dataSource='customerData' :query='query' placeholder="Sélectionnez un
client"></ejs-combobox>
    </div>
  </div>
</template>
<script>

### Style in Vue Combo box component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the appearance of wrapper element

Use the following CSS to customize the appearance of wrapper element.

`

```

.e-ddl.e-input-group.e-control-wrapper .e-input {
font-size: 20px;
font-family: emoji;
color: #ab3243;
background: #32a5ab;
}

```

,

### Customizing the dropdown icon's color

Use the following CSS to customize the dropdown icon's color.

,

```
.e-ddl.e-input-group .e-input-group-icon,.e-ddl.e-input-group.e-control-wrapper .e-input-group-
icon:hover {
color: #bb233d;
font-size: 13px;
}
```

,

### Customizing the focus color

Use the following CSS to customize the focusing color of input element.

,

```
.e-ddl.e-input-group.e-control-wrapper.e-input-focus::before, .e-ddl.e-input-group.e-control-wrapper.e-
input-focus::after {
background: #c000ff;
}
```

,

### Customizing the outline theme's focus color

Use the following CSS to customize the focusing color of outline theme.

,

```
.e-outline.e-input-group.e-input-focus:hover:not(.e-success):not(.e-warning):not(.e-error):not(.e-
disabled):not(.e-float-icon-left),.e-outline.e-input-group.e-input-focus.e-control-wrapper:hover:not(.e-
success):not(.e-warning):not(.e-error):not(.e-disabled):not(.e-float-icon-left),.e-outline.e-input-group.e-
input-focus:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled),.e-outline.e-input-group.e-
control-wrapper.e-input-focus:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled) {
border-color: #b1bd15;
box-shadow: inset 1px 1px #b1bd15, inset -1px 0 #b1bd15, inset 0 -1px #b1bd15;
}
```

,

### Customizing the disabled component's text color

Use the following CSS to customize the text color when the component is disabled.

,

```
.e-input-group.e-control-wrapper .e-input[disabled] {
-webkit-text-fill-color: #0d9133;
}
```

### Customizing the float label element's focusing color

Use the following CSS to customize the focusing color of float label element.

```
.e-float-input.e-input-group:not(.e-float-icon-left) .e-float-line::before,.e-float-input.e-control-
wrapper.e-input-group:not(.e-float-icon-left) .e-float-line::before,.e-float-input.e-input-group:not(.e-
float-icon-left) .e-float-line::after,.e-float-input.e-control-wrapper.e-input-group:not(.e-float-icon-left)
.e-float-line::after {
background-color: #2319b8;
}

.e-ddl.e-input-group.e-control-wrapper.e-float-input.e-input-focus .e-float-text.e-label-top, .e-float-
input.e-control-wrapper:not(.e-error).e-input-focus input ~ label.e-float-text {
color: #2319b8;
}
```

### Customizing the color of the placeholder text

Use the following CSS to customize the text color of placeholder.

```
.e-ddl.e-input-group input.e-input::placeholder {
color: red;
}
```

### Customizing the text selection color

Use the following CSS to customize the selection color of text and background.

```
.e-ddl.e-input-group input.e-input::selection {
color: red;
background: yellow;
}
```

### Customizing the background color of focus, hover, and active item's

Use the following CSS to customize the background color of focus, hover and active item's.

```
.e-dropdownbase .e-list-item.e-item-focus, .e-dropdownbase .e-list-item.e-active, .e-dropdownbase .e-
list-item.e-active.e-hover, .e-dropdownbase .e-list-item.e-hover {
background-color: #1f9c99;
```

```
color: #2319b8;
}
```

### Customizing the appearance of pop-up element

Use the following CSS to customize the appearance of popup element.

```
.e-dropdownbase .e-list-item, .e-dropdownbase .e-list-item.e-item-focus {
background-color: #29c2b8;
color: #207cd9;
font-family: emoji;
min-height: 29px;
}
```

### Adding mandatory asterisk to placeholder and float label

You can add a mandatory asterisk(\*) to placeholder and float label using `<b>.e-input-group.e-control-wrapper.e-float-input .e-float-text::after</b>` class.

#### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' :dataSource='sportsData'
placeholder='Select a game' :floatLabelType= "auto"></ejs-combobox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ComboBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ComboBoxPlugin);
export default {
  data () {
    return {
      sportsData: ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis']
    }
  }
}
</script>

## Accessibility in Vue Combo box component

The ComboBox component has been designed, keeping in mind the WAI-ARIA specifications, and applies the WAI-ARIA roles, states, and properties along with keyboard support. This component is characterized by complete keyboard interaction support and ARIA accessibility support that makes it easy for people who use assistive technologies (AT) or those who completely rely on keyboard navigation.

The ComboBox component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the ComboBox component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) |  |

| [Section 508 Support](#) |  |

| [Screen Reader Support](#) |  |

| [Right-To-Left Support](#) |  |

| [Color Contrast](#) |  |

| [Mobile Device Support](#) |  |

| [Keyboard Navigation Support](#) |  |

| [Accessibility Checker Validation](#) |  |

| [Axe-core Accessibility Validation](#) |  |

<style>

```
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
```

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The ComboBox component uses the **combobox** role, and each list item has an **option** role. The following ARIA attributes denote the ComboBox state.

#### | Properties | Functionalities |

| --- | --- |

| aria-haspopup | Indicates whether the ComboBox input element has a popup list or not. |

| aria-expanded | Indicates whether the popup list has expanded or not. |

| aria-selected | Indicates the selected option. |

| aria-readonly | Indicates the readonly state of the ComboBox element. |

| aria-disabled | Indicates whether the ComboBox component is in a disabled state or not. |

| aria-activedescendent | This attribute holds the ID of the active list item to focus its descendant child element. |

| aria-owns | This attribute contains the ID of the popup list to indicate popup as a child element. |

| aria-autocomplete | This attribute contains the 'both' to a list of options shows and the currently selected suggestion also shows inline. |

### Keyboard interaction

You can use the following key shortcuts to access the ComboBox without interruptions.

#### | Keyboard shortcuts | Actions |

| --- | --- |

| Arrow Down | Selects the first item in the ComboBox when no item selected. Otherwise, selects the item next to the currently selected item. |

| Arrow Up | Selects the item previous to the currently selected one. |

| Page Down | Scrolls down to the next page and selects the first item when popup list opens. |

| Page Up | Scrolls up to the previous page and selects the first item when popup list opens. |

| Enter | Selects the focused item and popup list closes when it is in open state. |

| Tab | Focuses on the next TabIndex element on the page when the popup is closed. Otherwise, closes the popup list and remains the focus of the component. |

| Shift + tab | Focuses on the previous TabIndex element on the page when the popup is closed. Otherwise, closes the popup list and remains the focus of the component. |

| Alt + Down | Open the popup list |

| Alt + Up | Close the popup list|

| Esc(Escape) | Closes the popup list when it is in an open state and the currently selected item remains the same. |

| Home | Cursor moves to before of first character in input |

| End | Cursor moves to next of last character in input |

In the below sample, alt+t keys are used to focus the ComboBox component.

#### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' ref='comboboxInstance'
      :dataSource='gameList' :fields='fields' popupHeight='200px'
      placeholder='Select a game'></ejs-combobox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ComboBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ComboBoxPlugin);
export default {
  mounted () {
    let comboboxObj = this.$refs.comboboxInstance;
    document.onkeyup = function (e) {
      if (e.altKey && e.keyCode === 84) {
        // press alt+t to focus the control.
        comboboxObj.$el.focus();
      }
    }
  },
  data () {
    return {
      gameList: [
        { Id: 'Game2', Game: 'Badminton' },
        { Id: 'Game3', Game: 'Basketball' },
        { Id: 'Game4', Game: 'Cricket' },
        { Id: 'Game5', Game: 'Football' },
        { Id: 'Game6', Game: 'Golf' },
        { Id: 'Game7', Game: 'Hockey' },
        { Id: 'Game8', Game: 'Rugby' },
        { Id: 'Game9', Game: 'Snooker' },
        { Id: 'Game10', Game: 'Tennis' }
      ],
      fields : { text: 'Game', value: 'Id' }
    }
  }
}
</script>
<style>
```

```
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";

### Ensuring accessibility

The ComboBox component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the ComboBox component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the ComboBox component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/combo-box.html" %}

- [Accessibility in Syncfusion Vue components](#)

### Two way binding in Vue Combo box component

Two-way binding can be achieved by using the **v-model** directive in Vue. In the following sample, when you change the value in one ComboBox component, v-model will automatically update the value in the other ComboBox.

The following example demonstrates how to set the **two-way-binding** in the ComboBox.

#### APP.VUE

```
<template>
<div id="app">
  <div id="wrapper1">
    <ejs-combobox id='first':dataSource='sportsData' :fields='fields'
:placeholder="waterMark" v-model="value" ></ejs-combobox>
  </div>
  <div id="wrapper2">
    <ejs-combobox id='second' :dataSource='sportsData'
:fields='fields' :placeholder="waterMark" v-model="value" ></ejs-combobox>
  </div>
</div>
</template>
<script>
import Vue from 'vue';
import { ComboBoxPlugin } from '@syncfusion/ej2-vue-dropdowns';
Vue.use(ComboBoxPlugin);
export default {
  name: 'app',
  data () {
    return {
      waterMark : 'Select a game',
      value: null,
      sportsData: [
        { Id: 'Game1', Game: 'Badminton' },
        { Id: 'Game2', Game: 'Basketball' },
      ]
    }
  }
}
```

```

    { Id: 'Game3', Game: 'Cricket' },
    { Id: 'Game4', Game: 'Football' },
    { Id: 'Game5', Game: 'Golf' },
    { Id: 'Game6', Game: 'Hockey' },
    { Id: 'Game7', Game: 'Rugby' },
    { Id: 'Game8', Game: 'Snooker' }
  ],
  fields: { value: 'Game' }
}
}
</script>
<style>
@import ".../node_modules/@syncfusion/ej2-base/styles/material.css";
@import ".../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import ".../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
#wrapper1{
  min-width: 250px;
  float: left;
  margin-left: 100px;
}
#wrapper2{
  min-width: 250px;
  float: right;
  margin-right: 100px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/combobox/two-way-cs1" %}

## How To

### Autofill in Vue Combo box component

The ComboBox supports the **autofill** behaviour with the help of [autofill](#) property. Whenever you change the input value, the ComboBox will autocomplete your data by matching the typed character. Suppose, if no matches found then, ComboBox doesn't suggest any item.

The following examples, showcase that how to work autofill with ComboBox.

### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' :dataSource='sportsData'
      :autofill='autofill' placeholder='Select a game'></ejs-combobox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ComboBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ComboBoxPlugin);
export default {
  data () {

```

```

    return {
      sportsData: ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'],
      autofill : true,
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/combobox/autofill-cs1" %}

### Cascading in Vue Combo box component

The cascading ComboBox is a series of ComboBox, where the value of one ComboBox depends upon another's value. This can be configured by using the [change](#) event of the parent ComboBox. Within that change event handler, data has to be loaded to the child ComboBox based on the selected value of the parent ComboBox.

The following example, shows the cascade behavior of country, state, and city ComboBox. Here, the [dataBind](#) method is used to reflect the property changes immediately to the ComboBox.

### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='countries' :dataSource='countryData'
      :fields='countryfields' :change='onCountryChange' placeholder='Select a
      country'></ejs-combobox>
      <div class="padding-top">
        <ejs-combobox id='states' :dataSource='stateData'
        :enabled='stateenabled' :fields='statefields' :change='onStateChange'
        placeholder='Select a state'></ejs-combobox>
      </div>
      <div class="padding-top">
        <ejs-combobox id='cities' :dataSource='cityData'
        :enabled='cityenabled' :fields='cityfields' placeholder='Select a
        city'></ejs-combobox>
      </div>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ComboBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ComboBoxPlugin);
import { Query } from '@syncfusion/ej2-data';
export default {
  data () {
    return {
      countryData: [

```

```

        { CountryName: 'Australia', CountryId: '2' },
        { CountryName: 'United States', CountryId: '1' }
    ],
    stateData: [
        { StateName: 'New York', CountryId: '1', StateId: '101' },
        { StateName: 'Virginia ', CountryId: '1', StateId: '102' },
        { StateName: 'Tasmania ', CountryId: '2', StateId: '105' }
    ],
    cityData : [
        { CityName: 'Albany', StateId: '101', CityId: 201 },
        { CityName: 'Beacon ', StateId: '101', CityId: 202 },
        { CityName: 'Emporia', StateId: '102', CityId: 206 },
        { CityName: 'Hampton ', StateId: '102', CityId: 205 },
        { CityName: 'Hobart', StateId: '105', CityId: 213 },
        { CityName: 'Launceston ', StateId: '105', CityId: 214 }
    ]
    countryfields : { value: 'CountryId', text: 'CountryName' }
    statefields : { value: 'StateId', text: 'StateName' },
    cityfields : { text: 'CityName', value: 'CityId' },
    stateenabled : false,
    cityenabled : false
    }
},
methods: {
    onCountryChange: function(e) {
        var countryObj =
document.getElementById('countries').ej2_instances[0];
        var stateObj = document.getElementById('states').ej2_instances[0];
        var cityObj = document.getElementById('cities').ej2_instances[0];
        //Query the data source based on country ComboBox selected value
        stateObj.query = new Query().where('CountryId', 'equal',
countryObj.value);
        // enable the state ComboBox
        stateObj.enabled = true;
        //clear the existing selection.
        stateObj.text = null;
        // bind the property changes to state ComboBox
        stateObj.dataBind();
        //clear the existing selection in city ComboBox
        cityObj.text = null;
        //disabe the city ComboBox
        cityObj.enabled = false;
        //bind the property cahnges to City ComboBox
        cityObj.dataBind();
    },
    onStateChange: function(e) {
        var stateObj = document.getElementById('states').ej2_instances[0];
        var cityObj = document.getElementById('cities').ej2_instances[0];
        cityObj.query = new Query().where('StateId', 'equal',
stateObj.value);
        // enable the city ComboBox
        cityObj.enabled = true;
        //clear the existing selection
        cityObj.text = null;
        // bind the property change to city ComboBox
        cityObj.dataBind();
    }
}

```

```

    }
  }
</script>
<style>
@import ".../node_modules/@syncfusion/ej2-base/styles/material.css";
@import ".../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import ".../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
  #container .padding-top {
    padding-top: 35px;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/combobox/cascade-cs1" %}

### Icons support in Vue Combo box component

You can render **icons** to the list items by mapping the the [iconCss](#) &#160;fields. This **iconCss** field create a span in the list item with mapped class name to allow styling as per your need.

In the following sample, icon classes are mapped with **iconCss** field.

#### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-combobox id='combobox' :dataSource='sortFormatData'
:fields='fields' placeholder='Select a format'></ejs-combobox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ComboBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ComboBoxPlugin);
export default {
  data () {
    return {
      sortFormatData: [
        { Class: 'sort', Type: 'Sort A to Z', Id: '1' },
        { Class: 'filter', Type: 'Filter', Id: '2' },
        { Class: 'clear', Type: 'Clear', Id: '3' }
      ],
      fields : { text: 'Type', iconCss: 'Class', value: 'Id' }
    }
  }
}
</script>
<style>
@import ".../node_modules/@syncfusion/ej2-base/styles/material.css";
@import ".../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import ".../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
.e-list-icon{
  line-height: 1.3;

```

```
padding-right: 10px;
text-indent: 5px;
}
.sort:before {
  content: '\e890';
  font-family: 'e-icons';
  font-size: 15px;
}
.filter:before {
  content: '\e7ee';
  font-family: 'e-icons';
  font-size: 15px;
  opacity: 0.78;
}
.clear:before {
  content: '\e7fc';
  font-family: 'e-icons';
  font-size: 15px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/combobox/icons-cs1" %}

## Context Menu

### Getting Started with the Vue Context menu Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLI](#) and integrating the Syncfusion Vue Context menu component using the [Composition API](#) / [Options API](#).

#### Prerequisites

[System requirements for Syncfusion Vue UI components](#)

#### Dependencies

The following list of dependencies are required to use the ContextMenu component in your application.

```
`js
|-- @syncfusion/ej2-vue-navigations
|-- @syncfusion/ej2-vue-base
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-buttons
\`
```

### Setting up the Vue 2 project

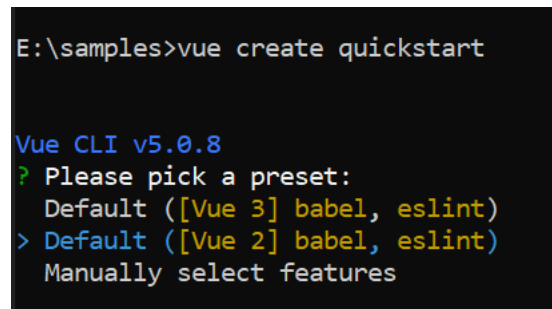

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```
`bash
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
`
```

or

```
`bash
yarn global add @vue/cli
vue create quickstart
cd quickstart
yarn run serve
`
```

When creating a new project, choose the option `Default ([Vue 2] babel, eslint)` from the menu.

```
E:\samples>vue create quickstart

Vue CLI v5.0.8
? Please pick a preset:
  Default ([Vue 3] babel, eslint)
> Default ([Vue 2] babel, eslint)
  Manually select features
```

Once the `quickstart` project is set up with default settings, proceed to add Syncfusion components to the project.

### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.npmjs.com). To use Vue components, install the required npm package.

This article uses the [Vue Context menu component](#) as an example. Install the `@syncfusion/ej2-vue-navigations` package by running the following command:

```
`bash
npm install @syncfusion/ej2-vue-navigations --save
`

or
```

```
`bash
```

```
yarn add @syncfusion/ej2-vue-navigations
```

```
,
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the **Material** theme is applied using CSS styles, which are available in installed packages. The necessary **Material** CSS styles for the Context menu component and its dependents were imported into the `<style>` section of **src/App.vue** file.

#### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
</style>
```

### Add Syncfusion Vue component

Follow the below steps to add the Vue Context menu component using **Composition API** or **Options API**:

1\ First, import and register the Context menu component in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { ContextMenuComponent as EjsContextmenu } from "@syncfusion/ej2-vue-navigations";
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { ContextMenuComponent } from "@syncfusion/ej2-vue-navigations";
export default {
  components: {
    'ejs-contextmenu': ContextMenuComponent
  }
}
</script>
```

2\ In the **template** section, define the Context menu component with the [items](#) property.

#### ~/SRC/APP.VUE

```
<template>
<div>
<div id="target">Right click / Touch hold to open the ContextMenu</div>
<ejs-contextmenu target='#target' :items='menuItems'></ejs-contextmenu>
</div>
</template>
```

3\ Declare the value for the `itemd` property in the `script` section.

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<script setup>
const menuItems = [
{
text: 'Cut'
},
{
text: 'Copy'
},
{
text: 'Paste'
}];
</script>
```

#### **OPTIONS API (~SRC/APP.VUE)**

```
<script>
data () {
return {
menuItems:[
{
text: 'Cut'
},
{
text: 'Copy'
},
{
text: 'Paste'
}
}];
};
}
</script>
```

Here is the summarized code for the above steps in the `src/App.vue` file:

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<template>
<div>
<div id="target">Right click / Touch hold to open the ContextMenu</div>
<ejs-contextmenu target='#target' :items='menuItems'></ejs-contextmenu>
</div>
</template>
<script setup>
import { ContextMenuComponent as EjsContextmenu } from "@syncfusion/ej2-vue-
navigations";
```

```

import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
const menuItems = [
    {
        text: 'Cut'
    },
    {
        text: 'Copy'
    },
    {
        text: 'Paste'
    }
];
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
#target {
    border: 1px dashed;
    height: 150px;
    padding: 10px;
    position: relative;
    text-align: justify;
    color: gray;
    user-select: none;
}
</style>

```

### OPTIONS API (~SRC/APP.VUE)

```

<template>
<div>
<div id="target">Right click / Touch hold to open the ContextMenu</div>
<ejs-contextmenu target='#target' :items='menuItems'></ejs-contextmenu>
</div>
</template>
<script>
import { ContextMenuComponent } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
    components: {
        'ejs-contextmenu': ContextMenuComponent
    },
    data () {
        return {
            menuItems:[
                {
                    text: 'Cut'
                },
                {
                    text: 'Copy'
                },
                {

```

```

        text: 'Paste'
      }
    ]
  };
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
#target {
  border: 1px dashed;
  height: 150px;
  padding: 10px;
  position: relative;
  text-align: justify;
  color: gray;
  user-select: none;
}
</style>

```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run serve
```

```
,
```

```
or
```

```
`bash
```

```
yarn run serve
```

```
,
```

```
{% previewsample "page.domainurl/code-snippet/context-menu/default-cs2" %}
```

### Rendering items with Separator

The Separators are the horizontal lines that are used to separate the menu items. You cannot select the separators. You can enable separators to group the menu items using the [separator](#) property. Cut, Copy, and Paste menu items are grouped using the [separator](#) property in the following sample.

### COMPOSITION API (~SRC/APP.VUE)

```

<template>
<div>
<div id="target">Right click / Touch hold to open the ContextMenu</div>
<ejs-contextmenu target='#target' :items='menuItems'></ejs-contextmenu>
</div>
</template>
<script setup>
import { ContextMenuComponent as EjsContextmenu } from "@syncfusion/ej2-vue-
navigations";

```

```

import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
const menuItems = [
    {
        text: 'Cut'
    },
    {
        text: 'Copy'
    },
    {
        text: 'Paste'
    },
    {
        separator: true
    },
    {
        text: 'Font'
    },
    {
        text: 'Paragraph'
    }
];
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
#target {
    border: 1px dashed;
    height: 150px;
    padding: 10px;
    position: relative;
    text-align: justify;
    color: gray;
    user-select: none;
}
</style>

```

### OPTIONS API (~SRC/APP.VUE)

```

<template>
<div>
<div id="target">Right click / Touch hold to open the ContextMenu</div>
<ejs-contextmenu target='#target' :items='menuItems'></ejs-contextmenu>
</div>
</template>
<script>
import { ContextMenuComponent } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
    components: {
        'ejs-contextmenu': ContextMenuComponent
    },
    data () {

```

```
    return {
      menuItems: [
        {
          text: 'Cut'
        },
        {
          text: 'Copy'
        },
        {
          text: 'Paste'
        },
        {
          separator: true
        },
        {
          text: 'Font'
        },
        {
          text: 'Paragraph'
        }
      ]
    };
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
#target {
  border: 1px dashed;
  height: 150px;
  padding: 10px;
  position: relative;
  text-align: justify;
  color: gray;
  user-select: none;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/context-menu/default-cs3" %}

The [separator](#) property **should not** be given along with the other fields in the [MenuItem](#).

### Getting Started with the Vue ContextMenu Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue ContextMenu component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

#### Prerequisites

##### [System requirements for Syncfusion Vue UI components](#)

#### Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm create vite@latest
```

```
,
```

or

```
`bash
```

```
yarn create vite
```

```
,
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as **my-project** for this article.

```
`bash
```

```
? Project name: » my-project
```

```
,
```

2. Select **Vue** as the framework. It will create a Vue 3 project.

```
`bash
```

```
? Select a framework: » - Use arrow-keys. Return to submit.
```

```
Vanilla
```

```
Vue
```

```
React
```

```
Preact
```

```
Lit
```

```
Svelte
```

```
Others
```

```
,
```

3. Choose `JavaScript` as the framework variant to build this Vite project using JavaScript and Vue.

```
`bash
```

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

,

4. Upon completing the aforementioned steps to create the `my-project`, run the following command to install its dependencies:

```
`bash
```

```
cd my-project
```

```
npm install
```

,

or

```
`bash
```

```
cd my-project
```

```
yarn install
```

,

Now that `my-project` is ready to run with default settings, let's add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue ContextMenu component](#) as an example. To use the Vue ContextMenu component in the project, the `@syncfusion/ej2-vue-navigations` package needs to be installed using the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-navigations --save
```

,

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-navigations
```

,

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, **Material** theme is applied using CSS styles, which are available in installed packages. The necessary **Material** CSS styles for the ContextMenu component and its dependents were imported into the `<style>` section of **src/App.vue** file.

#### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

### Add Syncfusion Vue component

Follow the below steps to add the Vue ContextMenu component using **Composition API** or **Options API**:

1.First, import and register the ContextMenu component and its child directives in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { ContextMenuComponent as EjsContextmenu } from "@syncfusion/ej2-vue-navigations";
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { ContextMenuComponent } from "@syncfusion/ej2-vue-navigations";
//Component registration
export default {
  name: "App",
  components: {
    "ejs-contextmenu": ContextMenuComponent
  }
}
</script>
```

2.In the **template** section, define the ContextMenu component with the [items](#) property.

#### ~/SRC/APP.VUE

```
<template>
```

```
<div>
<div id="target">Right click / Touch hold to open the ContextMenu</div>
<ejs-contextmenu target='#target' :items='menuItems'></ejs-contextmenu>
</div>
</template>
```

3. Declare the values for the `items` property in the `script` section.

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<script setup>
const menuItems = [
  {
    text: 'Cut'
  },
  {
    text: 'Copy'
  },
  {
    text: 'Paste'
  },
  {
    separator: true
  },
  {
    text: 'Font'
  },
  {
    text: 'Paragraph'
  }
];
</script>
```

#### **OPTIONS API (~SRC/APP.VUE)**

```
<script>
data() {
  return {
    menuItems:[
      {
        text: 'Cut'
      },
      {
        text: 'Copy'
      },
      {
        text: 'Paste'
      },
      {
        separator: true
      },
      {
        text: 'Font'
      },
      {
        text: 'Paragraph'
      }
    ]
  }
}
</script>
```

```
  }]  
  };  
}  
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<template>  
<div>  
<div id="target">Right click / Touch hold to open the ContextMenu</div>  
<ejs-contextmenu target='#target' :items='menuItems'></ejs-contextmenu>  
</div>  
</template>  
<script setup>  
import { ContextMenuComponent as EjsContextmenu } from "@syncfusion/ej2-vue-  
navigations";  
const menuItems = [  
  {  
    text: 'Cut'  
  },  
  {  
    text: 'Copy'  
  },  
  {  
    text: 'Paste'  
  },  
  {  
    separator: true  
  },  
  {  
    text: 'Font'  
  },  
  {  
    text: 'Paragraph'  
  }  
];  
</script>  
<style>  
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";  
#target {  
  border: 1px dashed;  
  height: 150px;  
  padding: 10px;  
  position: relative;  
  text-align: justify;  
  color: gray;  
  user-select: none;  
}  
</style>
```

**OPTIONS API (~SRC/APP.VUE)**

```
<template>
<div>
<div id="target">Right click / Touch hold to open the ContextMenu</div>
<ejs-contextmenu target='#target' :items='menuItems'></ejs-contextmenu>
</div>
</template>
<script>
import { ContextMenuComponent } from "@syncfusion/ej2-vue-navigations";
// Component registration
export default {
name: "App",
// Declaring component and its directives
components: {
"ejs-contextmenu": ContextMenuComponent
},
// Bound properties declarations
data() {
return {
menuItems:[
{
text: 'Cut'
},
{
text: 'Copy'
},
{
text: 'Paste'
},
{
separator: true
},
{
text: 'Font'
},
{
text: 'Paragraph'
}],
};
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
#target {
border: 1px dashed;
height: 150px;
padding: 10px;
position: relative;
text-align: justify;
color: gray;
user-select: none;
}
```

```
}  
</style>
```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
,
```

or

```
`bash
```

```
yarn run dev
```

```
,
```

The output will appear as follows:

For migrating from Vue 2 to Vue 3, refer to the [migration](#) documentation.

### Icons and navigation in Vue Context menu component

#### Icons

The ContextMenu item have an icon/image in it to provide visual representation of the action. To place the icon on a menu item, set the [iconCss](#) property to e-icons with the required icon CSS. By default, the icon is positioned to the left side of the menu item. In the following sample, the icons for Cut, Copy and Paste menu items are

added using the `iconCss` property.

**APP.VUE**

```

<template>
<div>
<div id="target">Right click / Touch hold to open the ContextMenu</div>
<ejs-contextmenu target='#target' :items='menuItems'></ejs-contextmenu>
</div>
</template>
<script>
import Vue from 'vue';
import { ContextMenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ContextMenuPlugin);
export default {
  data () {
    return {
      menuItems:[
        {
          text: 'Cut',
          iconCss: 'e-cm-icons e-cut'
        },
        {
          text: 'Copy',
          iconCss: 'e-icons e-copy'
        },
        {
          text: 'Paste',
          iconCss: 'e-cm-icons e-paste',
        }
      ]
    };
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
#target {
  border: 1px dashed;
  height: 150px;
  padding: 10px;
  position: relative;
  text-align: justify;
  color: gray;
  user-select: none;
}

{% previewsample "page.domainurl/code-snippet/context-menu/default-cs11" %}

## Navigation

Navigation in ContextMenu is usage to navigate to the other web page when menu item is clicked. This can be achieved by providing link to the menu item using the [url](#) property. In the following sample, Navigation URL for Flipkart, Amazon, and Snapdeal menu items are added using the [url](#) property.

### APP.VUE

```
<template>
<div>
<div id="target">Right click / Touch hold to open the ContextMenu</div>
<ejs-contextmenu target='#target' :items='menuItems'
:beforeItemRender='onBeforeItemRender'></ejs-contextmenu>
</div>
</template>
<script>
import Vue from 'vue';
import { ContextMenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ContextMenuPlugin);
export default {
  data () {
    return {
      menuItems:[
        {
          text: 'Flipkart',
          iconCss: 'e-cart-icon e-link',
          url: 'https://www.google.co.in/search?q=flipkart'
        },
        {
          text: 'Amazon',
          iconCss: 'e-cart-icon e-link',
          url: 'https://www.google.co.in/search?q=amazon'
        },
        {
          text: 'Snapdeal',
          iconCss: 'e-cart-icon e-link',
          url: 'https://www.google.co.in/search?q=snapdeal'
        }
      ]
    };
  },
  methods: {
    onBeforeItemRender: function(args) {
      args.element.getElementsByTagName('a')[0].setAttribute('target',
'_blank');
    }
  }
}

## Template and multilevel nesting in Vue Context menu component

### Template

The ContextMenu items can be customized by using the [Render](#) event. The item render event triggers while rendering each menu item. The event argument will be used to identify the menu item and customize it based on the requirement. In the following sample, the menu item is rendered with keycode for specified action in ContextMenu using the template. Here, the keycode is specified for Save as, View page source, and Inspect in the right side corner of the menu items by adding span element in the [beforeItemRender](#) event.

### APP.VUE

```
<template>
<div>
<div id="target">Right click / Touch hold to open the ContextMenu</div>
<ejs-contextmenu target='#target' :items='menuItems'
:beforeItemRender="onBeforeItemRender"></ejs-contextmenu>
</div>
</template>
<script>
import Vue from 'vue';
import { ContextMenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { enableRipple, createElement } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ContextMenuPlugin);
export default {
  data () {
    return {
      menuItems:[
        {
          text: 'Save as...'
        },
        {
          text: 'View page source'
        },
        {
          text: 'Inspect'
        }
      ]
    };
  },
  methods: {
    onBeforeItemRender: function(args) {
      var shortCutSpan = createElement('span');
      var text = args.item.text;
      var shortCutText = text === 'Save as...' ? 'Ctrl + S' : (text
      === 'View page source' ?
      'Ctrl + U' : 'Ctrl + Shift + I');
      shortCutSpan.textContent = shortCutText;
      args.element.appendChild(shortCutSpan);
      shortCutSpan.setAttribute('class','shortcut');
```

```

    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
#target {
  border: 1px dashed;
  height: 150px;
  padding: 10px;
  position: relative;
  text-align: justify;
  color: gray;
  user-select: none;
}
.shortcut {
  float: right;
  font-size: 10px;
  opacity: 0.5;
  padding-left: 50px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/context-menu/default-cs13" %}

To create span element, `createElement` utility function used from `ej2-base`.

### Multilevel nesting

The Multiple level nesting supports in ContextMenu. It can be achieved by mapping the `items` property inside the parent `menuItems`. In the below sample, three level nesting of ContextMenu is provided.

### APP.VUE

```

<template>
<div>
<div id="target">Right click / Touch hold to open the ContextMenu</div>
<ejs-contextmenu target='#target' :items='menuItems'></ejs-contextmenu>
</div>
</template>
<script>
import Vue from 'vue';
import { ContextMenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ContextMenuPlugin);
export default {
  data () {
    return {
      menuItems: [
        {
          text: 'Show All Bookmarks',

```

```

        {
            text: 'Bookmarks Toolbar',
            items: [
                {
                    text: 'Most Visited',
                    items: [
                        {
                            text: 'Google',
                        },
                        {
                            text: 'Gmail'
                        }
                    ]
                },
                {
                    text: 'Recently Added'
                }
            ]
        }
    ];
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
#target {
    border: 1px dashed;
    height: 150px;
    padding: 10px;
    position: relative;
    text-align: justify;
    color: gray;
    user-select: none;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/context-menu/default-cs14" %}

### Accessibility in Vue Context menu component

The Context menu component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Context menu component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support | ` |`

| Right-To-Left Support | ` |`

| Color Contrast | ` |`

| Mobile Device Support | ` |`

| Keyboard Navigation Support | ` |`

| [Accessibility Checker](#) Validation | ` |`

| [Axe-core](#) Accessibility Validation | ` |`

```
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The
component does not meet the requirement.</div>
```

### WAI-ARIA attributes

The Context menu component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Context menu component:

Attributes	Purpose
role	Indicates Context menu component popup as <code>menu</code> , and the popup items as <code>menuitem</code> .
aria-haspopup	Indicates the availability and type of interactive popup element.
aria-expanded	Indicates whether the subtree can be expanded or collapsed, as well as indicates whether its current state is expanded or collapsed.
aria-label	Indicates the menu item text.

### Keyboard interaction

The Context menu component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Context menu component.

| **Press** | **To do this** |

| --- | --- |

| **Esc** | **Closes the opened sub menu.** |

| **Enter** | **Selects the focused item.** |

| **Up** | **Navigates up or to the previous menu item.** |

| **Down** | **Navigates down or to the next menu item.** |

| **Left** | **Close the current sub menu and navigates to the parent menu.** |

| **Right** | **Navigates and open the next sub menu.** |

### Ensuring accessibility

The Context menu component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Context menu component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Context menu component with accessibility tools.

```
{% previewsample "page.domainurl/code-snippet/context-menu/default-cs1" %}
```

- [Accessibility in Syncfusion Vue components](#)

### Style and appearance in Vue Context menu component

To modify the ContextMenu appearance, you need to override the default CSS of ContextMenu component. Please find the list of CSS classes and its corresponding section in ContextMenu component. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

CSS Class | Purpose of Class

|.e-contextmenu-wrapper |To customize the context menu wrapper

|.e-contextmenu-wrapper .e-menu-parent|To customize the context menu items

|.e-contextmenu-wrapper ul .e-menu-item.e-selected .e-caret::before|To customize the context menu caret icon

|.e-contextmenu-wrapper ul .e-menu-item .e-menu-icon::before|To customize the icons of the context menu

### How To

#### Open and close contextmenu in Vue Context menu component

ContextMenu can be opened and closed programmatically whenever required by using the open and close methods.

Install Syncfusion **Button** packages using below command.

```
`bash
```

```
npm install @syncfusion/ej2-vue-buttons --save
```

```
`
```

In the following example, the ContextMenu is opened using the [open](#) method at the specified position using **top** and **left**. Also, ContextMenu is closed using [close](#) method on ContextMenu item click or document click.

### APP.VUE

```
<template>
<div>
<ejs-contextmenu id='cmenu' :items='menuItems'></ejs-contextmenu>
<ejs-button v-on:click.native='btnClick'>Open ContextMenu</ejs-button>
</div>
</template>
<script>
import Vue from 'vue';
import { ContextMenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ContextMenuPlugin);
Vue.use(ButtonPlugin);
export default {
  data () {
    return {
      menuItems:[
        {
          text: 'Cut'
        },
        {
          text: 'Copy'
        },
        {
          text: 'Paste'
        }
      ]
    };
  },
  methods: {
    btnClick: function(event) {
      document.getElementById('cmenu').ej2_instances[0].open(40, 20);
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
#target {
```

```
border: 1px dashed;
height: 150px;
padding: 10px;
position: relative;
text-align: justify;
color: gray;
user-select: none;
}
</style>
```

```
{% previewsample "page.domainurl/code-snippet/context-menu/default-cs7" %}
```

### Change menu items dynamically in Vue Context menu component

The items visible in the ContextMenu can be changed dynamically based on the target in which you open the ContextMenu. To achieve this behavior, initialize ContextMenu with all items using [items](#) property and then based on the context you open hide/show required items using [hideItems](#)/[showItems](#) method in [beforeOpen](#) event.

In the following example, the datasource for Clipboard div is **Cut**, **Copy**, **Paste** and for the Editor div is **Add**, **Edit**, **Delete** is changed on [beforeOpen](#) event using [hideItems](#) and [showItems](#) method.

### APP.VUE

```
<template>
<div>
  <div id="target">
    <div id='left' class='e-div'>Clipboard</div>
    <div id='right' class='e-div'>Editor</div>
  </div>
  <ejs-contextmenu id='cmenu' target='#target' :items='menuItems'
:beforeOpen="onBeforeOpen"></ejs-contextmenu>
</div>
</template>
<script>
import Vue from 'vue';
import { ContextMenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ContextMenuPlugin);
export default {
  data () {
    return {
      menuItems: [
        {
          text: 'Cut'
        },
        {
          text: 'Copy'
        },
        {
          text: 'Paste'
        },
        {
          text: 'Add'
        },
        {

```

```

        text: 'Edit'
      },
      {
        text: 'Delete'
      }
    ]
  };
},
methods: {
  onBeforeOpen: function(args) {
    var menuObj = document.getElementById("cmenu").ej2_instances[0];
    // To hide/show items on right click.
    if ((args.event.target).id === 'right') {
      menuObj.hideItems(['Cut', 'Copy', 'Paste']);
      menuObj.showItems(['Add', 'Edit', 'Delete']);
    } else if (args.event.target.id === 'left') {
      menuObj.showItems(['Cut', 'Copy', 'Paste']);
      menuObj.hideItems(['Add', 'Edit', 'Delete']);
    }
  }
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
#target {
  user-select: none;
}
.e-div {
  width: 40%;
  border: 1px dashed;
  height: 150px;
  margin: 10px;
  text-align: center;
  line-height: 150px;
  display: inline-block;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/context-menu/default-cs5" %}

Template in Vue Context menu component

[Show table in sub ContextMenu](#)

Menu items of the ContextMenu can be customized according to the requirement. The section explains about how to customize table template

in sub menu item.

This can be achieved by appending table layout while `li` rendering by using [beforeItemRender](#) event.

## **APP.VUE**

```

<template>
<div>
<div id="target">Right click / Touch hold to open the ContextMenu</div>
<ejs-contextmenu target='#target' :items='menuItems'
:beforeItemRender="onBeforeItemRender"></ejs-contextmenu>
</div>
</template>
<script>
import Vue from 'vue';
import { ContextMenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ContextMenuPlugin);
export default {
  data () {
    return {
      menuItems:[
        {
          text: 'Cut',
          iconCss: 'e-cm-icons e-cut'
        },
        {
          text: 'Copy',
          iconCss: 'e-icons e-copy'
        },
        {
          text: 'Paste',
          iconCss: 'e-cm-icons e-paste'
        },
        {
          separator: true
        },
        {
          text: 'Link',
          iconCss: 'e-icons e-link'
        },
        {
          text: 'Table',
          iconCss: 'e-icons e-table',
          items: [
            {
              id: 'table'
            }
          ]
        }
      ]
    };
  },
  methods: {
    onBeforeItemRender: function(args) {
      // To create header element.
      var header = document.createElement('h4');
      header.textContent = 'Insert Table';
      // To create table with five rows and six columns.
      var table = document.createElement('table');
      for (var i = 0; i < 5; i++) {
        var row = document.createElement('tr');
        table.appendChild(row);
      }
    }
  }
}

```

```

        for (var j = 0; j < 6; j++) {
            var col = document.createElement('td');
            row.appendChild(col);
            col.setAttribute('class', 'e-border');
        }
    }
    // To append table on `li` rendering.
    if (args.item.id === 'table') {
        args.element.classList.add('bg-transparent');
        args.element.appendChild(header);
        args.element.appendChild(table);
    }
}
}

*Show UI components in ContextMenu*

UI components can also be placed inside the each `li` element of ContextMenu.

In the following example, CheckBox component is placed inside each `li` element and this can be achieved by creating CheckBox component in [beforeItemRender](#) event and appending it into the `li` element.

### APP.VUE

```
<template>
<div>
<div id="target">Right click / Touch hold to open the ContextMenu</div>
<ejs-contextmenu target='#target' :items='menuItems'
:beforeItemRender='itemRender' :beforeClose='beforeClose'></ejs-contextmenu>
</div>
</template>
<script>
import Vue from 'vue';
import { ContextMenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { enableRipple, closest, createElement } from '@syncfusion/ej2-base';
import { createCheckBox } from '@syncfusion/ej2-buttons';
enableRipple(true);
Vue.use(ContextMenuPlugin);
export default {
  data () {
    return {
      menuItems:[
        { text: 'Option 1' },
        { text: 'Option 2' },
        { text: 'Option 3' }
      ]
    };
  },
  methods: {
    itemRender: function(args) {
      var check = createCheckBox(createElement, false, {
        label: args.item.text,
        checked: (args.item.text == 'Option 2') ? true : false
      });
      args.element.innerHTML = '';
      args.element.appendChild(check);
    },
    beforeClose: function(args) {
      if (args.event.target.closest('.e-menu-item')) {
        args.cancel = true;
        var selectedElem, i, checkbox, ele, frame;
        selectedElem = args.element.querySelectorAll('.e-selected');
        for(i = 0; i < selectedElem.length; i++){
          ele = selectedElem[i];
          ele.classList.remove('e-selected');
        }
        checkbox = closest(args.event.target, '.e-checkbox-wrapper');
        frame = checkbox && checkbox.querySelector('.e-frame');
```

```

        if (checkbox && frame.classList.contains('e-check')) {
            frame.classList.remove('e-check');
        } else if (checkbox) {
            frame.classList.add('e-check');
        }
    }
}
}
}
</script>
<style>

Underline a character in the item text in Vue Context menu component

Underline a particular character in a text can be handled in [beforeItemRender](#) event by adding `<u>` tag in between the text and given as innerHTML in `li` rendering.

#### APP.VUE

```

<template>
<div>
<div id="target">Right click / Touch hold to open the ContextMenu</div>
<ejs-contextmenu target='#target' :items='menuItems'
:beforeItemRender='itemRender'></ejs-contextmenu>
</div>
</template>
<script>
import Vue from 'vue';
import { ContextMenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ContextMenuPlugin);
export default {
    data () {
        return {
            menuItems: [
                {

```

```

        text: 'Cut'
      },
      {
        text: 'Copy'
      },
      {
        text: 'Paste'
      }
    ]
  };
},
methods: {
  itemRender: function(args ) {
    if (args.item.text === 'Copy') {
      // To underline a particular character.
      args.element.innerHTML = '<u>C</u>opy';
    }
  }
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";

.list {
  display: none;
}
#target {
  border: 1px dashed;
  height: 150px;
  padding: 10px;
  position: relative;
  text-align: justify;
  color: gray;
  user-select: none;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/context-menu/default-cs10" %}

Open a dialog on contextmenu item click in Vue Context menu component

This section explains about how to open a dialog on ContextMenu item click. This can be achieved by handling dialog open in [select](#) event of the ContextMenu.

Install Syncfusion **Popups** packages using below command.

```
`bash
```

```
npm install @syncfusion/ej2-vue-popups --save
```

```
,
```

In the following sample, Dialog will open while clicking **Save As...** item.

**APP.VUE**

```

<template>
<div>
<div id="target">Right click / Touch hold to open the ContextMenu</div>
<ejs-dialog id="dialog" content="This file can be saved as PDF"
:buttons='buttons' width='200px' height='110px' :visible='false'></ejs-
dialog>
<ejs-contextmenu target='#target' :items='menuItems'
:select='onSelect'></ejs-contextmenu>
</div>
</template>
<script>
import Vue from 'vue';
import { ContextMenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { DialogPlugin } from "@syncfusion/ej2-vue-popups";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ContextMenuPlugin);
Vue.use(DialogPlugin);
export default {
  data () {
    return {
      menuItems:[
        {
          text: 'Back'
        },
        {
          text: 'Forward'
        },
        {
          text: 'Reload'
        },
        {
          separator: true
        },
        {
          text: 'Save As...'
        },
        {
          text: 'Print'
        },
        {
          text: 'Cast'
        }
      ],
      buttons: [{
        buttonModel: {
          isPrimary: true,
          content: 'Submit',
          cssClass: 'e-flat',
        },
        click: function () {
          this.hide();
        }
      }],
    };
  },
  methods: {
    onSelect: function(args) {

```

```

        if(args.item.text === 'Save As...') {
            if (document.getElementById('dialog_dialog-content')) {

document.getElementById("dialog").ej2_instances[0].show();
            }
            else {

document.getElementById("dialog").ej2_instances[0].appendTo('#dialog');
            }
        }
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
.list {
    display: none;
}
#target {
    border: 1px dashed;
    height: 150px;
    padding: 10px;
    position: relative;
    text-align: justify;
    color: gray;
    user-select: none;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/context-menu/default-cs6" %}

### Change animation settings in Vue Context menu component

To change the animation of the ContextMenu, [animationSettings](#) property

is used. The supported effects for ContextMenu are,

| Effect | Functionality |

| ----- | ----- |

| None | Specifies the sub menu transform with no animation effect. |

| SlideDown | Specifies the sub menu transform with slide down effect. |

| ZoomIn | Specifies the sub menu transform with zoom in effect. |

| FadeIn | Specifies the sub menu transform with fade in effect. |

The following sample illustrates how to open ContextMenu with **FadeIn** effect with the **duration** of **800ms**.

### APP.VUE

```

<template>
<div>
<div id="target">Right click / Touch hold to open the ContextMenu</div>
<ejs-contextmenu target='#target' :items='menuItems'
:animationSettings='animationSettings'></ejs-contextmenu>
</div>
</template>
<script>
import Vue from 'vue';
import { ContextMenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { MenuEventArgs } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ContextMenuPlugin);
export default {
  data () {
    return {
      menuItems:[
        {
          text: 'Show All Bookmarks'
        },
        {
          text: 'Bookmarks Toolbar',
          items: [
            {
              text: 'Most Visited',
              items:[
                {
                  text: 'Gmail'
                },
                {
                  text: 'Google'
                }
              ]
            }
          ],
        },
        {
          text: 'Recently Added'
        }
      ],
      animationSettings: { effect: 'FadeIn', duration: 800 }
    }
  },
};

## Dashboard layout

### Getting Started with the Vue Dashboard layout Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLI](#)[Link to the Video](#) and integrating the Syncfusion Vue Dashboard layout component.

To get start quickly with Vue Dashboard layout, you can check on this video:

Prerequisites

[System requirements for Syncfusion Vue UI components](#)

Dependencies

The following list of dependencies is required to use the DashboardLayout component in your application.

```
`javascript
|-- @syncfusion/ej2-vue-layouts
|-- @syncfusion/ej2-vue-base
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-layouts
`
```

### Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```
`bash
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
`
```

or

```
`bash
yarn global add @vue/cli
vue create quickstart
cd quickstart
```

```
yarn run serve
```

When creating a new project, choose the option `Default ([Vue 2] babel, eslint)` from the menu.

```
E:\samples>vue create quickstart

Vue CLI v5.0.8
? Please pick a preset:
  Default ([Vue 3] babel, eslint)
> Default ([Vue 2] babel, eslint)
  Manually select features
```

Once the `quickstart` project is set up with default settings, proceed to add Syncfusion components to the project.

### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.npmjs.com). To use Vue components, install the required npm package.

This article uses the [Vue Layouts component](#) as an example. Install the `@syncfusion/ej2-vue-layouts` package by running the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-layouts --save
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-layouts
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the `Material` theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Dashboard layout component and its dependents were imported into the `<style>` section of `src/App.vue` file.

#### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css";
</style>
```

Note: If you want to refer the combined component styles, please make use of our [CRG](#) (Custom Resource Generator) in your application.

### Add Syncfusion Vue component

Follow the below steps to add the Vue Dashboard layout component:

1\ First, import and register the Dashboard layout component in the **script** section of the **src/App.vue** file.

#### ~/SRC/APP.VUE

```
<script>
// Import syncfusion dashboardlayout component from layouts package
import { DashboardLayoutComponent } from "@syncfusion/ej2-vue-layouts";
export default {
  components: {
    'ejs-dashboardlayout': DashboardLayoutComponent
  }
}
</script>
```

2\ In the **template** section, define the Dashboard layout component with [cellSpacing](#) property.

#### ~/SRC/APP.VUE

```
<template>
<div>
<div class="control-section">
<!-- DashboardLayout element declaration -->
<ejs-dashboardlayout id='defaultLayout' :cellSpacing="spacing" :columns="6">
<div id="one" class="e-panel" data-row="0" data-col="0" data-sizeX="1" data-sizeY="1">
<div class="e-panel-container">
<div class="text-align">
<div>0</div>
</div>
</div>
</div>
<div id="two" class="e-panel" data-row="1" data-col="0" data-sizeX="1" data-sizeY="2">
<div class="e-panel-container">
<div class="text-align">
<div>1</div>
</div>
</div>
</div>
<div id="three" class="e-panel" data-row="0" data-col="1" data-sizeX="2" data-sizeY="2">
<div class="e-panel-container">
<div class="text-align">
<div>2</div>
</div>
</div>
</div>
<div id="four" class="e-panel" data-row="2" data-col="1" data-sizeX="1" data-sizeY="1">
<div class="e-panel-container">
```

```
<div class="text-align">
<div>3</div>
</div>
</div>
</div>
<div id="five" class="e-panel" data-row="2" data-col="2" data-sizeX="2"
data-sizeY="1">
<div class="e-panel-container">
<div class="text-align">
<div>4</div>
</div>
</div>
</div>
<div id="six" class="e-panel" data-row="0" data-col="3" data-sizeX="1" data-
sizeY="1">
<div class="e-panel-container">
<div class="text-align">
<div>5</div>
</div>
</div>
</div>
<div id="seven" class="e-panel" data-row="1" data-col="3" data-sizeX="1"
data-sizeY="1">
<div class="e-panel-container">
<div class="text-align">
<div>6</div>
</div>
</div>
</div>
<div id="eight" class="e-panel" data-row="0" data-col="4" data-sizeX="1"
data-sizeY="3">
<div class="e-panel-container">
<div class="text-align">
<div>7</div>
</div>
</div>
</div>
</ejs-dashboardlayout>
<!-- end of dashboardlayout element -->
</div>
</div>
</template>
```

3\ Declare the value for the `cellSpacing` property in the `script` section.

~/SRC/APP.VUE

```
<script>
data: function() {
  return {
    count: 8,
    spacing: [10,10]
  };
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

**~/SRC/APP.VUE**

```
<template>
  <div>
    <div class="control-section">
      <!-- DashboardLayout element declaration -->
      <ejs-dashboardlayout id='defaultLayout' :cellSpacing="spacing"
:columns="6">
        <div id="one" class="e-panel" data-row="0" data-col="0"
data-sizeX="1" data-sizeY="1">
          <div class="e-panel-container">
            <div class="text-align">
              <div>0</div>
            </div>
          </div>
        </div>
        <div id="two" class="e-panel" data-row="1" data-col="0"
data-sizeX="1" data-sizeY="2">
          <div class="e-panel-container">
            <div class="text-align">
              <div>1</div>
            </div>
          </div>
        </div>
        <div id="three" class="e-panel" data-row="0" data-col="1"
data-sizeX="2" data-sizeY="2">
          <div class="e-panel-container">
            <div class="text-align">
              <div>2</div>
            </div>
          </div>
        </div>
        <div id="four" class="e-panel" data-row="2" data-col="1"
data-sizeX="1" data-sizeY="1">
          <div class="e-panel-container">
            <div class="text-align">
              <div>3</div>
            </div>
          </div>
        </div>
        <div id="five" class="e-panel" data-row="2" data-col="2"
data-sizeX="2" data-sizeY="1">
          <div class="e-panel-container">
            <div class="text-align">
              <div>4</div>
            </div>
          </div>
        </div>
        <div id="six" class="e-panel" data-row="0" data-col="3"
data-sizeX="1" data-sizeY="1">
          <div class="e-panel-container">
            <div class="text-align">
              <div>5</div>
            </div>
          </div>
        </div>
      </div>
    </div>
  </div>
</template>
```

```

        </div>
        <div id="seven" class="e-panel" data-row="1" data-col="3"
data-sizeX="1" data-sizeY="1">
            <div class="e-panel-container">
                <div class="text-align">
                    <div>6</div>
                </div>
            </div>
        </div>
        <div id="eight" class="e-panel" data-row="0" data-col="4"
data-sizeX="1" data-sizeY="3">
            <div class="e-panel-container">
                <div class="text-align">
                    <div>7</div>
                </div>
            </div>
        </div>
    </ejs-dashboardlayout>
    <!-- end of dashboardlayout element -->
</div>
</div>
</template>
<script>
// Import syncfusion dashboardlayout component from layouts package
import { DashboardLayoutComponent } from "@syncfusion/ej2-vue-layouts";
export default {
    components: {
        'ejs-dashboardlayout': DashboardLayoutComponent
    },
    data: function() {
        return {
            count: 8,
            spacing: [10,10]
        };
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css";
/* DashboardLayout element styles */
#defaultLayout .e-panel .e-panel-container {
    vertical-align: middle;
    font-weight: 600;
    font-size: 20px;
    text-align: center;
}
.text-align {
    line-height: 80px;
}
#defaultLayout .e-panel {
    transition:none !important;
}
</style>

```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run serve
```

```
`
```

or

```
`bash
```

```
yarn run serve
```

```
`
```

```
{% previewsample "page.domainurl/code-snippet/dashboard-layout/getting-started-cs1" %}
```

### Setting the `panels` property using helper

You can render the DashboardLayout component by using the **panels** property through `<e-panels>`.

### ~/SRC/APP.VUE

```

<template>
  <div>
    <div class="control-section">
      <!-- DashboardLayout element declaration -->
      <ejs-dashboardlayout id="defaultLayout" :cellSpacing="spacing"
:columns="6">
        <e-panels>
          <e-panel :row="0" :col="0" :sizeX="1" :sizeY="1"
content="<div class='panel-content'>0</div>"></e-panel>
          <e-panel :row="0" :col="1" :sizeX="3" :sizeY="2"
content="<div class='panel-content'>1</div>"></e-panel>
          <e-panel :row="0" :col="4" :sizeX="1" :sizeY="3"
content="<div class='panel-content'>2</div>"></e-panel>
          <e-panel :row="1" :col="0" :sizeX="1" :sizeY="1"
content="<div class='panel-content'>3</div>"></e-panel>
          <e-panel :row="2" :col="0" :sizeX="2" :sizeY="1"
content="<div class='panel-content'>4</div>"></e-panel>
          <e-panel :row="2" :col="2" :sizeX="1" :sizeY="1"
content="<div class='panel-content'>5</div>"></e-panel>
          <e-panel :row="2" :col="3" :sizeX="1" :sizeY="1"
content="<div class='panel-content'>6</div>"></e-panel>
        </e-panels>
      </ejs-dashboardlayout>
      <!-- end of dashboardlayout element -->
    </div>
  </div>
</template>
<script>
// Import syncfusion dashboardlayout component from layouts package
import { DashboardLayoutComponent, PanelDirective, PanelsDirective } from
"@syncfusion/ej2-vue-layouts";
export default {
  components: {
    'ejs-dashboardlayout': DashboardLayoutComponent,
    'e-panel': PanelDirective,

```

```
    'e-panels': PanelsDirective
  },
  data: function() {
    return {
      spacing: [10,10]
    };
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css";
/* DashboardLayout element styles */
#defaultLayout .e-panel .e-panel-container {
  vertical-align: middle;
  font-weight: 600;
  font-size: 20px;
  text-align: center;
}
.panel-content {
  line-height: 80px;

#defaultLayout .e-panel {
  transition:none !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/dashboard-layout/getting-started-panel-cs1" %}

You can refer to our [Vue Dashboard Layout](#) feature tour page for its groundbreaking feature representations. You can also explore our [Vue Dashboard Layout example](#) to know how to present and manipulate data.

### Getting Started with the Vue Dashboard Layout Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue Dashboard Layout component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

#### Prerequisites

##### [System requirements for Syncfusion Vue UI components](#)

##### Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm create vite@latest
```

`

or

```
`bash
```

```
yarn create vite
```

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as **my-project** for this article.

```
`bash
```

```
? Project name: » my-project
```

`

2. Select **Vue** as the framework. It will create a Vue 3 project.

```
`bash
```

```
? Select a framework: » - Use arrow-keys. Return to submit.
```

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3. Choose **JavaScript** as the framework variant to build this Vite project using JavaScript and Vue.

```
`bash
```

```
? Select a variant: » - Use arrow-keys. Return to submit.
```

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4. Upon completing the aforementioned steps to create the **my-project**, run the following command to install its dependencies:

```
`bash
```

```
cd my-project
```

```
npm install
```

```
,
```

```
or
```

```
`bash
```

```
cd my-project
```

```
yarn install
```

```
,
```

Now that `my-project` is ready to run with default settings, let's add Syncfusion components to the project.

### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue Dashboard Layout component](#) as an example. To use the Vue Dashboard Layout component in the project, the `@syncfusion/ej2-vue-layouts` package needs to be installed using the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-layouts --save
```

```
,
```

```
or
```

```
`bash
```

```
yarn add @syncfusion/ej2-vue-layouts
```

```
,
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, `Material` theme is applied using CSS styles, which are available in installed packages. The necessary `Material` CSS styles for the Dashboard Layout component and its dependents were imported into the `<style>` section of `src/App.vue` file.

### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css";
</style>
```

### Add Syncfusion Vue component

Follow the below steps to add the Vue Dashboard Layout component using **Composition API** or **Options API**:

1.First, import and register the Grid component and its child directives in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.Find the list of child directives and the tag names that can be used in the Dashboard Layout component in the following table.

Directive Name	Tag Name
-----	-----
<b>PanelsDirective</b>	<b>e-panels</b>
<b>PanelDirective</b>	<b>e-panel</b>

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<script setup>
import { DashboardLayoutComponent as EjsDashboardlayout, PanelDirective as
EPanel, PanelsDirective as EPanels } from "@syncfusion/ej2-vue-layouts";
</script>
```

#### **OPTIONS API (~SRC/APP.VUE)**

```
<script>
import { DashboardLayoutComponent, PanelDirective, PanelsDirective } from
"@syncfusion/ej2-vue-layouts";
//Component registration
export default {
name: "App",
components: {
"ejs-dashboardlayout": DashboardLayoutComponent,
"e-panels":PanelsDirective,
"e-panel":PanelDirective,
}
}
</script>
```

2.Add the component definition in template section.

#### **~/SRC/APP.VUE**

```
<template>
<ejs-dashboardlayout id="defaultLayout" :columns="6"
:cellSpacing='cellSpacing' :cellAspectRatio='aspectRatio'>
<e-panels>
<e-panel :row="0" :col="0" :sizeX="1" :sizeY="1" content="<div class='panel-
content'>0</div>"></e-panel>
<e-panel :row="0" :col="1" :sizeX="3" :sizeY="2" content="<div class='panel-
content'>1</div>"></e-panel>
<e-panel :row="0" :col="4" :sizeX="1" :sizeY="3" content="<div class='panel-
content'>2</div>"></e-panel>
<e-panel :row="1" :col="0" :sizeX="1" :sizeY="1" content="<div class='panel-
content'>3</div>"></e-panel>
```

```

<e-panel :row="2" :col="0" :sizeX="2" :sizeY="1" content="<div class='panel-content'>4</div>"></e-panel>
<e-panel :row="2" :col="2" :sizeX="1" :sizeY="1" content="<div class='panel-content'>5</div>"></e-panel>
<e-panel :row="2" :col="3" :sizeX="1" :sizeY="1" content="<div class='panel-content'>6</div>"></e-panel>
</e-panels>
</ejs-dashboardlayout>
</template>

```

Here is the summarized code for the above steps in the **src/App.vue** file:

#### **COMPOSITION API (~ /SRC /APP.VUE)**

```

<template>
<ejs-dashboardlayout id="defaultLayout" :columns="6"
:cellSpacing='cellSpacing' :cellAspectRatio='aspectRatio'>
<e-panels>
<e-panel :row="0" :col="0" :sizeX="1" :sizeY="1" content="<div class='panel-content'>0</div>"></e-panel>
<e-panel :row="0" :col="1" :sizeX="3" :sizeY="2" content="<div class='panel-content'>1</div>"></e-panel>
<e-panel :row="0" :col="4" :sizeX="1" :sizeY="3" content="<div class='panel-content'>2</div>"></e-panel>
<e-panel :row="1" :col="0" :sizeX="1" :sizeY="1" content="<div class='panel-content'>3</div>"></e-panel>
<e-panel :row="2" :col="0" :sizeX="2" :sizeY="1" content="<div class='panel-content'>4</div>"></e-panel>
<e-panel :row="2" :col="2" :sizeX="1" :sizeY="1" content="<div class='panel-content'>5</div>"></e-panel>
<e-panel :row="2" :col="3" :sizeX="1" :sizeY="1" content="<div class='panel-content'>6</div>"></e-panel>
</e-panels>
</ejs-dashboardlayout>
</template>
<script setup>
import { DashboardLayoutComponent as EjsDashboardlayout, PanelDirective as EPanel, PanelsDirective as EPanels } from "@syncfusion/ej2-vue-layouts";
const cellSpacing = [10,10];
const aspectRatio = 100/85;
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css";
/* DashboardLayout element styles */
#defaultLayout .e-panel .e-panel-container {
vertical-align: middle;
font-weight: 600;
font-size: 20px;
text-align: center;
}
.panel-content {
line-height: 80px;
}
#defaultLayout .e-panel {
transition:none !important;

```

```
}
</style>
```

### OPTIONS API (~SRC/APP.VUE)

```
<template>
<ejs-dashboardlayout id="defaultLayout" :columns="6"
:cellSpacing='cellSpacing' :cellAspectRatio='aspectRatio'>
<e-panels>
<e-panel :row="0" :col="0" :sizeX="1" :sizeY="1" content="<div class='panel-
content'>0</div>"></e-panel>
<e-panel :row="0" :col="1" :sizeX="3" :sizeY="2" content="<div class='panel-
content'>1</div>"></e-panel>
<e-panel :row="0" :col="4" :sizeX="1" :sizeY="3" content="<div class='panel-
content'>2</div>"></e-panel>
<e-panel :row="1" :col="0" :sizeX="1" :sizeY="1" content="<div class='panel-
content'>3</div>"></e-panel>
<e-panel :row="2" :col="0" :sizeX="2" :sizeY="1" content="<div class='panel-
content'>4</div>"></e-panel>
<e-panel :row="2" :col="2" :sizeX="1" :sizeY="1" content="<div class='panel-
content'>5</div>"></e-panel>
<e-panel :row="2" :col="3" :sizeX="1" :sizeY="1" content="<div class='panel-
content'>6</div>"></e-panel>
</e-panels>
</ejs-dashboardlayout>
</template>
<script>
import { DashboardLayoutComponent, PanelDirective, PanelsDirective } from
"@syncfusion/ej2-vue-layouts";
//Component registration
export default {
name: "App",
components: {
"ejs-dashboardlayout": DashboardLayoutComponent,
"e-panels": PanelsDirective,
"e-panel": PanelDirective,
},
data() {
return {
cellSpacing: [10,10],
aspectRatio: 100/85
};
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css";
/* DashboardLayout element styles */
#defaultLayout .e-panel .e-panel-container {
vertical-align: middle;
font-weight: 600;
font-size: 20px;
text-align: center;
}
.panel-content {
```

```
line-height: 80px;  
}  
#defaultLayout .e-panel {  
  transition:none !important;  
}  
</style>
```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
`
```

or

```
`bash
```

```
yarn run dev
```

```
`
```

The output will appear as follows:

For migrating from Vue 2 to Vue 3, refer to the [migration](#) documentation.

### Setting size of cells in Vue Dashboard layout component

The entire layout dimensions are assigned based on the height and width of the parent element. Hence, a responsive or static layout can be created by assigning a percentage or static dimension values to the

parent element. The layout adapts to mobile resolutions by transforming the entire layout into a stacked orientation, so that, the panels will be displayed in a vertical column.

The **Dashboard Layout** is a grid structured component which can be split into subsections of equal size known as cells. The total number of cells in each row is defined by using the [columns](#) property of the component. The width of each cell will be auto calculated based on the total number of cells placed in a row and the height of a cell will be same as that of its width. However, the height of these cells can also be configured to any desired size using the [cellAspectRatio](#) property (cellwidth/cellheight ratio) which defines the cell width to height ratio.

The number of rows within the layout has no limits and can have any number of rows based on the panels count and position. Panels which acts as data containers will be placed or positioned over these cells.

### Modifying cell size

In a dashboard, the data to be held by the panel in a cell may be of different size, hence different cell dimensions may be required in different scenarios. In this case, the size of these grid cells can be modified to the required size using the [columns](#) and [cellAspectRatio](#) properties.

The following sample demonstrates how to modify a cell size using the [columns](#) and [cellAspectRatio](#) properties. In the following sample the width of the parent element is divided into 5 equal cells based on the columns property value resulting the width of each cell as 100 px. The height of these cells will be 50 px based on the cellAspectRatio value 100/50 (i.e. for every 100 px of width, 50 px will be the height of the cell).

### APP.VUE

```
<template>
  <div class="control-section">
    <!-- DashboardLayout element declaration -->
    <ejs-dashboardlayout id='dashboard_layout' :columns="5"
:cellSpacing='cellSpacing' :cellAspectRatio='cellAspectRatio'>
      <e-panels>
        <e-panel :sizeX="1" :sizeY="1" :row="0" :col="0"
content="<div class='content'>0</div>"></e-panel>
        <e-panel :sizeX="3" :sizeY="2" :row="0" :col="1"
content="<div class='content'>1</div>"></e-panel>
        <e-panel :sizeX="1" :sizeY="3" :row="0" :col="4"
content="<div class='content'>2</div>"></e-panel>
        <e-panel :sizeX="1" :sizeY="1" :row="1" :col="0"
content="<div class='content'>3</div>"></e-panel>
        <e-panel :sizeX="2" :sizeY="1" :row="2" :col="0"
content="<div class='content'>4</div>"></e-panel>
        <e-panel :sizeX="1" :sizeY="1" :row="2" :col="2"
content="<div class='content'>5</div>"></e-panel>
        <e-panel :sizeX="1" :sizeY="1" :row="2" :col="3"
content="<div class='content'>6</div>"></e-panel>
      </e-panels>
    </ejs-dashboardlayout>
    <!-- end of dashboardlayout element -->
  </div>
</template>
<script>
import Vue from "vue";
// Import syncfusion dashboardlayout component from layouts package
```

```

import { DashboardLayoutPlugin } from "@syncfusion/ej2-vue-layouts";
Vue.use(DashboardLayoutPlugin);
export default {
  data: function() {
    return {
      cellSpacing: [10, 10],
      cellAspectRatio: 100/50,
    };
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css";
/* DashboardLayout element styles */
#dashboard_layout .e-panel .e-panel-content {
  vertical-align: middle;
  font-weight: 600;
  font-size: 20px;
  text-align: center;
  line-height: 60px;
}
#dashboard_layout .e-panel {
  transition:none !important;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/dashboard-layout/modifying-cell-size-cs1" %}

### Setting cell spacing

The spacing between each panel in a row and column can be defined using the [cellSpacing](#) property. Adding spacing between the panels will make the layout effective and provides a clear data representation.

The following sample demonstrates the usage of the [cellSpacing](#) property which helps in a neat and clear representation of a data.

### APP.VUE

```

<template>
  <div class="control-section">
    <!-- DashboardLayout element declaration -->
    <ejs-dashboardlayout id='dashboard_layout' :columns="5"
:cellSpacing='cellSpacing' >
      <e-panels>
        <e-panel :sizeX="1" :sizeY="1" :row="0" :col="0"
content="<div class='content'>0</div>"></e-panel>
        <e-panel :sizeX="3" :sizeY="2" :row="0" :col="1"
content="<div class='content'>1</div>"></e-panel>
        <e-panel :sizeX="1" :sizeY="3" :row="0" :col="4"
content="<div class='content'>2</div>"></e-panel>
        <e-panel :sizeX="1" :sizeY="1" :row="1" :col="0"
content="<div class='content'>3</div>"></e-panel>

```

```

        <e-panel :sizeX="2" :sizeY="1" :row="2" :col="0"
content="<div class='content'>4</div>"></e-panel>
        <e-panel :sizeX="1" :sizeY="1" :row="2" :col="2"
content="<div class='content'>5</div>"></e-panel>
        <e-panel :sizeX="1" :sizeY="1" :row="2" :col="3"
content="<div class='content'>6</div>"></e-panel>
    </e-panels>
</ejs-dashboardlayout>
<!-- end of dashboardlayout element -->
</div>
</template>
<script>
import Vue from "vue";
// Import syncfusion dashboardlayout component from layouts package
import { DashboardLayoutPlugin } from "@syncfusion/ej2-vue-layouts";
Vue.use(DashboardLayoutPlugin);
export default {
    data: function() {
        return {
            cellSpacing: [20, 20]
        };
    }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css";
/* DashboardLayout element styles */
#dashboard_layout .e-panel .e-panel-content {
    vertical-align: middle;
    font-weight: 600;
    font-size: 20px;
    text-align: center;
    line-height: 100px;
}
#dashboard_layout .e-panel {
    transition:none !important;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/dashboard-layout/setting-cell-spacing-cs3" %}

### Graphical representation of layout

These cells combinedly forms a grid-structured layout which will be hidden initially. This grid structured layout can be made visible by enabling the [showGridLines](#) property, which clearly pictures the cells split-up within the layout. These gridlines will be helpful in panels sizing and placement within the layout during initial designing of a dashboard.

In the following sample, the grid lines indicate the cells split-up of the layout and the data containers placed over these cells are known as panels.

### APP.VUE

```
<template>
```

```

<div class="control-section">
  <!-- DashboardLayout element declaration -->
  <ejs-dashboardlayout id='dashboard_layout'
:cellSpacing='cellSpacing' :showGridLines='showGridLines' :columns="5">
    <e-panels>
      <e-panel :sizeX="3" :sizeY="2" :row="0" :col="1"
content="<div class='content'>1</div>"></e-panel>
      <e-panel :sizeX="1" :sizeY="3" :row="0" :col="4"
content="<div class='content'>2</div>"></e-panel>
      <e-panel :sizeX="1" :sizeY="1" :row="2" :col="2"
content="<div class='content'>3</div>"></e-panel>
      <e-panel :sizeX="1" :sizeY="1" :row="2" :col="3"
content="<div class='content'>4</div>"></e-panel>
    </e-panels>
  </ejs-dashboardlayout>
  <!-- end of dashboardlayout element -->
</div>
</template>
<script>
import Vue from "vue";
// Import syncfusion dashboardlayout component from layouts package
import { DashboardLayoutPlugin } from "@syncfusion/ej2-vue-layouts";
Vue.use(DashboardLayoutPlugin);
export default {
  data: function() {
    return {
      cellSpacing: [10, 10],
      showGridLines: true,
    };
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css";
/* DashboardLayout element styles */
#dashboard_layout .e-panel .e-panel-container .content {
  vertical-align: middle;
  font-weight: 600;
  font-size: 20px;
  text-align: center;
  line-height: 100px;
}
#dashboard_layout .e-panel {
  transition:none !important;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/dashboard-layout/graphical-layout-cs1" %}

### Rendering component in right-to-left direction

It is possible to render the Dashboard Layout in right-to-left direction by setting the [enableRtl](#) API to true.

The following sample demonstrates Dashboard Layout in right-to-left direction.

### APP.VUE

```
<template>
  <div class="col-lg-8 control-section">
    <!-- DashboardLayout element declaration -->
    <ejs-dashboardlayout id="defaultLayout" :cellSpacing="spacing"
:columns="5" :enableRtl="enableRtl">
      <e-panels>
        <e-panel id="panel0" :row="0" :col="0" :sizeX="1" :sizeY="1"
header="<div>Panel 0</div>" content='<div class="content">Panel
Content<div>'></e-panel>
        <e-panel id="panel1" :row="0" :col="1" :sizeX="3" :sizeY="2"
header="<div>Panel 1</div>" content='<div class="content">Panel
Content<div>'></e-panel>
        <e-panel id="panel2" :row="0" :col="4" :sizeX="1" :sizeY="3"
header="<div>Panel 2</div>" content='<div class="content">Panel
Content<div>'></e-panel>
        <e-panel id="panel3" :row="1" :col="0" :sizeX="1" :sizeY="1"
header="<div>Panel 3</div>" content='<div class="content">Panel
Content<div>'></e-panel>
        <e-panel id="panel4" :row="2" :col="0" :sizeX="2" :sizeY="1"
header="<div>Panel 4</div>" content='<div class="content">Panel
Content<div>'></e-panel>
        <e-panel id="panel5" :row="2" :col="2" :sizeX="1" :sizeY="1"
header="<div>Panel 5</div>" content='<div class="content">Panel
Content<div>'></e-panel>
        <e-panel id="panel6" :row="2" :col="3" :sizeX="1" :sizeY="1"
header="<div>Panel 6</div>" content='<div class="content">Panel

## Panels

### Position sizing of panels in Vue Dashboard layout component

Panels are the basic building blocks of the dashboard layout component. They act as a container for the data to be visualized or presented. These panels can be positioned or resized for effective presentation of the data.

The following table represents all the available panel properties and the corresponding functionalities.

PanelObject	Description
-------------	-------------

---	---
-----	-----

id	Specifies the ID value of the panel.
----	--------------------------------------

row	Specifies the row value in which the panel to be placed.
-----	--

col	Specifies the column value in which the panel to be placed.
-----	---

sizeX	Specifies the width of the panel in cells count.
-------	--

sizeY	Specifies the height of the panel in cells count.
-------	---

minSizeX	Specifies the minimum width of the panel in cells count.
----------	--

minSizeY	Specifies the minimum height of the panel in cells count.
----------	---

maxSizeX	Specifies the maximum width of the panel in cells count.
----------	--

maxSizeY	Specifies the maximum height of the panel in cells count.
----------	---

header	Specifies the header template of the panel.
--------	---

content	Specifies the content template of the panel.
---------	--

cssClass	Specifies the CSS class name that can be appended with each panel element.
----------	--

### Positioning of panels

The panels within the layout can be easily positioned or ordered using the `row` and `col` properties of the panels. Positioning of panels will be beneficial to represent the data in any desired order.

The following sample demonstrates the positioning of panels within the dashboard layout using the row, and, column properties of the panels.

### APP.VUE

```
<template>
  <div class="control-section">
    <!-- DashboardLayout element declaration -->
    <ejs-dashboardlayout id='dashboard_default' :cellSpacing='cellSpacing'
:columns="5">
      <e-panels>
        <e-panel :row="0" :col="0" content="<div
class='content'>1</div>"></e-panel>
        <e-panel :row="0" :col="1" content="<div
class='content'>2</div>"></e-panel>
        <e-panel :row="0" :col="2" content="<div
class='content'>3</div>"></e-panel>
        <e-panel :row="1" :col="0" content="<div
class='content'>4</div>"></e-panel>
        <e-panel :row="1" :col="1" content="<div
class='content'>5</div>"></e-panel>
        <e-panel :row="1" :col="2" content="<div
class='content'>6</div>"></e-panel>
      </e-panels>
    </ejs-dashboardlayout>
    <!-- end of dashboardlayout element -->
  </div>
</template>
<script>
import Vue from "vue";
// Import syncfusion dashboardlayout component from layouts package
import { DashboardLayoutPlugin } from "@syncfusion/ej2-vue-layouts";
Vue.use(DashboardLayoutPlugin);
export default {
  data: function() {
    return {
      cellSpacing: [20, 20]
    };
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css";
/* DashboardLayout element styles */
#dashboard_default .e-panel .e-panel-container .content {
  vertical-align: middle;
  font-weight: 600;
  font-size: 20px;
  text-align: center;
  line-height: 100px;
}
#dashboard_default .e-panel {
  transition:none !important;
}
</style>
```

```
{% previewsample "page.domainurl/code-snippet/dashboard-layout/position-of-panels-cs1" %}
```

### Sizing of panels

A panel's size can be varied easily by defining the `sizeX` and `sizeY` properties. The `sizeX` property defines the width and the `sizeY` property defines height of a panel in cells count. These properties will be helpful in designing a dashboard, where the content of each panel may vary in size.

The following sample demonstrates the sizing of panels within the dashboard layout using the `sizeX` and `sizeY` properties of the panels.

### APP.VUE

```
<template>
  <div class="control-section">
    <!-- DashboardLayout element declaration -->
    <ejs-dashboardlayout id='dashboard_default' :columns="5">
      <e-panels>
        <e-panel :sizeX="1" :sizeY="1" :row="0" :col="0" content="<div
class='content'>0</div>"></e-panel>
        <e-panel :sizeX="3" :sizeY="2" :row="0" :col="1" content="<div
class='content'>1</div>"></e-panel>
        <e-panel :sizeX="1" :sizeY="3" :row="0" :col="4" content="<div
class='content'>2</div>"></e-panel>
        <e-panel :sizeX="1" :sizeY="1" :row="1" :col="0" content="<div
class='content'>3</div>"></e-panel>
        <e-panel :sizeX="2" :sizeY="1" :row="2" :col="0" content="<div
class='content'>4</div>"></e-panel>
        <e-panel :sizeX="1" :sizeY="1" :row="2" :col="2" content="<div
class='content'>5</div>"></e-panel>
        <e-panel :sizeX="1" :sizeY="1" :row="2" :col="3" content="<div
class='content'>6</div>"></e-panel>
      </e-panels>
    </ejs-dashboardlayout>
    <!-- end of dashboardlayout element -->
  </div>
</template>
<script>
import Vue from "vue";
// Import syncfusion dashboardlayout component from layouts package
import { DashboardLayoutPlugin } from "@syncfusion/ej2-vue-layouts";
Vue.use(DashboardLayoutPlugin);
export default {
  data: function() {
    return {
    };
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css";
/* DashboardLayout element styles */
#dashboard_default .e-panel .e-panel-container .content {
  vertical-align: middle;
  font-weight: 600;
  font-size: 20px;
  text-align: center;
}
```

```

    line-height: 100px;
  }
  #dashboard_default .e-panel {
    transition:none !important;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/dashboard-layout/setting-cell-spacing-cs2" %}

You can refer to our [Vue Dashboard Layout](#) feature tour page for its groundbreaking feature representations. You can also explore our [Vue Dashboard Layout example](#) to know how to present and manipulate data.

### Setting header of panels in Vue Dashboard layout component

The dashboard layout component is mostly used to represent the data used for monitoring or managing a process. These data or any HTML template can be placed as the content of a panel using the `content` property. Also, word or phrase that summarize the panel's content can be added as the header on the top of each panel using the `header` property of the panel.

The following sample demonstrates how to add content for each panel using the header and content properties of the panels.

### APP.VUE

```

<template>
  <div class="col-lg-8 control-section">
    <!-- DashboardLayout element declaration -->
    <ejs-dashboardlayout id="defaultLayout" :cellSpacing="spacing"
:columns="7">
      <e-panels>
        <e-panel id="panel0" :row="0" :col="0" :sizeX="1" :sizeY="1"
header="<div>Panel 0</div>" content='<div class="content">Panel
Content<div>'></e-panel>
        <e-panel id="panel1" :row="0" :col="1" :sizeX="3" :sizeY="2"
header="<div>Panel 1</div>" content='<div class="content">Panel
Content<div>'></e-panel>
        <e-panel id="panel2" :row="0" :col="4" :sizeX="1" :sizeY="3"
header="<div>Panel 2</div>" content='<div class="content">Panel
Content<div>'></e-panel>
        <e-panel id="panel3" :row="1" :col="0" :sizeX="1" :sizeY="1"
header="<div>Panel 3</div>" content='<div class="content">Panel
Content<div>'></e-panel>
        <e-panel id="panel4" :row="2" :col="0" :sizeX="2" :sizeY="1"
header="<div>Panel 4</div>" content='<div class="content">Panel
Content<div>'></e-panel>
        <e-panel id="panel5" :row="2" :col="2" :sizeX="1" :sizeY="1"
header="<div>Panel 5</div>" content='<div class="content">Panel
Content<div>'></e-panel>
        <e-panel id="panel6" :row="2" :col="3" :sizeX="1" :sizeY="1"
header="<div>Panel 6</div>" content='<div class="content">Panel
Content<div>'></e-panel>
      </e-panels>
    </ejs-dashboardlayout>
    <!-- end of dashboardlayout element -->
  </div>
</template>

```

```

<script>
import Vue from "vue";
// Import syncfusion dashboardlayout component from layouts package
import { DashboardLayoutPlugin } from "@syncfusion/ej2-vue-layouts";
Vue.use(DashboardLayoutPlugin);
export default {
  data: function() {
    return {
      spacing: [10,10]
    };
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css";

  vertical-align: middle;
  font-weight: 600;
  font-size: 20px;
  text-align:center;
  padding:10px
}
.e-panel-content {
  text-align:center;
  padding:20px;
  line-height:40px;
}
#defaultLayout .e-panel {
  transition:none !important;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/dashboard-layout/header-cs1" %}

### Placing components as content of panels

In a dashboard, components like the chart, grids, maps, gauge, and more etc. can be used to present a complex data. Such components can be placed as the panel content by assigning the corresponding component element as the **content** of the panel.

The following sample demonstrates how to add EJ2 Chart components as the **content** for each panel in the dashboard layout component.

### APP.VUE

```

<template>
  <div className="control-section" id="control_dash">
    <div className="content-wrapper">
      <!-- DashboardLayout element declaration -->
      <ejs-dashboardlayout ref="DashbordInstance" :columns="6"
id='edit_dashboard' :allowResizing="false" :allowDragging="true" >
        <e-panels>
          <e-panel :row="0" :col="0" :sizeX="3" :sizeY="2"
header="<div>Product usage ratio</div>" :content="pie"></e-panel>

```

```

        <e-panel :row="0" :col="3" :sizeX="3" :sizeY="2"
header="<div>Mobile browsers usage</div>" :content="pie1"></e-panel>
        <e-panel :row="1" :col="0" :sizeX="3" :sizeY="2"
header="<div>Spline Chart</div>" :content="spline"></e-panel>
    </e-panels>
</ejs-dashboardlayout>
<!-- end of dashboardlayout element -->
</div>
</div>
</template>
<script>
import Vue from "vue";

#### Add remove panels in Vue Dashboard layout component

In real-time cases, the data being presented within the dashboard should be updated frequently which includes adding or removing the data dynamically within the dashboard. This can be easily achieved by using the [addPanel](#) and [removePanel](#) public methods of the component.

#### Add or remove panels dynamically

Panels can be added dynamically by using the [addPanel](#) public method by passing the [panel](#) property as parameter. Also, they can be removed dynamically by using the [removePanel](#) public method by passing the [panel id](#) value as a parameter.

It is also possible to remove all the panels in a Dashboard Layout by calling [removeAll](#) method.

```
`js
```

```
dashboard.removeAll();
```

The following sample demonstrates how to add and remove the panels dynamically in the dashboard layout component. Here, panels can be added in any desired position of required size by selecting them in the numeric boxes and clicking add button and remove them by selecting the ID of the panel.

#### APP.VUE

```
<template>
  <div>
    <div className="col-lg-8 control-section" id="control_dash">
      <div className="content-wrapper">
        <div id = "dashboardElement">
          <!-- DashboardLayout element declaration -->
          <ejs-dashboardlayout id='dashboard_default'

You can refer to our [Vue Dashboard Layout](#) feature tour page for its groundbreaking feature representations. You can also explore our [Vue Dashboard Layout example](#) to know how to present and manipulate data.

## Interaction With Panels

### Dragging moving of panels in Vue Dashboard layout component

The Dashboard Layout component is provided with dragging functionality to drag and reorder the panels within the layout. While dragging a panel, a holder will be highlighted below the panel indicating the panel placement on panel drop. This helps the user to decide whether to place the panel in the current position or revert to previous position without disturbing the layout.

If one or more panels collide while dragging, then the colliding panels will be pushed towards the left or right or top or bottom direction where an adaptive space for the collided panel is available. The position changes of these collided panels will be updated dynamically during dragging of a panel, so the user can conclude whether to place the panel in the current position or not.

While dragging a panel in Dashboard layout the following dragging events will be triggered,

- [dragStart](#) - Triggers when panel drag starts
- [drag](#) - Triggers when panel is being dragged
- [dragStop](#) - Triggers when panel drag stops

The following sample demonstrates dragging and pushing of panels. For example, while dragging the panel 0 over panel 1, these panels get collided and push the panel 1 towards the feasible direction, so that, the panel 0 gets placed in the panel 1 position.

### *Customizing the dragging handler*

Initially, the complete panel will act as the handler for dragging the panel such that the dragging action occurs on clicking anywhere over a panel. However, this dragging handler for the panels can be customized using the [draggableHandle](#) property to restrict the dragging action within a particular element in the panel.

The following sample demonstrates customizing the dragging handler of the panels where the dragging action of panel occurs only with the header of the panel.

```

{% previewsample "page.domainurl/code-snippet/dashboard-layout/drag-handler-cs1" %}

By default, the dragging of panels is enabled in Dashboard Layout. It can also be disabled with the help of [allowDragging](#) API. Setting [allowDragging](#) to false disables the dragging functionality in Dashboard Layout.

The following sample demonstrates Dashboard Layout with dragging support disabled.

#### APP.VUE

```

<template>
  <div class="control-section">
    <!-- DashboardLayout element declaration -->
    <ejs-dashboardlayout id='dashboard_layout' :columns="5"
:cellSpacing='cellSpacing' :allowDragging ='allowDragging' >
      <e-panels>
        <e-panel :sizeX="1" :sizeY="1" :row="0" :col="0"
content="<div class='content'>0</div>"></e-panel>

### Moving panels in Vue Dashboard layout component

Other than drag and drop, it is possible to move the panels in Dashboard Layout programmatically. This can be achieved using [movePanel](#) method. The method is invoked as follows,

```

`js
movePanel(id, row, col)
`

```

Where,

- id - ID of the panel which needs to be moved.
- row - New row position for moving the panel.
- col - New column position for moving the panel.

Each time a panel's position is changed(Programatically or through UI interaction), the Dashboard Layout's [change](#) event will be triggered.

The following sample demonstrates moving a panel programatically to a new position in the Dashboard Layout's [created](#) event.

#### APP.VUE

### Resizing of panels in Vue Dashboard layout component

The Dashboard Layout component is also provided with the panel resizing functionality which can be enabled or disabled using the [allowResizing](#) property. This functionality allows you to resize the panels dynamically through UI interactions using the resizing handlers which controls the panel resizing in various directions.

Initially, the panels can be resized only in south-east direction. However, panels can also be resized in east, west, north, south and south-west directions by defining the required directions with the [resizableHandles](#) property.

On resizing a panel in Dashboard layout the following events will be triggered,

- [resizeStart](#) - Triggers when panel resize starts
- [resize](#) - Triggers when panel is being resized
- [resizeStop](#) - Triggers when panel resize stops

The following sample demonstrates how to enable and disable the resizing of panels in the Dashboard Layout component in different directions.

### APP.VUE

```

<template>
  <div class="control-section">
    <!-- DashboardLayout element declaration -->
    <ejs-dashboardlayout id='dashboard_default' ref="dashboard"
      :cellSpacing='cellSpacing' :allowResizing='true'

```

```

:resizableHandles='resizableHandles' :columns="6"
:resizeStart="onResizeStart" :resize="onResize" :resizeStop="onResizeStop">
  <e-panels>
    <e-panel :sizeX="1" :sizeY="1" :row="0" :col="0" content="<div
class='content'>0</div>"></e-panel>
    <e-panel :sizeX="3" :sizeY="2" :row="0" :col="1" content="<div
class='content'>1</div>"></e-panel>
    <e-panel :sizeX="1" :sizeY="3" :row="0" :col="4" content="<div
class='content'>2</div>"></e-panel>
    <e-panel :sizeX="1" :sizeY="1" :row="1" :col="0" content="<div
class='content'>3</div>"></e-panel>
    <e-panel :sizeX="2" :sizeY="1" :row="2" :col="0" content="<div
class='content'>4</div>"></e-panel>
    <e-panel :sizeX="1" :sizeY="1" :row="2" :col="2" content="<div
class='content'>5</div>"></e-panel>
    <e-panel :sizeX="1" :sizeY="1" :row="2" :col="3" content="<div
class='content'>6</div>"></e-panel>
  </e-panels>
</ejs-dashboardlayout>
<!-- end of dashboardlayout element -->
</div>
</template>
<script>
import Vue from "vue";
// Import syncfusion dashboardlayout component from layouts package
import { DashboardLayoutPlugin } from "@syncfusion/ej2-vue-layouts";
Vue.use(DashboardLayoutPlugin);
export default {
  data: function() {
    return {
      cellSpacing: [10, 10],
      resizableHandles: ['e-south-east', 'e-east', 'e-west', 'e-north', 'e-
south'],
    };
  },
  methods: {
    //Dashboard Layout's resizestart event function
    onResizeStart: function(args) {
      console.log("Resize Start");
    },
    //Dashboard Layout's resize event function
    onResize: function(args) {
      console.log("Resizing");
    },
    //Dashboard Layout's resizestop event function
    onResizeStop: function(args) {
      console.log("Resize Stop")
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
layouts/styles/material.css";
/* DashboardLayout element styles */
#dashboard_default .e-panel .e-panel-container .content {

```

```

vertical-align: middle;
font-weight: 600;
font-size: 20px;
text-align: center;
line-height: 80px;
}
#dashboard_default .e-panel {
  transition:none !important;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/dashboard-layout/resizing-cs1" %}

### *Resizing panels programatically*

The Dashboard Layout panels can also be resized programatically by using [resizePanel](#) method. The method is invoked as follows,

```
`js
```

```
resizePanel(id, sizeX, sizeY)
```

```
,
```

Where,

- id - ID of the panel which needs to be resized.
- sizeX - New panel width in cells count for resizing the panel.
- sizeY - New panel height in cells count for resizing the panel.

The following sample demonstrates resizing panels programatically in the Dashboard Layout's [created](#) event.

### **APP.VUE**

```

<template>

### Floating of panels in Vue Dashboard layout component

The floating functionality of the component allows you to effectively use the entire layout for the panel's placement. If the floating functionality is enabled, the panels within the layout get floated upwards automatically to occupy the empty cells available in previous rows. This functionality can be enabled or disabled using the [allowFloating](#) property of the component.

The following sample demonstrates how to enable or disable the floating of panels in the Dashboard Layout component.

#### APP.VUE

```
<template>

### Responsive adaptive in Vue Dashboard layout component

The control is provided with built-in responsive support, where panels within the layout get adjusted based on their parent element's dimensions to accommodate any resolution which relieves the burden of building responsive dashboards.

The dashboard layout is designed to automatically adapt with lower resolutions by transforming the entire layout into a stacked one, so that, the panels will be displayed in a vertical column. By default, whenever the screen resolution meets 600 px or lower resolutions this layout transformation occurs. This transformation can be modified for any user defined resolution by defining the `mediaQuery` property of the component.

The following sample demonstrates the usage of the `mediaQuery` property to turn out the layout into a stacked one in user defined resolution. Here, whenever, the window size reaches 700 px or lesser, the layout becomes a stacked layout.

#### APP.VUE

```
<template>
```

```

### State maintenance in Vue Dashboard layout component

The current layout structure of the Dashboard Layout component can be obtained and saved to construct another dashboard with same panel structure using the `serialize` public method of the component. This method returns the component's current panel setting which can be used to construct a dashboard with the same layout settings.

The following sample demonstrates how to save and restore the state of the panels using the `serialize` method. Click Save to store the panel's settings and click Restore to restore the previously saved panel settings.

#### APP.VUE

            </table>
            <!-- Button element declaration -->
          </div>
        </div>
      </div>
    </div>
  </div>
```

```

<ej2-button id="restore"
cssClass="e-flat e-outline" v-on:click.native="onRestore">Restore
Panel</ej2-button>

</td>
</tr>
</tbody>
</table>
</div>
</div>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
// Import syncfusion dashboardlayout component from layouts package
import { DashboardLayoutPlugin } from "@syncfusion/ej2-vue-layouts";
// Import syncfusion button component from buttons package
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(DashboardLayoutPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return {
      cellSpacing: [20, 20],
      restoreModel: []
    };
  },
  methods: {
    // Restore the initial panels
    onRestore: function(args) {
      // Create instances for dashboardlayout element
      this.$refs.dashboard.$el.ej2_instances[0].panels =
this.$refs.restoreModel;
    },
    // Save the current panels
    onSave: function(args) {
      // Create instances for dashboardlayout element
      this.$refs.restoreModel =
this.$refs.dashboard.$el.ej2_instances[0].serialize();
      this.$refs.restoreModel[0].content = '<div
class="content">0</div>';
      this.$refs.restoreModel[1].content = '<div
class="content">1</div>';
      this.$refs.restoreModel[2].content = '<div
class="content">2</div>';
      this.$refs.restoreModel[3].content = '<div
class="content">3</div>';
      this.$refs.restoreModel[4].content = '<div
class="content">4</div>';
      this.$refs.restoreModel[5].content = '<div
class="content">5</div>';
      this.$refs.restoreModel[6].content = '<div
class="content">6</div>';
    },
  },
}

```

```

</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css";

    border: 1px solid black;
    padding: 20px;
    margin: 30px;
}
#remove {
    border: 1px solid black;
    margin: 30px;
}
td {
    padding: 20px;
}
#dashboard_default .e-panel {
    transition: none !important;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/dashboard-layout/state-maintenance-cs1" %}

You can refer to our [Vue Dashboard Layout](#) feature tour page for its groundbreaking feature representations. You can also explore our [Vue Dashboard Layout example](#) to know how to present and manipulate data.

### Style in Vue Dashboard layout component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the dashboard layout panel header

Use the following CSS to customize the dashboard layout panel header.

```

.e-dashboardlayout.e-control .e-panel .e-panel-container .e-panel-header {
color: #754131;

```

```
background-color: #c9e2f7;
text-align: center;
}
`
```

### Customizing the dashboard layout panel content

Use the following CSS to customize the dashboard layout panel content.

```
`
.e-dashboardlayout.e-control .e-panel .e-panel-container .e-panel-content {
background-color: #c9e2f7;
padding: 50px;
}
`
```

### Customizing the dashboard layout panel resize icon

Use the following CSS to customize the dashboard layout resize icon.

```
`
.e-dashboardlayout.e-control .e-panel .e-panel-container .e-resize.e-double{
color: #0378d5;
font-size: 30px;
height: 20px;
width: 20px;
}
`
```

### Customizing the dashboard layout panel background

Use the following CSS to customize the dashboard layout panel background.

```
`
.e-dashboardlayout.e-control.e-responsive {
background: #b3d3ed;
}
`
```

You can refer to our [Vue Dashboard Layout](#) feature tour page for its groundbreaking feature representations. You can also explore our [Vue Dashboard Layout example](#) to know how to present and manipulate data.

### Accessibility in Vue Dashboard Layout component

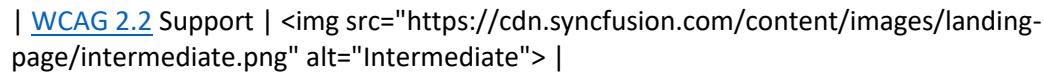

The Dashboard Layout component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

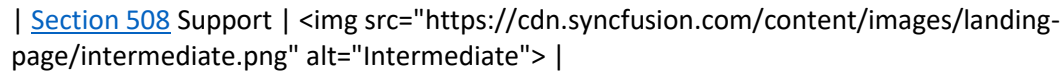

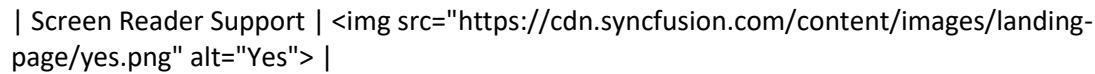

The accessibility compliance for the Dashboard Layout component is outlined below.

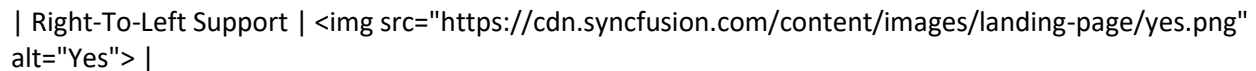

| Accessibility Criteria | Compatibility |

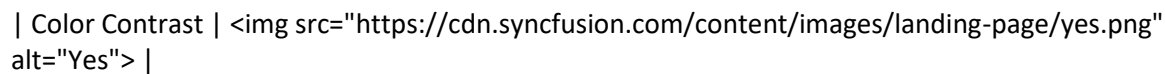

| -- | -- |

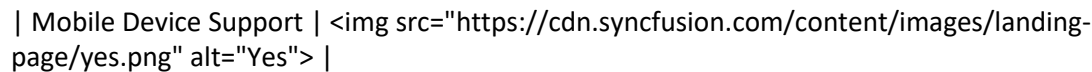

| [WCAG 2.2](#) Support |  |

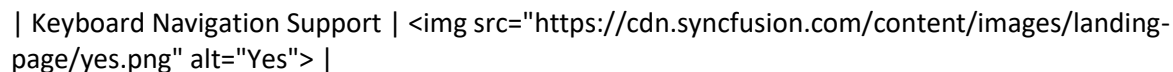

| [Section 508](#) Support |  |

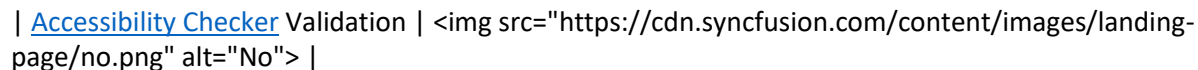

| Screen Reader Support |  |

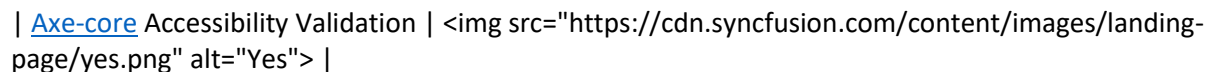

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### [WAI-ARIA attributes](#)

The Dashboard Layout component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Dashboard Layout component:

| **Attributes** | **Purpose** |

| --- | --- |

| **role=list** | Indicates the role as a list for the Dashboard Layout element. |

| **role=listitem** | Indicates the role as a listitem for the Dashboard panels. |

| **role=presentation** | Indicates the role as a presentation for the table when the **showGridLines** property is enabled. |

| **aria-grabbed** | When the panel is chosen for dragging, the aria-grabbed attribute is set to "true." If it's set to "false," the element can be grabbed for drag-and-drop, but it won't be actively held. |

### Keyboard interaction

Keyboard support is not applicable for the Dashboard Layout.

### Ensuring accessibility

The Dashboard Layout component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Dashboard Layout component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Dashboard Layout component with accessibility tools.

```
{% previewsample "https://ej2.syncfusion.com/accessibility/dashboard-layout.html" %}
```

## DatePicker

### Getting Started with the Vue Datepicker Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLI](#) and integrating the Syncfusion Vue Datepicker component using the [Composition API](#) / [Options API](#).

### Prerequisites

[System requirements for Syncfusion Vue UI components](#)

### Dependencies

The list of dependencies required to use the DatePicker component in your application is given below:

```
`javascript
|-- @syncfusion/ej2-vue-calendars
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-vue-base
|-- @syncfusion/ej2-calendars
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-splitbuttons
|-- @syncfusion/ej2-lists
```

```
|-- @syncfusion/ej2-popups  
|-- @syncfusion/ej2-buttons  
,
```

### Setting up the Vue 2 project

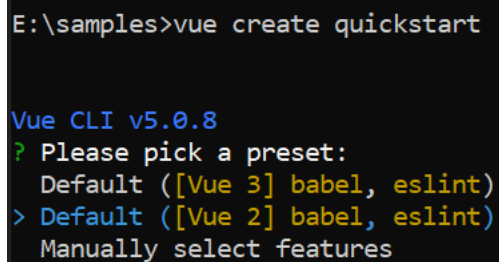

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```
`bash  
npm install -g @vue/cli  
vue create quickstart  
cd quickstart  
npm run serve  
,
```

or

```
`bash  
yarn global add @vue/cli  
vue create quickstart  
cd quickstart  
yarn run serve  
,
```

When creating a new project, choose the option **Default ([Vue 2] babel, eslint)** from the menu.

```
E:\samples>vue create quickstart  
  
Vue CLI v5.0.8  
? Please pick a preset:  
  Default ([Vue 3] babel, eslint)  
> Default ([Vue 2] babel, eslint)  
  Manually select features
```

Once the **quickstart** project is set up with default settings, proceed to add Syncfusion components to the project.

### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.syncfusion.com). To use Vue components, install the required npm package.

This article uses the [Vue DatePicker component](#) as an example. Install the **@syncfusion/ej2-vue-calendars** package by running the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-calendars --save
```

```
,
```

```
or
```

```
`bash
```

```
yarn add @syncfusion/ej2-vue-calendars
```

```
,
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the **Material** theme is applied using CSS styles, which are available in installed packages. The necessary **Material** CSS styles for the DatePicker component and its dependents were imported into the `<style>` section of **src/App.vue** file.

#### ~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
</style>
```

Note: If you want to refer the combined component styles, please make use of our [CRG](#) (Custom Resource Generator) in your application.

### Add Syncfusion Vue component

Follow the below steps to add the Vue DatePicker component using **Composition API** or **Options API**:

1\ First, import and register the DatePicker component in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script>
import { DatePickerComponent as EjsDatepicker } from '@syncfusion/ej2-vue-calendars';
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { DatePickerComponent } from '@syncfusion/ej2-vue-calendars';
export default {
  components: {
    'ejs-datepicker': DatePickerComponent
  }
}
```

```
}  
</script>
```

2\ In the **template** section, define the Datepicker component with the [placeholder](#) property.

#### ~/SRC/APP.VUE

```
<template>  
  <div id="app">  
    <div class='wrapper'>  
      <ejs-datepicker :placeholder="waterMark"></ejs-datepicker>  
    </div>  
  </div>  
</template>
```

3\ Declare the value for the **placeholder** property in the **script** section.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script>  
  const waterMark = 'Select a date';  
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>  
  data () {  
    return {  
      waterMark : 'Select a date'  
    }  
  }  
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

#### COMPOSITION API (~/SRC/APP.VUE)

```
<template>  
  <div id="app">  
    <div class='wrapper'>  
      <ejs-datepicker :placeholder="waterMark"></ejs-datepicker>  
    </div>  
  </div>  
</template>  
<script setup>  
import { DatePickerComponent as EjsDatepicker } from '@syncfusion/ej2-vue-calendars';  
const waterMark = 'Select a date';  
</script>  
<style>  
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';  
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
```

```
.wrapper {  
  max-width: 250px;  
  margin: 0 auto;  
}  
</style>
```

### OPTIONS API (~SRC/APP.VUE)

```
<template>  
  <div id="app">  
    <div class='wrapper'>  
      <ejs-datepicker :placeholder="waterMark"></ejs-datepicker>  
    </div>  
  </div>  
</template>  
<script>  
import { DatePickerComponent } from '@syncfusion/ej2-vue-calendars';  
export default {  
  components: {  
    'ejs-datepicker': DatePickerComponent  
  },  
  data () {  
    return {  
      waterMark : 'Select a date'  
    }  
  }  
}  
</script>  
<style>  
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';  
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";  
  .wrapper {  
    max-width: 250px;  
    margin: 0 auto;  
  }  
</style>
```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run serve
```

```
,
```

or

```
`bash
```

```
yarn run serve
```

```
,
```

```
{% previewsample "page.domainurl/code-snippet/datepicker/getting-started-cs3" %}
```

### Setting the value, min and max dates

The following example demonstrates how to set the value, min and max dates on initializing the DatePicker. Here you can able to select a date within a range from 9th to 15th in a month of May 2017. To know more about range restriction in DatePicker, please refer this [page](#).

#### COMPOSITION API (~SRC/APP.VUE)

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-datepicker :min="minDate" :max="maxDate" :value="dateVal" ></ejs-
datepicker>
    </div>
  </div>
</template>
<script setup>
import { DatePickerComponent as EjsDatepicker } from '@syncfusion/ej2-vue-
calendars';
const minDate = new Date("05/09/2017");
const maxDate = new Date("05/15/2017");
const dateVal = new Date("05/11/2017");
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
  .wrapper {
    max-width: 250px;
    margin: 0 auto;
  }
</style>
```

#### OPTIONS API (~SRC/APP.VUE)

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-datepicker :min="minDate" :max="maxDate" :value="dateVal" ></ejs-
datepicker>
    </div>
  </div>
</template>
<script>
import { DatePickerComponent } from '@syncfusion/ej2-vue-calendars';
export default {
  components: {
    'ejs-datepicker': DatePickerComponent
  },
  data () {
    return {
      minDate : new Date("05/09/2017"),
```

```
      maxDate : new Date("05/15/2017"),
      dateVal : new Date("05/11/2017")
    }
  }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
  .wrapper {
    max-width: 250px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/datepicker/min-max-cs3" %}

- [How to achieve validation with DatePicker](#)

**Note:** You can also explore our [Vue DatePicker example](#) that shows you how to render the DatePicker in Vue.

## Getting Started with the Vue DatePicker Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue DatePicker component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

### Prerequisites

#### [System requirements for Syncfusion Vue UI components](#)

#### Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm create vite@latest
```

```
,
```

or

```
`bash
```

```
yarn create vite
```

```
,
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as `my-project` for this article.

```
`bash
```

```
? Project name: » my-project
```

```
,
```

2. Select `Vue` as the framework. It will create a Vue 3 project.

```
`bash
```

```
? Select a framework: » - Use arrow-keys. Return to submit.
```

```
Vanilla
```

```
Vue
```

```
React
```

```
Preact
```

```
Lit
```

```
Svelte
```

```
Others
```

```
,
```

3. Choose `JavaScript` as the framework variant to build this Vite project using JavaScript and Vue.

```
`bash
```

```
? Select a variant: » - Use arrow-keys. Return to submit.
```

```
JavaScript
```

```
TypeScript
```

```
Customize with create-vue ↗
```

```
Nuxt ↗
```

```
,
```

4. Upon completing the aforementioned steps to create the `my-project`, run the following command to install its dependencies:

```
`bash
```

```
cd my-project
```

```
npm install
`
or
`bash
cd my-project
yarn install
`
```

Now that `my-project` is ready to run with default settings, let's add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue DatePicker component](#) as an example. To use the Vue DatePicker component in the project, the `@syncfusion/ej2-vue-calendars` package needs to be installed using the following command:

```
`bash
npm install @syncfusion/ej2-vue-calendars --save
`
or
`bash
yarn add @syncfusion/ej2-vue-calendars
`
```

#### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, `Material` theme is applied using CSS styles, which are available in installed packages. The necessary `Material` CSS styles for the DatePicker component and its dependents were imported into the `<style>` section of `src/App.vue` file.

#### ~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

### Add Syncfusion Vue component

Follow the below steps to add the Vue DatePicker component using **Composition API** or **Options API**:

1.First, import and register the DatePicker component in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### **COMPOSITION API (~/SRC/APP.VUE)**

```
<script setup>
import { DatePickerComponent as EjsDatepicker } from '@syncfusion/ej2-vue-
calendars';
</script>
```

#### **OPTIONS API (~/SRC/APP.VUE)**

```
<script>
import { DatePickerComponent } from "@syncfusion/ej2-vue-calendars";
//Component registration
export default {
  name: "App",
  components: {
    'ejs-datepicker' : DatePickerComponent,
  }
}
</script>
```

2.In the **template** section, define the DatePicker component with the [dataSource](#) property and column definitions.

#### **~/SRC/APP.VUE**

```
<template>
<div class="control_wrapper">
<ejs-datepicker></ejs-datepicker>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

#### **COMPOSITION API (~/SRC/APP.VUE)**

```
<template>
<div class="control_wrapper">
<ejs-datepicker></ejs-datepicker>
</div>
</template>
<script setup>
import { DatePickerComponent as EjsDatepicker } from '@syncfusion/ej2-vue-
calendars';
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.control_wrapper {
max-width: 250px;
margin: 0 auto;
}
</style>
```

### OPTIONS API (~SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<ejs-datepicker></ejs-datepicker>
</div>
</template>
<script>
import { DatePickerComponent } from "@syncfusion/ej2-vue-calendars";
//Component registration
export default {
name: 'App',
components: {
"ejs-datepicker": DatePickerComponent
},
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.control_wrapper {
max-width: 250px;
margin: 0 auto;
}
</style>
```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
,
```

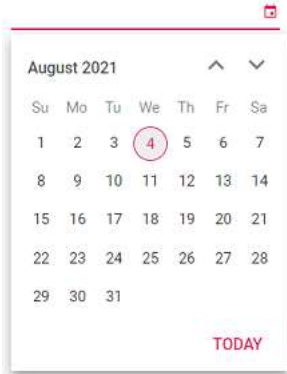

or

```
`bash
```

```
yarn run dev
```

```
,
```

The output will appear as follows:

### Setting the value, min and max dates

The following example demonstrates how to set the value, min and max dates on initializing the DatePicker. Here you can able to select a date within a range from 9th to 15th in a month of May 2017. To know more about range restriction in DatePicker, please refer this [page](#).

#### COMPOSITION API (~SRC/APP.VUE)

```
<template>
<div id="app">
<div class='wrapper'>
<ejs-datepicker :min="data[0].minDate" :max="data[0].maxDate"
:value="data[0].dateVal" ></ejs-datepicker>
</div>
</div>
</template>
<script setup>
import { DatePickerComponent as EjsDatepicker } from '@syncfusion/ej2-vue-
calendars';
const data = [{minDate: new Date("05/04/2017"),
maxDate: new Date("05/16/2017"),
dateVal: new Date("05/10/2017")}];
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.control_wrapper {
max-width: 250px;
margin: 0 auto;
}
</style>
```

#### OPTIONS API (~SRC/APP.VUE)

```
<template>
<div id="app">
<div class='wrapper'>
<ejs-datepicker :min="minDate" :max="maxDate" :value="dateVal" ></ejs-
datepicker>
</div>
</div>
```

```

</template>
<script>
import { DatePickerComponent } from "@syncfusion/ej2-vue-calendars";
//Component registration
export default {
  name: 'App',
  components: {
    "ejs-datepicker": DatePickerComponent
  },
  data () {
    return {
      minDate : new Date("05/09/2017"),
      maxDate : new Date("05/15/2017"),
      dateVal : new Date("05/11/2017")
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>

```

The output will appear as follows:

- [Change the format of selected date](#)
- [Render DatePicker with specific culture](#)
- [How to achieve validation with DatePicker](#)

### Date range in Vue Datepicker component

DatePicker provides an option to select a date value within a specified range by using the [min](#) and [max](#) properties. Always the min value has to be lesser than the max value.

When the min and max properties are configured and the selected date value is out-of-range or invalid, then the model value will be set to **out of range** date value or **null** respectively with highlighted **error** class to indicates the date is out of range or invalid.

The value property depends on the min/max with respect to [strictMode](#) property.

The below example allows selecting a date within the range from 7th to 27th day in a month.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrap'>
      <ejs-datepicker id='datepicker' :value='calVal' :min='minVal'
: max='maxVal'></ejs-datepicker>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(DatePickerPlugin);
export default {
  data () {
    var today = new Date();
    var currentYear = today.getFullYear();
    var currentMonth = today.getMonth();
    var currentDay = today.getDate();
    return {
      calVal: new Date(new Date().setDate(14)),
      minVal: new Date(currentYear, currentMonth, 7),
      maxVal: new Date(currentYear, currentMonth, 27),
    }
  }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
  .wrap {
    margin: 35px auto;
    width: 240px;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/datepicker/min-max-cs2" %}

If the value of **min** or **max** properties changed through code behind, then you have to update the **value** property to set within the range.

#### Date format in Vue Datepicker component

Date format is a way of representing the date value in different string format in the textbox.

By default, the DatePicker's format is based on the culture. You can also set the own custom format by using the [format](#) property.

Once the date format property has been defined it will be common to all the cultures.

To know more about the date format standards, refer to the [Internationalization Date Format](#) section.

The following example demonstrates the DatePicker with the custom format (yyyy-MM-dd).

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-datepicker :placeholder="waterMark" :value="dateVal"
      :format="dateFormat"></ejs-datepicker>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DatePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DatePickerPlugin);
export default {
  data () {
    return {
      waterMark : 'Select a date',
      dateVal : new Date(),
      dateFormat : 'yyyy-MM-dd'
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/datepicker/getting-started-cs2" %}

#### Date masking in Vue Datepicker component

DatePicker has `enableMask` property that provides the option to enable the built-in date masking support. Also, you must inject the MaskedDateTime module to enable the masking support.

#### APP.VUE

```
<template>
<div id="app">
  <div class='wrapper'>
```

```

        <ejs-datepicker id="datepicker" :enableMask="true"></ejs-
datepicker>
    </div>
</div>
</template>
<script>
import Vue from "vue";
import { DatePickerPlugin, DatePicker, MaskedDateTime } from
"@syncfusion/ej2-vue-calendars";
DatePicker.Inject(MaskedDateTime)
Vue.use(DatePickerPlugin);
export default Vue.extend({
    data: function() {
        return {
        };
    },
    provide: {
        datepicker: [MaskedDateTime]
    }
});
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
    max-width: 250px;
    margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/datepicker/mask-module-cs1" %}

The mask pattern is defined based on the provided date format to the component. If the format is not specified, the mask pattern is formed based on the default format of the current culture.

**| Keys | Actions |**

**| --- | --- |**

**| Up / Down arrows | To increment and decrement the selected portion of the date. |**

**| Left / Right arrows and Tab | To navigate the selection from one portion to next portion |**

The following example demonstrates default and custom format of DatePicker component with mask module.

#### APP.VUE

```

<template>
<div id="app">
    <div class='wrapper1'>
        <!-- Specifies the masked datepicker without format property. -->
        <ejs-datepicker id="datepicker" :enableMask='true' ></ejs-
datepicker>
    </div>

```

```

        <div class='wrapper2'>
            <!-- Specifies the masked datepicker with format property. -->
            <ejs-datepicker id="format" :enableMask='true'
:format='dateFormat'></ejs-datepicker>
        </div>
    </div>
</template>
<script>
import Vue from "vue";
import { DatePickerPlugin, DatePicker, MaskedDateTime } from
"@syncfusion/ej2-vue-calendars";
DatePicker.Inject(MaskedDateTime)
Vue.use(DatePickerPlugin);
export default Vue.extend({
    data: function() {
        return {
            dateFormat: 'M/d/yyyy'
        };
    },
    provide: {
        datepicker: [MaskedDateTime]
    }
});
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
#wrapper1{
    min-width: 250px;
    float: left;
    margin-left: 100px;
}
#wrapper2{
    min-width: 250px;
    float: right;
    margin-right: 100px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/datepicker/mask-module-cs2" %}

### Configure Mask Placeholder

You can change mask placeholder value through property `maskPlaceholder`. By default , it takes the full name of date and time co-ordinates such as `day`, `month`, `year`, `hour` etc.

While changing to a culture other than `English`, ensure that locale text for the concerned culture is loaded through load method of `L10n` class for mask placeholder values like below.

```
`ts
```

```
//Load the L10n from ej2-base
```

```
import { L10n } from '@syncfusion/ej2-base';
```

//load the locale object to set the localized mask placeholder value

```
L10n.load({
  'de': {
    'datepicker': { day: 'Tag', month: 'Monat', year: 'Jahr' }
  }
});
```

The following example demonstrates default and customized mask placeholder value.

### APP.VUE

```
<template>
<div id="app">
  <div class='wrapper1'>
    <!-- Specifies the masked datepicker without mask placeholder. -->
    <ejs-datepicker id="datepicker" :enableMask="true" ></ejs-
datepicker>
  </div>
  <div class='wrapper2'>
    <!-- Specifies the masked datepicker with mask placeholder. -->
    <ejs-datepicker id="placeholder" :enableMask="true"
:maskPlaceholder='maskPlaceholderValue'></ejs-datepicker>
  </div>
</div>
</template>
<script>
import Vue from "vue";
import { DatePickerPlugin, MaskedDateTime, DatePicker } from
"@syncfusion/ej2-vue-calendars";
DatePicker.Inject(MaskedDateTime)
Vue.use(DatePickerPlugin);
export default Vue.extend({
  data: function() {
    return {
      maskPlaceholderValue: {day: 'd', month: 'M', year: 'y'}
    }
  },
  provide: {
    datepicker: [MaskedDateTime]
  }
});
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
#wrapper1{
  min-width: 250px;
  float: left;
  margin-left: 100px;
}
```

```

}
#wrapper2{
  min-width: 250px;
  float: right;
  margin-right: 100px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/datepicker/mask-module-cs3" %}

### Globalization in Vue Datepicker component

Globalization is the combination of adapting the component to various languages by means of parsing and formatting the date or number [Internationalization](#) and also by adding cultural specific customizations and translating the text [localization](#)

By default, DatePicker date format, week and month names are specific to English culture. It utilizes the [Essential JavaScript 2 Internationalization](#) package to parse and format the date object based on the culture by using the official [UNICODE CLDR](#) JSON data and it allows to load the culture specific CLDR JSON data by using `loadCldr` method

The DatePicker component supports only the Gregorian type of calendar. All the Essential JS 2 component are specific to English cultur ('en-US'). If you want to go with the different culture other than English, follow the below steps.

- Install the `CLDR-Data` package by using the below command (it installs the CLDR JSON data). To know more about CLDR-Data refer the

[CLDR-Data](#) link.

,

`npm install cldr-data --save`

,

Once the package installed, you can find the culture specific JSON data under the location `/node_modules/cldr-data`.

- Now import the installed CLDR JSON data into the `app.vue` file.
- Now use the `loadCldr` method to load the culture specific CLDR JSON data from the installed location to `app.vue` file.
- DatePicker displayed **Sunday** as the first day of week based on default culture ("en-US"). If you want to display the DatePicker with loaded culture's first day of week, you need to import `weekdata.json` file from the `cldr-data/supplemental` as given in the code example.

`ts

`//Load the loadCldr from ej2-base`

`import { loadCldr } from '@syncfusion/ej2-base';`

`import * as numberingSystems from 'cldr-data/supplemental/numberingSystems.json';`

```
import * as gregorian from 'cldr-data/main/de/ca-gregorian.json';
import * as numbers from 'cldr-data/main/de/numbers.json';
import * as timeZoneNames from 'cldr-data/main/de/timeZoneNames.json';
import * as weekData from 'cldr-data/supplemental/weekdata.json'; // To load the culture based first day of week

loadCldr(numberingSystems, gregorian, numbers, timeZoneNames, weekData);
,
```

The **Localization** library allows you to localize default text content of the DatePicker. The DatePicker component has static text for **today** feature that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [locale](#) value and translation object.

Locale keywords | Text----- | -----today | Name of the button to choose Today date. placeholder | Hint to describe expected value in input element.

- Before changing the culture other than **English**, ensure that locale text for the concerned culture is loaded through **load** method of

[L10n](#) class.

```
`ts
//Load the L10n from ej2-base
import { L10n } from '@syncfusion/ej2-base';
//load the locale object to set the localized placeholder value
L10n.load({
  'de': {
    'datepicker': { placeholder: 'Wählen Sie ein Datum aus', today: 'heute' }
  }
});
,
```

- Set the culture by using the [locale](#) property. The following example demonstrates the DatePicker in **German** culture.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-datepicker id="datepicker" locale='de' ></ejs-datepicker>
    </div>
  </div>
</template>
<script>
```

```

import Vue from "vue";
import { loadCldr, L10n } from '@syncfusion/ej2-base';
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
// Here we have referred local json files for preview purpose
import * as numberingSystems from './numberingSystems.json';
import * as gregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';
import * as timeZoneNames from './timeZoneNames.json';
Vue.use(DatePickerPlugin);
loadCldr(numberingSystems, gregorian, numbers, timeZoneNames);
L10n.load({
  'de': {
    'datepicker': { placeholder: "Wählen Sie Datum und Uhrzeit",
      today: "heute" }
  }
});
export default {}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
  .wrapper {
    margin: 0px auto;
    width: 240px;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/datepicker/locale-cs1" %}

### Right-To-Left

The DatePicker supports right-to-left functionality for languages like Arabic, Hebrew to displays the text in the right-to-left direction. Use

[enableRtl](#) property to set the RTL direction.

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-datepicker id="datepicker" :locale="locale" :enableRtl="rtl"
    ></ejs-datepicker>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { loadCldr, L10n } from '@syncfusion/ej2-base';
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
// Here we have referred local json files for preview purpose
import * as numberingSystems from './numberingSystems.json';
import * as gregorian from './ca-gregorian.json';

```

```

import * as numbers from './numbers.json';
import * as timeZoneNames from './timeZoneNames.json';
Vue.use(DatePickerPlugin);
loadCldr(numberingSystems, gregorian, numbers, timeZoneNames);
L10n.load({
  'he': {
    'datepicker': { placeholder: 'הזן תאריך',
      today: 'היום' }
  }
});
export default {
  data () {
    return {
      locale: "he",
      rtl: true
    }
  }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
  .wrapper {
    margin: 0px auto;
    width: 240px;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/datepicker/rtl-cs1" %}

## Strict mode in Vue Datepicker component

### Enable Strict Mode

The [strictMode](#) is an act, that allows the user to enter only the valid date within the specified min/max range in textbox. If the date is invalid, then the component will stay with the previous value. Else, if the date is out of range, then the component will set the date to the min/max date.

The following example demonstrates the DatePicker in `strictMode` with min/max range of 5th to 25th in a month of May. Here, it allows to enter

only the valid date within the specified range. If you are trying to enter the out-of-range value as like 28th of May, then the value will set to the max date of 25th May. Since the value 28th is greater than to max value of 25th. Or else if you are trying to enter the invalid date, then the value will stay with the previous value.

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrap'>
      <ejs-datepicker id='datepicker' :strictMode='strict'
        :value='dateVal' :min='minVal' :max='maxVal'></ejs-datepicker>
    </div>
  </div>

```

```

        </div>
    </div>
</template>
<script>
import Vue from "vue";
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(DatePickerPlugin);
export default {
    data () {
        return {
            strict:true,
            dateVal: new Date('5/28/2017'),
            minVal: new Date('5/5/2017'),
            maxVal: new Date('5/25/2017')
        }
    }
}
</script>
<style>
    @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
    @import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
    .wrap {
        margin: 35px auto;
        width: 240px;
    }
</style>

```

{% previewsample "page.domainurl/code-snippet/datepicker/strict-mode-cs1" %}

### Disable Strict Mode

By default, the DatePicker act in strictMode **false** state, that allows to enter the invalid or out-of-range date in textbox.

If the date is out-of-range or invalid, then the model value will be set to **out of range** date value or **null** respectively with highlighted **error** class to indicates the date is out of range or invalid.

The following example demonstrates the **strictMode** as **false**. Here, it allows to enter the valid or invalid value in textbox. If you are entering out-of-range or invalid date value, then the model value will be set to **out of range** date value or **null** respectively with highlighted **error** class to indicates the date is out of range or invalid.

The following example demonstrates the DatePicker with strictMode **false**.

### APP.VUE

```

<template>
    <div id="app">
        <div class='wrap'>
            <ejs-datepicker id='datepicker' :value='dateVal' :min='minVal'
:max='maxVal'></ejs-datepicker>
        </div>
    </div>

```

```

</template>
<script>
import Vue from "vue";
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(DatePickerPlugin);
export default {
  data () {
    return {
      dateVal: new Date('5/28/2017'),
      minVal: new Date('5/5/2017'),
      maxVal: new Date('5/25/2017')
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrap {
  margin: 35px auto;
  width: 240px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/datepicker/strict-mode-cs2" %}

### Customization in Vue Datepicker component

You can customize the entire appearance of the input element and Calendar by using custom [cssClass](#) property.

and also you can use the calendar's [renderDayCell](#) event to customize the appearance of the each day cell.

Below is the list of classes that provides flexible way to customize the DatePicker component.

Class Name	Description
---	---
e-date-wrapper	Applied to DatePicker wrapper
e-datepicker	Applied to the DatePicker element.
e-float-text	Applied to the floating label.
e-date-icon	Applied to the DatePicker icon.
e-popup-wrapper	Applied to DatePicker popup wrapper.
e-calendar	Applied to Calendar element.
e-header	Applied to Calendar header.
e-title	Applied to Calendar title.
e-icon-container	Applied to Calendar previous and next icon container.

- | e-prev | Applied to Calendar previous icon.|
- | e-next | Applied to Calendar next icon.|
- | e-weekend | Applied to Calendar weekend dates.|
- | e-other-month | Applied to Calendar other month dates.|
- | e-day | Applied to each day cell of the Calendar.|
- | e-selected | Applied to Calendar selected dates.|
- | e-disabled | Applied to Calendar disabled dates.|

The following example disables the weekends of every month using `renderDayCell` event. Here we have used the `e-disabled` class to highlight the disabled date.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrap'>
      <ejs-datepicker id='datepicker' :renderDayCell="disableDate"
placeholder='Select a Date'></ejs-datepicker>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(DatePickerPlugin);
export default {
  methods: {
    disableDate: function(args) {
      if (args.date.getDay() === 0 || args.date.getDay() === 6) {
        args.isDisabled = true;
      }
    }
  }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
  .wrap {
    margin: 35px auto;
    width: 240px;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/datepicker/min-max-cs1" %}

### Adding mandatory asterisk to placeholder and float label

You can add a mandatory asterisk(\*) to placeholder and float label using `<b>.e-input-group.e-control-wrapper.e-float-input .e-float-text::after</b>` class.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-datepicker :placeholder="waterMark"
      :floatLabelType="Auto"></ejs-datepicker>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DatePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DatePickerPlugin);
export default {
  data () {
    return {
      waterMark : 'Select a date'
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
.e-input-group.e-control-wrapper.e-float-input .e-float-text::after {
  content: '*';
  color: red;
}
</style>
```

### View in Vue Datepicker component

The [Vue DatePicker](#) has the following predefined views that provides a flexible way to navigate back and forth to select the date.

**| View | Description |****| --- | --- |****| month (default) | Displays the days in a month |****| year | Displays the months in a year |****| decade | Displays the years in a decade |****Start view**

You can use the **start** property to define the initial rendering view.

The following example demonstrates how to create a DatePicker with **decade** as initial rendering view.

**APP.VUE**

```
<template>
  <div id="app">
    <div class='wrap'>
      <ejs-datepicker id='datepicker' start='Decade'
placeholder='Select a date'></ejs-datepicker>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(DatePickerPlugin);
export default {
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
  .wrap {
    margin: 35px auto;
    width: 240px;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/datepicker/view-cs1" %}

**Depth view**

Define the **depth** property to control the view navigation.

Always the depth view has to be smaller than the start view, otherwise the view restriction will be not restricted.

The following example demonstrates how to create a DatePicker that allows users to select a month.

**APP.VUE**

```
<template>
```

```

<div id="app">
  <div class='wrap'>
    <ejs-datepicker id='datepicker' start='Decade' depth='Year'
placeholder='Select a date'></ejs-datepicker>
  </div>
</div>
</template>
<script>
import Vue from "vue";
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(DatePickerPlugin);
export default {
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
  .wrap {
    margin: 35px auto;
    width: 240px;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/datepicker/depth-cs1" %}

### Accessibility in Vue Datepicker component

The DatePicker component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the DatePicker component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) |  |

| [Section 508 Support](#) |  |

| [Screen Reader Support](#) |  |

| [Right-To-Left Support](#) |  |

| [Color Contrast](#) |  |

| [Mobile Device Support](#) |  |

| [Keyboard Navigation Support](#) |  |

| [Accessibility Checker Validation](#) |  |

| [Axe-core Accessibility Validation](#) |  |

```
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The
component does not meet the requirement.</div>
```

### WAI-ARIA attributes

The Web accessibility defines a way to make web content and web applications more accessible to disabled people. It especially helps the dynamic content change and advanced user interface controls developed with Ajax, HTML, JavaScript, and related technologies.

DatePicker provides built-in compliance with the [WAI-ARIA](#) specifications. WAI-ARIA supports is achieved through the attributes like `aria-expanded`, `aria-disabled`, `aria-activedescendant` applied to the input element.

To know about the accessibility of Calendar refer to the Calendar's [Accessibility](#) section.

It helps to provide information about the widget for assistive technology to the disabled person in screen reader.

- **Aria-expanded:** attributes indicates the state of a collapsible element.
- **Aria-disabled:** attribute indicates the disabled state of this DatePicker component.
- **Aria-activedescendent:** attribute helps in managing the current active child of the DatePicker component.

### Keyboard Interaction

You can use the following keys to interact with the DatePicker.

The component implements the keyboard navigation support by following the [WAI-ARIA practices](#).

It supports the below list of shortcut keys.

#### Input Navigation

Before opening the popup, use the below list of keys to control the popup element.

| **Press** | **To do this** |

| --- | --- |

| **Alt + Down Arrow** | **Opens the popup.** |

| **Alt + Up Arrow** | **Closes the popup.** |

| **Esc** | **Closes the popup.** |

#### Calendar Navigation

Use the below list of keys to navigate the Calendar after the popup has opened.

| **Press** | **To do this** |

| --- | --- |

| **Upper Arrow** | **Focus the previous week date.** |

| **Down Arrow** | **Focus the next week date.** |

| **Left Arrow** | **Focus the previous date.** |

| **Right Arrow** | **Focus the next date.** |

| **Home** | **Focus the first date in the month.** |

| **End** | **Focus the last date in the month.** |

| **Page Up** | **Focus the same date in the previous month.** |

| **Page Down** | **Focus the same date in the next month.** |

| **Enter** | **Select the currently focused date.** |

| **Shift + Page Up** | **Focus the same date in the previous year.** |

| **Shift + Page Down** | **Focus the same date in the previous year.** |

| **Control + Upper Arrow** | **Moves into the inner level of view like month-year, year-decade** |

| **Control + Down Arrow** | **Moves out from the depth level view like decade-year, year-month** |

| **Control + Home** | **Focus the starting date in the current year.** |

| **Control + End** | **Focus the ending date in the current year.** |

To focus the DatePicker component use the **alt+t** keys.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrap'>
      <ejs-datepicker id='date' placeholder='Select Date'
        ref="DateInstance"></ejs-datepicker>
    </div>
  </div>
</template>
```

```

<script>
import Vue from "vue";
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(DatePickerPlugin);
export default {
  mounted () {
    let DateObj = this.$refs.DateInstance;
    document.onkeyup = function (e) {
      if (e.altKey && e.keyCode === 84) {
        // press alt+t to focus the control.
        DateObj.$el.focus();
      }
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "@syncfusion/ej2-vue-calendars/styles/material.css";
.wrap {
  margin: 35px auto;
  width: 240px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/datepicker/access-cs1" %}

### Ensuring accessibility

The DatePicker component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the DatePicker component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the DatePicker component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/date-picker.html" %}

See also

- [Accessibility in Syncfusion Vue components](#)

### Two way binding in Vue Datepicker component

Two-way binding can be achieved by using the `v-model` directive in Vue. In the following sample, when you change the value in one DatePicker component, v-model will automatically update the value in the other DatePicker.

The following example demonstrates how to set the `two-way-binding` in the DatePicker.

#### APP.VUE

```
<template>
```

```

<div id="app">
  <div id="wrapper1">
    <ejs-datepicker id="datepicker" v-model="date"></ejs-datepicker>
  </div>
  <div id="wrapper2">
    <ejs-datepicker id="datepicker1" v-model="date"></ejs-datepicker>
  </div>
</div>
</template>
<script>
import Vue from "vue";
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(DatePickerPlugin);
export default {
  data: function() {
    return {
      date: new Date()
    };
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
#wrapper1{
  min-width: 250px;
  float: left;
  margin-left: 100px;
}
#wrapper2{
  min-width: 250px;
  float: right;
  margin-right: 100px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/datepicker/two-way-cs1" %}

### Style appearance in Vue DatePicker component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the appearance of DatePicker wrapper element

Use the following CSS to customize the appearance of wrapper element.

,

*/ To specify height and font size /*

```

.e-input-group input.e-input, .e-input-group.e-control-wrapper input.e-input {
height: 40px;
font-size: 20px;

```

```
}
,
```

### Customizing the DatePicker icon element

Use the following CSS to customize the DatePicker icon element

```
,
```

*/ To specify background color and font size /*

```
.e-input-group .e-input-group-icon:last-child, .e-input-group.e-control-wrapper .e-input-group-icon:last-child {
```

```
font-size: 12px;
```

```
background-color: darkgray;
```

```
}
```

```
,
```

### Customizing the Calendar popup of the DatePicker

Please check the below section, to customize the style and appearance of the Calendar component

#### [Customizing Calendar's style and appearance](#)

#### Full screen mode support in mobiles and tablets

The DatePicker component's full-screen mode feature enables users to view the component popup element in full-screen mode on mobile devices with improved visibility and a better user experience. It is important to mention that this feature is exclusively available for mobile and tablet devices in both landscape and portrait orientations. To activate the full screen mode within the DatePicker component, simply set the [fullScreenMode](#) API value to `true`. This action will extend the calendar element to occupy the entire screen on mobile devices.

```
`html
```

```
<template>
```

```
<div id="app">
```

```
<ejs-datepicker :fullScreenMode="mobileMode" ></ejs-datepicker>
```

```
</div>
```

```
</template>
```

```
<script>
```

```
import Vue from 'vue';
```

```
import { DatePickerPlugin } from '@syncfusion/ej2-vue-calendars';
```

```
Vue.use(DatePickerPlugin);
```

```
export default {
```

```
data () {
```

```
return {
```

```
mobileMode : true
```

```
}  
}  
}  
</script>  
,
```

## How To

Disabled the datepicker component in Vue Datepicker component

To disable the DatePicker, use its [enable](#) property.

The following example demonstrates the DatePicker in a disabled state.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrap'>
      <ejs-datepicker id='date' :enabled="enable"></ejs-datepicker>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(DatePickerPlugin);
export default {
  data () {
    return{
      enable: false
    }
  }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
  .wrap {
    margin: 35px auto;
    width: 240px;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/datepicker/access-cs2" %}

Set the placeholder in Vue Datepicker component

The following example demonstrates how to set **placeholder** in the DatePicker component.

Using **placeholder** you can display a short hint in the input element.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrap'>
      <ejs-datepicker id='date' placeholder="Select Date"></ejs-datepicker>
    </div>
  </div>
</template>
```

```

</template>
<script>
import Vue from "vue";
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(DatePickerPlugin);
export default {
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
  .wrap {
    margin: 35px auto;
    width: 240px;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/datepicker/access-cs3" %}

### Set the readonly in Vue DatePicker component

The following example demonstrates how to set **readonly** in DatePicker component. You can achieve this by using **readonly** property.

#### APP.VUE

```

<template>
  <div id="app">
    <div class='wrap'>
      <ejs-datepicker id='date' placeholder="Select Date"
:readonly='read' :value='dateval'></ejs-datepicker>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(DatePickerPlugin);
export default {
  data () {
    return{
      dateval: new Date(),
      read: true
    }
  }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';

```

```
@import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
.wrap {
  margin: 35px auto;
  width: 240px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/datepicker/access-cs4" %}

### Open datepicker popup on input click in Vue Datepicker component

You can open the DatePicker popup on input focus by calling the `show` method in the input `focus` event.

The following example demonstrates how to open the DatePicker popup when the input is focused.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrap'>
      <ejs-datepicker ref="dateObj" id='date' placeholder="Choose a
date" :focus='onFocus'></ejs-datepicker>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(DatePickerPlugin);
export default {
  methods:{
    onFocus: function(args){
      this.$refs.dateObj.show();
    }
  }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
  .wrap {
    margin: 35px auto;
    width: 240px;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/datepicker/open-popup-cs1" %}

### Prevent the popup close in Vue Datepicker component

To prevent the DatePicker popup from closing, use the `preventDefault` method from the `PreventableEventArgs`.

The following example demonstrates how to prevent the popup from closing.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrap'>
      <ejs-datepicker id='date' placeholder="Select Date"
      :close='onClose' :value='dateval'></ejs-datepicker>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(DatePickerPlugin);
export default {
  methods:{
    onClose: function(args){
      args.preventDefault();
    }
  },
  data () {
    return{
      dateval: new Date()
    }
  }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
  .wrap {
    margin: 35px auto;
    width: 240px;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/datepicker/min-max-cs4" %}

#### Client side validation in Vue DatePicker component

To achieve the client side validation in a DatePicker component by using [Essential JavaScript 2 FormValidator](#). It provides an option to customize the feedback error messages to the corresponding fields to take action to resolve the issue.

In the below example, the required field validation is implemented by mapping the name attribute value to the rules property. It will validate the DatePicker component and display the validation message when the textbox value is empty during form post back or focus out.

#### APP.VUE

```
<template>
```

```

<div id="app">
  <div class='wrap'>
    <form id="form-element" class="form-horizontal">
      <div class="form-group" style="padding-top: 11px;">
        <div class="col-lg-8">
          <ejs-datepicker id="datepicker" name="date"
:change="onValueChanged" class="form-control" placeholder='Select a
date'></ejs-datepicker>
        </div>
      </div>
    </form>
  </div>
</div>
</template>
<script>
import Vue from "vue";
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
import { FormValidator } from '@syncfusion/ej2-inputs';
Vue.use(DatePickerPlugin);
export default {
  data: function() {
    return {
      formObj: '',
      options : {
        customPlacement: function(inputelement, errorElement) {
          var parentElement = inputelement.closest('.form-group');
          parentElement.appendChild(errorElement);
        },
        rules: {
          'date': {
            required: true
          }
        }
      }
    },
    mounted: function () {
      this.formObj = new FormValidator('#form-element', this.options);
    },
    methods: {
      onValueChanged: function(args) {
        this.formObj.validate();
      }
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
.wrap {
  margin: 0 auto;
  width: 240px;
}

```

```
</style>
```

```
{% previewsample "page.domainurl/code-snippet/datepicker/getting-started-cs4" %}
```

Customize the datepicker day header in Vue Datepicker component

You can change the format of the day that to be displayed in header using [dayHeaderFormat](#) property.

By default, the format is **Short**.

You can find the possible formats on below.

Name	Description
Short	Sets the short format of day name (like Su ) in day header.
Narrow	Sets the single character of day name (like S ) in day header.
Abbreviated	Sets the min format of day name (like Sun ) in day header.
Wide	Sets the long format of day name (like Sunday ) in day header.

### APP.VUE

```
<template>
  <div id="container">
    <div id='datepicker'>
      <ejs-datepicker dayHeaderFormat="Short"
ref="datepickerObj"></ejs-datepicker>
    </div>
    <div id="format">
      <label id="custom-input-label">Header Format Types</label>
      <ejs-dropdownlist id="select" :fields = "fields" :index =
"currentIndex" :dataSource = "items" :popupHeight= "popupHeight" :change=
"formatHandler">
      </ejs-dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DatePickerPlugin);
Vue.use(DropDownListPlugin);
export default {
  data () {
    return {
      items: [
        { sizeVal: 'Short' , sizeTxt: 'Short' },
        { sizeVal: 'Narrow' , sizeTxt: 'Narrow' },
        { sizeVal: 'Abbreviated' , sizeTxt: 'Abbreviated' },
        { sizeVal: 'Wide' , sizeTxt: 'Wide' },
      ],
      fields: { text: 'sizeTxt', value: 'sizeVal' },
      popupHeight: 200,
      currentIndex: 0,
      formatHandler: (args) => {
```

```

        this.$refs.datepickerObj.dayHeaderFormat = args.value;
    }
}
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
    #container{
        width: 100%;
    }
    #datepicker {
        width: 25%;
        margin-left: 30px;
        margin-top: 30px;
        display: inline-flex;
    }
    #format {
        width: 180px;
        margin-left: 400px;
        display: inline-block;
    }
    #select {
        height: 30px;
        width: 150px;
        margin-top: 10px;
    }
    #custom-input-label{
        font-size: 15px;
        font-weight: bold
    }
</style>

```

{% previewsample "page.domainurl/code-snippet/datepicker/header-format-cs1" %}

## DateRangePicker

### Getting Started with the Vue Daterangepicker Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLI](#) and integrating the Syncfusion Vue Daterangepicker component using the [Composition API](#) / [Options API](#).

#### Prerequisites

[System requirements for Syncfusion Vue UI components](#)

#### Dependencies

The list of dependencies required to use the DateRangePicker component in your application is given below:

```
`javascript`
```

```
|-- @syncfusion/ej2-vue-calendars
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-vue-base
|-- @syncfusion/ej2-calendars
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-splitbuttons
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-buttons
`
```

### Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```
`bash
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
`
```

or

```
`bash
yarn global add @vue/cli
vue create quickstart
cd quickstart
yarn run serve
`
```

When creating a new project, choose the option **Default ([Vue 2] babel, eslint)** from the menu.

```
E:\samples>vue create quickstart

Vue CLI v5.0.8
? Please pick a preset:
  Default ([Vue 3] babel, eslint)
> Default ([Vue 2] babel, eslint)
  Manually select features
```

Once the `quickstart` project is set up with default settings, proceed to add Syncfusion components to the project.

### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.npmjs.com). To use Vue components, install the required npm package.

This article uses the [Vue Daterangepicker component](#) as an example. Install the `@syncfusion/ej2-vue-calendars` package by running the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-calendars --save
```

```
,
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-calendars
```

```
,
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the `Material` theme is applied using CSS styles, which are available in installed packages. The necessary `Material` CSS styles for the Daterange component and its dependents were imported into the `<style>` section of `src/App.vue` file.

### ~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
</style>
```

Note: If you want to refer the combined component styles, please make use of our [CRG](#) (Custom Resource Generator) in your application.

### Add Syncfusion Vue component

Follow the below steps to add the Vue Daterangepicker component using **Composition API** or **Options API**:

1\ First, import and register the Daterangepicker component in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<script>
import { DateRangePickerComponent as EjsDaterangepicker } from
 '@syncfusion/ej2-vue-calendars';
</script>
```

#### **OPTIONS API (~SRC/APP.VUE)**

```
<script>
import { DateRangePickerComponent } from '@syncfusion/ej2-vue-calendars';
export default {
  components: {
    'ejs-daterangepicker': DateRangePickerComponent
  }
}
</script>
```

2\ In the **template** section, define the Daterangepicker component with the [placeholder](#) property.

#### **~/SRC/APP.VUE**

```
<template>
<div id="app">
<div class='wrapper'>
<ejs-daterangepicker :placeholder="waterMark"></ejs-daterangepicker>
</div>
</div>
</template>
```

3\ Declare the value for the **placeholder** property in the **script** section.

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<script setup>
const waterMark = 'Select a Range';
</script>
```

#### **OPTIONS API (~SRC/APP.VUE)**

```
<script>
data () {
  return {
    waterMark : 'Select a Range'
  }
}
```

```
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

### COMPOSITION API (~SRC/APP.VUE)

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-daterangepicker :placeholder="waterMark"></ejs-
daterangepicker>
    </div>
  </div>
</template>
<script setup>
import { DateRangePickerComponent as EjsDaterangepicker } from
'@syncfusion/ej2-vue-calendars';
const waterMark = 'Select a Range';
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>
```

### OPTIONS API (~SRC/APP.VUE)

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-daterangepicker :placeholder="waterMark"></ejs-
daterangepicker>
    </div>
  </div>
</template>
<script>
import { DateRangePickerComponent } from '@syncfusion/ej2-vue-calendars';
export default {
  components: {
    'ejs-daterangepicker': DateRangePickerComponent
  },
  data () {
    return {
      waterMark : 'Select a Range'
    }
  }
}
</script>
<style>
```

```

@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
    max-width: 250px;
    margin: 0 auto;
}
</style>

```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run serve
```

```
,
```

or

```
`bash
```

```
yarn run serve
```

```
,
```

```
{% previewsample "page.domainurl/code-snippet/daterangepicker/getting-started-cs5" %}
```

### Setting the start date and end date

The start and end date in a range can be defined with the help of startDate and endDate property. The following example demonstrates to set the start and end date on initializing the DateRangePicker. To know more about range restriction in DateRangePicker, please refer this [page](#).

### COMPOSITION API (~ / SRC / APP.VUE)

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-daterangepicker :startDate="startVal" :endDate="endVal"
:placeholder="waterMark"></ejs-daterangepicker>
    </div>
  </div>
</template>
<script setup>
import { DateRangePickerComponent as EjsDaterangepicker } from
'@syncfusion/ej2-vue-calendars';
const startVal = new Date("11/12/2019 12:00 PM");
const endVal = new Date("11/25/2019 5:00 PM");
const waterMark = 'Select a Range';

</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';

```

```
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
    max-width: 250px;
    margin: 0 auto;
}
</style>
```

### **OPTIONS API (~SRC/APP.VUE)**

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-daterangepicker :startDate="startVal" :endDate="endVal"
:placeholder="waterMark"></ejs-daterangepicker>
    </div>
  </div>
</template>
<script>
import { DateRangePickerComponent } from '@syncfusion/ej2-vue-calendars';
export default {
  components: {
    'ejs-daterangepicker': DateRangePickerComponent
  },
  data () {
    return {
      startVal : new Date("11/12/2019 12:00 PM"),
      endVal : new Date("11/25/2019 5:00 PM"),
      waterMark : 'Select a Range'
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
    max-width: 250px;
    margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/daterangepicker/min-max-cs1" %}

You can refer to our [Vue DateRangePicker](#) feature tour page for its groundbreaking feature representations. You can also explore our [Vue DateRangePicker example](#) that shows how to render the DateRangePicker in Vue.

## See Also

- [Render DateRangePicker with pre-defined ranges](#)
- [Render DateRangePicker with specific culture](#)

## Getting Started with the Vue DateRangePicker Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue DateRangePicker component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

### Prerequisites

#### [System requirements for Syncfusion Vue UI components](#)

#### Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
npm create vite@latest
```

,

or

```
`bash
yarn create vite
```

,

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as **my-project** for this article.

```
`bash
? Project name: » my-project
```

,

2. Select **Vue** as the framework. It will create a Vue 3 project.

```
`bash
? Select a framework: » - Use arrow-keys. Return to submit.
```

Vanilla

Vue

React

Preact

Lit

Svelte

Others

,

3. Choose **JavaScript** as the framework variant to build this Vite project using JavaScript and Vue.

```
`bash
```

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

,

4. Upon completing the aforementioned steps to create the **my-project**, run the following command to install its dependencies:

```
`bash
```

```
cd my-project
```

```
npm install
```

,

or

```
`bash
```

```
cd my-project
```

```
yarn install
```

,

Now that **my-project** is ready to run with default settings, let's add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue DateRangePicker component](#) as an example. To use the Vue DateRangePicker component in the project, the **@syncfusion/ej2-vue-calendars** package needs to be installed using the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-calendars --save
```

```
,
```

```
or
```

```
`bash
```

```
yarn add @syncfusion/ej2-vue-calendars
```

```
,
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, **Material** theme is applied using CSS styles, which are available in installed packages. The necessary **Material** CSS styles for the DateRangePicker component and its dependents were imported into the `<style>` section of **src/App.vue** file.

#### ~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

### Add Syncfusion Vue component

Follow the below steps to add the Vue DateRangePicker component using **Composition API** or **Options API**:

1. First, import and register the DateRangePicker component in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { DateRangePickerComponent as EjsDaterangepicker } from
"@syncfusion/ej2-vue-calendars";
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { DateRangePickerComponent } from "@syncfusion/ej2-vue-calendars";
//Component registration
export default {
  name: "App",
```

```
components: {
  'ejs-daterangepicker' : DateRangePickerComponent,
}
}
</script>
```

2. In the **template** section, define the DateRangePicker component with the [dataSource](#) property and column definitions.

### ~/SRC/APP.VUE

```
<template>
<div class="control_wrapper">
<ejs-daterangepicker></ejs-daterangepicker>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

### COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<ejs-daterangepicker></ejs-daterangepicker>
</div>
</template>
<script setup>
import { DateRangePickerComponent as EjsDaterangepicker } from
"@syncfusion/ej2-vue-calendars";
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.control_wrapper {
max-width: 250px;
margin: 0 auto;
}
</style>
```

### OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<ejs-daterangepicker></ejs-daterangepicker>
</div>
</template>
<script>
import { DateRangePickerComponent } from "@syncfusion/ej2-vue-calendars";
//Component registration
export default {
name: 'App',
```

```
components: {  
  "ejs-daterangepicker": DateRangePickerComponent  
},  
}  
</script>  
<style>  
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';  
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";  
.control_wrapper {  
  max-width: 250px;  
  margin: 0 auto;  
}  
</style>
```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
,
```

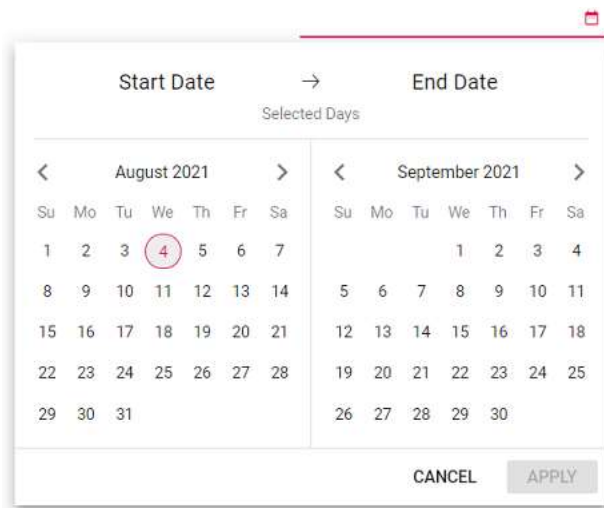

or

```
`bash
```

```
yarn run dev
```

```
,
```

The output will appear as follows:

### Setting the start date and end date

The start and end date in a range can be defined with the help of startDate and endDate property. The following example demonstrates to set the start and end date on initializing the DateRangePicker. To know more about range restriction in DateRangePicker, please refer this [page](#).

#### COMPOSITION API (~SRC/APP.VUE)

```
<template>
<div id="app">
<div class='wrapper'>
<ejs-daterangepicker :startDate="startVal" :endDate="endVal"
:placeholder="waterMark"></ejs-daterangepicker>
</div>
</div>
</template>
<script setup>
import { DateRangePickerComponent as EjsDaterangepicker } from
"@syncfusion/ej2-vue-calendars";
const startVal = new Date("11/12/2019 12:00 PM");
const endVal = new Date("11/25/2019 5:00 PM");
const waterMark = 'Select a Range';
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.control_wrapper {
max-width: 250px;
margin: 0 auto;
}
</style>
```

#### OPTIONS API (~SRC/APP.VUE)

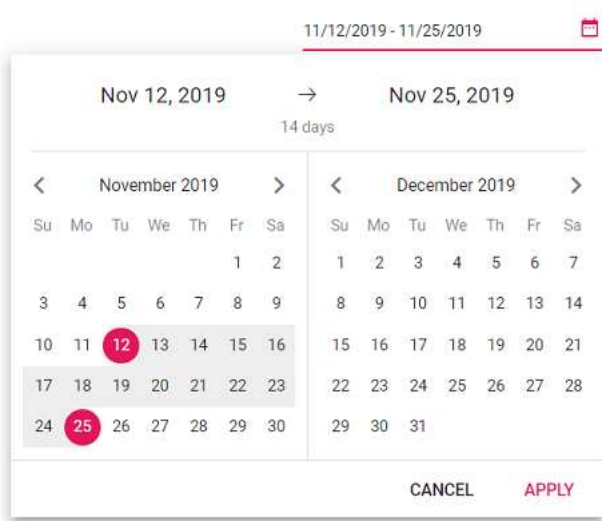

```
<template>
<div id="app">
<div class='wrapper'>
<ejs-daterangepicker :startDate="startVal" :endDate="endVal"
:placeholder="waterMark"></ejs-daterangepicker>
</div>
</div>
</template>
<script>
import { DateRangePickerComponent } from "@syncfusion/ej2-vue-calendars";
//Component registration
export default {
name: 'App',
components: {
"ejs-daterangepicker": DateRangePickerComponent
},
data () {
return {
startVal : new Date("11/12/2019 12:00 PM"),
```

```

endVal : new Date("11/25/2019 5:00 PM"),
waterMark : 'Select a Range'
}
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
max-width: 250px;
margin: 0 auto;
}
</style>

```

The output will appear as follows:

See Also

- [Render DateRangePicker with pre-defined ranges](#)
- [Render DateRangePicker with specific culture](#)

### Range restriction in Vue Daterangepicker component

Range selection in a DateRangePicker can be made-to-order with desire restrictions based on the application needs.

#### Restrict the range within a range

You can restrict the minimum and maximum date that can be allowed as start and end date in a range selection with the help of [min](#), [max](#) properties.

- **min** – sets the minimum date that can be selected as startDate.

- **max** – sets the maximum date that can be selected as endDate.

In the following sample, you can select a range from 15th day of this month to 15th day of next month.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-daterangepicker :min="minDate" :max="maxDate"
:placeholder="waterMark"></ejs-daterangepicker>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DateRangePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateRangePickerPlugin);
export default {
  data () {
    return {
      waterMark: 'Select a Range',
      minDate : new Date(new Date().getFullYear(), new
Date().getMonth(), 15),
      maxDate : new Date(new Date().getFullYear(), new
Date().getMonth()+1, 15)
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/daterangepicker/getting-started-cs10" %}

If the value of **min** or **max** property is changed through code behind, update the **start date** and **end date** properties to set within the range. Or else , if the **start** and **end** date is out of specified date range, a validation error class will be appended to the input element.

If **strictMode** is enabled, and both the start, end date is lesser than the min date then start and end date will be updated with **min** date. If both the start and end date is higher than the max date then start and end date will be updated with **max** date. Or else, if startDate is less than **min** date, startDate will be updated with **min** date or if endDate is greater than **max** date, endDate will be updated with the **max** date.

### Range span

Span between ranges can be limited to avoid excess or less days selection towards the required days in a range.

In this, minimum and maximum span allowed within the date range can be customized by [minDays](#) and [maxDays](#) properties.

- minDays- Sets the minimum number of days between start and end date.
- maxDays- Sets the maximum number of days between start and end date.

In the following sample, the range selection should be greater than 3 days and less than 8 days else it will not set.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-daterangepicker :minDays="min" :maxDays="max"
:placeholder="waterMark"></ejs-daterangepicker>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DateRangePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateRangePickerPlugin);
export default {
  data () {
    return {
      waterMark : 'Select a Range',
      min : 4,
      max : 8
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/daterangepicker/getting-started-cs11" %}

### Strict mode

DateRangePicker provides an option to limit the user towards entering the valid date. With strict mode, you can set only the valid date.

If any invalid range is specified, the date range value resets to previous value. This restriction can be availed by enabling [strictMode](#) property as true.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-daterangepicker :strictMode="mode"
:placeholder="waterMark"></ejs-daterangepicker>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DateRangePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateRangePickerPlugin);
export default {
  data () {
    return {
      waterMark : 'Select a Range',
      mode : true
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/daterangepicker/getting-started-cs12" %}

### Globalization in Vue Daterangepicker component

Globalization is the combination of internationalization and localization. You can adapt the component to various languages by parsing and formatting the date or number (Internationalization), and also add culture specific customization and translation to the text (Localization).

By default, DateRangePicker date format, week, and month names are specific to the English culture. It utilizes the [Essential JavaScript 2 Internationalization](#) package to parse and format the date object based on the culture by using the official [UNICODE CLDR](#) JSON data. It allows to load culture specific CLDR JSON data by using `loadCldr` method.

To use a different culture other than **English**, follow the below steps:

- Install the **CLDR-Data** package by using the below command (Installs the CLDR JSON data). To know more about CLDR-Data refer to the [CLDR-Data](#) link.

```
npm install cldr-data --save
```

Once the package is installed, you can find the culture specific JSON data under the location `/node_modules/cldr-data`.

- Import the installed CLDR JSON data into the `app.vue` file.
- Use the `loadCldr` method to load the culture specific CLDR JSON data from the installed location to `app.vue` file.
- DateRangePicker displayed **Sunday** as the first day of week based on default culture ("en-US"). If you want to display the DateRangePicker with loaded culture's first day of week, you need to import `weekdata.json` file from the `cldr-data/supplemental` as given in the code example.

```
`ts
```

```
//Load the loadCldr from ej2-base
```

```
import { loadCldr } from '@syncfusion/ej2-base';
```

```
import * as numberingSystems from 'cldr-data/supplemental/numberingSystems.json';
```

```
import * as gregorian from 'cldr-data/main/de/ca-gregorian.json';
```

```
import * as numbers from 'cldr-data/main/de/numbers.json';
```

```
import * as timeZoneNames from 'cldr-data/main/de/timeZoneNames.json';
```

```
import * as weekData from 'cldr-data/supplemental/weekdata.json'; // To load the culture based first day of week
```

```
loadCldr(numberingSystems, gregorian, numbers, timeZoneNames, weekData);
```

The **Localization** library allows you to localize default text content of the DateRangePicker. The DateRangePicker component has static text for **today** feature that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [locale](#) value and translation object.

Locale keywords | Text

placeholder | Hint to describe expected value in input element.

startLabel | Label to represent the start date.

endLabel | Label to represent the end date.

applyText | Text present in the apply button.

cancelText | Text present in the cancel button.

selectedDays | Text to represent selected days.

days | Text represents days.

customRange | Text present in the custom range button in presets container.

- Before changing to a culture other than **English**, ensure that locale text for the concerned culture is loaded through **load** method of

[L10n](#) class.

```
`ts
//Load the L10n, loadCldr from ej2-base
import { loadCldr, L10n } from '@syncfusion/ej2-base';
//load the locale object to set the localized placeholder value
L10n.load({
  'de': {
    'daterangepicker': { placeholder: 'Wählen Sie ein Datum aus' }
  }
});
`
```

- Set the culture by using the [locale](#) property.

The following example demonstrates the DateRangePicker in **German** culture.

#### **APP.VUE**

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-daterangepicker id="daterange" locale="de" ></ejs-
daterangepicker>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { loadCldr, L10n } from '@syncfusion/ej2-base';
import { DateRangePickerPlugin } from '@syncfusion/ej2-vue-calendars';
// Here we have referred local json files for preview purpose
import * as numberingSystems from './numberingSystems.json';
import * as gregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';
import * as timeZoneNames from './timeZoneNames.json';
Vue.use(DateRangePickerPlugin);
loadCldr(numberingSystems, gregorian, numbers, timeZoneNames);
L10n.load({
  'de': {
```

```

    'daterangepicker': {
      placeholder: 'Wählen Sie einen Bereich aus',
      startLabel: 'Wählen Sie Startdatum',
      endLabel: 'Wählen Sie Enddatum',
      applyText: 'Sich bewerben',
      cancelText: 'Stornieren',
      selectedDays: 'Ausgewählte Tage',
      days: 'Tage',
      customRange: 'benutzerdefinierten Bereich'
    }
  });
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/daterangepicker/locale-cs1" %}

### Right-To-Left

The DateRangePicker supports RTL (right-to-left) functionality for languages like Arabic and Hebrew to displays the text in the right-to-left direction. Use [enableRtl](#) property to set the RTL direction. The following code example initialize the DateRangePicker component in **Hebrew** culture and also explains how to set the localized text to the placeholder using **load** method of

[L10n](#) class.

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-daterangepicker id="daterange" :locale="locale"
      :enableRtl="rtl" ></ejs-daterangepicker>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { loadCldr, L10n } from '@syncfusion/ej2-base';
import { DateRangePickerPlugin } from '@syncfusion/ej2-vue-calendars';
// Here we have referred local json files for preview purpose
import * as numberingSystems from './numberingSystems.json';
import * as gregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';
import * as timeZoneNames from './timeZoneNames.json';

```

```

Vue.use(DateRangePickerPlugin);
loadCldr(numberingSystems, gregorian, numbers, timeZoneNames);
L10n.load({
  'he': {
    'daterangepicker': {
      placeholder: 'בחר טווח',
      startLabel: 'תווית התחלה',
      endLabel: 'סוף',
      applyText: 'להחיל טקסט',
      cancelText: 'בטל טקסט',
      selectedDays: 'ימים נבחרים',
      days: 'ימים',
      customRange: 'טווח מותאם אישית'
    }
  }
});
export default {
  data () {
    return {
      locale: "he",
      rtl: true
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/daterangepicker/locale-rtl-cs1" %}

### Customize the date format

Representation of start and end date strings can be customized to required format by using [format](#) property.

By default, the format is based on the culture. To know more about the date format standards, refer to the Internationalization Date Format section. In the following sample, the date strings are formatted to `yyyy-MM-dd` and in between the string "to" is set as a [separator](#).

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-daterangepicker :format="dateFormat" :separator="seperate"
      :placeholder="waterMark"></ejs-daterangepicker>
    </div>
  </div>

```

```

    </div>
  </template>
  <script>
    import Vue from 'vue';
    import { DateRangePickerPlugin } from '@syncfusion/ej2-vue-calendars';
    Vue.use(DateRangePickerPlugin);
    export default {
      data () {
        return {
          waterMark : 'Select a Range',
          dateFormat : "yyyy-MM-dd",
          seperate : "to"
        }
      }
    }
  </script>
  <style>
    @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
    @import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
    .wrapper {
      max-width: 250px;
      margin: 0 auto;
    }
  </style>

```

{% previewsample "page.domainurl/code-snippet/daterangepicker/getting-started-cs6" %}

### Customization in Vue Daterangepicker component

The DateRangePicker is available for UI customization that can be achieved by using available properties and events in the component.

#### Day cell format

The DateRangePicker is available for UI customization based on your application requirements. It can be achieved by using [renderDayCell](#) event that provides an option to customize each day cell on rendering.

The following example disables the weekends of every month by using `renderDayCell` event.

#### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-daterangepicker :placeholder="waterMark"
      :renderDayCell="disableDate" ></ejs-daterangepicker>
    </div>
  </div>
</template>
<script>
    import Vue from 'vue';
    import { DateRangePickerPlugin } from '@syncfusion/ej2-vue-calendars';
    Vue.use(DateRangePickerPlugin);
    export default {

```

```

data () {
  return {
    waterMark : 'Select a Range'
  }
},
methods: {
  disableDate: function(args) {
    if (args.date.getDay() === 0 || args.date.getDay() === 6) {
      args.isDisabled = true;
    }
  }
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/daterangepicker/getting-started-cs2" %}

### Preset Ranges

DateRangePicker provides an option to set the predefined ranges via [presets](#) property with the corresponding label. This property will accept the values in the order of label, start date (date object), end date (date object), and append these ranges in the component for quick selection. In the following sample, you can easily choose the frequently used range options from the list of ranges.

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-daterangepicker :placeholder="waterMark">
        <e-presets>
          <e-preset label="This Week" :start='weekStart'
: end='weekEnd'></e-preset>
          <e-preset label="This Month" :start='monthStart'
: end='monthEnd'></e-preset>
          <e-preset label="Last Month" :start='lastStart'
: end='lastEnd'></e-preset>
          <e-preset label="Last Year" :start='yearStart'
: end='yearEnd'></e-preset>
        </e-presets>
      </ejs-daterangepicker>
    </div>
  </div>
</template>
</script>

```

```

import Vue from 'vue';
import { DateRangePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateRangePickerPlugin);
export default {
  data () {
    return {
      watermark : 'Selct a Range',
      weekStart : new Date(new Date(new Date().setDate(new
Date().getDate() - (new Date().getDay() + 7) % 7)).toDateString()),
      weekEnd : new Date(new Date(new Date().setDate(new Date(new
Date().setDate((new Date().getDate()
- (new Date().getDay() + 7) % 7))).getDate() +
6)).toDateString()),
      monthStart : new Date(new Date(new
Date().setDate(1)).toDateString()),
      monthEnd : new Date(new Date(new Date(new Date().setMonth(new
Date().getMonth() + 1)).setDate(0)).toDateString()),
      lastStart : new Date(new Date(new Date(new Date().setMonth(new
Date().getMonth() - 1)).setDate(1)).toDateString()),
      lastEnd : new Date(new Date(new
Date().setDate(0)).toDateString()),
      yearStart : new Date(new Date(new Date().getFullYear() - 1, 0,
1).toDateString()),
      yearEnd : new Date(new Date(new Date().getFullYear() - 1, 11,
31).toDateString())
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/daterangepicker/getting-started-cs3" %}

### First day of week

Start day in a week will differ based on the culture, but you can also customize this based on the application needs. For this, you have to make use of [firstDayOfWeek](#) property. By default, first day of a week in en-US is Sunday. In the following example it is customized to Monday with the help of this property.

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>

```

```

        <ejs-daterangepicker :firstDayOfWeek="week"
        :placeholder="waterMark"></ejs-daterangepicker>
      </div>
    </div>
  </template>
  <script>
    import Vue from 'vue';
    import { DateRangePickerPlugin } from '@syncfusion/ej2-vue-calendars';
    Vue.use(DateRangePickerPlugin);
    export default {
      data () {
        return {
          waterMark : 'Select a Range',
          week : 1
        }
      }
    }
  </script>
  <style>
    @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
    @import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
    .wrapper {
      max-width: 250px;
      margin: 0 auto;
    }
  </style>

```

{% previewsample "page.domainurl/code-snippet/daterangepicker/getting-started-cs4" %}

## Accessibility in Vue Daterangepicker component

The DateRangePicker component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the DateRangePicker component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) |  |

| [Section 508 Support](#) |  |

| [Screen Reader Support](#) |  |

| [Right-To-Left Support](#) |  |

| [Color Contrast](#) |  |

| [Mobile Device Support](#) |  |

| [Keyboard Navigation Support](#) |  |

| [Accessibility Checker Validation](#) |  |

| [Axe-core Accessibility Validation](#) |  |

```
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The
component does not meet the requirement.</div>
```

### WAI-ARIA attributes

The web accessibility makes web content and web applications more accessible for people with disabilities. It especially helps in dynamic content change and development of advanced user interface controls with AJAX, HTML, JavaScript, and related technologies. DateRangePicker provides built-in compliance with [WAI-ARIA](#) specifications. WAI-ARIA support is achieved through the attributes like `aria-expanded`, `aria-disabled`, and `aria-activedescendant` applied as an input element.

To know about the accessibility of Calendar, refer to the Calendar's [Accessibility](#) section.

It helps people with disabilities by providing information about the widget for assistive technology in the screen readers. DateRangePicker component contains grid role and grid cell for each day cell.

- **Aria-expanded:** Indicates the currently selected date of the DateRangePicker component.
- **Aria-disabled:** Indicates the disabled state of the DateRangePicker component.

### Keyboard Interaction

Use the below keys to interact with the DateRangePicker. This component implements the keyboard navigation support by following the [WAI-ARIA practices](#).

It supports the following list of shortcut keys:

#### Input Navigation

Before opening the popup, use the following list of keys to control the popup element.

| **Press** | **To do this** |

| --- | --- |

| **Alt + Down Arrow** | Opens the popup. |

| **Alt + Up Arrow** | Closes the popup. |

| **Esc** | Closes the popup. |

#### Calendar Navigation

Use the following list of keys to navigate the currently focused Calendar after the popup has opened.

| **Press** | **To do this** |

| --- | --- |

| **Upper Arrow** | Focuses the same day of the previous week. |

| **Down Arrow** | Focuses the same day of the next week. |

| **Left Arrow** | Focuses the day before. |

| **Right Arrow** | Focuses the next day. |

| **Home** | Focuses the first day of the month. |

| **End** | Focuses the last day of the month. |

| **Page Up** | Focuses the same date of the previous month. |

| **Page Down** | Focuses the same date of the next month. |

| **Enter** | Selects the currently focused date. |

| **Shift + Page Up** | Focuses the same date for the previous year. |

| **Shift + Page Down** | Focuses the same date for the next year. |

| **Control + Home** | Focuses the first date of the current year. |

| **Control + End** | Focuses the last date of the current year. |

To focus the DateRangePicker component, use the **alt+t** keys.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
```

```

    <ejs-daterangepicker placeholder="Select a Range"
    ref="DateInstance"></ejs-daterangepicker>
  </div>
</div>
</template>
<script>
import Vue from 'vue';
import { DateRangePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateRangePickerPlugin);
export default {
  mounted () {
    let DateObj = this.$refs.DateInstance;
    document.onkeyup = function (e) {
      if (e.altKey && e.keyCode === 84) {
        // press alt+t to focus the control.
        DateObj.$el.focus();
      }
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/daterangepicker/getting-started-cs1" %}

### Ensuring accessibility

The DateRangePicker component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the DateRangePicker component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the DateRangePicker component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/date-range-picker.html" %}

See also

- [Accessibility in Syncfusion Vue components](#)

### Two way binding in Vue Daterangepicker component

Two-way binding can be achieved by using the `v-model` directive in Vue. In the following sample, when you change the value in one DateRangePicker component, v-model will automatically update the value in the other DateRangePicker.

The following example demonstrates how to set the **two-way-binding** in the DateRangePicker.

#### APP.VUE

```
<template>
<div id="app">
  <div id="wrapper1">
    <ejs-daterangepicker id="daterangepicker" :placeholder="waterMark"
v-model="date"></ejs-daterangepicker>
  </div>
  <div id="wrapper2">
    <ejs-daterangepicker id="daterangepicker1" :placeholder="waterMark"
v-model="date"></ejs-daterangepicker>
  </div>
</div>
</template>
<script>
import Vue from "vue";
import { DateRangePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(DateRangePickerPlugin);
export default {
  data: function() {
    return {
      waterMark: "Select a Range",
      date: null
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
  #wrapper1{
    min-width: 250px;
    float: left;
    margin-left: 100px;
  }
  #wrapper2{
    min-width: 250px;
    float: right;
    margin-right: 100px;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/daterangepicker/two-way-cs1" %}

#### Style appearance in Vue Daterangepicker component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the appearance of DateRangePicker wrapper element

Use the following CSS to customize the appearance like height and font size of the wrapper element.

,

*/ To specify height and font size /*

```
.e-input-group input.e-input, .e-input-group.e-control-wrapper input.e-input {  
font-size: 20px;  
height: 40px;  
}  
,
```

#### Customizing the DateRangePicker icon element

Use the following CSS to customize the DateRangePicker icon element

,

*/ To specify background color and font size /*

```
.e-input-group .e-input-group-icon:last-child, .e-input-group.e-control-wrapper .e-input-group-icon:last-child {  
background-color: darkgray;  
font-size: 14px;  
}  
,
```

#### Customizing the DateRangePicker popup calendar header

Use the following CSS to customize the DateRangePicker popup calendar header

,

*/ To specify background and height /*

```
.e-daterangepicker.e-popup .e-range-header {  
background: beige;  
height: 80px;  
}  
,
```

#### Customizing the DateRangePicker popup calendar header title

Use the following CSS to customize the DateRangePicker popup calendar header title

,

*/ To specify color and font size /*

```
.e-daterangepicker.e-popup .e-range-header .e-start-label, .e-daterangepicker.e-popup .e-range-header .e-end-label {  
color: brown;  
font-size: 30px;  
}  
,
```

### Customizing the DateRangePicker popup calendar content

Use the following CSS to customize the DateRangePicker popup calendar content

,

*/ To specify background color /*

```
.e-daterangepicker.e-popup .e-calendar {  
background-color: brown;  
}
```

,

### Customizing the DateRangePicker popup calendar content title

Use the following CSS to customize the DateRangePicker popup calendar content title

,

*/ To specify color and font size /*

```
.e-daterangepicker.e-popup .e-calendar .e-header .e-title {  
color: beige;  
font-size: 20px;  
}
```

,

### Customizing the DateRangePicker popup calendar previous and next icon

Use the following CSS to customize the DateRangePicker popup calendar previous and next icon

,

*/ To specify font size /*

```
.e-calendar .e-header .e-prev, .e-calendar .e-header .e-next, .e-bigger.e-small .e-calendar .e-header .e-  
prev, .e-bigger.e-small .e-calendar .e-header .e-next {  
font-size: 20px;  
}
```

,

### Customizing the DateRangePicker popup calendar date cell grid on hovering

Use the following CSS to customize the DateRangePicker popup calendar date cell grid on hovering

,

*/ To specify background color and border /*

```
.e-calendar .e-content td:hover span.e-day {  
background-color: beige;  
border: 1px solid black;  
}
```

### Customizing the DateRangePicker popup calendar primary button in footer

Use the following CSS to customize the DateRangePicker popup calendar primary button in footer

*/ To specify background color and border color /*

```
.e-daterangepicker.e-popup .e-footer .e-btn.e-apply.e-flat.e-primary:disabled, .e-daterangepicker.e-popup .e-footer .e-btn.e-apply.e-flat.e-primary:disabled, .e-daterangepicker.e-popup .e-footer .e-css.e-btn.e-apply.e-flat.e-primary:disabled, .e-daterangepicker.e-popup .e-footer .e-css.e-btn.e-apply.e-flat.e-primary:disabled {
```

```
background-color: brown;
```

```
border-color: black;
```

```
}
```

### Customizing the DateRangePicker popup calendar cancel button in footer

Use the following CSS to customize the DateRangePicker popup calendar cancel button in footer

*/ To specify background color, color, and border color /*

```
.e-daterangepicker.e-popup .e-footer .e-btn.e-flat, .e-daterangepicker.e-popup .e-footer .e-css.e-btn.e-flat {
```

```
background-color: beige;
```

```
border-color: black;
```

```
color: maroon;
```

```
}
```

### Customizing the footer element in the DateRangePicker popup calendar

Use the following CSS to customize the DateRangePicker popup calendar footer element

*/ To specify background color, color, and border color /*

```
.e-daterangepicker.e-popup .e-footer {
```

```
background-color: beige;
```

```
height: 50px;
```

```
}
```

### Customizing the selected date cell grid in the DateRangePicker popup calendar

Use the following CSS to customize the selected date cell grid in the DateRangePicker popup calendar

*/ To specify background and border /*

```
.e-calendar .e-content td.e-focused-date.e-today span.e-day {
background: lightgrey;
border: 1px solid black;
}
```

### Full screen mode support in mobiles and tablets

The DateRangePicker component's full-screen mode feature enables users to view the component popup element in full-screen mode on mobile devices with improved visibility and a better user experience. It is important to mention that this feature is exclusively available for mobile and tablet devices in both landscape and portrait orientations. To activate the full screen mode within the DateRangePicker component, simply set the [fullScreenMode](#) API value to **true**. This action will extend the calendar and presets popup element to occupy the entire screen on mobile devices.

```
`html
<template>
<div id="app">
<ejs-daterangepicker :fullScreenMode="mobileMode" ></ejs-daterangepicker>
</div>
</template>
<script>
import Vue from 'vue';
import { DateRangePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateRangePickerPlugin);
export default {
name: 'app',
data () {
return {
mobileMode : true
}
}
}
</script>
```

![DateRangePickerPresetsFullScreen](../images/DateRangePickerPresetsFullScreen.gif)

## How To

Disable the daterangepicker component in Vue Daterangepicker component

DateRangePicker can be inactivated on a page, by setting [enabled](#) value as false that will disable the component completely from all the user interactions including in form post. The following example demonstrates the disabled component.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-daterangepicker :enabled="enable"
:placeholder="waterMark"></ejs-daterangepicker>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DateRangePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateRangePickerPlugin);
export default {
  data () {
    return {
      waterMark: 'Select a Range',
      enable : false
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/daterangepicker/getting-started-cs8" %}

Set the placeholder in Vue Daterangepicker component

The following example demonstrates how to set [placeholder](#) in the DateRangePicker control.

Using **placeholder** you can display a short hint in the input element.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
```

```

        <ejs-daterangepicker :placeholder="waterMark"></ejs-daterangepicker>
      </div>
    </div>
  </template>
  <script>
import Vue from 'vue';
import { DateRangePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateRangePickerPlugin);
export default {
  data () {
    return {
      waterMark: 'Select a Range',
    }
  }
}
  </script>
  <style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
  </style>

```

{% previewsample "page.domainurl/code-snippet/daterangepicker/getting-started-cs9" %}

### Customization using cssclass in Vue Daterangepicker component

To customize UI, you can make use of [cssClass](#) that will be added to the DateRangePicker component as the root CSS class. With this CSS class, you can override existing styles of DateRangePicker.

Following is the list of classes that provides flexible way to customize the DateRangePicker component.

Class Name	Description
---	---
e-date-range-wrapper	Applied to DateRangePicker wrapper.
e-range-icon	Applied to DateRangePicker icon.
e-popup	Applied to DateRangePicker popup wrapper.
e-calendar	Applied to both Calendar element.
e-right-calendar	Applied to right Calendar element.
e-left-calendar	Applied to left Calendar element.
e-start-label	Applied to start label in a popup.
e-end-calendar	Applied to end label in a popup.
e-day-span	Applied to day span details label in a popup.

- | e-footer | Applied to footer elements in a popup. |
- | e-apply | Applied to apply button in footer in a popup. |
- | e-cancel | Applied to cancel button in footer in a popup. |
- | e-header | Applied to Calendar header. |
- | e-title | Applied to Calendar title. |
- | e-icon-container | Applied to Calendar previous and next icon container. |
- | e-prev | Applied to Calendar previous icon. |
- | e-next | Applied to Calendar next icon. |
- | e-weekend | Applied to Calendar weekend dates. |
- | e-other-month | Applied to Calendar other month dates. |
- | e-day | Applied to each day cell of the Calendar. |
- | e-selected | Applied to Calendar selected dates. |
- | e-disabled | Applied to Calendar disabled dates. |

#### **APP.VUE**

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-daterangepicker :placeholder="waterMark"
      :cssClass="classVal"></ejs-daterangepicker>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DateRangePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateRangePickerPlugin);
export default {
  data () {
    return {
      waterMark: "Select a Range",
      classVal: "customCSS"
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}

```

```

.customCSS .e-calendar .e-content .e-selected span.e-day, /* csslint allow:
adjoining-classes*/
.customCSS .e-calendar .e-content .e-selected span.e-day:hover, /* csslint
allow: adjoining-classes*/
.customCSS .e-calendar .e-content .e-today.e-selected:hover span.e-day, /*
csslint allow: adjoining-classes*/
.customCSS .e-calendar .e-content .e-today.e-selected span.e-day, /* csslint
allow: adjoining-classes*/
.customCSS .e-calendar .e-content .e-selected:hover span.e-day /* csslint
allow: adjoining-classes*/
{
background-color: #35b86b;
}
.customCSS .e-calendar .e-content .e-today span.e-day, /* csslint allow:
adjoining-classes*/
.customCSS .e-calendar .e-content .e-focused-date.e-today span.e-day { /*
csslint allow: adjoining-classes*/
border: 1px solid #35b86b;
color: #ff3337;
}
.customCSS .e-calendar .e-content .e-weekend span { /* csslint allow:
adjoining-classes*/
color: #ff3337;
}
.customCSS.e-date-range-wrapper .e-input-group-icon.e-icons.e-active, /*
csslint allow: adjoining-classes*/
.customCSS .e-btn.e-flat, /* csslint allow: adjoining-classes*/
.customCSS .e-btn.e-flat:hover { /* csslint allow: adjoining-classes*/
color: #35b86b;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/daterangepicker/getting-started-cs7" %}

[Customize the daterangepicker day header in Vue Daterangepicker component](#)

You can change the format of the day that to be displayed in header using [dayHeaderFormat](#) property. By default, the format is **Short**.

You can find the possible formats on below.

Name	Description
Short	Sets the short format of day name (like Su ) in day header.
Narrow	Sets the single character of day name (like S ) in day header.
Abbreviated	Sets the min format of day name (like Sun ) in day header.
Wide	Sets the long format of day name (like Sunday ) in day header.

#### APP.VUE

```

<template>
  <div id="container">
    <div id='daterangepicker'>

```

```

        <ejs-daterangepicker cssClass="format-wide"
dayHeaderFormat="Short" ref="daterangepickerObj"></ejs-daterangepicker>
    </div>
    <div id="format">
        <label id="custom-input-label">Header Format Types</label>
        <ejs-dropdownlist id="select" :fields = "fields" :index =
"currentIndex" :dataSource = "items" :popupHeight= "popupHeight" :change=
"formatHandler">
        </ejs-dropdownlist>
    </div>
</div>
</template>
<script>
import Vue from "vue";
import { DateRangePickerPlugin } from "@syncfusion/ej2-vue-calendars";
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DateRangePickerPlugin);
Vue.use(DropDownListPlugin);
export default {
    data () {
        return {
            items: [
                { sizeVal: 'Short' , sizeTxt: 'Short' },
                { sizeVal: 'Narrow' , sizeTxt: 'Narrow' },
                { sizeVal: 'Abbreviated' , sizeTxt: 'Abbreviated' },
                { sizeVal: 'Wide' , sizeTxt: 'Wide' },
            ],
            fields: { text: 'sizeTxt', value: 'sizeVal' },
            popupHeight: 200,
            currentIndex: 0,
            formatHandler: (args) => {
                this.$refs.daterangepickerObj.dayHeaderFormat = args.value;
            }
        }
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
    #container{
        width: 100%;
    }
    #daterangepicker {
        width: 25%;
        margin-left: 30px;
        margin-top: 30px;
        display: inline-flex;
    }
    .e-daterangepicker.e-daterange-day-header-lg.format-wide .e-calendar.e-
calendar-day-header-lg{
        min-width: 490px;
    }

```

```
.e-daterangepicker.e-daterange-day-header-lg.format-wide {
  max-width: 1000px;
  left: 0px !important;
}
#format {
  width: 180px;
  margin-left: 400px;
  display: inline-block;
}
#select {
  height: 30px;
  width: 150px;
  margin-top: 10px;
}
#custom-input-label{
  font-size: 15px;
  font-weight: bold
}
</style>
```

{% previewsample "page.domainurl/code-snippet/daterangepicker/header-format-cs1" %}

## DateTimePicker

### Getting Started

This section explains how to create a simple DateTimePicker and how to configure the DateTimePicker component.

#### Prerequisites

[System requirements for Syncfusion Vue UI components](#)

#### Dependencies

The list of dependencies required to use the DateTimePicker component in your application is given below:

```
`javascript
|-- @syncfusion/ej2-vue-calendars
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-vue-base
|-- @syncfusion/ej2-calendars
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-splitbuttons
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-buttons
,`
```

### Get Started with Vue CLI

You can use [Vue CLI](#) to setup your vue applications.

To install Vue CLI use the following command.

```
`bash
npm install -g @vue/cli
npm install -g @vue/cli-init
`
```

Start a new project using below Vue CLI command.

```
`bash
vue init webpack-simple quickstart
cd quickstart
npm install
`
```

### Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](https://www.npmjs.com) registry.

You can choose the component that you want to install. For this application, we are going to use DateTimePicker component.

To install DateTimePicker component, use the following command

```
`bash
npm install @syncfusion/ej2-vue-calendars --save
`
```

### Registering Vue Component

For Registering Vue Component two ways are available. They are as follows.

- `Vue.use()`
- `Vue.component()`

#### Using `Vue.use()`

Import the Component Plugin from the EJ2 Vue Package and register the same using `Vue.use()` with Component Plugin as its argument.

Refer the code snippet given below.

```
`ts
import { DateTimePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateTimePickerPlugin);
`
```

By Registering Component Plugin in Vue, all child directives are also globally registered.

### Using `Vue.component()`

Import the Component and Component Plugin from EJ2 Vue Package, register the same using the `Vue.component()` with name of Component from ComponentPlugin and the EJ2 Vue Component as its arguments.

Refer the code snippet given below.

```
`ts
import { DateTimePickerComponent, DateTimePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.component(DateTimePickerPlugin.name, DateTimePickerComponent);
`
```

By using `Vue.component()`, only the EJ2 Vue Component is registered. Child directives needs to be registered separately.

### Creating Vue Sample

Add the EJ2 Vue DateTimePicker using `<ejs-datetimepicker>` to the `<template>` section of the `App.vue` file in `src` directory, the content attribute of the DateTimePicker component is provided as name in data option in the `<script>` section.

```
`
<template>
<div id="app">
<ejs-datetimepicker :placeholder="waterMark" ></ejs-datetimepicker>
</div>
</template>
<script>
import Vue from 'vue';
import { DateTimePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateTimePickerPlugin);
export default {
name: 'app',
data () {
return {
waterMark : 'Select a datetime'
}
}
}
</script>
`
```

### Adding CSS Reference

To render the DateTimePicker component, need to import DateTimePicker and its dependent component's styles as given below in `<style>` section of the `App.vue` file.

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
</style>
```

If you want to refer the combined component styles, please make use of our [CRG](#) (Custom Resource Generator) in your application.

### Running the Application

Now run the `npm run dev` command in the console, it will build your application and open in the browser.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-datetimepicker :placeholder="waterMark" ></ejs-datetimepicker>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DateTimePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateTimePickerPlugin);
export default {
  data () {
    return {
      waterMark : 'Select a datetime'
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
```

```
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>
```

```
{% previewsample "page.domainurl/code-snippet/datetimepicker/getting-started-cs5" %}
```

### Setting the value,min and max

The minimum and maximum date time can be defined with the help of `min` and `max` property. The following example demonstrates to set the `min` and `max` on initializing the DateTimePicker. To know more about range restriction in DateTimePicker, please refer this [page](#).

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-datetimepicker :placeholder="waterMark" :min="minDate"
      :max="maxDate" :value="val"></ejs-datetimepicker>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DateTimePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateTimePickerPlugin);
export default {
  data () {
    return {
      waterMark : 'Select a datetime',
      minDate : new Date('5/5/2019 2:00 AM'),
      maxDate : new Date('5/25/2019 2:00 AM'),
      val : new Date('5/10/2019 12:00 AM')
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>
```

```
{% previewsample "page.domainurl/code-snippet/datetimepicker/getting-started-cs6" %}
```

If the value of `min` or `max` properties changed through code behind, then you have to update the `value` property to set within the range.

## Getting Started with the Vue DateTimePicker Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue DateTimePicker component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

## Prerequisites

### [System requirements for Syncfusion Vue UI components](#)

### Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm create vite@latest
```

```
,
```

```
or
```

```
`bash
```

```
yarn create vite
```

```
,
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as **my-project** for this article.

```
`bash
```

```
? Project name: » my-project
```

```
,
```

2. Select **Vue** as the framework. It will create a Vue 3 project.

```
`bash
```

```
? Select a framework: » - Use arrow-keys. Return to submit.
```

```
Vanilla
```

```
Vue
```

React

Preact

Lit

Svelte

Others

,

3. Choose **JavaScript** as the framework variant to build this Vite project using JavaScript and Vue.

```
`bash
```

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

,

4. Upon completing the aforementioned steps to create the **my-project**, run the following command to install its dependencies:

```
`bash
```

```
cd my-project
```

```
npm install
```

,

or

```
`bash
```

```
cd my-project
```

```
yarn install
```

,

Now that **my-project** is ready to run with default settings, let's add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue DateTimePicker component](#) as an example. To use the Vue DateTimePicker component in the project, the **@syncfusion/ej2-vue-calendars** package needs to be installed using the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-calendars --save
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-calendars
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, **Material** theme is applied using CSS styles, which are available in installed packages. The necessary **Material** CSS styles for the DateTimePicker component and its dependents were imported into the `<style>` section of **src/App.vue** file.

#### ~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

### Add Syncfusion Vue component

Follow the below steps to add the Vue DateTimePicker component using **Composition API** or **Options API**:

1.First, import and register the DateTimePicker component in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { DateTimePickerComponent as EjsDatetimepicker } from
"@syncfusion/ej2-vue-calendars";
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { DateTimePickerComponent } from "@syncfusion/ej2-vue-calendars";
//Component registration
export default {
  name: "App",
  components: {
    'ejs-datetimepicker' : DateTimePickerComponent,
```

```
}
}
```

2. In the **template** section, define the DateTimePicker component with the [dataSource](#) property and column definitions.

### ~/SRC/APP.VUE

```
<template>
<div class="control_wrapper">
<ejs-datetimepicker></ejs-datetimepicker>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

### COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<ejs-datetimepicker></ejs-datetimepicker>
</div>
</template>
<script setup>
import { DateTimePickerComponent as EjsDatetimepicker } from
"@syncfusion/ej2-vue-calendars";
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "@syncfusion/ej2-vue-calendars/styles/material.css";
.control_wrapper {
max-width: 250px;
margin: 0 auto;
}
</style>
```

### OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<ejs-datetimepicker></ejs-datetimepicker>
</div>
</template>
<script>
import { DateTimePickerComponent } from "@syncfusion/ej2-vue-calendars";
//Component registration
export default {
name: 'App',
components: {
"ejs-datetimepicker": DateTimePickerComponent
},
}
```

```

}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.control_wrapper {
max-width: 250px;
margin: 0 auto;
}
</style>

```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
`
```

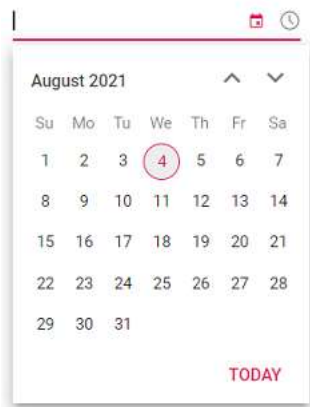

or

```
`bash
```

```
yarn run dev
```

```
`
```

The output will appear as follows:

### Setting the value,min and max

The minimum and maximum date time can be defined with the help of `min` and `max` property. The following example demonstrates to set the `min` and `max` on initializing the DateTimePicker. To know more about range restriction in DateTimePicker, please refer this [page](#).

#### COMPOSITION API (~SRC/APP.VUE)

```

<template>
<div id="app">

```

```

<div class='wrapper'>
  <ejs-datetimepicker :placeholder="data[0].waterMark" :min="data[0].minDate"
    :max="data[0].maxDate" :value="data[0].val"></ejs-datetimepicker>
</div>
</div>
</template>
<script setup>
import { DateTimePickerComponent as EjsDatetimepicker } from
"@syncfusion/ej2-vue-calendars";
const data = [{ waterMark : 'Select a datetime',
minDate : new Date('5/5/2019 2:00 AM'),
maxDate : new Date('5/25/2019 2:00 AM'),
val : new Date('5/10/2019 12:00 AM') }]];
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
max-width: 250px;
margin: 0 auto;
}
</style>

```

### OPTIONS API (~SRC/APP.VUE)

```

<template>
<div id="app">
  <div class='wrapper'>
    <ejs-datetimepicker :placeholder="waterMark" :min="minDate" :max="maxDate"
      :value="val"></ejs-datetimepicker>
  </div>
</div>
</template>
<script>
import { DateTimePickerComponent } from "@syncfusion/ej2-vue-calendars";
//Component registration
export default {
name: 'App',
components: {
"ejs-datetimepicker": DateTimePickerComponent
},
data () {
return {
waterMark : 'Select a datetime',
minDate : new Date('5/5/2019 2:00 AM'),
maxDate : new Date('5/25/2019 2:00 AM'),
val : new Date('5/10/2019 12:00 AM')
}
}
}
</script>
<style>

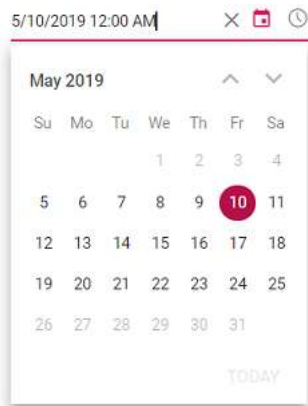

```

```

@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
max-width: 250px;
margin: 0 auto;
}
</style>

```

The output will appear as follows:

If the value of `min` or `max` properties changed through code behind, then you have to update the `value` property to set within the range.

See Also

- [Render DateTimePicker with specific culture](#)

## Globalization in Vue Datetimepicker component

Globalization is the combination of internalization and localization. You can adapt the component to various languages by parsing and formatting the date or number [Internationalization](#), and also add culture specific customization and translation to the text [localization](#).

By default, the date format, week, month, time format and meridian names are specific to the American English culture. It utilizes the

[Essential JavaScript 2 Internationalization](#) package to parse and format the date object based on the culture by using the official [UNICODE CLDR](#) JSON data. It provides the `loadCldr` method to load culture specific CLDR JSON data. To use a different culture other than English, follow the steps below:

- Install the `CLDR-Data` package by using the following command (installs all the CLDR JSON data). To know more about CLDR-Data refer to the [CLDR-Data](#) link.

```
npm install cldr-data --save
```

Once the package is installed, you can find the culture specific JSON data under the location `/node_modules/cldr-data`.

- Import the installed CLDR JSON data into the `app.vue` file.
- Use the [loadCldr](#) method to load the culture specific CLDR JSON data

from the installed location to `app.vue` file.

- DateTimePicker displayed `Sunday` as the first day of week based on default culture ("en-US"). If you want to display the DateTimePicker with loaded culture's first day of week, you need to import `weekdata.json` file from the `cldr-data/supplemental` as given in the code example.

```
`ts
```

```
//Load the loadCldr from ej2-base
```

```
import { loadCldr } from '@syncfusion/ej2-base';
```

```
import * as numberingSystems from 'cldr-data/supplemental/numberingSystems.json';
```

```
import * as gregorian from 'cldr-data/main/de/ca-gregorian.json';
```

```
import * as numbers from 'cldr-data/main/de/numbers.json';
```

```
import * as timeZoneNames from 'cldr-data/main/de/timeZoneNames.json';
```

```
import * as weekData from 'cldr-data/supplemental/weekdata.json'; // To load the culture based first day of week
```

```
loadCldr(numberingSystems, gregorian, numbers, timeZoneNames, weekData);
```

The `Localization` library allows you to localize default text content of the DateTimePicker. The DateTimePicker component has static text for **today** feature that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [locale](#) value and translation object.

Locale keywords | Text

today | Name of the button to choose Today date.

placeholder | Hint to describe expected value in input element.

- Before changing to a culture other than `English`, ensure that locale text for the concerned culture is loaded through `load` method of

[L10n](#) class.

```
`ts
```

```
//Load the L10n, loadCldr from ej2-base
```

```
import { loadCldr, L10n } from '@syncfusion/ej2-base';
```

```
//load the locale object to set the localized placeholder value
```

```
L10n.load({
  'de': {
    'datetimepicker': { placeholder: 'Wählen Sie ein Datum und eine Uhrzeit aus', today: 'heute' }
  }
});
```

- Set the culture by using the [locale](#) property.

The following example demonstrates the DateTimePicker in **German** culture.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-datetimepicker id="datetime" locale="de" ></ejs-
datetimepicker>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { loadCldr,L10n} from '@syncfusion/ej2-base';
import { DateTimePickerPlugin } from '@syncfusion/ej2-vue-calendars';
// Here we have referred local json files for preview purpose
import * as numberingSystems from './numberingSystems.json';
import * as gregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';
import * as timeZoneNames from './timeZoneNames.json';
Vue.use(DateTimePickerPlugin);
loadCldr(numberingSystems, gregorian, numbers, timeZoneNames);
L10n.load({
  'de': {
    'datetimepicker': { placeholder: "Wählen Sie Datum und Uhrzeit",
      today: "heute"}
  }
});
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>
```

```
{% previewsample "page.domainurl/code-snippet/datetimepicker/locale-cs1" %}
```

### Right-To-Left

The DateTimePicker supports RTL (right-to-left) functionality for languages like Arabic and Hebrew to displays the text in the right-to-left direction. Use [enableRtl](#) property to set the RTL direction. The following code example initialize the DateTimePicker component in Arabic culture and also explains how to set the localized text to the placeholder using `load` method of [L10n](#) class.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-datetimepicker id="datetime" :locale="locale" :enableRtl="rtl"
    ></ejs-datetimepicker>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { loadCldr,L10n} from '@syncfusion/ej2-base';
import { DateTimePickerPlugin } from '@syncfusion/ej2-vue-calendars';
// Here we have referred local json files for preview purpose
import * as numberingSystems from './numberingSystems.json';
import * as gregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';
import * as timeZoneNames from './timeZoneNames.json';
Vue.use(DateTimePickerPlugin);
loadCldr(numberingSystems, gregorian, numbers, timeZoneNames);
L10n.load({
  'ar': {
    'datetimepicker': { placeholder: 'حدد التاريخ والوقت',
      today: 'اليوم' }
  }
});
export default {
  data () {
    return {
      locale: "ar",
      rtl: true
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
```

```
</style>
```

```
{% previewsample "page.domainurl/code-snippet/datetimepicker/locale-rtl-cs1" %}
```

## Strict mode in Vue Datetimepicker component

### Enable Strict Mode

The [strictMode](#) is an act, that allows the user to enter only the valid date and time within the specified min/max range in textbox. If the input entered is invalid, then the component will stay with the previous value. Else, if the date and time is out of range, then the component will set the date to the min/max value.

The following example demonstrates the DateTimePicker in `strictMode` with min/max range of 5/5/2019 2:00 AM to 5/25/2019 2:00 AM. Here, it allows to enter only the valid date and time within the specified range. If you are trying to enter the out-of-range value as like 5/28/2019, then the value will set to the `max` value as 5/25/2019 2:00 AM. Since the value 28 is greater than to `max` value of 25. Or else if you are trying to enter the invalid date, then the value will stay with the previous value.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-datetimepicker :min="minDate" :max="maxDate" :value="dateVal"
:strictMode="mode" ></ejs-datetimepicker>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DateTimePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateTimePickerPlugin);
export default {
  data () {
    return {
      minDate : new Date('5/5/2019 2:00 AM'),
      maxDate : new Date('5/25/2019 2:00 AM'),
      dateVal : new Date('5/10/2019 2:00 AM'),
      mode : true
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>
```

```
{% previewsample "page.domainurl/code-snippet/datetimepicker/getting-started-cs9" %}
```

### Disable Strict Mode

By default, the DateTimePicker act in strictMode `false` state, that allows to enter the invalid or out-of-range datetime in textbox.

If the datetime is out-of-range or invalid, then the model value will be set to `out of range` datetime value or `null` respectively with highlighted `error` class to indicates the datetime is out of range or invalid.

The following example demonstrates the `strictMode` as `false`. Here, it allows to enter the valid or invalid value in textbox. If you are entering the out-of-range or invalid datetime value, then the model value will be set to `out of range` datetime value or `null` respectively with highlighted `error` class to indicates the datetime is out of range or invalid.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-datetimepicker :min="minDate" :max="maxDate" :value="dateVal"
:placeholder="waterMark" ></ejs-datetimepicker>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DateTimePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateTimePickerPlugin);
export default {
  data () {
    return {
      minDate : new Date('5/5/2017 2:00 PM'),
      maxDate : new Date('5/25/2017 3:00 PM'),
      dateVal : new Date('5/25/2017 4:00 PM'),
      waterMark: "Select a date and time"
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>
```

```
{% previewsample "page.domainurl/code-snippet/datetimepicker/getting-started-cs10" %}
```

## Date time range in Vue Datetimepicker component

DateTimePicker provides an option to select a date and time value within a specified range by using the [min](#) and [max](#) properties. Always the min value has to be lesser than the max value.

When the min and max properties are configured and the selected datetime value is out-of-range or invalid, then the model value will be set to **out of range** datetime value or **null** respectively with highlighted **error** class to indicates the datetime is out of range or invalid. The value property depends on the min/max with respect to [strictMode](#) property.

The below example allows selecting a date within the range from 7th to 27th day in a month.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-datetimepicker :min="minDate" :max="maxDate"
:placeholder="waterMark" :value="dateVal"></ejs-datetimepicker>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DateTimePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateTimePickerPlugin);
export default {
  data () {
    return {
      minDate : new Date(new Date().getFullYear(), new Date().getMonth(),
7, 0, 0, 0),
      maxDate : new Date(new Date().getFullYear(), new Date().getMonth(),
27, new Date().getHours(), new Date().getMinutes(), new
Date().getSeconds()),
      dateVal : new Date(new Date().setDate(14)),
      waterMark : 'Select a datetime'
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/datetimepicker/getting-started-cs4" %}

If the value of `min` or `max` properties changed through code behind, then you have to update the `value` property to set within the range.

### Date time masking in Vue Datetimepicker component

DateTimePicker has `enableMask` property that provides the option to enable the built-in date masking support. Also, you must inject the `MaskedDateTime` module to enable the masking support.

#### APP.VUE

```
<template>
<div id="app">
  <div class='wrapper'>
    <ejs-datetimepicker id="datetimepicker" :enableMask="true"></ejs-
datetimepicker>
  </div>
</div>
</template>
<script>
import Vue from "vue";
import { DateTimePickerPlugin, DateTimePicker, MaskedDateTime } from
"@syncfusion/ej2-vue-calendars";
DateTimePicker.Inject (MaskedDateTime)
Vue.use(DateTimePickerPlugin);
export default Vue.extend({
  data: function() {
    return {
    };
  },
  provide: {
    datetimepicker: [MaskedDateTime]
  }
});
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/datetimepicker/mask-module-cs1" %}

The mask pattern is defined based on the provided date format to the component. If the format is not specified, the mask pattern is formed based on the default format of the current culture.

| **Keys** | **Actions** |

| --- | --- |

| Up / Down arrows | To increment and decrement the selected portion of the date and time. |

| Left / Right arrows and Tab | To navigate the selection from one portion to next portion |

The following example demonstrates default and custom format of DateTimePicker component with mask.

#### APP.VUE

```
<template>
<div id="app">
  <div class='wrapper1'>
    <!-- Specifies the masked datetimepicker without format property. -->
  >
    <ejs-datetimepicker id="datetimepicker" :enableMask="true" ></ejs-
datetimepicker>
  </div>
  <div class='wrapper2'>
    <!-- Specifies the masked datetimepicker with format property. -->
    <ejs-datetimepicker id="datetimepicker" :enableMask="true"
:format='dateFormat'></ejs-datetimepicker>
  </div>
</div>
</template>
<script>
import Vue from "vue";
import { DateTimePickerPlugin, DateTimePicker, MaskedDateTime } from
"@syncfusion/ej2-vue-calendars";
DateTimePicker.Inject(MaskedDateTime)
Vue.use(DateTimePickerPlugin);
export default Vue.extend({
  data: function() {
    return {
      dateFormat: 'M/d/yyyy hh:mm a'
    };
  },
  provide: {
    datetimepicker: [MaskedDateTime]
  }
});
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
#wrapper1{
  min-width: 250px;
  float: left;
  margin-left: 100px;
}
#wrapper2{
  min-width: 250px;
  float: right;
  margin-right: 100px;
}
</style>
```

```
{% previewsample "page.domainurl/code-snippet/datetimepicker/mask-module-cs2" %}
```

### Configure Mask Placeholder

You can change mask placeholder value through property `maskPlaceholder`. By default , it takes the full name of date and time co-ordinates such as `day`, `month`, `year`, `hour` etc.

While changing to a culture other than `English`, ensure that locale text for the concerned culture is loaded through load method of `L10n` class for mask placeholder values like below.

```
`ts
//Load the L10n from ej2-base
import { L10n } from '@syncfusion/ej2-base';
//load the locale object to set the localized mask placeholder value
L10n.load({
  'de': {
    'datetimepicker': { day: 'Tag' , month: 'Monat', year: 'Jahr', hour: 'Stunde' ,minute: 'Minute',
    second:'Sekunden' }
  }
});
`
```

The following example demonstrates default and customized mask placeholder value.

### APP.VUE

```
<template>
<div id="app">
  <div class='wrapper1'>
    <!-- Specifies the masked datetimepicker without mask placeholder.
-->
    <ejs-datetimepicker id="datetimepicker" :enableMask="true" ></ejs-
datetimepicker>
  </div>
  <div class='wrapper2'>
    <!-- Specifies the masked datetimepicker with mask placeholder. --
>
    <ejs-datetimepicker id="placeholder" :enableMask="true"
:maskPlaceholder='maskPlaceholderValue'></ejs-datetimepicker>
  </div>
</div>
</template>
<script>
import Vue from "vue";
import { DateTimePickerPlugin, DateTimePicker, MaskedDateTime } from
"@syncfusion/ej2-vue-calendars";
DateTimePicker.Inject(MaskedDateTime)
Vue.use(DateTimePickerPlugin);
export default Vue.extend({
  data: function() {
    return {
```

```

        maskPlaceholderValue: {day: 'd', month: 'M', year: 'y', hour: 'h',
minute: 'm', second: 's'}
    };
  },
  provide: {
    datetimepicker: [MaskedDateTime]
  }
});
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
#wrapper1{
  min-width: 250px;
  float: left;
  margin-left: 100px;
}
#wrapper2{
  min-width: 250px;
  float: right;
  margin-right: 100px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/datetimepicker/mask-module-cs3" %}

### Customization in Vue Datetimepicker component

The DateTimePicker is available for UI customization that can be achieved by using available properties and events in the component.

#### Day and Time Cell format

The DateTimePicker is available for UI customization based on your application requirements. It can be achieved by using [renderDayCell](#) event that provides an option to customize each day cell on rendering.

The following example disables the weekends of every month by using `renderDayCell` event.

#### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-datetimepicker :renderDayCell="disableDate"
:placeholder="waterMark"></ejs-datetimepicker>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DateTimePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateTimePickerPlugin);
export default {
  data () {
    return {

```

```

        waterMark : 'Select a date and time'
      }
    },
    methods: {
      disableDate: function(args) {
        if (args.date.getDay() === 0 || args.date.getDay() === 6) {
          args.isDisabled = true;
        }
      }
    }
  }
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/datetimepicker/getting-started-cs2" %}

### Adding mandatory asterisk to placeholder and float label

You can add a mandatory asterisk(\*) to placeholder and float label using **<e-input-group.e-control-wrapper.e-float-input .e-float-text::after</b>** class.

### APP.VUE

```

<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-datetimepicker :placeholder="Select Date"
      :floatLabelType="auto"></ejs-datetimepicker>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DateTimePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateTimePickerPlugin);
export default {
  data () {
    return {
      waterMark : 'Select a datetime'
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';

```

```

@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";

.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
.e-input-group.e-control-wrapper.e-float-input .e-float-text::after {
  content: '*';
  color: red;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/datetimepicker/getting-started-cs3" %}

## Accessibility in Vue Datetimepicker component

The DateTimePicker component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the DateTimePicker component is outlined below.

Accessibility Criteria   Compatibility
--   --
<a href="#">WCAG 2.2 Support</a>   
<a href="#">Section 508 Support</a>   
<a href="#">Screen Reader Support</a>   
<a href="#">Right-To-Left Support</a>   
<a href="#">Color Contrast</a>   
<a href="#">Mobile Device Support</a>   
<a href="#">Keyboard Navigation Support</a>   
<a href="#">Accessibility Checker Validation</a>   

| [Axe-core Accessibility Validation](#) |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The Web accessibility defines a way to make web content and web applications more accessible to disabled people. It especially helps the dynamic content change and advanced user interface controls developed with Ajax, HTML, JavaScript, and related technologies.

DateTimePicker provides built-in compliance with the [WAI-ARIA](#) specifications. WAI-ARIA supports is achieved through the attributes like `aria-expanded`, `aria-disabled`, `aria-activedescendant` applied to the input element.

To know about the accessibility of Calendar refer to the Calendar's [Accessibility](#) section.

It helps to provide information about the widget for assistive technology to the disabled person in screen reader.

- **Aria-expanded:** attributes indicates the state of a collapsible element.
- **Aria-disabled:** attribute indicates the disabled state of this DateTimePicker component.
- **Aria-activedescendent:** attribute helps in managing the current active child of the DateTimePicker component.

### Keyboard Interaction

You can use the following keys to interact with the DateTimePicker. The component implements the keyboard navigation support by following the [WAI-ARIA practices](#).

DateTimePicker supports the below list of shortcut keys.

#### Input Navigation

Before opening the popup, use the below list of keys to `DateTimePicker` control the popup element.

| **Press** | **To do this** |

| --- | --- |

| **Alt + Down Arrow** | **Open the select popup** |

| Alt + Down Arrow + Alt + Down Arrow | Toggle between two popups |

#### Calendar Navigation

Use the below list of keys to interact with the Calendar after the DatePicker popup has opened.

| Press | To do this |

| --- | --- |

| Upper Arrow | Focus the previous week date. |

| Down Arrow | Focus the next week date. |

| Left Arrow | Focus the previous date. |

| Right Arrow | Focus the next date. |

| Home | Focus the first date in the month. |

| End | Focus the last date in the month. |

| Page Up | Focus the same date in the previous month. |

| Page Down | Focus the same date in the next month. |

| Enter | Select the currently focused date. |

| Shift + Page Up | Focus the same date in the previous year. |

| Shift + Page Down | Focus the same date in the next year. |

| Control + Upper Arrow | Moves into the inner level of view like month-year, year-decade |

| Control + Down Arrow | Moves out from the depth level view like decade-year, year-month |

| Control + Home | Focus the starting date in the current year. |

| Control + End | Focus the ending date in the current year. |

Use the below list of shortcut keys to interact with the TimePicker after the TimePicker Popup has opened.

| Press | To do this |

| --- | --- |

| Upper Arrow | Navigate and select the previous item. |

| Down Arrow | Navigate and select the next item. |

| Left Arrow | Move the cursor towards arrow key pressed direction. |

| Right Arrow | Move the cursor towards arrow key pressed direction. |

| Home | Navigate and select the first item. |

| End | Navigate and select the last item. |

| Enter | Select the currently focused item and close the popup. |

| Alt + Upper Arrow | Close the popup. |

| Alt + Down Arrow | Open the popup. |

| Esc | Close the popup. |

To focus the DateTimePicker component use the **alt+t** keys.

#### APP.VUE

```
<template>
  <div id="app">
    <div class='wrap'>
      <ejs-datetimepicker placeholder='Select a datetime'
ref="DateInstance"></ejs-datetimepicker>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { DateTimePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(DateTimePickerPlugin);
export default {
  mounted () {
    let DateObj = this.$refs.DateInstance;
    document.onkeyup = function (e) {
      if (e.altKey && e.keyCode === 84) {
        // press alt+t to focus the control.
        DateObj.$el.focus();
      }
    }
  }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
  @import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
  .wrap {
    margin: 35px auto;
    width: 240px;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/datetimepicker/getting-started-cs1" %}

#### Ensuring accessibility

The DateTimePicker component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the DateTimePicker component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the DateTimePicker component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/date-time-picker.html" %}

## Two way binding in Vue Datetimepicker component

Two-way binding can be achieved by using the `v-model` directive in Vue. In the following sample, when you change the value in one DateTimePicker component, v-model will automatically update the value in the other DateTimePicker.

The following example demonstrates how to set the `two-way-binding` in the DateTimePicker.

### APP.VUE

```
<template>
<div id="app">
  <div id="wrapper1">
    <ejs-datetimepicker id="datetimepicker" v-model="date"></ejs-
datetimepicker>
  </div>
  <div id="wrapper2">
    <ejs-datetimepicker id="datetimepicker1" v-model="date"></ejs-
datetimepicker>
  </div>
</div>
</template>
<script>
import Vue from "vue";
import { DateTimePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(DateTimePickerPlugin);
export default {
  data: function() {
    return {
      date: new Date()
    };
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
#wrapper1{
  min-width: 250px;
  float: left;
  margin-left: 100px;
}
#wrapper2{
  min-width: 250px;
  float: right;
  margin-right: 100px;
}
</style>
```

```
{% previewsample "page.domainurl/code-snippet/datetimepicker/two-way-cs1" %}
```

### Style appearance in Vue Datetimepicker component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the appearance of DateTimePicker wrapper element

Use the following CSS to customize the appearance of wrapper element.

`

*/ To specify height and font size /*

```
.e-input-group input.e-input, .e-input-group.e-control-wrapper input.e-input {  
font-size: 20px;  
height: 40px;  
}
```

`

#### Customizing the DateTimePicker icons element

Use the following CSS to customize the DateTimePicker icons element

`

*/ To specify background color and font size /*

```
.e-datetime-wrapper .e-input-group-icon.e-date-icon, .e-datetime-wrapper .e-input-group-icon.e-time-  
icon {  
font-size: 16px;  
background-color: blanchedalmond;  
}
```

`

#### Customizing the time picker popup in the DateTimePicker

Use the following CSS to customize the time picker popup in the DateTimePicker

`

*/ To specify height /*

```
.e-datetimepicker.e-popup {  
height: 100px;  
}
```

`

#### Customizing the Calendar popup of the DateTimePicker

Please check the below section, to customize the style and appearance of the Calendar component in the DateTimePicker

#### [Customizing Calendar's style and appearance](#)

### Full screen mode support in mobiles and tablets

The DateTimePicker component's full-screen mode feature enables users to view the component popup element in full-screen mode on mobile devices with improved visibility and a better user experience. It is important to mention that this feature is exclusively available for mobile and tablet devices in both landscape and portrait orientations. To activate the full screen mode within the DateTimePicker component, simply set the [fullScreenMode](#) API value to `true`. This action will extend the calendar and time popup element to occupy the entire screen on mobile devices.

```
`html
<template>
<div id="app">
<ejs-datetimepicker :fullScreenMode="mobileMode" ></ejs-datetimepicker>
</div>
</template>
<script>
import Vue from 'vue';
import { DateTimePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateTimePickerPlugin);
export default {
  name: 'app',
  data () {
    return {
      mobileMode : true
    }
  }
}
</script>
`
```

**Default Sample**

## How To

Disable the datetimepicker component in Vue Datetimepicker component

To disable the DateTimePicker, use its [enable](#) property to `false`.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-datetimepicker :enabled="enable" :placeholder="waterMark"
    ></ejs-datetimepicker>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DateTimePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateTimePickerPlugin);
export default {
  data () {
    return {
      enable : false,
      waterMark: "Select a date and time"
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/datetimepicker/getting-started-cs7" %}

Set the placeholder in Vue Datetimepicker component

The following example demonstrates how to set [placeholder](#) in the DateTimePicker control.

Using `placeholder` you can display a short hint in the input element.

### APP.VUE

```
<template>
  <div id="app">
    <div class='wrapper'>
      <ejs-datetimepicker :placeholder="waterMark" ></ejs-datetimepicker>
    </div>
  </div>
</template>
```

```

<script>
import Vue from 'vue';
import { DateTimePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DateTimePickerPlugin);
export default {
  data () {
    return {
      watermark: "Select a date and time"
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
  max-width: 250px;
  margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/datetimetypepicker/getting-started-cs8" %}

Customize the datetimetypepicker day header in Vue Datetimetypepicker component

You can change the format of the day that to be displayed in header using [dayHeaderFormat](#) property. By default, the format is **Short**.

You can find the possible formats on below.

Name	Description
----- -----	
<b>Short</b>	Sets the short format of day name (like Su ) in day header.
<b>Narrow</b>	Sets the single character of day name (like S ) in day header.
<b>Abbreviated</b>	Sets the min format of day name (like Sun ) in day header.
<b>Wide</b>	Sets the long format of day name (like Sunday ) in day header.

## APP.VUE

```

<template>
  <div id="container">
    <div id='datetimepicker'>
      <ejs-datetimepicker dayHeaderFormat="Short"
        ref="datetimepickerObj"></ejs-datetimepicker>
    </div>
    <div id="format">
      <label id="custom-input-label">Header Format Types</label>
      <ejs-dropdownlist id="select" :fields = "fields" :index =
        "currentIndex" :dataSource = "items" :popupHeight= "popupHeight" :change=
        "formatHandler">

```

```

        </ejs-dropdownlist>
    </div>
</div>
</template>
<script>
import Vue from "vue";
import { DateTimePickerPlugin } from "@syncfusion/ej2-vue-calendars";
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DateTimePickerPlugin);
Vue.use(DropDownListPlugin);
export default {
    data () {
        return {
            items: [
                { sizeVal: 'Short' , sizeTxt: 'Short' },
                { sizeVal: 'Narrow' , sizeTxt: 'Narrow' },
                { sizeVal: 'Abbreviated' , sizeTxt: 'Abbreviated' },
                { sizeVal: 'Wide' , sizeTxt: 'Wide' },
            ],
            fields: { text: 'sizeTxt', value: 'sizeVal' },
            popupHeight: 200,
            currentIndex: 0,
            formatHandler: (args) => {
                this.$refs.datetimepickerObj.dayHeaderFormat = args.value;
            }
        }
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
    #container{
        width: 100%;
    }
    #datetimepicker {
        width: 25%;
        margin-left: 30px;
        margin-top: 30px;
        display: inline-flex;
    }
    #format {
        width: 180px;
        margin-left: 400px;
        display: inline-block;
    }
    #select {
        height: 30px;
        width: 150px;
        margin-top: 10px;
    }
    #custom-input-label{
        font-size: 15px;

```

```
font-weight: bold
}
</style>
```

{% previewsample "page.domainurl/code-snippet/datetimepicker/header-format-cs1" %}

## Diagram

### Getting Started with the Vue Diagram Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLI](#) and integrating the Syncfusion Vue Diagram component

#### Prerequisites

[System requirements for Syncfusion Vue UI components](#)

#### Dependencies

The following list of dependencies are required to use the **Diagram** component in your application.

```
`javascript
|-- @syncfusion/ej2-vue-diagrams
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-splitbuttons
|-- @syncfusion/ej2-diagrams
|-- @syncfusion/ej2-vue-base
`
```

#### Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```
`bash
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
`
```

or

```
`bash
```

```
yarn global add @vue/cli
```

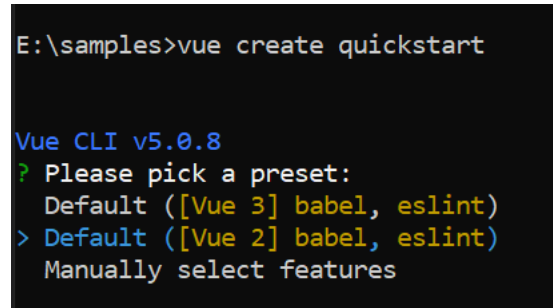

```
vue create quickstart
```

```
cd quickstart
```

```
yarn run serve
```

```
`
```

When creating a new project, choose the option `Default ([Vue 2] babel, eslint)` from the menu.

```
E:\samples>vue create quickstart

Vue CLI v5.0.8
? Please pick a preset:
  Default ([Vue 3] babel, eslint)
> Default ([Vue 2] babel, eslint)
  Manually select features
```

Once the `quickstart` project is set up with default settings, proceed to add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.npmjs.com). To use Vue components, install the required npm package.

This article uses the [Vue Diagram component](#) as an example. Install the `@syncfusion/ej2-vue-diagrams` package by running the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-diagrams --save
```

```
`
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-diagrams
```

```
`
```

#### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the `Material` theme is applied using CSS styles, which are available in installed packages. The necessary `Material` CSS styles for the Diagram component and its dependents were imported into the `<style>` section of `src/App.vue` file.

**~/SRC/APP.VUE**

```
<style>
@import "../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>
```

**Add Syncfusion Vue component**

Follow the below steps to add the Vue Diagram component:

1\ First, import and register the Diagram component in the **script** section of the **src/App.vue** file.

**~/SRC/APP.VUE**

```
<script>
import { DiagramComponent } from '@syncfusion/ej2-vue-diagrams';
export default {
  components: {
    'ejs-diagram': DiagramComponent
  }
}
</script>
```

2\ In the **template** section, define the Diagram component with [height](#) and [width](#) property.

**~/SRC/APP.VUE**

```
<template>
<div id="app">
<ejs-diagram id="diagram" :width='width' :height='height' ></ejs-diagram>
</div>
</template>
```

3\ Declare the value for the **height** and **width** properties in the **script** section.

**~/SRC/APP.VUE**

```
<script>
data () {
  return {
    width: "100%",
    height: "350px"
  }
}
</script>
```

**Run the project**

To run the project, use the following command:

`bash

npm run serve

,

or

```
`bash
```

```
yarn run serve
```

```
,
```

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height' ></ejs-
  diagram>
  </div>
</template>
<script>
import { DiagramComponent } from '@syncfusion/ej2-vue-diagrams';
export default {
  components: {
    'ejs-diagram': DiagramComponent
  },
  name: 'app'
  data () {
    return {
      width: "100%",
      height: "350px"
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/diagram/getting-started/initialize-cs1" %}
```

### Module Injection

Diagram component are segregated into individual feature-wise modules. In order to use a particular feature, you need to inject its feature service in the AppModule. Please find relevant feature service name and description as follows.

- **BpmnDiagrams** - Inject this provider to add built-in BPMN Shapes to diagrams.
- **ConnectorBridging** - Inject this provider to add bridges to connectors.
- **ConnectorEditing** - Inject this provider to edit the segments for connector.
- **ComplexHierarchicalTree** - Inject this provider to complex hierarchical tree like structure.
- **DataBinding** - Inject this provider to populate nodes from given data source.
- **DiagramContextMenu** - Inject this provider to manipulate context menu.
- **HierarchicalTree** - Inject this provider to use hierarchical tree like structure.
- **LayoutAnimation** - Inject this provider animation to layouts.
- **MindMap** - Inject this provider to use mind map.
- **PrintAndExport** - Inject this provider to print or export the objects.
- **RadialTree** - Inject this provider to use Radial tree like structure.
- **Snapping** - Inject this provider to Snap the objects.

- `SymmetricLayout` - Inject this provider to render layout in symmetrical method.
- `UndoRedo` - Inject this provider to revert and restore the changes.

These modules should be imported and injected into the Diagram component using `Diagram.Inject` method as follows.

```
,  
  
<template>  
<div id="app">  
<ejs-diagram id="diagram" :width='width' :height='height' ></ejs-diagram>  
</div>  
</template>  
  
<script>  
import { DiagramComponent, HierarchicalTree, MindMap, RadialTree, ComplexHierarchicalTree,  
  DataBinding, Snapping, PrintAndExport, BpmnDiagrams, SymmetricLayout, ConnectorBridging,  
  UndoRedo, LayoutAnimation, DiagramContextMenu, ConnectorEditing } from '@syncfusion/ej2-vue-  
diagrams';  
export default {  
  components: {  
    'ejs-diagram': DiagramComponent  
  },  
  name: 'app'  
  data () {  
    return {  
      width: "100%",  
      height: "350px"  
    }  
  },  
  provide:{  
    diagram: [BpmnDiagrams, ConnectorBridging, ConnectorEditing, ComplexHierarchicalTree,  
      DataBinding,DiagramContextMenu, HierarchicalTree, LayoutAnimation, MindMap, PrintAndExport,  
      RadialTree, Snapping, SymmetricLayout, UndoRedo]  
  },  
}  
</script>  
,
```

## Flow Diagram

[Create and Add Node](#)

Create and add a **node** (JSON data) with specific position, size, label, and shape.

**APP.VUE**

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
import { DiagramComponent } from '@syncfusion/ej2-vue-diagrams';
let nodes = [
  {
    id: "node1",
    height: 60,
    offsetX: 300,
    offsetY: 80,
    annotations: [
      {
        content: "start"
      }
    ]
  }
]
export default {
  components: {
    'ejs-diagram': DiagramComponent
  },
  name: 'app'
  data () {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/diagram/getting-started/addnode-cs1" %}

[Connect Nodes](#)

Add two node to the diagram as shown in the previous example. Connect these nodes by adding a connector using the **connector** property and refer the source and target end by using the **sourceNode** and **targetNode** properties.

**APP.VUE**

```
<template>
```

```

<div id="app">
  <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' :connectors='connectors' ></ejs-diagram>
</div>
</template>
<script>
import { DiagramComponent } from '@syncfusion/ej2-vue-diagrams';
let nodes = [
  {
    id: "node1",
    height: 100,
    width: 100,
    offsetX: 200,
    offsetY: 100,
  },
  {
    id: "node2",
    height: 100,
    width: 100,
    offsetX: 200,
    offsetY: 300,
  }
];
let connectors = [
  {
    id: "connector1",
    sourceID: "node1",
    targetID: "node2"
  },
]
export default {
  components: {
    'ejs-diagram': DiagramComponent
  },
  name: 'app'
  data () {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
      connectors: connectors
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/getting-started/connectnode-cs1" %}

Default values for all `nodes` and `connectors` can be set using the `getNodeDefaults` and `getConnectorDefaults` properties, respectively. For example, if all nodes have the same width and height, such properties can be moved into `getNodeDefaults`.

*Complete Flow Diagram*

Similarly, the required nodes and connectors can be added to form a complete flow diagram.

**APP.VUE**

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
      :nodes='nodes' :connectors='connectors' :getNodeDefaults='getNodeDefaults'
      :getConnectorDefaults='getConnectorDefaults' ></ejs-diagram>
  </div>
</template>
<script>
  import { DiagramComponent } from '@syncfusion/ej2-vue-diagrams';
  let nodes = [
    {
      id: "node1",
      offsetY: 50,
      shape: { type: "Flow", shape: "Terminator" },
      annotations: [
        {
          content: "Start"
        }
      ]
    },
    {
      id: "node2",
      offsetY: 140,
      shape: { type: "Flow", shape: "Process" },
      annotations: [
        {
          content: "var i = 0;"
        }
      ]
    },
    {
      id: "node3",
      offsetY: 230,
      shape: { type: "Flow", shape: "Decision" },
      annotations: [
        {
          content: "i < 10?"
        }
      ]
    },
    {
      id: "node4",
      offsetY: 320,
      shape: { type: "Flow", shape: "PreDefinedProcess" },
      annotations: [
        {
          content: 'print("Hello!!");',
          style: { fill: "white" }
        }
      ]
    }
  ],
  {

```

```

        id: "node5",
        offsetY: 410,
        shape: { type: "Flow", shape: "Process" },
        annotations: [
          {
            content: "i++;";
          }
        ]
      },
      {
        id: "node6",
        offsetY: 500,
        shape: { type: "Flow", shape: "Terminator" },
        annotations: [
          {
            content: "End"
          }
        ]
      }
    ];
    let connectors = [
      {
        id: "connector1",
        sourceID: "node1",
        targetID: "node2"
      },
      {
        id: "connector2",
        sourceID: "node2",
        targetID: "node3"
      },
      {
        id: "connector3",
        sourceID: "node3",
        targetID: "node4",
        annotations: [{ text: "Yes" }]
      },
      {
        id: "connector4",
        sourceID: "node3",
        targetID: "node6",
        labels: [{ text: "No" }],
        segments: [
          { length: 30, direction: "Right" },
          { length: 300, direction: "Bottom" }
        ]
      },
      {
        id: "connector5",
        sourceID: "node4",
        targetID: "node5"
      },
      {
        id: "connector6",
        sourceID: "node5",
        targetID: "node3",
        segments: [

```

```

        { length: 30, direction: "Left" },
        { length: 200, direction: "Top" }
      ]
    }
  ];
  export default {
    components: {
      'ejs-diagram': DiagramComponent
    },
    name: 'app',
    data () {
      return {
        width: "100%",
        height: "600px",
        nodes: nodes,
        connectors: connectors,
        getNodeDefaults: (node) => {
          node.height = 60;
          node.width = 100;
          node.offsetX = 300;
          return node;
        },
        getConnectorDefaults: (obj) => {
          obj.type = 'Orthogonal';
          return obj;
        },
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/getting-started/flowdiagram-cs1" %}

### Automatic Organization Chart

In the 'Flow Diagram' section, how to create a diagram manually was discussed. This section explains how to create and position the diagram automatically.

#### Business object (Employee information)

Define Employee Information as JSON data. The following code example shows an employee array whose, **Name** is used as a unique identifier and **ReportingPerson** is used to identify the person to whom an employee report to, in the organization.

```

`ts
public data: Object[] = [
{
  Name: "Elizabeth",
  Role: "Director"
},

```

```
{
  Name: "Christina",
  ReportingPerson: "Elizabeth",
  Role: "Manager"
},
{
  Name: "Yoshi",
  ReportingPerson: "Christina",
  Role: "Lead"
},
{
  Name: "Philip",
  ReportingPerson: "Christina",
  Role: "Lead"
},
{
  Name: "Yang",
  ReportingPerson: "Elizabeth",
  Role: "Manager"
},
{
  Name: "Roland",
  ReportingPerson: "Yang",
  Role: "Lead"
},
{
  Name: "Yvonne",
  ReportingPerson: "Yang",
  Role: "Lead"
}
];
、
```

### *Map data source*

You can configure the above "Employee Information" with diagram, so that the nodes and connectors are automatically generated using the mapping properties. The following code example show how `dataSourceSettings` is used to map ID and parent with property name identifiers for employee information.

,

```
<template>
<div id="app">
  <ejs-diagram id="diagram" :width='width' :height='height' :dataSourceSettings='dataSourceSettings'
  ></ejs-diagram>
</div>
</template>
<script>
import { DiagramComponent, HierarchicalTree, DataBinding } from '@syncfusion/ej2-vue-diagrams';
import { DataManager } from "@syncfusion/ej2-data";
export let localdata = [
{
  Name: "Elizabeth",
  Role: "Director"
},
{
  Name: "Christina",
  ReportingPerson: "Elizabeth",
  Role: "Manager"
},
{
  Name: "Yoshi",
  ReportingPerson: "Christina",
  Role: "Lead"
},
{
  Name: "Philip",
  ReportingPerson: "Christina",
  Role: "Lead"
},
},
],
```

```
{
  Name: "Yang",
  ReportingPerson: "Elizabeth",
  Role: "Manager"
},
{
  Name: "Roland",
  ReportingPerson: "Yang",
  Role: "Lead"
},
{
  Name: "Yvonne",
  ReportingPerson: "Yang",
  Role: "Lead"
}
];
export default {
  components: {
    'ejs-diagram': DiagramComponent
  },
  name: 'app',
  data () {
    return {
      width: "100%",
      height: "350px",
      dataSourceSettings: {
        id: 'Name', parentId: 'ReportingPerson',
        dataManager: new DataManager(localdata),
        doBinding: (nodeModel, localdata, diagram) => {
          nodeModel.shape = {
            type: "Text",
            content: (localdata).Role,
          }
        }
      }
    }
  }
}
```

```

}
}
}
}
}
</script>
`

```

### Visualize employee

The following code examples indicate how to define the default appearance of nodes and connectors. The `setNodeTemplate` is used to update each node based on employee data.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
      :getNodeDefaults='getNodeDefaults'
      :getConnectorDefaults='getConnectorDefaults' :layout='layout'
      :dataSourceSettings='dataSourceSettings' ></ejs-diagram>
    </div>
  </template>
<script>
  import { DiagramComponent, HierarchicalTree, DataBinding } from
  '@syncfusion/ej2-vue-diagrams';
  import { DataManager } from '@syncfusion/ej2-data';
  export let localdata = [
    {
      Name: "Elizabeth",
      Role: "Director"
    },
    {
      Name: "Christina",
      ReportingPerson: "Elizabeth",
      Role: "Manager"
    },
    {
      Name: "Yoshi",
      ReportingPerson: "Christina",
      Role: "Lead"
    },
    {
      Name: "Philip",
      ReportingPerson: "Christina",
      Role: "Lead"
    },
    {
      Name: "Yang",
      ReportingPerson: "Elizabeth",
      Role: "Manager"
    },
    {
      Name: "Roland",

```

```

        ReportingPerson: "Yang",
        Role: "Lead"
      },
      {
        Name: "Yvonne",
        ReportingPerson: "Yang",
        Role: "Lead"
      }
    ];
    export default {
      components: {
        'ejs-diagram': DiagramComponent
      },
      name: 'app',
      data () {
        return {
          width: "100%",
          height: "350px",
          getNodeDefaults: (node) => {
            node.height = 60;
            node.width = 100;
            return node;
          },
          getConnectorDefaults: (obj) => {
            obj.type = 'Orthogonal';
            return obj;
          },
          layout: {
            type: "OrganizationalChart",
          },
          dataSourceSettings: {
            id: 'Name', parentId: 'ReportingPerson',
            dataManager: new DataManager(localdata),
            doBinding: (nodeModel, localdata, diagram) => {
              nodeModel.shape = {
                type: "Text",
                content: (localdata).Role,
              }
            }
          }
        }
      },
      provide: {diagram: [DataBinding, HierarchicalTree]},
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/getting-started/orgchart-cs1" %}

You can refer to our [Vue Diagram](#) feature tour page for its groundbreaking feature representations. You can also explore our [Vue Diagram example](#) that shows how to render the Diagram in Vue.

## Getting Started with the Vue Diagram Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue Diagram component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

### Prerequisites

#### [System requirements for Syncfusion Vue UI components](#)

#### Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm create vite@latest
```

```
`
```

or

```
`bash
```

```
yarn create vite
```

```
`
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as **my-project** for this article.

```
`bash
```

```
? Project name: » my-project
```

```
`
```

2. Select **Vue** as the framework. It will create a Vue 3 project.

```
`bash
```

```
? Select a framework: » - Use arrow-keys. Return to submit.
```

```
Vanilla
```

```
Vue
```

```
React
```

```
Preact
```

```
Lit
```

Svelte

Others

,

3. Choose **JavaScript** as the framework variant to build this Vite project using JavaScript and Vue.

```
`bash
```

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

,

4. Upon completing the aforementioned steps to create the **my-project**, run the following command to install its dependencies:

```
`bash
```

```
cd my-project
```

```
npm install
```

,

or

```
`bash
```

```
cd my-project
```

```
yarn install
```

,

Now that **my-project** is ready to run with default settings, let's add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue Diagram component](#) as an example. To use the Vue Diagram component in the project, the **@syncfusion/ej2-vue-diagrams** package needs to be installed using the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-diagrams --save
```

,

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-diagrams
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, **Material** theme is applied using CSS styles, which are available in installed packages. The necessary **Material** CSS styles for the Diagram component and its dependents were imported into the `<style>` section of **src/App.vue** file.

#### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

### Add Syncfusion Vue component

Follow the below steps to add the Vue Diagram component using **Composition API** or **Options API**:

1.First, import and register the Diagram component and its child directives in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { DiagramComponent as EjsDiagram, NodesDirective as ENodes,
NodeDirective as ENode, ConnectorsDirective as EConnectors,
ConnectorDirective as EConnector,NodeAnnotationsDirective as
ENodeAnnotations, NodeAnnotationDirective as ENodeAnnotation,
ConnectorAnnotationsDirective as
EConnectorAnnotations,ConnectorAnnotationDirective as EConnectorAnnotation}
from '@syncfusion/ej2-vue-diagrams';
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { DiagramComponent, NodesDirective, NodeDirective,
ConnectorsDirective, ConnectorDirective,NodeAnnotationsDirective,
NodeAnnotationDirective,
ConnectorAnnotationsDirective,ConnectorAnnotationDirective } from
'@syncfusion/ej2-vue-diagrams';
//Component registration
export default {
```

```

name: "App",
components: {
  "ejs-diagram": DiagramComponent,
  "e-nodes": NodesDirective,
  "e-node": NodeDirective,
  "e-connectors": ConnectorsDirective,
  "e-connector": ConnectorDirective,
  "e-node-annotations": NodeAnnotationsDirective,
  "e-node-annotation": NodeAnnotationDirective,
  "e-connector-annotations": ConnectorAnnotationsDirective,
  "e-connector-annotation": ConnectorAnnotationDirective
}
}
</script>

```

2. In the **template** section, define the Diagram component with the [dataSource](#) property and column definitions.

#### ~/SRC/APP.VUE

```

<template>
  <ejs-diagram
    id="diagram"
    ref="diagramInstance"
    :width="width"
    :height="height"
    :layout="layout"
    :dataSourceSettings="dataSourceSettings"
    :getNodeDefaults="getNodeDefaults"
    :getConnectorDefaults="getConnectorDefaults"
  >
  </ejs-diagram>
</template>

```

3. Declare the values for the **dataSource** property in the **script** section.

#### COMPOSITION API (~/SRC/APP.VUE)

```

<script setup>
const localdata = [
  {
    Name: "Elizabeth",
    Role: "Editor",
  },
  {
    Name: "Christina",
    ReportingPerson: "Elizabeth",
    Role: "Managing Editor",
  },
  {
    Name: "Yoshi",
    ReportingPerson: "Christina",
    Role: "Assistant Editor",
  },
  {
    Name: "Philip",
  },
]

```

```
ReportingPerson: "Christina",
Role: "Copy Editor",
},
{
Name: "Yang",
ReportingPerson: "Elizabeth",
Role: "Bussiness Editor",
},
{
Name: "Roland",
ReportingPerson: "Yang",
Role: "Assistant Editor",
},
{
Name: "Yvonne",
ReportingPerson: "Yang",
Role: "Editorial Assistant",
},
];
</script>
```

### **OPTIONS API (~SRC/APP.VUE)**

```
<script>
data() {
  return {
    localdata:[
      {
        Name: "Elizabeth",
        Role: "Editor",
      },
      {
        Name: "Christina",
        ReportingPerson: "Elizabeth",
        Role: "Managing Editor",
      },
      {
        Name: "Yoshi",
        ReportingPerson: "Christina",
        Role: "Assistant Editor",
      },
      {
        Name: "Philip",
        ReportingPerson: "Christina",
        Role: "Copy Editor",
      },
      {
        Name: "Yang",
        ReportingPerson: "Elizabeth",
        Role: "Bussiness Editor",
      },
      {
        Name: "Roland",
        ReportingPerson: "Yang",
        Role: "Assistant Editor",
      },
    ],
  };
}
```

```
{
  Name: "Yvonne",
  ReportingPerson: "Yang",
  Role: "Editorial Assistant",
},
],
};
}
```

Here is the summarized code for the above steps in the **src/App.vue** file:

#### **COMPOSITION API (~ /SRC /APP.VUE)**

```
<template>
  <ejs-diagram
    id="diagram"
    :width="width"
    :height="height"
    :layout="layout"
    :dataSourceSettings="dataSourceSettings"
    :getNodeDefaults="getNodeDefaults"
    :getConnectorDefaults="getConnectorDefaults"
  >
  </ejs-diagram>
</template>
<script setup>
import {DiagramComponent as EjsDiagram, DataBinding, HierarchicalTree,} from
"@syncfusion/ej2-vue-diagrams";
import { provide } from "vue";
import { DataManager } from "@syncfusion/ej2-data";
const width="1300px";

];
nodeModel.style = { fill: "#6BA5D7", strokeWidth: 0 };
},
},
};
}
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
</style>
```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
`
```

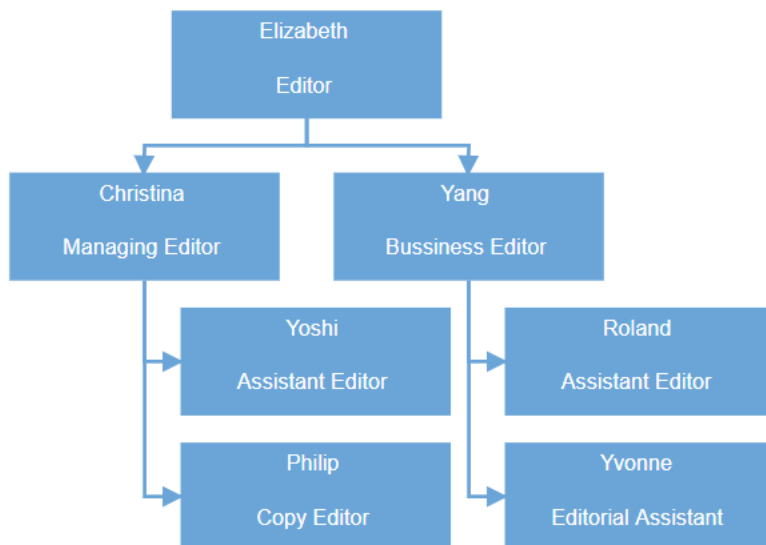

or

```
`bash
```

```
yarn run dev
```

```
`
```

The output will appear as follows:

**Sample:** [vue-3-diagram-getting-started](#).

For migrating from Vue 2 to Vue 3, refer to the [migration](#) documentation.

### Nodes in Vue Diagram component

Nodes are graphical objects used to visually represent the geometrical information, process flow, internal business procedure, entity, or any other kind of data.

<!-- markdownlint-disable MD033 -->

### Create node

A node can be created and added to the diagram, either programmatically or interactively. Nodes are stacked on the diagram area from bottom to top in the order they are added.

### Add node through nodes collection

To create a node, define the [node](#) object and add that to nodes collection of the diagram model. The following code example illustrates how to add a node to the diagram.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Text(label) added to the node
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/diagram/nodes/Node-cs1" %}

### Add/Remove node at runtime

- Nodes can be added at runtime by using public method, add and can be removed at runtime by using public method,

remove. On adding node at runtime, the nodes collection is changed and the [collectionChange](#) event will trigger.

- The node's ID property is used to define the name of the node and its further used to find the node at runtime and do any customization.

The following code illustrates how to add a node.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height' ></ejs-
  diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = {
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Text(label) added to the node
  }
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
      }
    }
    mounted: function() {
      let diagramInstance: Diagram;
      let diagramObj: any = document.getElementById("diagram");
      diagramInstance = diagramObj.ej2_instances[0];
      // Adds to the Diagram
      diagramInstance.add(nodes)
    }
  }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/diagram/nodes/run-cs1" %}
```

### Add node from palette

Nodes can be predefined and added to the palette, and can be dropped into the diagram when needed. For more information

about adding nodes from symbol palette, refer to [Symbol Palette](#).

- Once you drag a node/connector from the palette to the diagram, the following events can be used to do your customization.
- When a symbol is dragged into diagram from symbol palette, the [dragEnter](#) event gets triggered.
- When a symbol is dragged over diagram, the [dragOver](#) event gets triggered.
- When a symbol is dragged and dropped from symbol palette to diagram area, the [drop](#) event gets triggered.
- When a symbol is dragged outside of the diagram, the [dragLeave](#) event gets triggered.

### Create node through data source

Nodes can be generated automatically with the information provided through data source. The default properties for

these nodes are fetched from default settings. For more information about data source, refer to Data Binding.

### Draw nodes

Nodes can be interactively drawn by clicking and dragging the diagram surface by using `NodeDrawingTool`. For more

information about drawing nodes, refer to Draw Nodes.

### Position

- Position of a node is controlled by using its [offsetX](#) and [offsetY](#) properties. By default, these offset properties represent the distance between the origin of the diagram's page and node's center point.
- You may expect this offset values to represent the distance between page origin and node's top-left corner instead of center. The Pivot property helps to solve this problem. Default value of node's [pivot](#) point is (0.5, 0.5), that means center of the node.
- The size of the node can be controlled by using its [width](#) and

[height](#) properties.

- Rotation of a node is controlled by using its [rotateAngle](#) property.

The following table illustrates how pivot relates offset values with node boundaries.

Pivot	Offset
(0.5,0.5)	offsetX and offsetY values are considered as the node's center point.
(0,0)	offsetX and offsetY values are considered as the top-left corner of the node.

| (1,1) | offsetX and offsetY values are considered as the bottom-right corner of the node. |

The following code illustrates how to change the **pivot** value.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    pivot: {
      x: 0,
      y: 0
    }
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Text(label) added to the node
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
    mounted: function() {
      let diagramInstance: Diagram;
      let diagramObj: any = document.getElementById("diagram");
      diagramInstance = diagramObj.ej2_instances[0];
      diagramInstance.select([diagramInstance.nodes[0]]);
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/diagram/nodes/position-cs1" %}

## Flip

The diagram Provides support to flip the node. [flip](#) is performed to give the mirrored image of the original element.

The flip types are as follows:

- HorizontalFlip

[Horizontal](#) is used to change the element in horizontal direction.

- VerticalFlip

[Vertical](#) is used to change the element in vertical direction

- Both

[Both](#) which involves both vertical and horizontal changes of the element.

The following code illustrates how to provide the mirror image of the original element.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    // Flip the node in Horizontal Direction
    flip: 'Horizontal',
    shape: {
      type: 'Basic',
      shape: 'RightTriangle',
    },
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
  },
]
export default {
  name: 'app'
  data() {
    return {
```

```

        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
    mounted: function() {
      let diagramInstance: Diagram;
      let diagramObj: any = document.getElementById("diagram");
      diagramInstance = diagramObj.ej2_instances[0];
      diagramInstance.select([diagramInstance.nodes[0]]);
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/nodes/position-cs2" %}

Note: The flip is also applicable for group and BPMN shapes.

### Appearance

- The appearance of a node can be customized by changing its [fill](#) color, [borderColor](#), [borderWidth](#), [strokeDashArray](#),

[opacity](#), and [shadow](#).

- The [visible](#) property of the node enables or disables the visibility of the node.

The following code illustrates how to customize the appearance of the shape.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeDashArray: '5,5'
    }
  }];

```

```

    },
    borderWidth: 2,
    borderColor: 'red',
    // Text(label) added to the node
  ]
}
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/nodes/Appear-cs1" %}

## Gradient

The [gradient](#) property of the node allows you to define and apply the gradient effect to that node.

The gradient stop property defines the color and a position, where the previous color transition ends and a new color transition starts.

The gradient stop's opacity property defines the transparency level of the region.

There are two types of gradients as follows:

- Linear gradient
- Radial gradient

## Linear gradient

- [LinearGradient](#) defines a smooth transition between a set of colors (so-called stops) on a line.
- A linear gradient's x1, y1, x2, y2 properties are used to define the position (relative to the node) of the rectangular region that needs to be painted.

## APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';

```

```

import {
DiagramPlugin,GradientModel,LinearGradientModel,RadialGradientModel } from
'@syncfusion/ej2-vue-diagrams';
Vue.use(DiagramPlugin);
let linearGradient: GradientModel | LinearGradientModel |
RadialGradientModel;
linearGradient = {
  //Start point of linear gradient
  x1: 0,
  y1: 0,
  //End point of linear gradient
  x2: 50,
  y2: 50,
  //Sets an array of stop objects
  stops: [{
    color: 'white',
    offset: 0
  },
  {
    color: '#6BA5D7',
    offset: 100
  }
  ],
  type: 'Linear'
};
let nodes = [{
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  style: {
    gradient: linearGradient
  }
  // Text(label) added to the node
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/nodes/Gradient-cs1" %}

## Radial gradient

- [RadialGradient](#) defines a smooth transition between stops on a circle.
- A radial gradient's cx, cy, fx, fy properties are used to define the position (relative to the node) of the outermost or the innermost circle of the radial gradient.

**APP.VUE**

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import {
DiagramPlugin, GradientModel, LinearGradientModel, RadialGradientModel } from
'@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let radialGradient: GradientModel | LinearGradientModel |
RadialGradientModel;
  radialGradient = {
    //Center point of outer circle
    cx: 50,
    cy: 50,
    //Center point of inner circle
    fx: 25,
    fy: 25,
    //Radius of a radial gradient
    r: 50,
    //Sets an array of stop objects
    stops: [{
      color: 'white',
      offset: 0
    },
    {
      color: '#6BA5D7',
      offset: 100
    }
  ],
    type: 'Radial'
  };
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      gradient: radialGradient
    }
    // Text(label) added to the node
  }]
  export default {
```

```

    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/nodes/Gradient-cs2" %}

### Shadow

Diagram provides support to add [shadow](#) effect to a node that is disabled, by default. It can be enabled with the constraints property of the node. The following code illustrates how to drop shadow.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, NodeConstraints } from '@syncfusion/ej2-vue-
  diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    constraints: NodeConstraints.Default | NodeConstraints.Shadow,
    // Text(label) added to the node
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }

```

```

    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/nodes/shadow-cs1" %}

### Customizing shadow

The angle, distance, and opacity of the shadow can be customized with the shadow property of the node. The following code example illustrates how to customize shadow.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, NodeConstraints } from '@syncfusion/ej2-vue-
diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    constraints: NodeConstraints.Default | NodeConstraints.Shadow,
    shadow: {
      angle: 50,
      opacity: 0.8,
      distance: 9
    }
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }
</script>

```

```
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/diagram/nodes/shadow2-cs1" %}
```

### Icon

Diagram provides support to describe the state of the node. i.e., the node is expanded or collapsed state.

Note: Icon can be created only when the node has outEdges.

- To explore the properties of expand and collapse icon, refer to [expandIcon](#) and [collapselIcon](#).
- The expandIcon's and collapseIcon's shape properties allow to define the shape of the icon.

The following code example illustrates how to create an icon of various shapes.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' :connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'Start',
    width: 140,

{% previewsample "page.domainurl/code-snippet/diagram/nodes/icon-cs1" %}

### Customizing expand icon

- Set the borderColor, borderWidth, and background color for an expandIcon using borderColor, borderWidth, and fill properties.
- Set a size for an expandIcon by using width and height properties.
- The expand icon can be aligned relative to the node boundaries. It has margin, offset, horizontalAlignment, and verticalAlignment settings. It is quite tricky, when all four alignments are used together but gives you more control over alignment.
- The [iconColor](#) property can be used to set the strokeColor of the Icon.

### Customizing collapse icon

- Set the [borderColor](#),

[borderWidth](#), background color for an collapseIcon using [borderColor](#), [borderWidth](#), and [fill](#) properties.

- Set a size for collapseIcon by using [width](#) and

[height](#) properties.

- Like expand icon, collapse icon also can be aligned relative to the node boundaries. It has margin, offset, horizontalAlignment, and verticalAlignment settings. It is quite tricky, when all four alignments are used together but gives you more control over alignment.
- The [iconColor](#) property can be used to set the strokeColor of the Icon.

### Interaction

Diagram provides support to drag, resize, or rotate the node interactively. For more information about editing a node at runtime, refer to [Edit Nodes](#).

### Constraints

The constraints property of the node allows you to enable/disable certain features. For more information about node constraints, refer to [Node Constraints](#).

### Custom properties

The [addInfo](#) property of the node allows to maintain additional information to the node.

### Stack order

The nodes z-order property specifies the stack order of the node. A node with greater stack order is always in front of a node with a lower stack order.

### Data flow

Node has the InEdges and OutEdges read-only property. In this property, you can find what are all the connectors that are connected to the node, and then you can find these connectors by using the [getObject](#) method in the diagram.

## Shapes in Vue Diagram component

Diagram provides support to add different kind of nodes. They are as follows:

- Text node
- Image node
- HTML node
- Native node
- Basic shapes
- Flow shapes

<!-- markdownlint-disable MD033 -->

<!-- markdownlint-disable MD010 -->

### Text

Texts can be added to the diagram as [text](#) nodes. The shape property of the node allows you to set the type of node and for text nodes, it should be set as **text**. In addition, define the content object that is used to define the text to be added and style is used to customize the appearance of that text. The following code illustrates how to create a text node.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    //Sets type of the shape as text
    shape: {
      type: 'Text',
      content: 'Text Element'
    },
    //Customizes the appearances such as text, font, fill, and stroke.
    style: {
      strokeColor: 'none',
      fill: 'none',
      color: 'black',
      textAlign: 'Center'
    }
  }]
  export default {
    name: 'app'
    data() {
```

```

        return {
            width: "100%",
            height: "350px",
            nodes: nodes,
        }
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/shapes/Text-cs1" %}

### Image

Diagram allows to add images as [image](#) nodes. The shape property of node allows you to set the type of node and for image nodes, it should be set as **image**. In addition, the source property of shape enables you to set the image source.

The following code illustrates how an image node is created.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
        :nodes='nodes' ></ejs-diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
    Vue.use(DiagramPlugin);
    let nodes = [{
        // Position of the node
        offsetX: 250,
        offsetY: 250,
        // Size of the node
        width: 100,
        height: 100,
        // sets the type of the shape as image
        shape: {
            type: 'Image',
            source:
                'https://ej2.syncfusion.com/demos/src/diagram/employees/image16.png'
        },
        //Customizes the appearances such as text, font, fill, and stroke.
        style: {
            fill: 'none'
        }
    }]
    export default {
        name: 'app',
        data() {
            return {

```

```

        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }
</script>
<style>
  @import "../..//node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

```
{% previewsample "page.domainurl/code-snippet/diagram/shapes/Image-cs1" %}
```

### Base64 Encoded Image Into The Image Node:

The following code illustrates how add Base64 image into image node.

**APP.VUE**

```
<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
    </div>
</template>
<script>
import Vue from 'vue';
import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
Vue.use(DiagramPlugin);
let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    // sets the type of the shape as image
    shape: {
        type: 'Image',

        fill: 'none'
    }
  }
}
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/shapes/Image-cs2" %}

Note: Deploy your HTML file in the web application and export the diagram (image node) or else the image node will not be exported in the Chrome and Firefox due to security issues. Refer to the following link.

Link 1: <http://asked.online/draw-images-on-canvas-locally-using-chrome/2546077/>

Link 2: <http://stackoverflow.com/questions/4761711/local-image-in-canvas-in-chrome>

### Image alignment

Stretch and align the image content anywhere but within the node boundary.

The scale property of the node allows to stretch the image as you desired (either to maintain proportion or to stretch). By default, the [scale](#) property of the node is set as **meet**.

The following code illustrates how to scale or stretch the content of the image node.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    //sets the type of the shape as Image
    shape: {
      type: 'Image',
      source:
'https://ej2.syncfusion.com/demos/src/diagram/employees/image16.png',
      scale: 'None'
    },
    //Customizes the appearances such as text, font, fill, and stroke.
    style: {
      fill: 'none'
    }
  }
]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/diagram/shapes/HTML-cs1" %}

The following table illustrates all the possible scale options for the image node.

| Values | Images |

|-----| -----|

## HTML

Html elements can be embedded in the diagram through [Html](#) type node. The shape property of node allows you to set the type of node and to create a HTML node it should be set as **HTML**. The following code illustrates how an Html node is created.

## APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
```

```

import Vue from 'vue';
import { DiagramPlugin, NodeModel } from '@syncfusion/ej2-vue-diagrams';
Vue.use(DiagramPlugin);
let nodes = [{
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  style: {
    fill: '#6BA5D7',
    strokeColor: 'white'
  },
  //sets the type of the shape as HTML
  shape: {
    type: 'HTML',
    content: '<div
style="background:#6BA5D7;height:100%;width:100%;"><button type="button"
style="width:100px"> Button</button></div>'
  }
  as NodeModel
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/shapes/HTML-cs2" %}

Note: HTML node cannot be exported to image format, like JPEG, PNG, and BMP. It is by design, while exporting the diagram is drawn in a canvas. Further, this canvas is exported into image formats. Currently, drawing in a canvas equivalent from all possible HTML is not feasible. Hence, this limitation.

### HTML Node With Template

Html elements can be embedded in the diagram through [Html](#) type node. The shape property of node allows you to set the type of node. The following code illustrates how an Html node is created with template.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram
      ref="diagram"
    >

```

```

        id="diagram"
        :width='width'
        :height='height'
        :nodes = "nodes"
        :nodeTemplate="nodeTemplate"
    >

    </ejs-diagram>
</div>
</template>
<script>
import Vue from "vue";
import { DiagramPlugin, AnnotationConstraints } from "@syncfusion/ej2-vue-
diagrams";
Vue.use(DiagramPlugin);
let itemVue = Vue.component("nodeTemplate", {
    template: `<div style="background:#6BA5D7;height:100%;width:100%;"><button
type="button" style="width:100px"> Button</button></div> `,
    data() {
        return {};
    }
});
let nodes = [
    {
        //Id of the node
        id: "Node",
        //Position of the node
        offsetX: 250,
        offsetY: 250,
        //Size of the node
        width: 100,
        height: 100,
        //sets the type of the shape as HTML
        shape: {
            type: "HTML",
        },
    },
];
export default {
    name: "app",
    data() {
        return {
            width: "100%",
            height: "350px",
            nodes: nodes,
            nodeTemplate: function () {
                return { template: itemVue };
            },
        };
    },
    methods: {
    },
};
</script>

```

{% previewsample "page.domainurl/code-snippet/diagram/shapes/HTML-cs3" %}

## Native

Diagram provides support to embed SVG element into a node. The shape property of node allows you to set the type of node. To create a [native](#) node, it should be set as **native**. The following code illustrates how a native node is created.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    //sets the type of the shape as Native
    shape: {
      type: 'Native',
      content: '<g xmlns="http://www.w3.org/2000/svg"> <g
transform="translate(1 1)"><g> <path style="fill:#61443C;"

  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/shapes/Native-cs1" %}

Note: Like HTML node, the native node also cannot be exported to image format. Fill color of native node can be overridden by the inline style or fill of the SVG element specified in the template..

### SVG content alignment

Stretch and align the svg content anywhere but within the node boundary.

The scale property of the node allows to stretch the svg content as you desired (either to maintain proportion or to stretch). By default, the **scale** property of node is set as **meet**.

The following code illustrates how to scale or stretch the content of the node.

The following tables illustrates all the possible scale options for the node.

| Values | Images |

|-----| -----|

### Basic shapes

- The [Basic](#) shapes are common shapes that are used to represent the geometrical information visually. To create basic shapes, the type of the shape should be set as **basic**. Its shape property can be set with any one of the built-in shape.
- To render a rounded rectangle, you need to set the type as basic and shape as rectangle. Set the [cornerRadius](#) property to specify the radius of rounded rectangle.

The following code example illustrates how to create a basic shape.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
```

```

//sets the type of the shape as Basic
shape: {
  type: 'Basic',
  shape: 'Rectangle',
  cornerRadius: 10
},
style: {
  fill: '#6BA5D7',
  strokeColor: 'white'
},
// Text(label) added to the node
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/shapes/Basic-cs1" %}

Note: By default, the **shape** property of the node is set as **basic**.

Default property for shape is Rectangle.

Note: When the **shape** is not set for a basic shape, it is considered as a **rectangle**.

The list of basic shapes are as follows.

## Path

The [Path](#) node is a commonly used basic shape that allows visually to represent the geometrical information. To create a path node, specify the shape as **path**. The path property of node allows you to define the path to be drawn. The following code illustrates how a path node is created.

### APP.VUE

```

<template>
  <div id="app">

```

```

    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    //sets the type of the shape as Path
    shape: {
      type: 'Path',
      data: 'M35.2441,25 L22.7161,49.9937 L22.7161,0.00657536
L35.2441,25 z M22.7167,25 L-0.00131226,25 M35.2441,49.6337 L35.2441,0.368951
M35.2441,25 L49.9981,25'
    },
  ]
}
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/shapes/Path-cs1" %}

### Flow Shapes

The [flow](#) shapes are used to represent the process flow. It is used for analyzing, designing, and managing for documentation process. To create a flow shape, specify the shape type as **flow**. Flow shapes and by default, it is considered as **process**. The following code example illustrates how to create a flow shape.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';

```

```

import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
Vue.use(DiagramPlugin);
let nodes = [{
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  //sets the type of the shape as Flow
  shape: {
    type: 'Flow',
    shape: 'Document'
  },
  style: {
    fill: '#6BA5D7',
    strokeColor: 'white'
  },
},
]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/shapes/Flow-cs1" %}

The list of flow shapes are as follows.

### Bpmn shapes in Vue Diagram component

BPMN shapes are used to represent the internal business procedure in a graphical notation and enable you to communicate the procedures in a standard manner. To create a BPMN shape, in the node

property shape, type should be set as “bpmn” and its shape should be set as any one of the built-in shapes. The following code example illustrates how to create a simple business process.

Note: If you want to use BPMN shapes in diagram, you need to inject BpmnDiagrams in the diagram.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin,BpmnDiagrams,Diagram} from '@syncfusion/ej2-vue-
diagrams';
  Diagram.Inject(BpmnDiagrams);
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Text(label) added to the node
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>
```

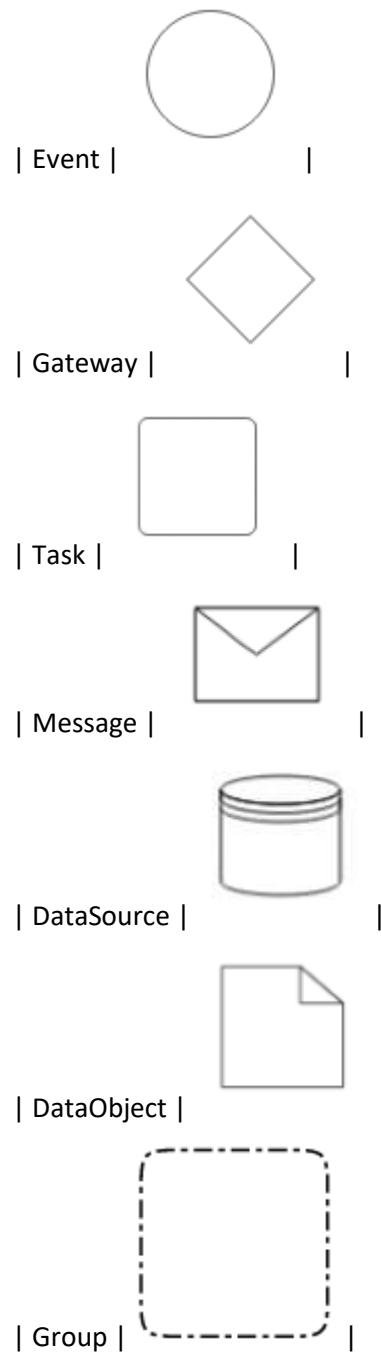

{% previewsample "page.domainurl/code-snippet/diagram/bpmn-shapes/bpmn-cs1" %}

Note : The default value for the property **shape** is “event”.

The list of BPMN shapes are as follows:

| Shape | Image |

| ----- | ----- |

The BPMN shapes and its types are explained as follows.

#### Event

An [event](#) is notated with a circle and it represents an event in a business process. The type of events are as follows:

- Start
- End
- Intermediate

The [event](#) property of the node allows you to define the type of the event. The default value of the event is **start**. The following code example illustrates how to create a BPMN event.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin,BpmnDiagrams,Diagram } from '@syncfusion/ej2-vue-
diagrams';
  Diagram.Inject(BpmnDiagrams);
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    //Sets type as Bpmn and shape as event
    shape: {
      type: 'Bpmn',
      shape: 'Event',
      // Sets event as End and trigger as None
      event: {
        event: 'End',
        trigger: 'None'
      }
    },
  },
]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/diagram/bpmn-shapes/Event-cs1" %}

Event triggers are notated as icons inside the circle and they represent the specific details of the process. The [trigger](#) property of the node allows you to set the type of trigger and by default, it is set as **none**. The following table illustrates the type of event triggers.

| Triggers | Start | Non-Interrupting Start | Intermediate | Non-Interrupting Intermediate | Throwing Intermediate | End |

| ----- | ----- | ----- | ----- | ----- | ----- | ----- |

### Gateway

Gateway is used to control the flow of a process and it is represented as a diamond shape. To create a gateway, the shape property of the node should be set as [gateway](#) and the gateway property can be set with any of the appropriate gateways. The following code example illustrates how to create a BPMN Gateway.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
      :nodes='nodes' ></ejs-diagram>
    </div>
  </template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, BpmnDiagrams, Diagram, BpmnGatewayModel } from
    '@syncfusion/ej2-vue-diagrams';
  Diagram.Inject(BpmnDiagrams);
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    //Sets type as Bpmn and shape as Gateway
    shape: {
      type: 'Bpmn',
      shape: 'Gateway',
      //Sets type of the gateway as None
      gateway: {
        type: 'None'
      }
    },
    as BpmnGatewayModel
  ],
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
```

```
</style>
```

{% previewsample "page.domainurl/code-snippet/diagram/bpmn-shapes/Gateway-cs1" %}

Note: By default, the **gateway** will be set as **none**.

There are several types of gateways as tabulated:

Shape	Image
-------	-------

-----	-----
-------	-------

Exclusive		
-----------	---	--

Parallel		
----------	---	--

Inclusive		
-----------	--	--

Complex		
---------	---	--

EventBased		
------------	---	--

ExclusiveEventBased		
---------------------	---	--

ParallelEventBased		
--------------------	---	--

### Activity

The [activity](#) is the task that is performed in a business process. It is represented by a rounded rectangle.

There are two types of activities. They are listed as follows:

- Task: Occurs within a process and it is not broken down to a finer level of detail.
- Subprocess: Occurs within a process and it is broken down to a finer level of detail.

To create a BPMN activity, set the shape as **activity**. You also need to set the type of the BPMN activity by using the activity property of the node. By default, the type of the activity is set as **task**. The following code example illustrates how to create an activity.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin,BpmnDiagrams,Diagram,BpmnGatewayModel } from
'@syncfusion/ej2-vue-diagrams';
  Diagram.Inject(BpmnDiagrams);
  Vue.use(DiagramPlugin);
  let nodes = [{
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    //Sets type as Bpmn and shape as Activity
    shape: {
      type: 'Bpmn',
      shape: 'Activity',
      //Sets activity as Task
      activity: {
        activity: 'Task'
      },
    },
  ],
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/diagram/bpmn-shapes/Activity-cs1" %}
```

The different activities of BPMN process are listed as follows.

### Tasks

The [task](#) property of the node allows you to define the type of task such as sending, receiving, user based task, etc. By

default, the type property of task is set as **none**. The following code illustrates how to create different types of

BPMN tasks.

The [type](#) property of tasks allows to represent these results as an event attached to the task.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
      :nodes='nodes' ></ejs-diagram>
    </div>
  </template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, BpmnDiagrams, Diagram, BpmnGatewayModel } from
  '@syncfusion/ej2-vue-diagrams';
  Diagram.Inject(BpmnDiagrams);
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    //Sets type as Bpmn and shape as Activity
    shape: {
      type: 'Bpmn',
      shape: 'Activity',
      //Sets activity as Task
      activity: {
        activity: 'Task',
        //Sets the type of the task as Send
        task: {
          type: 'Send'
        }
      }
    },
  ],
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }
```

```
    }  
  }  
</script>  
<style>  
  @import ".../node_modules/@syncfusion/ej2-vue-  
diagrams/styles/material.css";  
</style>
```

{% previewsample "page.domainurl/code-snippet/diagram/bpmn-shapes/Task-cs1" %}

The various types of BPMN tasks are tabulated as follows.

| Shape | Image |

| ----- | ----- |

| Service | |

| Send | |

| Receive | |

| Instantiating Receive | |

| Manual |

| Business Rule |

| User |

| Script |

### Subprocess

A [sub-process](#) is a group of tasks, which is used to hide or reveal details of additional levels using the [collapsed](#) property.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import {
DiagramPlugin,BpmnDiagrams,Diagram,BpmnGatewayModel,BpmnSubProcessModel }
from '@syncfusion/ej2-vue-diagrams';
  Diagram.Inject(BpmnDiagrams);
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
```

```

        offsetY: 250,
        // Size of the node
        width: 100,
        height: 100,
        //Sets type as Bpmn and shape as Activity
        shape: {
            type: 'Bpmn',
            shape: 'Activity',
            //Sets activity as SubProcess and collapsed of subprocess as
true
            activity: {
                activity: 'SubProcess',
                subprocess: {
                    collapsed: true
                }
            }
        },
    ],
    export default {
        name: 'app'
        data() {
            return {
                width: "100%",
                height: "350px",
                nodes: nodes,
            }
        }
    }
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/bpmn-shapes/Subprocess-cs1" %}

The different types of subprocess are as follows:

- Event subprocess
- Transaction

### Event Subprocess

A subprocess is defined as an event subprocess, when it is triggered by an event. An event subprocess is placed within another subprocess which is not part of the normal flow of its parent process. You can set event to a subprocess with the [event](#) and [trigger](#) property of the subprocess. The [type](#) property of subprocess allows you to define the type of subprocess whether it should be event subprocess or transaction subprocess.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'

## Transaction Subprocess

- [transaction](#) is a set of activities that logically belong together, in which all contained activities must complete their parts of the transaction; otherwise the process is undone. The execution result of a transaction is one of Successful Completion, Unsuccessful Completion (Cancel), and Hazard (Exception). The [events](#) property of subprocess allows to represent these results as an event attached to the subprocess.
- The event object allows you to define the type of event by which the subprocess will be triggered. The name of the event can be defined to identify the event at runtime.
- The event's offset property is used to set the fraction/ratio (relative to parent) that defines the position of the event shape.
- The trigger property defines the type of the event trigger.
- You can also use define ports and labels to subprocess events by using event's ports and labels properties.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import {
DiagramPlugin, BpmnDiagrams, Diagram, BpmnGatewayModel, BpmnSubProcessModel }
from '@syncfusion/ej2-vue-diagrams';
  Diagram.Inject(BpmnDiagrams);
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    //Sets type as Bpmn and shape as activity
    shape: {
      type: 'Bpmn',
      shape: 'Activity',
      //Sets activity as SubProcess
      activity: {
        activity: 'SubProcess',
        //Sets collapsed as true and type as Transition
        subprocess: {
          collapsed: true,
          type: 'Transaction',
          //Sets event as Intermediate and trigger as Cancel
          event: [{
            event: 'Intermediate',
            trigger: 'Cancel',
            offset: {
              x: 0.25,
```

```

        y: 1
      }
    },
    {
      event: 'Intermediate',
      trigger: 'Error',
      offset: {
        x: 0.25,
        y: 1
      }
    },
  ],
  as BpmnSubProcessModel
},
],

```

{% previewsample "page.domainurl/code-snippet/diagram/bpmn-shapes/TransitionSub-cs1" %}

## Process

Processes is an array collection that defines the children values for BPMN subprocess.

## Loop

[Loop](#) is a task that is internally being looped. The loop property of task allows you to define the type of loop. The default value for loop is **none**.

You can define the loop property in subprocess BPMN shape as shown in the following code.

## APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';

```

```

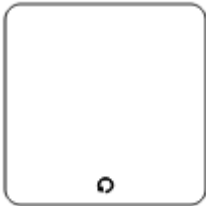

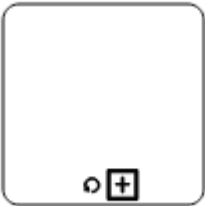

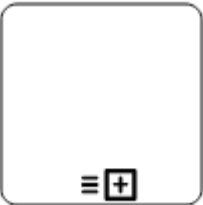

import {
DiagramPlugin, BpmnDiagrams, Diagram, BpmnGatewayModel, BpmnSubProcessModel }
from '@syncfusion/ej2-vue-diagrams';
Diagram.Inject(BpmnDiagrams);
Vue.use(DiagramPlugin);
let nodes = [{
  // Position of the node
  offsetX: 100,
  offsetY: 100,
  // Size of the node
  width: 100,
  height: 100,
  //Sets type as Bpmn and shape as Activity
  shape: {
    type: 'Bpmn',
    shape: 'Activity',
    //Sets activity as Task
    activity: {
      activity: 'Task',
      //Sets loop of the task as Standard
      task: {
        loop: 'Standard'
      }
    }
  },
},
{
  // Position of the node
  offsetX: 300,
  offsetY: 100,
  // Size of the node
  width: 100,
  height: 100,
  //Sets type as Bpmn and shape as activity
  shape: {
    type: 'Bpmn',
    shape: 'Activity',
    //Sets Activity as SubProcess
    activity: {
      activity: 'SubProcess',
      //Sets collapsed as true and loop as Standard
      subProcess: {
        collapsed: true,
        loop: 'Standard'
      }
    }
  }
  as BpmnSubProcessModel
},
],
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}

```

```
    }  
  }  
</script>  
<style>  
  @import "../node_modules/@syncfusion/ej2-vue-  
diagrams/styles/material.css";  
</style>
```

{% previewsample "page.domainurl/code-snippet/diagram/bpmn-shapes/Loop-cs1" %}

The following table contains various types of BPMN loops.

Loops	Task	Subprocess
-----	-----	-----
<div>Standard</div>	<div></div>	<div></div>
<div>SequenceMultiInstance</div>	<div></div>	<div></div>
<div>ParallelMultiInstance</div>	<div></div>	<div></div>

[Compensation](#)  
[Compensation](#) is triggered, when operation is partially failed and enabled it with the compensation property of the task and the subprocess.

APP.VUE

```
<template>  
  <div id="app">  
    <ejs-diagram id="diagram" :width='width' :height='height'  
:nodes='nodes' ></ejs-diagram>  
  </div>  
</template>  
<script>  
  import Vue from 'vue';
```

```

import {
DiagramPlugin, BpmnDiagrams, Diagram, BpmnGatewayModel, BpmnSubProcessModel }
from '@syncfusion/ej2-vue-diagrams';
Diagram.Inject(BpmnDiagrams);
Vue.use(DiagramPlugin);
let nodes = [{

diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/bpmn-shapes/Compensation-cs1" %}

## Call

A [call](#) activity is a global subprocess that is reused at various points of the business flow and set it with the call property of the task.

## APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, BpmnDiagrams, Diagram, BpmnGatewayModel } from
'@syncfusion/ej2-vue-diagrams';
  Diagram.Inject(BpmnDiagrams);
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    //Sets type as Bpmn and shape as Activity
    shape: {
      type: 'Bpmn',
      shape: 'Activity',
      //Sets the activity as task
      activity: {
        activity: 'Task',
        //Sets the call of the task as true
        task: {
          call: true
        }
      }
    },
  ],
  },
  ]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,

```

```

    }
  }
}
</script>

  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/bpmn-shapes/Call-cs1" %}

### Ad-Hoc

An adhoc subprocess is a group of tasks that are executed in any order or skipped in order to fulfill the end condition and set it with the [adhoc](#) property of subprocess.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import {
DiagramPlugin, BpmnDiagrams, Diagram, BpmnGatewayModel, BpmnSubProcessModel }
from '@syncfusion/ej2-vue-diagrams';
  Diagram.Inject(BpmnDiagrams);
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    //Sets type as Bpmn and shape as Activity
    shape: {
      type: 'Bpmn',
      shape: 'Activity',
      //Sets activity as SubProcess
      activity: {
        activity: 'SubProcess',
        //Sets collapsed as true and adhoc as true
        subprocess: {
          collapsed: true,
          adhoc: true
        }
      }
    },
    as BpmnSubProcessModel
  },
  ],
  export default {
    name: 'app'
    data() {

```

```

        return {
            width: "100%",
            height: "350px",
            nodes: nodes,
        }
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/bpmn-shapes/Adhoc-cs1" %}

### Boundary

Boundary represents the type of task that is being processed. The [boundary](#) property of subprocess allows you to define the type of boundary. By default, it is set as **default**.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
        :nodes='nodes' ></ejs-diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import {
    DiagramPlugin, BpmnDiagrams, Diagram, BpmnGatewayModel, BpmnSubProcessModel }
    from '@syncfusion/ej2-vue-diagrams';
    Diagram.Inject(BpmnDiagrams);
    Vue.use(DiagramPlugin);
    let nodes = [{
        // Position of the node
        offsetX: 250,
        offsetY: 250,
        // Size of the node
        width: 100,
        height: 100,
        //Sets type as Bpmn and shape as Activity
        shape: {
            type: 'Bpmn',
            shape: 'Activity',
            //Sets activity as SubProcess
            activity: {
                activity: 'SubProcess',
                //Sets collapsed as true and boundary as Call
                subprocess: {
                    collapsed: true,
                    boundary: 'Call'
                }
            }
        } as BpmnSubProcessModel
    },
    ],

```

```

  ]]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/bpmn-shapes/Boundary-cs1" %}

The following table contains various types of BPMN boundaries.

| Boundary | Image |

| ----- | ----- |

| Call |

| Event |

| Default |

### Data

A data object represents information flowing through the process, such as data placed into the process, data resulting from the process, data that needs to be collected, or data that must be stored. To define a

[data object](#), set the shape as **DataObject** and the type property defines whether data is an input or an output. You can create multiple instances of data object with the collection property of data.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import {
DiagramPlugin, BpmnDiagrams, Diagram, BpmnGatewayModel, BpmnShapeModel } from
'@syncfusion/ej2-vue-diagrams';
  Diagram.Inject(BpmnDiagrams);
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    //Sets type as Bpmn and shape as DataObject
    shape: {
      type: 'Bpmn',
      shape: 'DataObject',
      //Sets collection as true and type as Input
      dataObject: {
        collection: true,
        type: 'Input'
      }
    }
  ]
  as BpmnShapeModel,
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>
```

| ----- | ----- |

| Collection Data Object |

| Data Input |

| Data Output |

### Datasource

Datasource is used to store or access data associated with a business process. To create a datasource, set the shape as **datasource**. The following code example illustrates how to create a datasource.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin,BpmnDiagrams,Diagram,BpmnGatewayModel } from
'@syncfusion/ej2-vue-diagrams';
  Diagram.Inject(BpmnDiagrams);
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    //Sets type as Bpmn and shape as DataSource
    shape: {
      type: 'Bpmn',
      shape: 'DataSource',
    }
  }]
  export default {
    name: 'app'
```

```

    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/bpmn-shapes/Datasource-cs1" %}

### Artifact

Artifact is used to show additional information about a process in order to make it easier to understand. There are two types of artifacts in BPMN.

- Text annotation
- Group

### Text Annotation

- A BPMN object can be associated with a text annotation which does not affect the flow but gives details about objects within a flow. The annotation property of the node is used to connect an annotation element to the BPMN node.
- The annotation element can be displaced into a different position interactively by dragging the annotation to a particular position.
- The annotation element can be switched from a BPMN node to another BPMN node simply by dragging the source end of the annotation connector into the other BPMN node.
- The annotation angle property is used to set the angle between the BPMN shape and the annotation.
- The annotation direction property is used to set the direction of the text annotation.
- To set the size for text annotation, use width and height properties.
- The annotation length property is used to set the distance between the BPMN shape and the annotation.
- The annotation text property defines the additional information about the flow object in a BPMN process.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';

```

```

import {
DiagramPlugin, BpmnDiagrams, Diagram, BpmnGatewayModel, BpmnShapeModel } from
'@syncfusion/ej2-vue-diagrams';
Diagram.Inject(BpmnDiagrams);
Vue.use(DiagramPlugin);
let nodes = [{
// Position of the node
offsetX: 100,
offsetY: 100,
// Size of the node
width: 100,
height: 100,
//Sets type as Bpmn and shape as DataObject
shape: {
type: 'Bpmn',
shape: 'DataObject',
//Sets collection as true and type as Input
dataObject: {
collection: true,
type: 'Input'
},
//Sets the id, angle, length and text for the annotation
annotations: [{
id: 'left',
angle: 45,
length: 150,
text: 'Left',
}]
}
as BpmnShapeModel,
}]
export default {
name: 'app'
data() {
return {
width: "100%",
height: "350px",
nodes: nodes,
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/bpmn-shapes/Text-cs1" %}

### Group

A group is used to frame a part of the diagram, shows that elements included in it are logically belong together and don't have any other semantics other than organizing elements. To create a Group, the shape property of node should be set as "group". The following code example illustrates how to create a BPMN Group.

**APP.VUE**

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin,BpmnDiagrams,Diagram,BpmnGatewayModel } from
'@syncfusion/ej2-vue-diagrams';
  Diagram.Inject(BpmnDiagrams);
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    //Sets type as Bpmn and shape as Group
    shape: {
      type: 'Bpmn',
      shape: 'Group',
    }
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/bpmn-shapes/Group-cs1" %}

**BPMN Flows**

**BPMN Flows** are lines that connects BPMN flow objects.

**Association**

**BPMN Association** flow is used to link flow objects with its corresponding text or artifact. An association is represented as a dotted graphical line with opened arrow. The type of association are as follows.

- Directional
- BiDirectional
- Default

The `association` property allows you to define the type of association. The following code example illustrates how to create an association.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
      :connectors='connectors' ></ejs-diagram>
    </div>
  </template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, BpmnDiagrams, Diagram } from '@syncfusion/ej2-vue-
diagrams';
  Diagram.Inject(BpmnDiagrams);

The following table demonstrates the visual representation of association flows.

Note : The default value for the property `association` is “default”.

### Sequence

A [Sequence](#) flow shows the order in which the activities are performed in a BPMN Process and is represented with a solid graphical line. The type of sequence are as follows.

- Normal
- Conditional
- Default

The sequence property allows you to define the type of sequence. The following code example illustrates how to create a sequence flow.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin,BpmnDiagrams,Diagram } from '@syncfusion/ej2-vue-
diagrams';
  Diagram.Inject(BpmnDiagrams);
  Vue.use(DiagramPlugin);
  let connectors = [{
    // Position of the node
    sourcePoint: {
      x: 100,
      y: 200
    },
    targetPoint: {
      x: 300,
      y: 200
    },
    type: 'Orthogonal',
    //Sets type as Bpmn, flow as Sequence and sequence as Conditional
    shape: {
      type: 'Bpmn',
      flow: 'Sequence',
      sequence: 'Conditional'
    },
  },
```

```

  ]]
  export default {

## UML diagram in Vue Diagram component

### UML Class Diagram

A class diagram visually depicts the static structure of an application and is extensively employed in modeling object-oriented systems. It holds a unique position in UML diagrams, as it directly aligns with object-oriented languages. The diagram also facilitates automatic generation of class diagram shapes based on business logic, streamlining the translation from conceptual models to practical implementation.

### Uml Class Diagram Shapes

The UML class diagram shapes are explained as follows.

#### Class

- A class defines a group of objects that share common specifications, features, constraints, and semantics. To create a class object, the classifier should be defined using the [class](#) notation. This notation serves as a foundational element in object-oriented programming, encapsulating the essential characteristics and behavior that objects belonging to the class will exhibit.
- Also, define the [name](#), [attributes](#), and [methods](#) of the class using the class property of node.
- The attribute's [name](#), [type](#), and [scope](#) properties allow you to define the name, data type, and visibility of the attribute.
- The method's [name](#), [parameters](#), [type](#), and [scope](#) properties allow you to define the name, parameter, return type, and visibility of the methods.
- The method parameters object properties allow you to define the name and type of the parameter.
- The following code example illustrates how to create a class.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin,UmlClassifierShapeModel } from '@syncfusion/ej2-
vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: "Patient",
    //Position of the node
    offsetX: 200,
    offsetY: 200,
    style: {
      fill: '#26A0DA',
    },
    shape: {
      type: "UmlClassifier",
      //Define class object
      classShape: {
        name: "Patient",
        //Define class attributes
```

```

        attributes: [{ name: "accepted", type: "Date" }],
        //Define class methods
        methods: [{ name: "getHistory", type: "getHistory" }]
    },
    classifier: "Class"
  } as UmlClassifierShapeModel
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/umldiagramshapes/class-cs1" %}

### Interface

- An interface is a specific type of classifier that signifies a declaration of a cohesive set of public features and obligations. When creating an interface, it involves defining the classifier property using the [interface](#) notation. This essential concept in object-oriented programming outlines a contract for classes to adhere to, specifying the required methods and behaviors without delving into the implementation details.
- Also, define the [name](#), [attributes](#), and [methods](#) of the interface using the interface property of the node.
- The attribute's name, type, and scope properties allow you to define the name, data type, and visibility of the attribute.
- The method's name, parameter, type, and scope properties allow you to define the name, parameter, return type, and visibility of the methods.
- The method parameter object properties of name and type allows you to define the name and type of the parameter.
- The following code example illustrates how to create an interface.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';

```

```

import { DiagramPlugin,UmlClassifierShapeModel } from '@syncfusion/ej2-
vue-diagrams';
Vue.use(DiagramPlugin);
let nodes = [{
  id: "Patient",
  //Position of the node
  offsetX: 200,
  offsetY: 200,
  style: {
    fill: '#26A0DA',
  },
  shape: {
    type: "UmlClassifier",
    //Define interface object
    interfaceShape: {
      name: "Patient",
      //Define interface attributes
      attributes: [{ name: "owner", type: "String[*]" }],
      //Define interface methods
      methods: [
        {
          name: "deposit",
          parameters: [
            {
              name: "amount",
              type: "Dollars"
            }
          ]
        }
      ]
    },
    classifier: "Interface"
  } as UmlClassifierShapeModel
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/umldiagramshapes/interface-cs1" %}

### Enumeration

- To establish an enumeration, designate the classifier property of the node as [enumeration](#). Additionally, define the name and enumerate the members of the enumeration using the appropriate enumeration property of the node. This process encapsulates a set of distinct values within the enumeration, allowing for a clear representation of specific, named constants within a system.
- You can set a name for the enumeration members collection using the name property of members collection.
- The following code example illustrates how to create an enumeration.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin,UmlClassifierShapeModel } from '@syncfusion/ej2-
vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: "Patient",
    offsetX: 200,
    offsetY: 200,
    style: {
      fill: '#26A0DA',
    },
    shape: {
      type: "UmlClassifier",
      //Define enumeration object
      enumerationShape: {
        name: "AccountType",
        //set the members of enumeration
        members: [
          {
            name: "Checking Account",
          },
          {
            name: "Savings Account"
          },
          {
            name: "Credit Account"
          }
        ]
      },
      classifier: "Enumeration"
    } as UmlClassifierShapeModel
  ]
}
export default {
  name: 'app'
  data() {
```

```

    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/umldiagramshapes/enumeration-cs1" %}

## UML Class Relationships

- A class may be involved in one or more relationships with other classes. A relationship can be one of the following types:

### Association

Association is basically a set of links that connects elements of an UML model. The type of association are as follows.

1. Directional
2. BiDirectional

The association property allows you to define the type of association. The default value of association is “Directional”. The following code example illustrates how to create an association.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :connectors='connectors' ></ejs-diagram>
  </div>

```

```

</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, UmlClassifierShapeModel } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let connectors = [{
    id: "connector",
    //Define connector start and end points
    sourcePoint: { x: 100, y: 100 },
    targetPoint: { x: 300, y: 300 },
    type: "Straight",
    shape: {
      type: "UmlClassifier",
      relationship: "Association",
      //Define type of association
      association: "BiDirectional"
    }
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        connectors: connectors,
      }
    }
  }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/umldiagramshapes/association-cs1" %}

### Aggregation

Aggregation is a binary association between a property and one or more composite objects which group together a set of instances.

Aggregation is decorated with a hollow diamond. To create an aggregation shape, define the relationship as “aggregation”.

The following code example illustrates how to create an aggregation.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';

```

```

import { DiagramPlugin,UmlClassifierShapeModel } from '@syncfusion/ej2-
vue-diagrams';
Vue.use(DiagramPlugin);
let connectors = [{
  id: "connector",
  //Define connector start and end points
  sourcePoint: { x: 100, y: 100 },
  targetPoint: { x: 300, y: 300 },
  type: "Straight",
  shape: {
    type: "UmlClassifier",
    //Set an relationship for connector
    relationship: "Aggregation"
  }
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      connectors: connectors,
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/umldiagramshapes/aggregation-cs1" %}

### Composition

Composition is a “strong” form of “aggregation”. Composition is decorated with a black diamond. To create a composition shape, define the relationship property of connector as “composition”.

The following code example illustrates how to create a composition.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin,UmlClassifierShapeModel } from '@syncfusion/ej2-
vue-diagrams';
  Vue.use(DiagramPlugin);
  let connectors = [{
    id: "connector",
    //Define connector start and end points
    sourcePoint: { x: 100, y: 100 },
    targetPoint: { x: 300, y: 300 },

```

```

    type: "Straight",
    shape: {
      type: "UmlClassifier",
      //Set an relationship for connector
      relationship: "Composition"
    }
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        connectors: connectors,
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/umldiagramshapes/composition-cs1" %}

### Dependency

Dependency is a directed relationship, which is used to show that some UML elements needs or depends on other model elements for specifications. Dependency is shown as dashed line with opened arrow. To create a dependency, define the relationship property of connector as “dependency”.

The following code example illustrates how to create an dependency.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin,UmlClassifierShapeModel } from '@syncfusion/ej2-
  vue-diagrams';
  Vue.use(DiagramPlugin);
  let connectors = [{
    id: "connector",
    //Define connector start and end points
    sourcePoint: { x: 100, y: 100 },
    targetPoint: { x: 300, y: 300 },
    type: "Straight",
    shape: {
      type: "UmlClassifier",
      //Set an relationship for connector
      relationship: "Dependency"
    }
  }

```

```

]]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      connectors: connectors,
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/umldiagramshapes/dependency-cs1" %}

### Inheritance

Inheritance is also called as “generalization”. Inheritance is a binary taxonomic directed relationship between a more general classifier (super class) and a more specific classifier (subclass). Inheritance is shown as a line with hollow triangle. To create an inheritance, define the relationship as “inheritance”.

To create an inheritance, define the relationship as “inheritance”.

The following code example illustrates how to create an inheritance.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin,UmlClassifierShapeModel } from '@syncfusion/ej2-
  vue-diagrams';
  Vue.use(DiagramPlugin);
  let connectors = [{
    id: "connector",
    //Define connector start and end points
    sourcePoint: { x: 100, y: 100 },
    targetPoint: { x: 300, y: 300 },
    type: "Straight",
    shape: {
      type: "UmlClassifier",
      //Set an relationship for connector
      relationship: "Inheritance"
    }
  }]
  export default {
    name: 'app'
    data() {
      return {

```

```

        width: "100%",
        height: "350px",
        connectors: connectors,
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/umldiagramshapes/inheritance-cs1" %}

### Multiplicity

Multiplicity is a definition of an inclusive interval of non-negative integers to specify the allowable number of instances of described element. The type of multiplicity are as follows.

1. OneToOne
2. ManyToOne
3. OneToMany
4. ManyToMany
  - By default the multiplicity will be considered as “OneToOne”.
  - The multiplicity property in UML allows you to specify large number of elements or some collection of elements.
  - The shape multiplicity’s source property is used to set the source label to connector and the target property is used to set the target label to connector.
  - To set an optionality or cardinality for the connector source label, use optional property.
  - The [lowerBounds](#) and [upperBounds](#) could be natural constants or constant expressions evaluated to natural (non negative) number. Upper bound could be also specified as asterisk ‘\*’ which denotes unlimited number of elements. Upper bound should be greater than or equal to the lower bound.
  - The following code example illustrates how to customize the multiplicity.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin,UmlClassifierShapeModel } from '@syncfusion/ej2-
  vue-diagrams';
  Vue.use(DiagramPlugin);
  let connectors = [{
    id: "connector",
    //Define connector start and end points
    sourcePoint: { x: 100, y: 100 },
    targetPoint: { x: 300, y: 300 },
  }

```

```

    type: "Straight",
    shape: {
      type: "UmlClassifier",
      relationship: "Dependency",
      multiplicity: {
        //Set multiplicity type
        type: "OneToMany",
        //Set source label to connector
        source: {
          optional: true,
          lowerBounds: 89,
          upperBounds: 67
        },
        //Set target label to connector
        target: {
          optional: true,
          lowerBounds: 78,
          upperBounds: 90
        }
      }
    }
  }
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      connectors: connectors,
    }
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/umldiagramshapes/multiplicity-cs1" %}

### How to add UML child at runtime

In UML nodes, child elements such as member, method and attribute can be added either programmatically or interactively.

#### Adding UML child through code

The [addChildToUmlNode](#) method is employed for dynamically adding a child to the UML node during runtime, providing flexibility in modifying the diagram structure programmatically.

The following code illustrates how to add methods to UML nodes in diagram.

```
`ts
```

```
let node = diagram.selectedItems.nodes[0];
```

```
let methods = { name: 'getHistory', style: { color: "red", }, parameters: [{ name: 'Date', style: {} }], type: 'History' };
```

```
diagram.addChildToUmlNode(node, methods, 'Method');
```

```
,
```

### APP.VUE

```
<template>
  <div id="app">
    <button @click="addMethod">addMethod</button>
    <ejs-diagram id="diagram" ref="diagramObj" :width='width'
:height='height' :nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin,UmlClassifierShapeModel } from '@syncfusion/ej2-
vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'node1',
    offsetX: 150,
    offsetY: 150,
    style: {
      fill: '#26A0DA',
    },
    shape: {
      type: 'UmlClassifier',
      classShape: {
        attributes: [
          { name: 'accepted', type: 'Date', },
        ],
        methods: [{ name: 'getHistory', style: {}, parameters: [{

#### [Adding UML child through user interaction](#)

To include a child, select a node, move the mouse outside it, and position the pointer near the right side. A highlighter emerges between the two child elements. Click the highlighter to add a child type to the chosen UML node seamlessly. The following gif illustrates how to add Child through user interaction.

### Adding UML Nodes in Symbol palette

UML built-in shapes are efficiently rendered in a symbol palette. The `symbols` property is utilized to define UML symbols with the necessary classes and methods. By incorporating this feature, you can seamlessly augment the palette with a curated collection of predefined UML symbols, thereby enhancing the versatility of your UML diagramming application.

The following code example showcases the rendering of UML built-in shapes in a symbol palette.

#### APP.VUE

```

<template>
  <div style="width: 100%">
    <div id="palette-space" class="sb-mobile-palette">

### Editing

You can edit the name, attributes, and methods of the class diagram shapes just double clicking, similar to editing a node annotation.

The following image illustrates how the text editor looks in an edit mode.

### UML Activity diagram

An Activity diagram functions as a visual flowchart, illustrating the progression from one activity to the next within a system. Each activity corresponds to a system operation, providing a clear depiction of the sequential flow in a dynamic process..

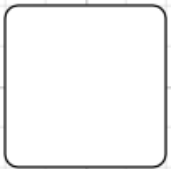

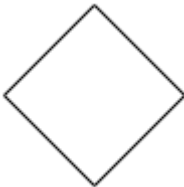

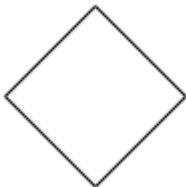

The purpose of an activity diagram can be described as follows.

1. Draw the activity flow of a system.
2. Describe the sequence from one activity to another.
3. Describe the parallel, branched, and concurrent flow of the system.

### UML Activity diagram Shapes

To create a UmlActivity, define type as "UmlActivity" and the list of built-in shapes as demonstrated as follows and it should be set in the "shape" property.

Shape	Image
-----	-----

Action		
Decision		
MergeNode		
InitialNode		
FinalNode		
ForkNode		
JoinNode		

| Note

The following code illustrates how to create a UmlActivity shapes.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin,UmlClassifierShapeModel } from '@syncfusion/ej2-
vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: "UmlDiagram",
    //Set node size
    width: 100,
    height: 100,
    //position the node
    offsetX: 200,
    offsetY: 200,
    shape: {
      type: "UmlActivity",
      //Define UmlActivity shape
      shape: "Action"
    }
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/umldiagramshapes/UmlActivity-cs1" %}

### UmlActivity connector

To create an UmlActivity connector, define the type as "UmlActivity" and flow as either "Exception" or "Control" or "Object".

The following code illustrates how to create a UmlActivity connector.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin,UmlClassifierShapeModel } from '@syncfusion/ej2-
vue-diagrams';
  Vue.use(DiagramPlugin);
  let connectors = [{
    id: 'connector',
    type: 'Straight',
    //Define connector start and end points
    sourcePoint: { x: 100, y: 100 },
    targetPoint: { x: 200, y: 200 },
    shape: { type: 'UmlActivity', flow: 'Exception' }
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        connectors: connectors,
      }
    }
  }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/diagram/umldiagramshapes/UmlActivityConnector-cs1" %}

### Connectors in Vue Diagram component

Connectors are objects used to create link between two points, nodes or ports to represent the relationships between them.

#### Create Connector

Connector can be created by defining the source and target point of the connector. The path to be drawn can be defined with a collection of segments. To explore the properties of a [connector](#), refer to [Connector Properties](#).

## Add connectors through connectors collection

- The [sourcePoint](#) and [targetPoint](#) properties of connector allow you to define the end points of a connector.

The following code example illustrates how to add a connector through connector collection.

**APP.VUE**

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let connectors = [{
    // Name of the connector
    id: "connector1",
    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7',
      strokeWidth: 2
    },
    targetDecorator: {
      style: {
        fill: '#6BA5D7',
        strokeColor: '#6BA5D7'
      }
    },
    // Sets source and target points
    sourcePoint: {
      x: 100,
      y: 100
    },
    targetPoint: {
      x: 200,
      y: 200
    }
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        connectors: connectors
      }
    }
  }
</script>
<style>
```

```
@import "../../../node_modules/@syncfusion/ej2-vue-  
diagrams/styles/material.css";  
</style>
```

{% previewsample "page.domainurl/code-snippet/diagram/connectors/Connectors-cs1" %}

Add connector at run time\*\*

- Connectors can be added at runtime by using public method, `diagram.add` and can be removed at runtime by using public method, `diagram.remove`.

The following code example illustrates how to add connector at runtime.

#### APP.VUE

```
<template>  
  <div id="app">  
    <ejs-diagram id="diagram" :width='width' :height='height'></ejs-  
diagram>  
  </div>  
</template>  
<script>  
  import Vue from 'vue';  
  import { DiagramPlugin, Diagram, ConnectorModel } from '@syncfusion/ej2-  
vue-diagrams';  
  Vue.use(DiagramPlugin);  
  let connector: ConnectorModel = {  
    // Name of the connector  
    id: "connector1",  
    style: {  
      strokeColor: '#6BA5D7',  
      fill: '#6BA5D7',  
      strokeWidth: 2  
    },  
    targetDecorator: {  
      style: {  
        fill: '#6BA5D7',  
        strokeColor: '#6BA5D7'  
      }  
    },  
    // Sets source and target points  
    sourcePoint: {  
      x: 100,  
      y: 100  
    },  
    targetPoint: {  
      x: 200,  
      y: 200  
    }  
  }  
  export default {  
    name: 'app'  
    data() {  
      return {  
        width: "100%",  

```

```

        height: "350px",
      }
    }
    mounted: function() {
      let diagramInstance: Diagram;
      let diagramObj: any = document.getElementById("diagram");
      diagramInstance = diagramObj.ej2_instances[0];
      // Adds to the diagram
      diagramInstance.add(connector)
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/connectors/Connectorsatruntime-cs1" %}

### Connectors from palette

- Connectors can be predefined and added to the symbol palette. You can drop those connectors into the Diagram, when required.

For more information about adding connectors from symbol palette, refer to [\[Symbol Palette\]](#).

### Draw connectors

Connectors can be interactively drawn by clicking and dragging on the Diagram surface by using [\[drawingObject\]](#). For more information about drawing connectors, refer to [Draw Connectors](#).

### Update Connector at runtime

Various Connector properties such as [sourcePoint](#), [targetPoint](#), [style](#), [sourcePortID](#), [targetPortID](#) etc can be update at the run time .

- The following code example illustrates how to update a connector's source point, target point, styles properties at runtime.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let connectors = [{
    // Name of the connector
    id: "connector1",
    // Sets source and target points
    sourcePoint: {

```

```

        x: 100,
        y: 100
      },
      targetPoint: {
        x: 200,
        y: 200
      }
    }
  ]
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      connectors: connectors
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    diagramInstance.connectors[0].style.strokeColor = '#6BA5D7';
    diagramInstance.connectors[0].style.fill = '#6BA5D7';
    diagramInstance.connectors[0].style.strokeWidth = 2;
    diagramInstance.connectors[0].targetDecorator.style.fill =
'#6BA5D7';
    diagramInstance.connectors[0].targetDecorator.style.strokeColor =
'#6BA5D7';
    diagramInstance.connectors[0].sourcePoint.x = 150;
    diagramInstance.connectors[0].targetPoint.x = 150;
    diagramInstance.dataBind();
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/connectors/Connectorsupdate-cs1" %}

### Connect nodes

- The [sourceID](#) and [targetID](#) properties allow to define the nodes to be connected.
- The [connectorSpacing](#) property allows you to define the distance between the source node and the connector. It is the minimum distance the connector will re-rout or the new segment will create.
- The following code example illustrates how to connect two nodes.

### APP.VUE

```

<template>
  <div id="app">

```

```

    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' :connectors='connectors' :getNodeDefaults='getNodeDefaults'
></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'Start',
    width: 140,
    height: 50,
    offsetX: 300,
    offsetY: 100,
    annotations: [{
      id: 'label1',
      content: 'Start'
    }],
    shape: {
      type: 'Flow',
      shape: 'Terminator'
    }
  },
  {
    id: 'Init',
    width: 140,
    height: 50,
    offsetX: 300,
    offsetY: 300,
    shape: {

{% previewsample "page.domainurl/code-snippet/diagram/connectors/ConnectNode-cs1" %}

- When you remove NodeConstraints InConnect from Default, the node accepts only an outgoing connection to dock in it. Similarly, when you remove NodeConstraints OutConnect from Default, the node accepts only an incoming connection to dock in it.
- When you remove both InConnect and OutConnect NodeConstraints from Default, the node restricts connector to establish connection in it.
- The following code illustrates how to disable InConnect constraints.

`ts

//Initialize diagram

```

let diagram: Diagram = new Diagram({
  nodes:[
    {
      id: 'node', width: 100, height: 100, offsetX: 100, offsetY: 150,
      shape: { type: 'Basic', shape: 'Rectangle' },
      //Disable InConnect constraints
      constraints: NodeConstraints.Default & ~NodeConstraints.InConnect,
    }
  ]
});

```

```
diagram.appendTo('#diagram');
```

```
,
```

### Connections with ports

The [sourcePortID](#) and [targetPortID](#) properties allow to create connections between some specific points of source/target nodes.

The following code example illustrates how to create port to port connections.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' :connectors='connectors' :getNodeDefaults='getNodeDefaults'
></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, PointPortModel, PortVisibility } from
'@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let port1: PointPortModel = {
    style: {
      strokeColor: '#366F8C',
      fill: '#366F8C'
    }
  }
  port1.shape = 'Circle';
  port1.id = 'nodeportnew'
  port1.visibility = PortVisibility.Visible
  port1.id = 'port';
  port1.offset = {
    x: 1,
    y: 1
  };
  let port2: PointPortModel = {
    style: {
      strokeColor: '#366F8C',
      fill: '#366F8C'
    }
  };
  port2.offset = {
    x: 1,
    y: 0.5
  };
  port2.id = 'port1';
  port2.visibility = PortVisibility.Visible
  port2.shape = 'Circle';
  let port3: PointPortModel = {
    style: {
      strokeColor: '#366F8C',
      fill: '#366F8C'
    }
  };
  port3.offset = {
```

```

        x: 0,
        y: 1
    };
    port3.id = 'newnodeport1';
    port3.visibility = PortVisibility.Visible
    port3.shape = 'Circle';
    let nodes = [{
        id: 'node',
        width: 100,
        height: 100,
        offsetX: 100,
        offsetY: 100,
        ports: [port1]
    },
    {
        id: 'node1',
        width: 100,
        height: 100,
        offsetX: 300,
        offsetY: 100,
        ports: [port2, port3]
    },
    ];
    let connectors = {
        id: "connector1",
        sourcePoint: {
            x: 100,
            y: 100
        },
        type: 'Orthogonal',
        targetPoint: {
            x: 200,
            y: 200
        },
        sourceID: 'node',
        targetID: 'node1',
        sourcePortID: 'port',
        targetPortID: 'port1'
    }
    export default {
        name: 'app'
        data() {
            return {
                width: "100%",
                height: "350px",
                nodes: nodes,
                connectors: [connectors],
                getNodeDefaults: (node) => {
                    node.height = 100;
                    node.width = 100;
                    node.style.fill = '#6BA5D7';
                    node.style.strokeColor = 'white';
                    return node;
                },
            }
        }
    }
}

```

```

</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/connectors/Connectorsportupdate-cs1" %}

similarly we can change the [sourcePortID] or [targetPortID] at the run time by the changing the port [sourcePortID](#) or [targetPortID](#)

The following code example illustrates how to create port to port connections.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' :connectors='connectors' :getNodeDefaults='getNodeDefaults'
    ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, PointPortModel, PortVisibility } from
  '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let port1: PointPortModel = {
    style: {
      strokeColor: '#366F8C',
      fill: '#366F8C'
    }
  }
  port1.shape = 'Circle';
  port1.id = 'nodeportnew'
  port1.visibility = PortVisibility.Visible
  port1.id = 'port';
  port1.offset = {
    x: 1,
    y: 1
  };
  let port2: PointPortModel = {
    style: {
      strokeColor: '#366F8C',
      fill: '#366F8C'
    }
  };
  port2.offset = {
    x: 1,
    y: 0.5
  };
  port2.id = 'port1';
  port2.visibility = PortVisibility.Visible
  port2.shape = 'Circle';
  let port3: PointPortModel = {
    style: {
      strokeColor: '#366F8C',

```

```

        fill: '#366F8C'
      }
    };
    port3.offset = {
      x: 0,
      y: 1
    };
    port3.id = 'newnodeport1';
    port3.visibility = PortVisibility.Visible;
    port3.shape = 'Circle';
    let nodes = [{
      id: 'node',
      width: 100,
      height: 100,
      offsetX: 100,
      offsetY: 100,
      ports: [port1]
    },
    {
      id: 'node1',
      width: 100,
      height: 100,
      offsetX: 300,
      offsetY: 100,

      x: 200,
      y: 200
    },
    sourceID: 'node',
    targetID: 'node1',
    sourcePortID: 'port',
    targetPortID: 'port1'
  }
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
        connectors: [connectors],
        getNodeDefaults: (node) => {
          node.height = 100;
          node.width = 100;
          node.style.fill = '#6BA5D7';
          node.style.strokeColor = 'white';
          return node;
        }
      }
    }
  }

```

```

    },
  },
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    diagramInstance.connectors[0].targetPortID = 'newnodeport1'
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/connectors/ConnectorsSegments-cs1" %}

- When you set PortConstraints to InConnect, the port accepts only an incoming connection to dock in it. Similarly, when you set PortConstraints to OutConnect, the port accepts only an outgoing connection to dock in it.
- When you set PortConstraints to None, the port restricts connector to establish connection in it.

`ts

//Initialize diagram

```

let diagram: Diagram = new Diagram({
nodes:[
{
id: 'node', width: 100, height: 100, offsetX: 100, offsetY: 150,
shape: { type: 'Basic', shape: 'Rectangle' },
ports: [
//Enable portConstraints Inconnect
{ id: 'port', height: 10, width: 10, offset: { x: 1, y: 0.5 }, constraints: PortConstraints.InConnect },
]
}
]
});
diagram.appendTo('#diagram');

```

### Segments

The path of the connector is defined with a collection of segments. There are three types of segments.

### Straight

To create a straight line, you should specify the [type](#) of the segment as “straight” and add a straight segment to [segments](#) collection and need to specify [type](#) for the connector. The following code example illustrates how to create a default straight segment.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let connectors = [{
    id: "connector1",
    type: 'Straight',
    segments: [{
      // Defines the segment type of the connector
      type: 'Straight'
    }],
    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7',
      strokeWidth: 2
    },
    targetDecorator: {
      style: {
        fill: '#6BA5D7',
        strokeColor: '#6BA5D7'
      }
    },
    sourcePoint: {
      x: 100,
      y: 100
    },
    targetPoint: {
      x: 200,
      y: 200
    }
  ]
}
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      connectors: connectors
    }
  }
}
</script>
<style>
```

```
@import "../../../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/diagram/connectors/ConnectorsSegmentsPoints-cs1"  
%}

The [point](#) property of straight segment allows you to define the end point of it. The following code example illustrates how to define the end point of a straight segment.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let connectors = [{
    id: "connector1",
    // Defines the segment type of the connector
    segments: [{
      type: 'Straight',
      // Defines the point of the segment
      point: {
        x: 100,
        y: 150
      }
    }],
    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7',
      strokeWidth: 2
    },
    targetDecorator: {
      style: {
        fill: '#6BA5D7',
        strokeColor: '#6BA5D7'
      }
    },
    type: 'Straight',
    sourcePoint: {
      x: 100,
      y: 100
    },
    targetPoint: {
      x: 200,
      y: 200
    }
  }],
  export default {
    name: 'app'
```

```

    data() {
      return {
        width: "100%",
        height: "350px",
        connectors: connectors
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/connectors/ConnectorsOrthoSegments-cs1" %}

### Orthogonal

Orthogonal segments are used to create segments that are perpendicular to each other.

Set the segment [type](#) as “orthogonal” to create a default orthogonal segment and need to specify [type](#). The following code example illustrates how to create a default orthogonal segment.

- Multiple segments can be defined one after another. To create a connector with multiple segments, define and add the segments to [connector.segments](#) collection. The Following code example illustrates how to create a connector with multiple segments.
- The property [maxSegmentThumb](#) is used to limit the segment thumb in the connector.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, ConnectorConstraints ,ConnectorEditing, Diagram}
  from '@syncfusion/ej2-vue-diagrams';
  Diagram.Inject(ConnectorEditing);
  Vue.use(DiagramPlugin);
  let connectors = [{
    id: "connector1",
    // Define the type of the segment
    type: 'Orthogonal',
    segments: [{
      type: 'Orthogonal'
    }],
    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7',
      strokeWidth: 2
    },
    targetDecorator: {

```

```

        style: {
            fill: '#6BA5D7',
            strokeColor: '#6BA5D7'
        },
        sourcePoint: {
            x: 100,
            y: 100
        },
        targetPoint: {
            x: 200,
            y: 200
        },
        maxSegmentThumb: 3,
        constraints: ConnectorConstraints.Default |
ConnectorConstraints.DragSegmentThumb
    ]]
    export default {
        name: 'app',
        data() {
            return {
                width: "100%",
                height: "350px",
                connectors: connectors
            }
        }
    }

### How to customize Orthogonal Segment Thumb Shape

The orthogonal connector has a number of segments in between the source and the target point. The segments are rendered with the default shape rhombus. Now, the option has been provided to change the segment thumb shape using the [segmentThumbShape](#) property. The predefined shapes provided are as follows:

- Rhombus
- Square
- Rectangle
- Ellipse
- Arrow
- Diamond
- OpenArrow
- Circle
- Fletch
- OpenFetch
- IndentedArrow
- OutdentedArrow
- DoubleArrow

You can customize the style of the thumb shape by overriding the class e-orthogonal-thumb.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
      :connectors='connectors'

```

```

        :getConnectorDefaults='getConnectorDefaults'
        :segmentThumbShape="segmentThumbShape"
    >
    </ejs-diagram>
</div>
</template>
<script>
    import Vue from 'vue';
    import { DiagramPlugin, ConnectorConstraints, ConnectorEditing, Diagram }
    from '@syncfusion/ej2-vue-diagrams';
    Diagram.Inject(ConnectorEditing);
    Vue.use(DiagramPlugin);
    let connectors = [{
        id : 'connector',
        // Define the type of the segment
        type : 'Orthogonal',
        sourcePoint : { x: 250, y: 250 },
        targetPoint : { x: 350, y: 350 },
        segments : [
            {
                type: 'Orthogonal',
                // Defines the direction for the segment lines
                direction: "Right",
                // Defines the length for the segment lines
                length: 70
            },
            {
                type: 'Orthogonal',
                direction: "Bottom",
                length: 20
            }
        ]
    }
    ]
    export default {
        name: 'app',
        data() {
            return {
                width: "900px",
                height: "500px",
                connectors: connectors,
                segmentThumbShape: 'Square',
                getConnectorDefaults: (connector) => {
                    connector.constraints = ConnectorConstraints.Default |
ConnectorConstraints.DragSegmentThumb;
                }
            }
        }
    }
</script>
<style>
    @import "../../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/connectors/ConnectorsThumbshape-cs1" %}

Use the following CSS to customize the segment thumb shape.

```
`scss
.e-orthogonal-thumb {
fill: rgb(126, 190, 219);
stroke: #24039e;
stroke-width: 3px;
}
`
```

### Bezier

Bezier segments are used to create curve segments and the curves are configurable either with the control points or with vectors.

To create a bezier segment, the [segment.type](#) is set as `bezier` and need to specify [type](#) for the connector. The following code example illustrates how to create a default Bezier segment.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
```

```

let connectors = [{
  id: 'connector1',
  style: {
    strokeColor: '#6BA5D7',
    fill: '#6BA5D7',
    strokeWidth: 2
  },
  targetDecorator: {
    style: {
      fill: '#6BA5D7',
      strokeColor: '#6BA5D7'
    }
  },
  type: 'Bezier',
  segments: [{
    // Defines the type of the segment
    type: 'Bezier',
  }],
  sourcePoint: {
    x: 50,
    y: 100
  },
  targetPoint: {
    x: 150,
    y: 200
  },
}, ]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      connectors: connectors
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/connectors/ConnectorsBezier-cs2" %}

The [point1](#) and [point2](#) properties of bezier segment enable you to set the control points. The following code example illustrates how to configure the Bezier segments with control points.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :connectors='connectors' ></ejs-diagram>
  </div>
</template>

```

```

<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let connectors = [{
    id: 'connector3',
    type: 'Bezier',
    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7',
      strokeWidth: 2
    },
    targetDecorator: {
      style: {
        fill: '#6BA5D7',
        strokeColor: '#6BA5D7'
      }
    },
    segments: [{
      type: 'Bezier',
      // First control point: an absolute position from the page origin
      point1: {
        x: 100,
        y: 100
      },
      // Second control point: an absolute position from the page origin
      point2: {
        x: 200,
        y: 200
      }
    }
  ]],
  sourcePoint: {
    x: 100,
    y: 200
  },
  targetPoint: {
    x: 200,
    y: 100
  },
}, ]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      connectors: connectors
    }
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/connectors/ConnectorsBezierPoints-cs2" %}

The [vector1](#) and [vector2](#) properties of bezier segment enable you to define the vectors. The following code illustrates how to configure a bezier curve with vectors.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let connectors = [{
    id: 'connector2',
    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7',
      strokeWidth: 2
    },
    targetDecorator: {
      style: {
        fill: '#6BA5D7',
        strokeColor: '#6BA5D7'
      }
    },
    // Defines the type of the segment
    type: 'Bezier',
    segments: [{
      type: 'Bezier',
      // Length and angle between the source point and the first control
point
      vector1: {
        distance: 100,
        angle: 90
      },
      // Length and angle between the target point and the second control
point
      vector2: {
        distance: 45,
        angle: 270
      }
    },
  ]},
  sourcePoint: {
    x: 100,
    y: 100
  },
  targetPoint: {
    x: 200,
    y: 200
  },
}, ]
export default {
```

```

    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        connectors: connectors
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/connectors/ConnectorsBezierVector-cs1" %}

### Avoid overlapping with bezier

By default, when there are no segments defined for a bezier connector, the bezier segments will be created automatically and routed in such a way that avoids overlapping with the source and target nodes.

,

<template>

<div id="app">

<ejs-diagram id="diagram" :width='width' :height='height' :nodes='nodes' :connectors='connectors'  
:getNodeDefaults='getNodeDefaults'

:getConnectorDefaults='getConnectorDefaults' ></ejs-diagram>

</div>

</template>

<script>

import Vue from 'vue';

import { DiagramPlugin,Diagram,NodeModel,ConnectorModel,ConnectorEditing,ConnectorConstraints }  
from '@syncfusion/ej2-vue-diagrams';

Diagram.Inject(ConnectorEditing);

Vue.use(DiagramPlugin);

let nodes: NodeModel[] = [{

id: 'Start',

offsetX: 250,

offsetY: 150,

annotations: [{ content: 'Start' }]

},

```
{
  id: 'End',
  offsetX: 450,
  offsetY: 200,
  annotations: [{ content: 'End' }]
  });
let connectors: ConnectorModel[] = [{
  id: "connector1",
  style: {
    strokeColor: '#6BA5D7',
    fill: '#6BA5D7',
    strokeWidth: 2
  },
  targetDecorator: { shape: 'None' },
  // ID of the source and target nodes
  sourceID: "Start",
  targetID: "End",
  type: 'Bezier'
  });
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "600px",
      nodes:nodes,
      connectors:connectors,
      getNodeDefaults: (node)=>{
        node.height = 100;
        node.width = 100;
        node.shape = { type: 'Basic', shape: 'Rectangle' }
        node.style.fill = '#6BA5D7';
        node.style.strokeColor = 'white';
```

```

return node;
},
getConnectorDefaults: (connector)=> {
  connector.constraints = ConnectorConstraints.Default | ConnectorConstraints.DragSegmentThumb;
}
}
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>
`

```

Also, the intermediate point of two adjacent bezier segments can be edited interactively based on the `bezierSettings.segmentEditOrientation` property of the connector class.

#### *How to interact with the bezier segments efficiently*

While interacting with multiple bezier segments, maintain their control points at the same distance and angle by using the `bezierSettings.smoothness` property of the connector class.

| BezierSmoothness value | Description   |
|------------------------|---|
| ----- -----            |   |
| SymmetricDistance      | Both control points of adjacent segments will be at the same distance when any one of them is editing.                |
| SymmetricAngle         | Both control points of adjacent segments will be at the same angle when any one of them is editing.                   |
| Default                | Both control points of adjacent segments will be at the same angle and same distance when any one of them is editing. |
| None                   | Segment's control points are interacted independently from each other.  |

```

<template>
<div id="app">
<ejs-diagram id="diagram" :width='width' :height='height' :nodes='nodes' :connectors='connectors'
:getNodeDefaults='getNodeDefaults'
:getConnectorDefaults='getConnectorDefaults' ></ejs-diagram>
</div>
</template>

```

```
<script>
import Vue from 'vue';

import { DiagramPlugin,Diagram,NodeModel,ConnectorModel,ConnectorEditing,ConnectorConstraints }
from '@syncfusion/ej2-vue-diagrams';

Diagram.Inject(ConnectorEditing);

Vue.use(DiagramPlugin);

let nodes: NodeModel[] = [{
  id: 'Start',
  offsetX: 250,
  offsetY: 150,
  annotations: [{ content: 'Start' }],
  ports: [{
    id: 'StartPort',
    visibility: PortVisibility.Visible,
    shape: 'Circle',
    offset: { x: 1, y: 0.5 },
    style: { strokeColor: '#366F8C', fill: '#366F8C' }
  ]
},
{
  id: 'End',
  offsetX: 450,
  offsetY: 200,
  annotations: [{ content: 'End' }],
  ports: [{
    id: 'EndPort',
    visibility: PortVisibility.Visible,
    shape: 'Circle',
    offset: { x: 0, y: 0.5 },
    style: { strokeColor: '#366F8C', fill: '#366F8C' }
  ]
}
];

let connectors: ConnectorModel[] = [{
```

```
id: "connector1",
style: {
  strokeColor: '#6BA5D7',
  fill: '#6BA5D7',
  strokeWidth: 2
},
targetDecorator: { shape: 'None' },
// ID of the source and target nodes
sourceID: "Start",
targetID: "End",
type: 'Bezier',
// Configuring settings for bezier interactions
bezierSettings = { smoothness: BezierSmoothness.SymmetricAngle }
});
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "600px",
      nodes:nodes,
      connectors:connectors,
      getNodeDefaults: (node)=>{
        node.height = 100;
        node.width = 100;
        node.shape = { type: 'Basic', shape: 'Rectangle' }
        node.style.fill = '#6BA5D7';
        node.style.strokeColor = 'white';
        return node;
      },
      getConnectorDefaults: (connector)=> {
        connector.constraints = ConnectorConstraints.Default | ConnectorConstraints.DragSegmentThumb;
      }
    }
  }
}
```

```

}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>
`

```

Also, the visibility of control points can be controlled using the `bezierSettings.controlPointsVisibility` property of the connector class.

```

## Decorator

- Start and end points of a connector can be decorated with some customizable shapes like arrows, circles, diamond or path. You can decorate the connection end points with the [sourceDecorator](#) and [targetDecorator](#) properties of connector.
- The [shape](#) property of [sourceDecorator](#) allows to define the shape of the decorators. Similarly, the [shape](#) property of [targetDecorator](#) allows to define the shape of the decorators.
- To create custom shape for source decorator, use [pathData](#) property. similarly, to create custom shape for target decorator, use [pathData](#) property.
- The following code example illustrates how to create decorators of various shapes.

**APP.VUE**

```

<template>

```

### Padding

Padding is used to leave the space between the Connector's end point and the object to where it is connected.

- The [sourcePadding](#) property of connector defines space between the source point and the source node of the connector.
- The [targetPadding](#) property of connector defines space between the end point and the target node of the connector.
- The following code example illustrates how to leave space between the connection end points and source and target nodes.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
      :nodes='nodes' :connectors='connectors' :getNodeDefaults='getNodeDefaults'
    ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'node',
    width: 100,
    height: 100,
    offsetX: 100,
    offsetY: 100,
  },
  {
    id: 'node1',
    width: 100,
    height: 100,
    offsetX: 300,
    offsetY: 100,
  }
];
  let connectors = [{
    id: "connector1",
    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7',
      strokeWidth: 2
    },
    targetDecorator: {
      style: {
        fill: '#6BA5D7',
        strokeColor: '#6BA5D7'
      }
    },
    sourceID: "node",
```

```

    targetID: "node1",
    // Set Source Padding value
    sourcePadding:20,
    // Set Target Padding value
    targetPadding:20
  }, ]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
      connectors: connectors,
      getNodeDefaults: (node) => {
        node.height = 100;
        node.width = 100;
        node.style.fill = '#6BA5D7';
        node.style.strokeColor = 'white';
        return node;
      },
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/connectors/ConnectNode-cs2" %}

### Hit padding

- The [hitPadding](#) property enables you to define the clickable area around the connector path. The default value for hitPadding is 10.
- The following code example illustrates how to specify hit padding for connector.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :connectors='connectors' :getConnectorDefaults='getConnectorDefaults'
    ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { Diagram, DiagramPlugin, ConnectorEditing, ConnectorConstraints }
  from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  Diagram.Inject(ConnectorEditing);
  let connectors = [{
    // Name of the connector

```

```

id: "connector1",
type: "Orthogonal",
//set hit padding
hitPadding: 50,
style: {
  strokeColor: '#6BA5D7',
  fill: '#6BA5D7',
  strokeWidth: 2
},
targetDecorator: {
  style: {
    fill: '#6BA5D7',
    strokeColor: '#6BA5D7'
  }
},
sourcePoint: { x: 100, y: 100 },
targetPoint: { x: 300, y: 300 }
}, ]
export default {
  name: 'app',
  data() {
    return {
      width: "100%",
      height: "350px",
      connectors: connectors,
      getConnectorDefaults: (connector) => {
        connector.constraints = ConnectorConstraints.Default |
ConnectorConstraints.DragSegmentThumb;
        return connector;
      },
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/connectors/ConnectorHitPadding-cs1" %}

## Flip

The diagram Provides support to flip the connector. The [flip](#) is performed to give the mirrored image of the original element.

The flip types are as follows:

- HorizontalFlip

[Horizontal](#) is used to interchange the connector source and target x points.

- VerticalFlip

[Vertical](#) is used to interchange the connector source and target y points.

- Both

[Both](#) is used to interchange the source point as target point and target point as source point

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let connectors = [{
    // Name of the connector
    id: "connector1",
    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7',
      strokeWidth: 2
    },
    targetDecorator: {
      style: {
        fill: '#6BA5D7',
        strokeColor: '#6BA5D7'
      }
    },
    sourcePoint: {
      x: 100,
      y: 100
    },
    targetPoint: {
      x: 200,
      y: 200
    },
    // Flip the connector in horizontal direction
    flip:"Horizontal"
  }
]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      connectors: connectors
    }
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/diagram/connectors/ConnectorsDecorator-cs2" %}
```

Note: The flip is not applicable when the connectors connect in nodes

### Bridging

Line Bridging creates a bridge for lines to smartly cross over other lines, at points of intersection. By default [bridgeDirection](#) is set to top. Depending upon the direction given bridging direction appears. Bridging can be enabled/disabled either with the `[connector.constraints]` or `[diagram.constraints]`. The following code example illustrates how to enable line bridging.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
      :nodes='nodes' :connectors='connectors' :constraints='constraints'
      :getNodeDefaults='getNodeDefaults'
      :getConnectorDefaults='getConnectorDefaults'></ejs-diagram>
    </div>
  </template>
<script>
  import Vue from 'vue';
  import { Diagram, DiagramPlugin, DiagramConstraints, ConnectorBridging }
  from '@syncfusion/ej2-vue-diagrams';
  Diagram.Inject(ConnectorBridging);
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'Transaction',
    width: 150,
    height: 60,
    offsetX: 300,
    offsetY: 60,
    shape: {
      type: 'Flow',
      shape: 'Terminator'
    },
    annotations: [{
      id: 'labell1',
      content: 'Start Transaction',
      offset: {
        x: 0.5,
        y: 0.5
      }
    }
  ]},
  {
    id: 'Verification',
    width: 150,
    height: 60,
    offsetX: 300,
    offsetY: 250,
    shape: {
      type: 'Flow',
      shape: 'Process'
    }
  },
```

```

        annotations: [{
          id: 'label2',
          content: 'Verification',
          offset: {
            x: 0.5,
            y: 0.5
          }
        }]
      }
    ]
  };
  let connectors = [{
    id: 'connector1',
    type: 'Straight',
    sourceID: 'Transaction',
    targetID: 'Verification'
  }, {
    id: 'connector2',
    type: 'Straight',
    sourcePoint: {
      x: 200,
      y: 130
    },
    targetPoint: {
      x: 400,
      y: 130
    }
  }, {
    id: 'connector3',
    type: 'Straight',
    sourcePoint: {
      x: 200,
      y: 170
    },
    targetPoint: {
      x: 400,
      y: 170
    }
  }
  ]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        constraints: DiagramConstraints.Default |
DiagramConstraints.Bridging,
        nodes: nodes,
        connectors: connectors,
        getNodeDefaults: (node) => {
          node.height = 100;
          node.width = 100;
          node.style.fill = '#6BA5D7';
          node.style.strokeColor = 'white';
          return node;
        },
      },
    },
  }

```

```

        getConnectorDefaults: (obj) => {
            obj.style.strokeColor = '#6BA5D7';
            obj.style.fill = '#6BA5D7';
            obj.style.strokeWidth = 2;
            obj.targetDecorator.style.fill = '#6BA5D7';
            obj.targetDecorator.style.strokeColor = '#6BA5D7';
            return obj;
        },
    },
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/connectors/ConnectorsBridging-cs1" %}

Note: We Need to inject Connector bridging module into the diagram.

You can use [bridgeSpace](#) property of connectors to define the width for line bridging.

Limitation: Bezier segments do not support bridging.

### Corner radius

Corner radius allows to create connectors with rounded corners. The radius of the rounded corner is set with [cornerRadius](#) property.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
        :nodes='nodes' :connectors='connectors'
        :getNodeDefaults='getNodeDefaults'></ejs-diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
    Vue.use(DiagramPlugin);
    let nodes = [{
        id: 'node1',
        width: 100,
        height: 100,
        offsetX: 100,
        offsetY: 100,
    },
    {
        id: 'node2',
        width: 100,
        height: 100,
        offsetX: 100,
        offsetY: 350,
    },
    ];

```

```

let connectors = [{
  id: "connector1",
  type: 'Orthogonal',
  style: {
    strokeColor: '#6BA5D7',
    fill: '#6BA5D7',
    strokeWidth: 2
  },
  targetDecorator: {
    style: {
      fill: '#6BA5D7',
      strokeColor: '#6BA5D7'
    }
  },
  // Sets the radius for the rounded corner
  cornerRadius: 10,
  sourceID: 'node1',
  targetID: 'node2',
  segments: [{
    type: 'Orthogonal',
    direction: 'Right',
    length: 50
  }],
}],
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
      connectors: connectors,
      getNodeDefaults: (node) => {
        node.height = 100;
        node.width = 100;
        node.style.fill = '#6BA5D7';
        node.style.strokeColor = 'white';
        return node;
      },
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

```
{% previewsample "page.domainurl/code-snippet/diagram/connectors/ConnectorsCornerRadius-cs1"
%}
```

### Appearance

- The Connector's [strokeWidth](#), [strokeColor](#), [strokeDashArray](#) and [opacity](#) properties are used to customize the appearance of the connector segments.

- The [visible](#) property of the connector enables or disables the visibility of connector.
- Default values for all the connectors can be set using the `getConnectorDefaults` properties. For example, if all connectors have the same type or having the same property then such properties can be moved into `getConnectorDefaults`.

### Segment Appearance

- The following code example illustrates how to customize the segment appearance.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:connectors='connectors' :getConnectorDefaults='getConnectorDefaults'
></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let connectors = [{
    id: "connector1",
    targetDecorator: {
      style: {
        strokeColor: '#6BA5D7',
        fill: '#6BA5D7',
        strokeWidth: 2
      }
    },
    style: {
      // Stroke color
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7',
      // Stroke width of the line
      strokeWidth: 2,
      // Line style
      strokeDashArray: '2,2'
    },
    sourcePoint: {
      x: 100,
      y: 100
    },
    targetPoint: {
      x: 200,
      y: 200
    },
    segments: [{
      type: 'Orthogonal',
      direction: 'Right',
      length: 50
    }],
  },
  {
    {
```

```

    id: "connector2",
    // Set the visibility of the connector to false
    visible: false,
    targetDecorator: {
      style: {
        strokeColor: '#6BA5D7',
        fill: '#6BA5D7',
        strokeWidth: 2
      }
    },
    style: {
      // Stroke color
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7',
      // Stroke width of the line
      strokeWidth: 2,
      // Line style
      strokeDashArray: '2,2'
    },
    sourcePoint: {
      x: 300,
      y: 300
    },
    targetPoint: {
      x: 400,
      y: 400
    },
    segments: [{
      type: 'Orthogonal',
      direction: 'Right',
      length: 50
    }],
  },
}
]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      connectors: connectors,
      getConnectorDefaults: (obj) => {
        obj.type = 'Orthogonal'
        return obj;
      },
    }
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/connectors/ConnectorsAppearance-cs1" %}

### Decorator Appearance

- The source decorator's [strokeColor](#), [strokeWidth](#) and [strokeDashArray](#) properties are used to customize the color and width and appearance of the decorator.
- To set the border stroke color, stroke width and stroke dash array for the target decorator, use [strokeColor](#), [strokeWidth](#) and [strokeDashArray](#).
- To set the size for source decorator, use width and height property. Similarly, to set the size for target decorator, use width and height.

The following code example illustrates how to customize the appearance of the decorator.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let connectors = [{
    id: "connector1",
    type: 'Straight',
    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7',
      strokeWidth: 2
    },
    bridgeSpace: 20,
    // Customize the target decorator
    targetDecorator: {
      style: {
        // Fill color of the decorator
        fill: '#6BA5D7',
        // Stroke color of the decorator
        strokeColor: '#6BA5D7'
      }
    },
    sourcePoint: {
      x: 100,
      y: 100
    },
    targetPoint: {
      x: 200,
      y: 200
    }
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
```

```

        height: "350px",
        connectors: connectors
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

```
{% previewsample "page.domainurl/code-snippet/diagram/connectors/ConnectorsDecAppearance-cs1"
%}
```

### Interaction

- Diagram allows to edit the connectors at runtime. To edit the connector segments at runtime, refer to [Connection Editing](#).

### Automatic line routing

Diagram provides additional flexibility to re-route the diagram connectors. A connector will frequently re-route itself when a shape moves next to it. The following screenshot illustrates how the connector automatically re-routes the segments.

- Dependency LineRouting module should be injected to the application as the following code snippet.

```

<script>
import {DiagramPlugin,LineRouting,Diagram,DiagramConstraints } from '@syncfusion/ej2-vue-
diagrams';
Diagram.Inject(LineRouting);
Vue.use(DiagramPlugin);
</script>

```

- Now, the line routing constraints must be included to the default diagram constraints to enable automatic line routing support like below.

```
/
```

- Initialize the Diagram

```
*/
```

```

<ejs-diagram #diagram [constraints]='constraints'>
<template>
<div id="app">
<ejs-diagram :constraints='constraints' ></ejs-diagram>
</div>
</template>
<script>
// Enable line routing constraints.
let constraints = DiagramConstraints.Default | DiagramConstraints.LineRouting;
</script>

```

- The following code block shows how to create the diagram with specifying nodes, connectors, constraints, and necessary modules for line routing.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:constraints='constraints' :nodes='nodes' :connectors='connectors'
:getNodeDefaults='getNodeDefaults'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, LineRouting, Diagram, DiagramConstraints } from
'@syncfusion/ej2-vue-diagrams';
  Diagram.Inject(LineRouting);
  Vue.use(DiagramPlugin);
  let nodes = [
    { id: 'shape1', offsetX: 100, offsetY: 100, width: 120, height: 50 },
    { id: 'shape2', offsetX: 300, offsetY: 300, width: 120, height: 50 },
    { id: 'shape3', offsetX: 150, offsetY: 200, width: 120, height: 50 }
  ];
  let connectors = [
    { id: 'connector', sourceID: 'shape1', targetID: 'shape2', type:
'Orthogonal' }
  ];
  function getNodeDefaults(obj) {
    obj = { style: { strokeColor: '#6BA5D7', fill: '#6BA5D7' } };
    return obj;
  }
  let constraints = DiagramConstraints.Default |
DiagramConstraints.LineRouting;
  export default {
    name: 'app',
    data () {
      return {

```

```

        width: "100%",
        height: "350px",
        connectors: connectors,
        nodes: nodes,
        constraints: constraints,
        getNodeDefaults: (obj) => {
            obj = { style: { strokeColor: '#6BA5D7', fill: '#6BA5D7' } };
            return obj;
        },
    },
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/connectors/ConnectorsLineRouting-cs1" %}

- In some situations, automatic line routing enabled diagram needs to ignore a specific connector from automatic line routing. So, in this case, auto routing feature can be disabled to the specific connector using the [constraints](#) property of the connector like the following code snippet.

## APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
        :constraints='constraints' :nodes='nodes' :connectors='connectors'
        :getNodeDefaults='getNodeDefaults'></ejs-diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import {
        DiagramPlugin, LineRouting, Diagram, DiagramConstraints, ConnectorConstraints }
    from '@syncfusion/ej2-vue-diagrams';
    Diagram.Inject(LineRouting);
    Vue.use(DiagramPlugin);
    let nodes = [
        { id: 'shape1', offsetX: 100, offsetY: 100, width: 120, height: 50 },
        { id: 'shape2', offsetX: 350, offsetY: 300, width: 120, height: 50 },
        { id: 'shape3', offsetX: 150, offsetY: 200, width: 120, height: 50 },
        { id: 'shape4', offsetX: 300, offsetY: 200, width: 120, height: 50 }
    ];
    let connectors = [
        { id: 'connector', sourceID: 'shape1', targetID: 'shape2', type:
        'Orthogonal', annotations: [{ offset: .7, content: 'Routing \n enabled',
        style: { fill: "white" } } ] },
        { id: 'connector2', sourceID: 'shape1', targetID: 'shape2', annotations:
        [{ offset: .6, content: 'Routing \n disabled', style: { fill: "white" } } ] },
    ];

```

```

type: 'Orthogonal', constraints: ConnectorConstraints.Default &
~ConnectorConstraints.InheritLineRouting }

### Constraints

- The [constraints](#) property of connector allows to enable/disable certain features of connectors.
- To enable or disable the constraints refer [constraints](#)

The following code illustrates how to disable selection.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin,ConnectorConstraints } from '@syncfusion/ej2-vue-
diagrams';

```

```

Vue.use(DiagramPlugin);
let connectors = [{
  id: "connector1",
  // Disables selection constraints
  constraints: ConnectorConstraints.Default &
~ConnectorConstraints.Select,
  type: 'Straight',
  style: {
    strokeColor: '#6BA5D7',
    fill: '#6BA5D7',
    strokeWidth: 2
  },
  targetDecorator: {
    style: {
      fill: '#6BA5D7',
      strokeColor: '#6BA5D7'
    }
  },
  sourcePoint: {
    x: 100,
    y: 100
  },
  targetPoint: {
    x: 200,
    y: 200
  }
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      connectors: connectors
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/connectors/ConnectorsConstraints-cs1" %}

### Custom Properties

- The [addInfo](#) property of connectors allows to maintain additional information to connectors.

```
`javascript
```

```

let connectors: ConnectorModel = {
  id: 'connector1',
  // Defines the information about the connector

```

```

addInfo:'centralconnector',
type: 'Straight',
sourceID: 'Transaction',
targetID: 'Verification'
};
`

```

### Stack Order

- The connectors [zIndex](#) property specifies the stack order of an connector. A connector with greater stack order is always in front of an connector with a lower stack order.

The following code illustrates how to render connector based on the stack order.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
      :connectors='connectors' :getConnectorDefaults='getConnectorDefaults'></ejs-
      diagram>
    </div>
  </template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, ConnectorConstraints } from '@syncfusion/ej2-vue-
  diagrams';
  Vue.use(DiagramPlugin);
  let connectors = [{
    id: 'connector1',
    // Defines the z-index value for the connector
    zIndex: 2,
    type: 'Straight',
    sourcePoint: {
      x: 300,
      y: 100
    },
    targetPoint: {
      x: 300,
      y: 200
    }
  },
  {
    id: 'connector2',
    type: 'Straight',
    // Defines the z-index value for the connector
    zIndex: 1,
    sourcePoint: {
      x: 100,
      y: 100
    },
    targetPoint: {
      x: 200,

```

```

        y: 200
      }
    }
  ]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        connectors: connectors,
        getConnectorDefaults: (obj) => {
          obj.style.strokeColor = '#6BA5D7';
          obj.style.fill = '#6BA5D7';
          obj.style.strokeWidth = 2;
          obj.targetDecorator.style.fill = '#6BA5D7';
          obj.targetDecorator.style.strokeColor = '#6BA5D7';
          return obj;
        },
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/connectors/zindex-cs1" %}

### Enable Connector Splitting

The connectors are used to create a link between two points, ports, or nodes to represent the relationship between them. Split the connector between two nodes when dropping a new node onto an existing connector and create a connection between the new node and existing nodes by setting the [enableConnectorSplit](#) as true. The default value of the [enableConnectorSplit](#) is false.

The following code illustrates how to split the connector and create a connection with new node.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :connectors='connectors' :nodes='nodes'
    :enableConnectorSplit='enableConnectorSplit'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, Diagram, DiagramConstraints, ConnectorConstraints }
  from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [
    { id: 'node1', offsetX: 150, offsetY: 150, width: 100, height: 100,
    annotations: [{ content: 'node1' }] },

```

```

    { id: 'node2', offsetX: 650, offsetY: 150, width: 100, height: 100,
      annotations: [{ content: 'node2' }] },
    { id: 'node3', offsetX: 490, offsetY: 290, width: 100, height: 100,
      annotations: [{ content: 'node3' }] }
  ];
  let connectors = [{
    id: 'connector1', sourceID: "node1", targetID: "node2",
    constraints: ConnectorConstraints.Default |
    ConnectorConstraints.AllowDrop
  }];
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
        connectors: connectors,
        enableConnectorSplit: true
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

## Group in Vue Diagram component

Group is used to cluster multiple nodes and connectors into a single element. It acts like a container for its children (nodes, groups, and connectors). Every change made to the group also affects the children. Child elements can be edited individually.

### Create group

#### Add group when initializing diagram

A group can be added to the diagram model through [nodes](#) collection. To define an object as group, add the child objects to the [children](#) collection of the group. The following code illustrates how to create a group node.

- The [padding](#) property of a group node defines the spacing between the group node's edges and its children.
- While creating group, its child node need to be declared before the group declaration.
- Add a node to the existing group child by using the `diagram.group` method.
- The group's `diagram.unGroup` method is used to define whether the group can be ungrouped or not.
- A group can be added into a child of another group.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' :getNodeDefaults='getNodeDefaults' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: "rectangle1",
    offsetX: 100,
    offsetY: 100,
    width: 100,
    height: 100,
    annotations: [{
      content: 'rectangle1'
    }]
  },
  {
    id: "rectangle2",
    offsetX: 200,
    offsetY: 200,

{% previewsample "page.domainurl/code-snippet/diagram/group/ungroup-cs1" %}

### Add group at runtime

A group node can be added at runtime by using the client-side method `diagram.add`.

The following code illustrates how a group node is added at runtime.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' :getNodeDefaults='getNodeDefaults'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, NodeModel } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: "rectangle1",
    offsetX: 100,
    offsetY: 100,
    width: 100,
    height: 100,
    annotations: [{
      content: 'rectangle1'
    }]
  },
  {
    id: "rectangle2",
    offsetX: 200,
    offsetY: 200,
    width: 100,
    height: 100,
    annotations: [{
      content: 'rectangle2'
    }]
  }
  ];
  let group: NodeModel = {
    id: 'group2',
    children: ['rectangle1', 'rectangle2']
  };
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,

```

```

        getNodeDefaults: (node) => {
            node.height = 100;
            node.width = 100;
            node.style.fill = '#6BA5D7';
            node.style.strokeColor = 'white';
            return node;
        },
    },
}
}
mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    diagramInstance.selectAll();
    // Add the group into the diagram
    diagramInstance.add(group);
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/group/groupadd-cs1" %}

### Add children To group at runtime

A childNode can be added to the specified Group at runtime by utilizing the client-side method **diagramInstance.addChildToGroup**.

This functionality is achieved by passing the group and existing children as arguments to the method.

The following code illustrates how a child node and a group node can be passed as arguments to the method and executed at runtime.

```
`html
```

```
diagramInstance.addChildToGroup(groupNode, childNode);
```

```
,
```

### Remove children from group at runtime

A specific child from a group node can be removed at runtime by utilizing the client-side method **diagramInstance.removeChildFromGroup**.

This functionality is achieved by passing the group and its children as arguments to the method.

The following code illustrates how a child node is removed from a group at runtime.

```
`html
```

```
diagramInstance.removeChildFromGroup (groupNode, childNode);
```

```
,
```

### APP.VUE

```
<template>
```

```

<div id="app">
  <button @click="addChild">addChild</button>
  <button @click="removeChild">removeChild</button>
  <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes'></ejs-diagram>
</div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let node = {
    id: 'node1', width: 150, height: 100, offsetX: 100, offsetY: 100,
    annotations: [{ content: 'Node1' }]
  };
  let node2 = {
    id: 'node2', width: 80, height: 130, offsetX: 200, offsetY: 200,
    annotations: [{ content: 'Node2' }]
  };
  let group = {
    id: 'group1', children: ['node1', 'node2']
  };
  let node3 = {
    id: 'node3', width: 100, height: 100, offsetX: 300, offsetY: 300,
    annotations: [{ content: 'Node3' }]
  };
  export default {
    name: 'app',
    data() {
      return {
        width: "100%",
        height: "450px",
        nodes: [node,node2,node3,group],
      }
    },
    methods: {
      addChild: function () {
        let diagram = this.$refs.diagram.ej2Instances;
        diagram.addChildToGroup(group, 'node3');
      },
      removeChild: function () {
        let diagram = this.$refs.diagram.ej2Instances;
        diagram.removeChildFromGroup(group, 'node3');
      },
    },
  }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/group/groupchild-cs1" %}

## Container

Containers are used to automatically measure and arrange the size and position of the child elements in a predefined manner. There are two types of containers available.

### Canvas

- The canvas panel supports absolute positioning and provides the least layout functionality to its contained diagram elements.
- Canvas allows you to position its contained elements by using the margin and alignment properties.
- Rendering alone possible in canvas container.
- It allows elements to be either vertically or horizontally aligned.
- Child can be defined with the collection [canvas.children](#) property.
- Basic element can be defined with the collection of `basicElements`.

### Stack

- Stack panel is used to arrange its children in a single line or stack order, either vertically or horizontally.
- It controls spacing by setting margin properties of child and padding properties of group. By default, a stack panel's [orientation](#) is vertical.

The following code illustrates how to add a stack panel.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
      :nodes='nodes' :setNodeTemplate='setNodeTemplate'
      :getNodeDefaults='getNodeDefaults'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, NodeModel, StackPanel, TextElement } from
  '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let count = 11;
  function getTextElement(text: string) {
    let textElement: TextElement = new TextElement();
    textElement.id = "text" + count;
    textElement.width = 50;
    textElement.height = 20;
    textElement.content = text;
    count++;
    return textElement;
  }
  function addRows(column: StackPanel) {
    column.children.push(getTextElement('Row1'));
    column.children.push(getTextElement('Row2'));
    column.children.push(getTextElement('Row3'));
    column.children.push(getTextElement('Row4'));
  }
</script>
```

```

    }
    let nodes = [
      {
        id: 'node5',
        width: 100,
        height: 100,
        offsetX: 100,
        offsetY: 100,
        style: {
          strokeColor: '#6BA5D7',
          fill: '#6BA5D7'
        },

            column1.children.push(getTextElement('Column1'));
            addRows(column1);
            let column2: StackPanel = new StackPanel();
            column2.children = [];
            column2.children.push(getTextElement('Column2'));
            addRows(column2);
            table.children = [column1, column2];
            return table;
          }
          return null;
        },
      },
    }
  }
}

```

```

</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/group/canvas-cs1" %}

### Difference between a basic group and containers

| Group | Container |

| ----- | ----- |

| It arranges the child elements based on the child elements position and size properties. | Each container has a predefined behavior to measure and arrange its child elements. Canvas and stack containers are supported in the diagram. |

| The Padding, Min, and Max Size properties are not applicable for basic group. | It is applicable for container. |

| The Children's margin and alignment properties are not applicable for basic group. | It is applicable for container. |

### Interaction

You can edit the group and its children at runtime. For more information about how to interact with a group, refer to [Edit Groups](#).

### Swim lane in Vue Diagram component

Swimlane is a type of diagram nodes, which is typically used to visualize the relationship between a business process and the department responsible for it by focusing on the logical relationships between activities.

#### Create a swimlane

To create a swimlane, the type of shape should be set as [swimlane](#). By Default swimlane's are arranged vertically.

The following code example illustrates how to define a swimlane object.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>

```

```

</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    shape: {
      // Set the node type as swimlane
      type: 'SwimLane',
      lanes: [
        {
          id: 'stackCanvas1',
          height: 100,
        },
      ],
      phases: [
        {
          id: 'phase1', offset: 170,
          header: { annotation: { content: 'Phase' } }
        },
      ],
      phaseSize: 20,
    },
    offsetX: 300, offsetY: 200,
    height: 200,
    width: 350
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/swimlane/swimlaneheader-cs1" %}

### Headers

Header was the primary element for swimlanes. The [header](#) property of swimlane allows you to define its textual description and to customize its appearance.

Note: By using this header, the swimlane interaction will be performed, like selection, dragging, etc.

The following code example illustrates how to define a swimlane header.

### APP.VUE

```

<template>
  <div id="app">

```

```

    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    shape: {
      type: 'SwimLane',
      orientation: 'Horizontal',
      // Intialize header to swimlane
      header: {
        annotation: { content: 'ONLINE PURCHASE STATUS', style:
{ fill: '#111111' } },
        height: 50, style: { fontSize: 11 },
      },
      lanes: [
        {
          id: 'stackCanvas1',
          height: 100,
        },
      ],
      phases: [
        {
          id: 'phase1', offset: 170,
          header: { annotation: { content: 'Phase' } }
        },
      ],
      phaseSize: 20,
    },
    offsetX: 300, offsetY: 200,
    height: 200,
    width: 350
  ]
}
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/swimlane/swimlaneheader-cs2" %}

### Customization of headers

The height and width of swimlane header can be customized with [weight](#) and [height](#) properties of swimlane header. set fill color of header by using the [style](#) property. The orientation of swimlane can be customized with the [orientation](#) property of the header.

Note: By default the swimlane orientation has Horizontal.

The following code example illustrates how to customize the swimlane header..

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
import Vue from 'vue';
import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
Vue.use(DiagramPlugin);
let nodes = [{
  shape: {
    type: 'SwimLane',
    orientation: 'Horizontal',
    // customize the swimlane header
    header: {
      annotation: { content: 'SALES PROCESS FLOW CHART', },
      height: 70, style: { fontSize: 11 }, style: { fill: 'pink'
},
    },
    lanes: [
      {
        id: 'stackCanvas1',
        height: 100,
      },
    ],
    phases: [
      {
        id: 'phase1', offset: 170,
        header: { annotation: { content: 'Phase' } }
      },
    ],
    phaseSize: 20,
  },
  offsetX: 300, offsetY: 200,
  height: 200,
  width: 350
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
```

```

    }
  }
</script>
<style>
  @import ".../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/swimlane/headercustomize-cs1" %}

#### *Dynamic customization of swimlane header*

You can customize the swimlane header style and text properties dynamically. The following code illustrates how to dynamically customize the lane header.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    shape: {
      type: 'SwimLane',
      orientation: 'Horizontal',
      // customize the swimlane header
      header: {
        annotation: { content: 'SALES PROCESS FLOW CHART', },
        height: 70, style: { fontSize: 11 }, style: { fill: 'pink' }
      },
    },
    lanes: [
      {
        id: 'stackCanvas1',
        height: 100,
      },
    ],
    phases: [
      {
        id: 'phase1', offset: 170,
        header: { annotation: { content: 'Phase' } }
      },
    ],
    phaseSize: 20,
  },
  {
    offsetX: 300, offsetY: 200,
    height: 200,
    width: 350
  }
  ]
  export default {
    name: 'app'
  }

```

```

data() {
  return {
    width: "100%",
    height: "350px",
    nodes: nodes,
  }
}
mounted: function() {
  let diagramInstance: Diagram;
  let diagramObj: any = document.getElementById("diagram");
  diagramInstance = diagramObj.ej2_instances[0];
  diagramInstance.nodes[0].shape.header.style.fill = 'red'
  diagramInstance.dataBind();
}
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

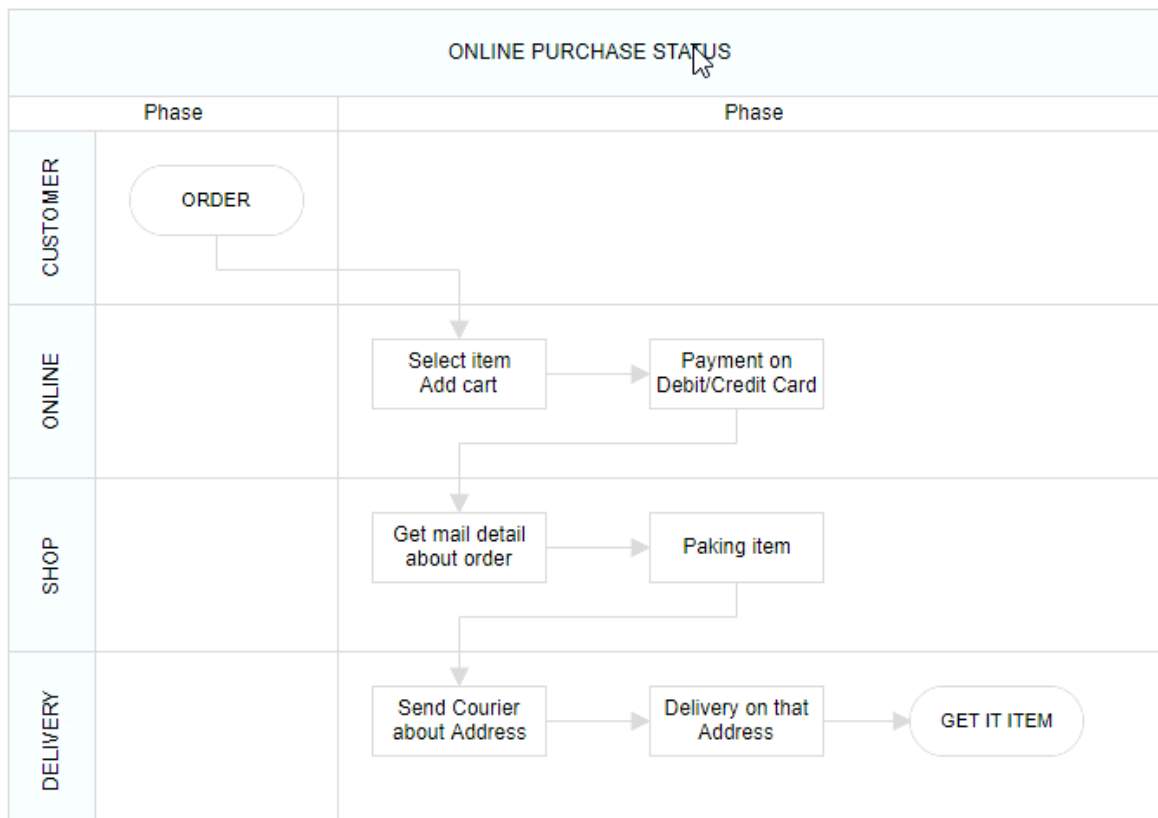

```

{% previewsample "page.domainurl/code-snippet/diagram/swimlane/dynamicheader-cs1" %}

#### Header editing

Diagram provides the support to edit swimlane headers at runtime. We achieve the header editing by double click event. Double clicking the header label will enables the editing of that.

The following image illustrates how to edit the swimlane header.

## Lanes

Lane is a functional unit or a responsible department of a business process that helps to map a process within the functional unit or in between other functional units.

The number of [lanes](#) can be added to swimlane. The lanes are automatically stacked inside swimlane based on the order they are added.

### Create an empty lane

- The lanes `id` is used to define the name of the lane and its further used to find the lane at runtime and do any customization.
- We can provide additional information to the lane by using the [addInfo](#) property of the lane.

The following code example illustrates how to define a swimlane with lane.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    shape: {
      type: 'SwimLane',
      orientation: 'Horizontal',
      header: {
        annotation: { content: 'ONLINE PURCHASE STATUS', style:
{ fill: '#111111' } } },
        height: 50, style: { fontSize: 11 },
      },
      // initialize the lane of swimlane
      lanes: [
        {
          id: 'stackCanvas1',
          // set the lane height
          height: 100,
          // set the lane info
          addInfo:{name:'lane1'}
        },
      ],
      phases: [
        {
          id: 'phase1', offset: 170,
          header: { annotation: { content: 'Phase' } }
        },
      ],
      phaseSize: 20,
    },
    offsetX: 300, offsetY: 200,
    height: 200,
```

```

        width: 350
    ]]
    export default {
      name: 'app'
      data() {
        return {
          width: "100%",
          height: "350px",
          nodes: nodes,
        }
      }
    }
  </script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/swimlane/emptylane-cs1" %}

[Create lane header](#)

- The [header](#) property of lane allows you to textually describe the lane and to customize the appearance of the description.

The following code example illustrates how to define a lane header.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    shape: {
      type: 'SwimLane',
      orientation: 'Horizontal',
      // Intialize header to swimlane
      header: {
        annotation: { content: 'ONLINE PURCHASE STATUS', style:
{ fill: '#111111' } },
        height: 50, style: { fontSize: 11 },
      },
      // Intialize lane to swimlane
      lanes: [
        {
          id: 'stackCanvas1',
          height: 100,
          // Intialize header to lane
          header: {

```

```

        annotation: { content: 'CUSTOMER' }, width: 50,
        style: { fontSize: 11 }
      },
    ],
    phases: [
      {
        id: 'phase1', offset: 170,
        header: { annotation: { content: 'Phase' } }
      },
    ],
    phaseSize: 20,
  },
  offsetX: 300, offsetY: 200,
  height: 200,
  width: 350
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/swimlane/laneheader-cs1" %}

### Customizing lane header

- The size of lane can be controlled by using the [width](#) and [height](#) properties of the lane.
- The appearance of the lane can be set by using the [style](#) properties.

The following code example illustrates how to customize the lane header.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    shape: {

```

```

        type: 'SwimLane',
        orientation: 'Horizontal',
        //Intialize header to swimlane
        header: {
            annotation: { content: 'ONLINE PURCHASE STATUS', style:
{ fill: '#111111' } },
            height: 50, style: { fontSize: 11 },
        },
        lanes: [
            {
                id: 'stackCanvas1',
                height: 100,
                // customization of lane header
                header: {
                    annotation: { content: 'Online Consumer' }, width:
30,
                    style: { fontSize: 11 },style: { fill: 'red' }
                },
            },
        ],
        phases: [
            {
                id: 'phase1', offset: 170,
                header: { annotation: { content: 'Phase' } }
            },
        ],
        phaseSize: 20,
    },
    offsetX: 300, offsetY: 200,
    height: 200,
    width: 350
}]
export default {
    name: 'app'
    data() {
        return {
            width: "100%",
            height: "350px",
            nodes: nodes,
        }
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/swimlane/laneheadercustomize-cs1" %}

#### [Dynamic customization of lane header](#)

You can customize the lane header style and text properties dynamically. The following code illustrates how to dynamically customize the lane header.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    shape: {
      type: 'SwimLane',
      orientation: 'Horizontal',
      //Intialize header to swimlane
      header: {
        annotation: { content: 'ONLINE PURCHASE STATUS', style:
{ fill: '#111111' } },
        height: 50, style: { fontSize: 11 },
      },
      lanes: [
        {
          id: 'stackCanvas1',
          height: 100,
          // customization of lane header
          header: {
            annotation: { content: 'Online Consumer' }, width:
30,
            style: { fontSize: 11 }, style: { fill: 'red' }
          },
        },
      ],
      phases: [
        {
          id: 'phase1', offset: 170,
          header: { annotation: { content: 'Phase' } }
        },
      ],
      phaseSize: 20,
    },
    offsetX: 300, offsetY: 200,
    height: 200,
    width: 350
  ]
}
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
  }
}

```

```

        let lane : nodeModel = diagramInstance.nodes[0];
        lane.shape.lanes[0].header.style.fill = 'red';
        diagramInstance.dataBind();
    }
}
</script>
<style>
    @import "../../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/swimlane/dynamiclaneheader-cs1" %}

#### Add lane at runtime

You can add the a lane at runtime by using the client side API method called `addLanes`.The following code illustrates how to dynamically add lane to swimlane.

#### APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width':height='height'
        :nodes='nodes' ></ejs-diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
    Vue.use(DiagramPlugin);
    let nodes = [{
        shape: {
            type: 'SwimLane',
            orientation: 'Horizontal',
            //Intialize header to swimlane
            header: {
                annotation: { content: 'ONLINE PURCHASE STATUS', style:
{ fill: '#111111' } } },
                height: 50, style: { fontSize: 11 },
            },
            lanes: [
                {
                    id: 'stackCanvas1',
                    height: 100,
                    // customization of lane header
                    header: {
                        annotation: { content: 'Online Consumer' }, width:
30,
                        style: { fontSize: 11 },style: { fill: 'red' }
                    },
                },
            ],
            phases: [
                {
                    id: 'phasel', offset: 170,
                    header: { annotation: { content: 'Phase' } }
                },
            ],
        },
    ]
}

```

```

    ],
    phaseSize: 20,
  },
  offsetX: 300, offsetY: 200,
  height: 200,
  width: 350
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    let lane = [{id:"lane1",height:100,}];
    diagramInstance.addLanes(diagramInstance.nodes[0],lane,1);
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/swimlane/addlanes-cs1" %}

#### [Add children to lane](#)

To add nodes to lane,you should add [children](#) collection of the lane.

The following code example illustrates how to add nodes to lane.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    shape: {
      type: 'SwimLane',
      orientation: 'Horizontal',
      // Intialize header to swimlane
      header: {
        annotation: { content: 'ONLINE PURCHASE STATUS', style:
        { fill: '#111111' } } },

```

```

        height: 50, style: { fontSize: 11 },
      },
      lanes: [
        {
          id: 'stackCanvas1',
          height: 100,
          header: {
            annotation: { content: 'CUSTOMER' }, width: 50,
            style: { fontSize: 11 }
          },
          // Set the children of lane
          children: [
            {
              id: 'node1',

{% previewsample "page.domainurl/code-snippet/diagram/swimlane/lanechildern-cs1" %}

*Lane interaction*

*Resizing lane*

- Lane can be resized in the bottom and left direction.
- Lane can be resized by using resize selector of the lane.
- Once you can resize the lane, the swimlane will be resized automatically.
- The lane can be resized either resizing the selector or the tight bounds of the child object. If the child node move to edge of the lane it can be automatically resized.

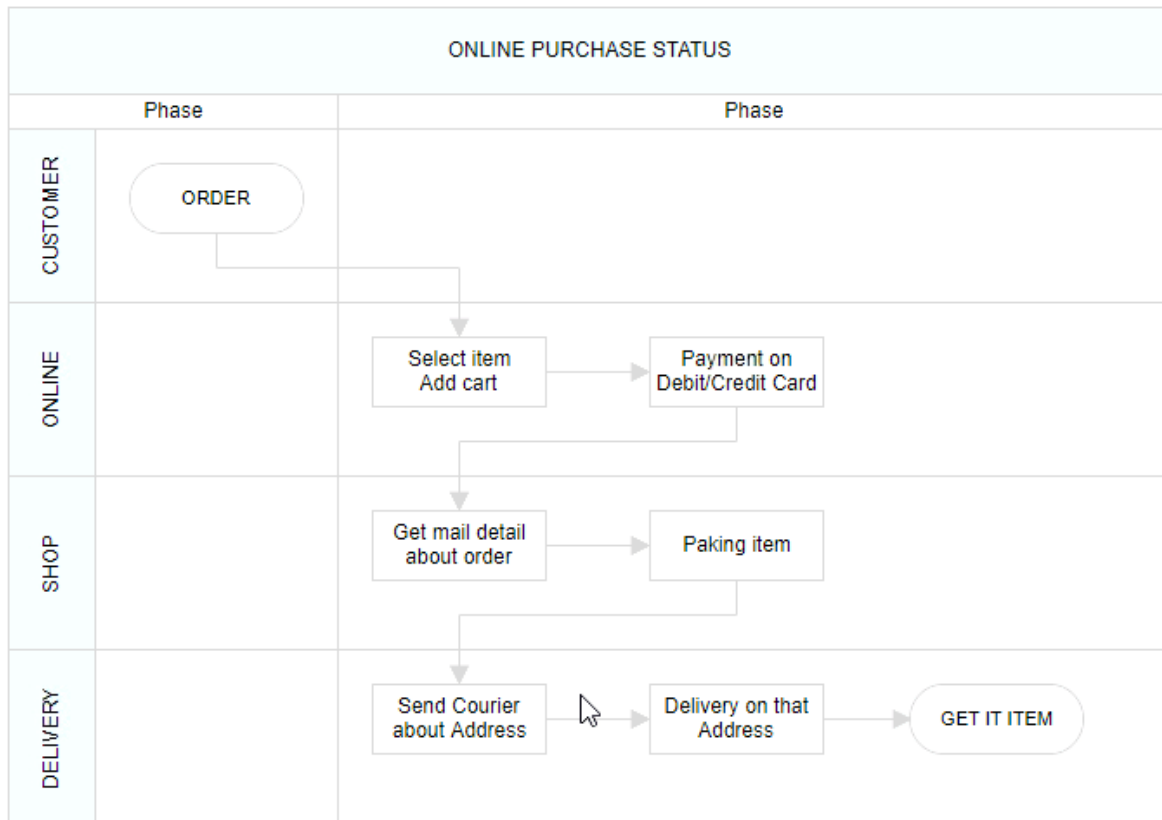

The following image illustrates how resize the lane.

### Lane swapping

- Lanes can be swapped using drag the lanes over another lane.
- Helper should intimate the insertion point while lane swapping.

The following image illustrates how swapping the lane.

### Disable Swimlane Lane swapping

You can disable swimlane lane swapping by using the property called `canMove`.

The following code illustrates how to disable swimlane lane swapping.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    shape: {
      type: 'SwimLane',
      orientation: 'Horizontal',
      //Intialize header to swimlane
      header: {
        annotation: { content: 'ONLINE PURCHASE STATUS', style:
{ fill: '#111111' } },
        height: 50, style: { fontSize: 11 },
      },
    },
  ],

```

```

        lanes: [
          {
            id: 'stackCanvas1',
            height: 100,
            // customization of lane header
            header: {
              annotation: { content: 'Online Consumer' }, width:
30,
              style: { fontSize: 11, fill: 'red' }
            },
            canMove: false,
          },
        ],
        phases: [
          {
            id: 'phase1', offset: 170,
            header: { annotation: { content: 'Phase' } }
          },
        ],
        phaseSize: 20,
      },
      offsetX: 300, offsetY: 200,
      height: 200,
      width: 350
    ]
  }
}
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    let lane = [{id:"lane1",height:100,canMove: false}];
    diagramInstance.addLanes(diagramInstance.nodes[0], lane, 1);
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/swimlane/addlanes-cs2" %}

[Resize helper](#)

- The special resize helper will be used to resize the lanes.
- The resize cursor will be available on the left and bottom direction alone.
- Once resize the lane the swimlane will be resized automatically.

*Children interaction in lanes*

- You can resize the child node within swimlanes.
- You can drag the child nodes within lane.
- Interchange the child nodes from one lane to another lane.
- Drag and drop the child nodes from lane to diagram.
- Drag and drop the child nodes from diagram to lane.
- Based on the child node interactions, the lane size should be updated.

The following image illustrates children interaction in lane.

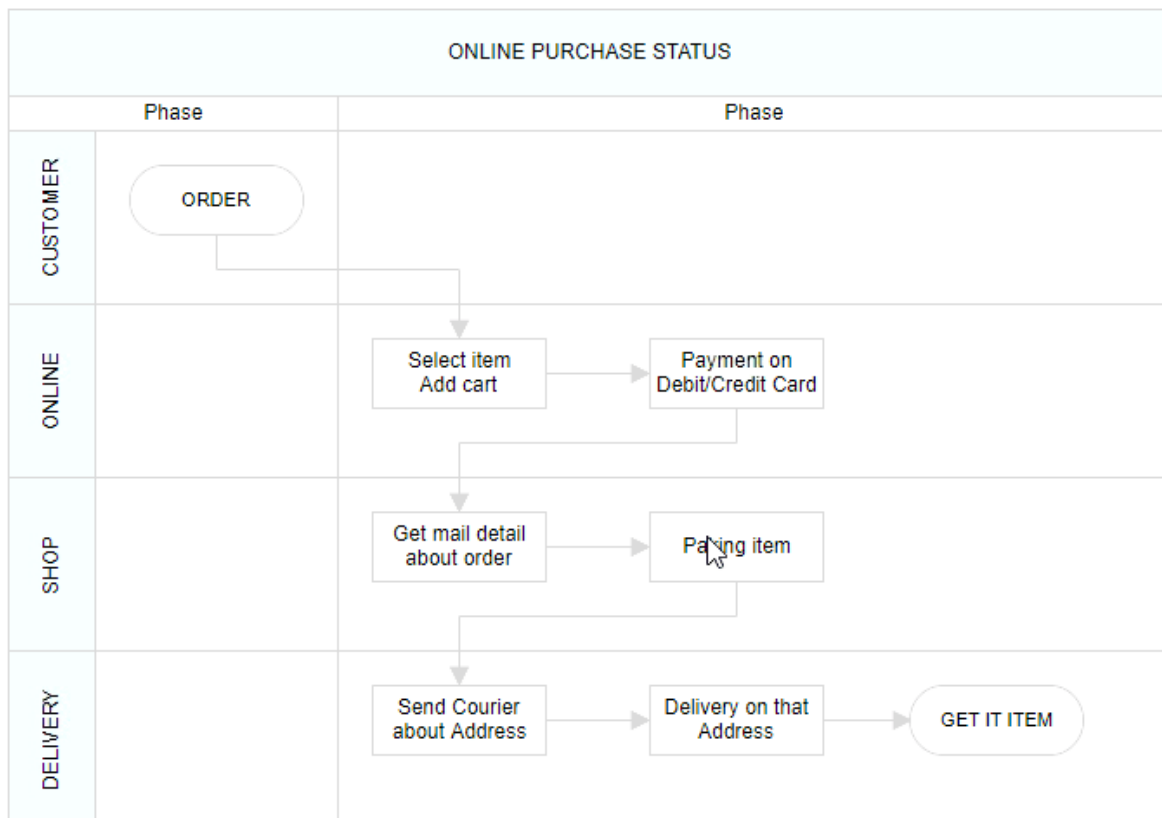

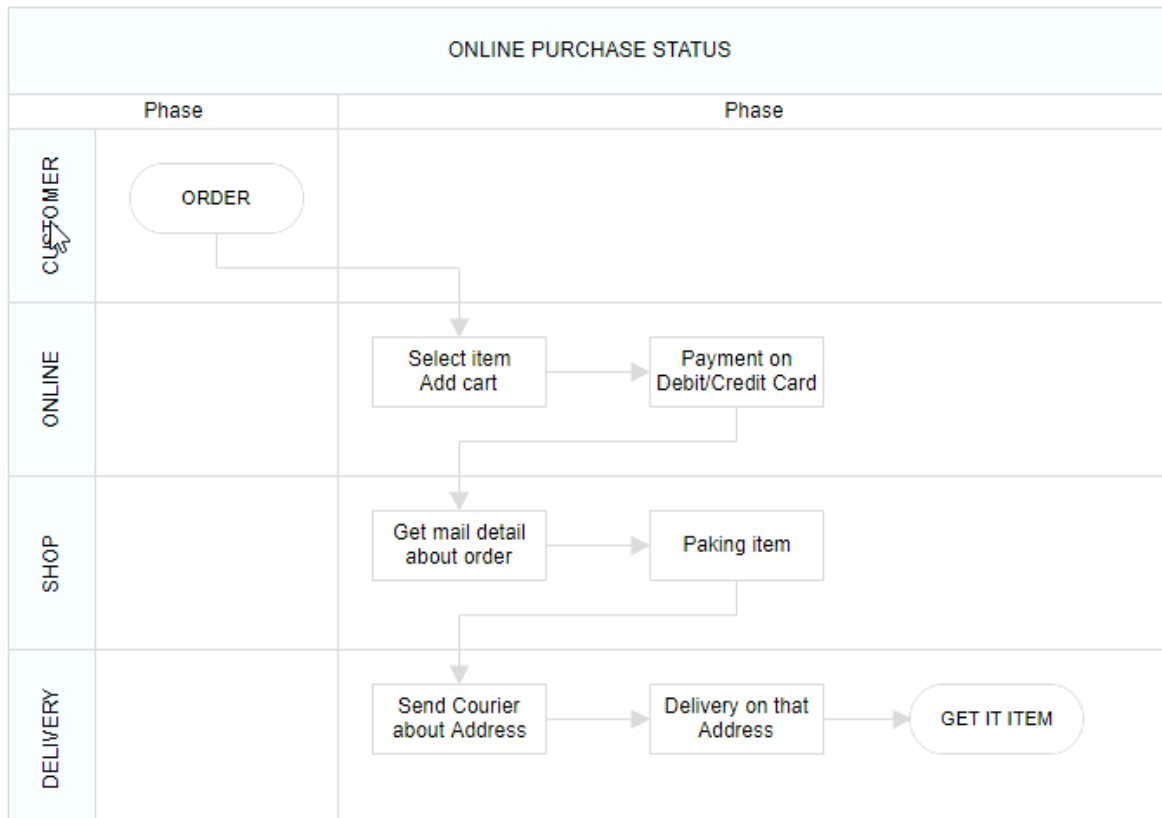

*Lane header editing*

Diagram provides the support to edit Lane headers at runtime. We achieve the header editing by double click event. Double clicking the header label will enables the editing of that.

The following image illustrates how to edit the swimlane header.

The following image illustrates how to edit the lane header.

### Phase

Phase are the subprocess which will split each lane as horizontally or vertically based on the swimlane orientation. The multiple number of [Phase](#) can be added to swimlane.

The following code example illustrates how to add phase at swimlane.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    shape: {
      type: 'SwimLane',
      orientation: 'Horizontal',
      //Intialize header to swimlane
      header: {
        annotation: { content: 'ONLINE PURCHASE STATUS', style: {
fill: '#111111' } },
        height: 50, style: { fontSize: 11 },
      },
    },
  ],
```

```

        lanes: [
          {
            id: 'stackCanvas1',
            height: 100,
            header: {
              annotation: { content: 'CUSTOMER' }, width: 50,
              style: { fontSize: 11 }
            },
            children: [
              {
                id: 'node1',
                annotations: [
                  {
                    content: 'Consumer learns \n of product',
                    style: { fontSize: 11 }
                  }
                ],
                margin: { left: 60, top: 30 },
                height: 40, width: 100,
              }, {
                id: 'node2',
                shape: { type: 'Flow', shape: 'Decision' },
                annotations: [
                  {
                    content: 'Does \n Consumer want \nthe product',
                    style: { fontSize: 11 }
                  }
                ],
                margin: { left: 200, top: 20 },
                height: 60, width: 120,
              },
            ],
          },
        ],
        // Set phase to swimlane
        phases: [
          {

#### *Dynamically add phase to lane*

You can add the a phase at runtime by using client side API method called **addPhases**. The following code example illustrates how to add phase at run time.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    shape: {
      type: 'SwimLane',
      orientation: 'Horizontal',
      //Intialize header to swimlane
      header: {
        annotation: { content: 'ONLINE PURCHASE STATUS', style:
{ fill: '#111111' } },
        height: 50, style: { fontSize: 11 },
      },
      lanes: [
        {
          id: 'stackCanvas1',
          height: 100,
          // customization of lane header
          header: {
            annotation: { content: 'Online Consumer' }, width:
30,
            style: { fontSize: 11 },style: { fill: 'red' }
          },
        },
      ],
      phases: [
        {
          id: 'phase1', offset: 170,
          header: { annotation: { content: 'Phase' } }
        },
      ],
      phaseSize: 20,
    }
  ]
}

```

```

        },
        offsetX: 300, offsetY: 200,
        height: 200,
        width: 350
    ]}
    export default {
        name: 'app'
        data() {
            return {
                width: "100%",
                height: "350px",
                nodes: nodes,
            }
        }
        mounted: function() {
            let diagramInstance: Diagram;
            let diagramObj: any = document.getElementById("diagram");
            diagramInstance = diagramObj.ej2_instances[0];
            let phase = [{
                id: 'phase3', offset: 220,
                header: { annotation: { content: 'Phase' } }
            }]
            diagramInstance.addPhases(diagramInstance.nodes[0], phase);
        }
    }
</script>
<style>
    @import "../../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/swimlane/addphases-cs1" %}

### Customizing phase

- The length of region can be set by using the [offset](#) property of the phase.
- Every phase region can be textually described with the [header](#) property of the phase
- You can increase the width of phase by using [phaseSize](#) property of swimlane.
- We can provide additional information to the phase by using the [addInfo](#) property of the phase.

The following code example illustrates how to customize the phase in swimlane.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
        :nodes='nodes' ></ejs-diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
    Vue.use(DiagramPlugin);
    let nodes = [{

```

```

    shape: {
      type: 'SwimLane',
      orientation: 'Horizontal',
      //Intialize header to swimlane
      header: {
        annotation: { content: 'ONLINE PURCHASE STATUS', style: {
fill: '#111111' } },
        height: 50, style: { fontSize: 11 },
      },
      lanes: [
        {
          id: 'stackCanvas1',
          height: 100,
          header: {
            annotation: { content: 'CUSTOMER' }, width: 50,
            style: { fontSize: 11 }
          },
          children: [

    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/swimlane/palette-cs1" %}

[Drag and drop swimlane to palette](#)

- The drag and drop support for swimlane shapes has been provided.
- When you drag and drop the lane shape, if the diagram already contains swimlane with the same orientation, the lane will be added and stacked inside a swimlane based on the order. Otherwise, it will be added a new swimlane.
- The phase will only drop on swimlane shape with same orientation.

The following image illustrates how to drag symbol from palette.

### Limitations

- Connectors cannot be canceled when added directly to swimlane. You must initialize the connector through connector collection.
- We cannot edit the phase line style.

### Labels in Vue Diagram component

[Annotation](#) is a block of text that can be displayed over a node or connector. Annotation is used to textually represent an object with a string that can be edited at runtime. Multiple annotations can be added to a node/connector.

<!-- markdownlint-disable MD033 -->

### Create annotation

An annotation can be added to a node/connector by defining the annotation object and adding that to the annotation collection of the node/connector. The [content](#) property of annotation defines the text to be displayed. The following code illustrates how to create a annotation.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' :connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 100,
    offsetY: 100,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Sets the Annotation for the Node
    annotations: [{
      // Sets the text to be displayed
      content: 'Annotation'
    }]
  }];
  let connectors = [{
    sourcePoint: {
      x: 300,
      y: 100
    },
    targetPoint: {
      x: 400,
      y: 300
    },
    type: 'Orthogonal',
    style: {
      strokeColor: '#6BA5D7'
    },
    // Sets the Annotation for the Connector
    annotations: [{
      // Sets the text to be displayed
      content: 'Annotation'
    }]
  }]
  export default {
    name: 'app'
  }
</script>
```

```

        data() {
            return {
                width: "100%",
                height: "350px",
                nodes: nodes,
                connectors: connectors
            }
        }
    }
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/labels/Annotation-cs1" %}

#### Add annotations at runtime

- Annotations can be added at runtime by using the client-side method [addLabels](#). The following code illustrates how to add a annotation to a node.
- The annotation's [ID](#) property is used to define the name of the annotation and its further used to find the annotation at runtime and do any customization.

#### APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
        :nodes='nodes' ></ejs-diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { DiagramPlugin ,ShapeAnnotationModel} from '@syncfusion/ej2-vue-
    diagrams';
    Vue.use(DiagramPlugin);
    let nodes = [{
        // Position of the node
        offsetX: 250,
        offsetY: 250,
        // Size of the node
        width: 100,
        height: 100,
        style: {
            fill: '#6BA5D7',
            strokeColor: 'white'
        },
    },
    ]
    export default {
        name: 'app'
        data() {
            return {
                width: "100%",
                height: "350px",
            }
        }
    }

```

```

        nodes: nodes,
      }
    }
    mounted: function() {
      let diagramInstance: Diagram;
      let diagramObj: any = document.getElementById("diagram");
      diagramInstance = diagramObj.ej2_instances[0];
      let annotation: ShapeAnnotationModel[] = [{
        id: 'label1',
        content: 'Annotation'
      }]
      //Method to add labels at run time
      diagramInstance.addLabels(diagramInstance.nodes[0], annotation);
      diagramInstance.dataBind();
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/labels/Run-cs1" %}

### Remove annotation

A collection of annotations can be removed from the node by using client-side method [removeLabels](#). The following code illustrates how to remove a annotation to a node.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, shapeAnnotationModel } from '@syncfusion/ej2-vue-
  diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Sets the annotation for the node
    annotations: [{
      id: 'label1',
      // Sets the text to be displayed

```

```

        content: 'Annotation'
      }]
    }]
    export default {
      name: 'app'
      data() {
        return {
          width: "100%",
          height: "350px",
          nodes: nodes,
        }
      }
      mounted: function() {
        let diagramInstance: Diagram;
        let diagramObj: any = document.getElementById("diagram");
        diagramInstance = diagramObj.ej2_instances[0];
        let annotation: shapeAnnotationModel[] = [{
          id: 'label1',
          content: 'Annotation'
        }];
        diagramInstance.removeLabels(diagramInstance.nodes[0],
        annotation);
      }
    }
  </script>
  <style>
    @import "../../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
  </style>

```

{% previewsample "page.domainurl/code-snippet/diagram/labels/Update-cs1" %}

### Update annotation at runtime

You can change any annotation properties at runtime and update it through the client-side method `dataBind`.

The following code example illustrates how to change the annotation properties.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,

```

```

        height: 100,
        style: {
            fill: '#6BA5D7',
            strokeColor: 'white'
        },
        // Sets the annotation for the node
        annotations: [{
            content: 'Annotation'
        }]
    }]
    export default {
        name: 'app'
        data() {
            return {
                width: "100%",
                height: "350px",
                nodes: nodes,
            }
        }
        mounted: function() {
            let diagramInstance: Diagram;
            let diagramObj: any = document.getElementById("diagram");
            diagramInstance = diagramObj.ej2_instances[0];
            // Adds to the Diagram
            diagramInstance.nodes[0].annotations[0].content = 'Updated
Annotation';
            //Method to update the annotation at run time
            diagramInstance.dataBind();
        }
    }
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/labels/Update-cs2" %}

### Alignment

Annotation can be aligned relative to the node boundaries. It has [margin](#), [offset](#), horizontal, and vertical alignment settings. It is quite tricky when all four alignments are used together but gives more control over alignment.

### Offset

The offset property of annotation is used to align the annotations based on fractions. 0 represents top/left corner, 1 represents bottom/right corner, and 0.5 represents half of width/height.

Set the size for a nodes annotation by using [width](#) and [height](#) properties.

The following code shows the relationship between the annotation position (black color circle) and offset (fraction values).

### APP.VUE

```

<template>
  <div id="app">

```

```

    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Sets the annotation for the node
    annotations: [{
      // Sets the content for the annotation
      content: 'Annotation',
      //Sets the offset for the content
      offset: {
        x: 0,
        y: 1
      }
    }]
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/labels/Update-cs3" %}

### Horizontal and vertical alignment

The [horizontalAlignment](#) property of annotation is used to set how the annotation is horizontally aligned at the annotation position determined from the fraction values. The [verticalAlignment](#) property is used to set how annotation is vertically aligned at the annotation position.

The following tables illustrates all the possible alignments visually with 'offset (0, 0)'.

| Horizontal Alignment | Vertical Alignment | Output with Offset(0,0) |

The following codes illustrates how to align annotations.

#### **APP.VUE**

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Sets the annotation for the node
    annotations: [{
      content: 'Annotation',
```

```

        // Sets the horizontal alignment as left
        horizontalAlignment: 'Left',
        // Sets the vertical alignment as Center
        verticalAlignment: 'Center'
    }]
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/labels/Alignment-cs1" %}

### Annotation alignment with respect to segments

The offset and alignment properties of annotation allows you to align the connector annotations with respect to the segments.

The following code example illustrates how to align connector annotations.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' :connectors='connectors'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'node1',
    // Position of the node
    offsetX: 100,
    offsetY: 100,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Sets the annotation for the node
    annotations: [{

```

```

        content: 'Task1'
      ]]
    },
    {
      id: 'node2',
      // Position of the node
      offsetX: 300,
      offsetY: 100,
      // Size of the node
      width: 100,
      height: 100,
      style: {
        fill: '#6BA5D7',
        strokeColor: 'white'
      },
      // Sets the annotation for the node
      annotations: [{
        content: 'Task2'
      }]
    }
  ]];
  let connectors = [{
    sourceID: 'node1',
    targetID: 'node2',
    type: 'Orthogonal',
    style: {
      strokeColor: '#6BA5D7',
      strokeWidth: 2
    },
    // Sets the annotation for the connector
    annotations: [{
      content: '0',
      // Sets the offset for the content
      offset: 0
    }, {
      content: '1',
      // Sets the offset for the content
      offset: 1
    }]
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
        connectors: connectors
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

```
{% previewsample "page.domainurl/code-snippet/diagram/labels/Segment-cs1" %}
```

### Margin

[Margin](#) is an absolute value used to add some blank space in any one of its four sides. The annotations can be displaced with the margin property.

The following code example illustrates how to align a annotation based on its `offset`, `horizontalAlignment`, `verticalAlignment`, and `margin` values.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'node1',
    // Position of the node
    offsetX: 100,
    offsetY: 100,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Sets the annotation for the connector
    annotations: [{
      content: 'Task1',
      // Sets the margin for the content
      margin: {
        top: 10
      },
      horizontalAlignment: 'Center',
      verticalAlignment: 'Top',
      offset: {
        x: 0.5,
        y: 1
      }
    }
  ]
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
```

```

    }
  </script>
  <style>
    @import ".../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
  </style>

```

{% previewsample "page.domainurl/code-snippet/diagram/labels/Margin-cs1" %}

### Text align

The [textAlign](#) property of annotation allows you to set how the text should be aligned (left, right, center, or justify) inside the text block. The following codes illustrate how to set `textAlign` for an annotation.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'node1',
    // Position of the node
    offsetX: 100,
    offsetY: 100,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Sets the annotation for the NOde
    annotations: [{
      content: 'Text align is set as Left',
      // Sets the textAlign as left for the content
      style: {
        textAlign: 'Left'
      }
    }]
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }

```

```

</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/labels/TextAlign-cs1" %}

### Hyperlink

Diagram provides a support to add a [hyperlink](#) for the nodes/connectors annotation. It can also be customized.

A User can open the hyperlink in the new window, the same tab and the new tab by using the [hyperlinkOpenState](#) property

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'node1',
    // Position of the node
    offsetX: 100,
    offsetY: 100,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Sets the annotation for the Node
    annotations: [{
      hyperlink: {
        link: 'https://hr.syncfusion.com/home',
        //Set the link to open in the current tab
        hyperlinkOpenState: 'CurrentTab'
      }
    }]
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }

```

```

    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/labels/Link-cs1" %}

### Template Support for Annotation

Diagram provides template support for annotation. you should define a SVG/HTML content as string in the annotation's [template](#) property.

The following code illustrates how to define a template in node's annotation. similarly, you can define it in connectors.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width':height='height'
    :nodes='nodes' :connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'node1',
    // Position of the node
    offsetX: 100,
    offsetY: 100,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Sets the annotation for the Node
    annotations: [{
      // Set an template for annotation
      template: '<div><input type="button" value="Submit"></div>'
    }]
  }]
  let connectors = [{
    sourcePoint: {
      x: 300,
      y: 100
    },
    targetPoint: {
      x: 400,
      y: 300
    },
  ],

```

```

        type: 'Orthogonal',
        style: {
            strokeColor: '#6BA5D7'
        },
        // Sets the Annotation for the Connector
        annotations: [{
            // Set an template for annotation
            height: 60, width: 100, offset: 0.5,
            template: '<div><input type="button" value="Submit"></div>'
        }]
    }];
    export default {
        name: 'app'
        data() {
            return {
                width: "100%",
                height: "350px",
                nodes: nodes,
                connectors: connectors
            }
        }
    }
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/labels/labeltemplate-cs1" %}

### Wrapping

When text overflows node boundaries, you can control it by using [text wrapping](#). So, it is wrapped into multiple lines. The wrapping property of annotation defines how the text should be wrapped. The following code illustrates how to wrap a text in a node.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
        :nodes='nodes' ></ejs-diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
    Vue.use(DiagramPlugin);
    let nodes = [{
        id: 'node1',
        // Position of the node
        offsetX: 100,
        offsetY: 100,
        // Size of the node
        width: 100,
        height: 100,
        style: {

```

```

        fill: '#6BA5D7',
        strokeColor: 'white'
    },
    //Sets the annotation for the node
    annotations: [{
        content: 'Annotation Text Wrapping',
        // Sets the style for the text wrapping
        style: {
            textWrapping: 'Wrap'
        }
    }]
  ]
}
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/labels/Wrap-cs1" %}

| Value | Description | Image |

| ----- | ----- | ----- |

| No Wrap | Text will not be wrapped. |

| Wrap | Text-wrapping occurs, when the text overflows beyond the available node width. |

| WrapWithOverflow (Default) | Text-wrapping occurs, when the text overflows beyond the available node width. However, the text may overflow beyond the node width in the case of a very long word. |

### Text overflow

The label's [TextOverflow](#) property is used control whether to display the overflowed content in node or not.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'node1',
    // Position of the node
    offsetX: 100,
    offsetY: 100,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Sets the annotation for the node
    annotations: [{
      content: 'Annotation Text',
      // Sets the style for the text to be displayed
      style: {
        textOverflow: 'Ellipsis'
      }
    }]
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }
</script>
```

```

    }
  }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/labels/Overflow-cs1" %}

### Appearance

- You can change the font style of the annotations with the font specific properties (fontSize, fontFamily, color). The following code illustrates how to customize the appearance of the annotation.
- The label's [bold](#), [italic](#), and [textDecoration](#) properties are used to style the label's text.
- The label's [fill](#), [strokeColor](#), and [strokeWidth](#) properties are used to define the background color and border color of the annotation and the [opacity](#) property is used to define the transparency of the annotations.
- The [visible](#) property of the annotation enables or disables the visibility of annotation.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'node1',
    // Position of the node
    offsetX: 100,
    offsetY: 100,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Sets the annotation for the node
    annotations: [{
      content: 'Annotation Text',
      // Sets the style for the text to be displayed
      style: {
        color: 'black',
        bold: true,
        italic: true,
        fontSize: '12',

```

```

        fontFamily: 'TimesNewRoman'
    }
  ]]
  ]]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/labels/Appear-cs1" %}

The fill, border, and opacity appearances of the text can also be customized with appearance specific properties of annotation. The following code illustrates how to customize background, opacity, and border of the annotation.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'node1',
    // Position of the node
    offsetX: 100,
    offsetY: 100,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Sets the annotation for the node
    annotations: [{
      content: 'Annotation Text',
      style: {
        color: 'black',
        fill: 'white',

```

```

        opacity: 0.7,
        strokeColor: 'black',
        strokeWidth: 2
      }
    ]
  ]
}
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/labels/Opacity-cs1" %}

### Interaction

Diagram allows annotation to be interacted by selecting, dragging, rotating, and resizing. Annotation interaction is disabled, by default. You can enable annotation interaction with the [constraints](#) property of annotation. You can also curtail the services of interaction by enabling either selecting, dragging, rotating, or resizing individually with the respective constraints property of annotation. The following code illustrates how to enable annotation interaction.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, AnnotationConstraints } from '@syncfusion/ej2-
  vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'node1',
    // Position of the node
    offsetX: 100,
    offsetY: 100,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    }
  },

```

```

// Sets the annotation for the node
annotations: [{
  content: 'Annotation Text',
  //Sets the constraints as Interaction
  constraints: AnnotationConstraints.Interaction
}]
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/labels/Interaction-cs1" %}

### Edit

Diagram provides support to edit an annotation at runtime, either programmatically or interactively. By default, annotation is in view mode. But it can be brought to edit mode in two ways;

- Programmatically

By using [startTextEdit](#) method, edit the text through programmatically.

- Interactively
  1. By double-clicking the annotation.
  2. By selecting the item and pressing the F2 key.

Double-clicking any annotation will enables editing and the node enables first annotation editing. When the focus of editor is lost, the annotation for the node is updated.

When you double-click on the node/connector/diagram model, the [doubleClick](#) event gets triggered.

### Read-only annotations

Diagram allows to create read-only annotations. You have to set the read-only property of annotation to enable/disable the read-only [constraints](#). The following code illustrates how to enable read-only mode.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>
</template>

```

```

<script>
  import Vue from 'vue';
  import { DiagramPlugin, AnnotationConstraints } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'node1',
    // Position of the node
    offsetX: 100,
    offsetY: 100,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Sets the annotation for the node
    annotations: [{
      content: 'Annotation Text',
      //Sets the constraints as Read only
      constraints: AnnotationConstraints.ReadOnly
    }]
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/labels/Read-cs1" %}

### Drag Limit

- The diagram control now supports defining the [dragLimit](#) to the label while dragging from the connector and also update the position to the nearest segment offset.
- You can set the value to dragLimit [left](#), [right](#), [top](#), and [bottom](#) properties which allow the dragging of connector labels to a certain limit based on the user defined values.
- By default, drag limit will be disabled for the connector. It can be enabled by setting connector constraints as drag.
- The following code illustrates how to set a dragLimit for connector annotations.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, AnnotationConstraints } from '@syncfusion/ej2-
vue-diagrams';
  Vue.use(DiagramPlugin);
  let connectors = [
    {
      id: 'connector2',
      type: 'Orthogonal',
      sourcePoint: { x: 300, y: 300 },
      targetPoint: { x: 400, y: 400 },
      annotations: [
        {
          content: 'connector1', offset: 0.5,
          //Enables drag constraints for a connector.
          constraints: AnnotationConstraints.Interaction |
AnnotationConstraints.Drag,
          //Set drag limit for a connector annotation.
          dragLimit: {left: 20, right: 20, top: 20, bottom: 20}
        }
      ],
    }
  ]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        connectors: connectors,
      }
    }
  }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/labels/Interaction-cs2" %}

### Multiple annotations

You can add any number of annotations to a node or connector. The following code illustrates how to add multiple annotations to a node.

#### APP.VUE

```

<template>
  <div id="app">

```

```

    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'node1',
    // Position of the node
    offsetX: 100,
    offsetY: 100,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Sets the multiple annotation for the node
    annotations: [{
      content: 'Left',
      offset: {
        x: 0.12,
        y: 0.1
      }
    },
    {
      content: 'Center',
      offset: {
        x: 0.5,
        y: 0.5
      }
    },
    {
      content: 'Right',
      offset: {
        x: 0.82,
        y: 0.9
      }
    }
  ]
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }
</script>
<style>

```

```
@import "../../../node_modules/@syncfusion/ej2-vue-  
diagrams/styles/material.css";  
</style>
```

{% previewsample "page.domainurl/code-snippet/diagram/labels/Multiple-cs1" %}

### Constraints

The constraints property of annotation allows you to enable/disable certain annotation behaviors. For instance, you can disable annotation editing.

### Ports in Vue Diagram component

Diagram provides support to define custom ports for making connections.

<!-- markdownlint-disable MD033 -->

When a connector is connected between two nodes, its end points are automatically docked to the node's nearest boundary as shown in the following image.

Ports act as the connection points of the node and allows to create connections with only those specific points as shown in the following image.

### Create Port

#### Add ports when initializing nodes

To add a connection port, define the port object and add it to node's ports collection. The `offset` property of port accepts an object of fractions and used to determine the position of ports. The following code illustrates how to add ports when initializing the node.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, PortVisibility } from '@syncfusion/ej2-vue-
diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Initialize port collection
    ports: [{
      // Sets the position for the port
      offset: {
        x: 0.5,
        y: 0.5
      },
      visibility: PortVisibility.Visible
    }]
  }]
  export default {
    name: 'app'
    data() {
```

```

        return {
            width: "100%",
            height: "350px",
            nodes: nodes,
        }
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/ports/Remove-cs1" %}

### Add ports at runtime

Add ports at runtime by using the client-side method [addPorts](#). The following code illustrates how to add ports to node at runtime.

The port's ID property is used to define the unique ID for the port and its further used to find the port at runtime.

If ID is not set, then default ID is automatically set.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
        :nodes='nodes' ></ejs-diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { DiagramPlugin , PointPortModel, PortVisibility} from
    '@syncfusion/ej2-vue-diagrams';
    Vue.use(DiagramPlugin);
    let nodes = [{
        // Position of the node
        offsetX: 250,
        offsetY: 250,
        // Size of the node
        width: 100,
        height: 100,
        style: {
            fill: '#6BA5D7',
            strokeColor: 'white'
        },
    },
    ];
    let port: PointPortModel[] = [{
        id: 'port1',
        offset: {
            x: 0,
            y: 0.5
        },
        visibility: PortVisibility.Visible
    } {

```

```

        id: 'port2',
        offset: {
            x: 1,
            y: 0.5
        },
        visibility: PortVisibility.Visible
    },
    {
        id: 'port3',
        offset: {
            x: 0.5,
            y: 0
        },
        visibility: PortVisibility.Visible
    },
    {
        id: 'port4',
        offset: {
            x: 0.5,
            y: 1
        },
        visibility: PortVisibility.Visible
    }
];
export default {
    name: 'app'
    data() {
        return {
            width: "100%",
            height: "350px",
            nodes: nodes,
        }
    }
    mounted: function() {
        let diagramInstance: Diagram;
        let diagramObj: any = document.getElementById("diagram");
        diagramInstance = diagramObj.ej2_instances[0];
        // Adds to the Diagram
        diagramInstance.addPorts(diagramInstance.nodes[0], port);
    }
}
</script>
<style>
    @import "../../../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/ports/Node-cs1" %}

### Remove ports at runtime

Remove ports at runtime by using client-side method [removePorts](#). Refer to the following example which shows how to remove ports at runtime.

### APP.VUE

```
<template>
```

```

<div id="app">
  <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
</div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, PortVisibility, PointPortModel } from
'@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Initialize port collection
    ports: [{
      id: 'port1',
      offset: {
        x: 0,
        y: 0.5
      },
      visibility: PortVisibility.Visible
    },
    {
      id: 'port2',
      offset: {
        x: 1,
        y: 0.5
      },
      visibility: PortVisibility.Visible
    },
    {
      id: 'port3',
      offset: {
        x: 0.5,
        y: 0
      },
      visibility: PortVisibility.Visible
    },
    {
      id: 'port4',
      offset: {
        x: 0.5,
        y: 1
      },
      visibility: PortVisibility.Visible
    }
  ]
  }]
  export default {

```

```

    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
    mounted: function() {
      let ports: PointPortModel[] = [{
        id: 'port1',
      }, {
        id: 'port2',
      }, {
        id: 'port3',
      }, {
        id: 'port4',
      }]
      let diagramInstance: Diagram;
      let diagramObj: any = document.getElementById("diagram");
      diagramInstance = diagramObj.ej2_instances[0];
      // Adds to the Diagram
      diagramInstance.removePorts(diagramInstance.nodes[0], ports);
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/ports/ports-cs1" %}

### Update Port at runtime

You can change any port properties at runtime and update it through the client-side method [dataBind](#).

The following code example illustrates how to change the port properties.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, PortVisibility } from '@syncfusion/ej2-vue-
  diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,

```

```

    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Initialize port collection
    ports: [{
      offset: {
        x: 0.5,
        y: 0.5
      },
      visibility: PortVisibility.Visible
    }]
  ]
}
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  },
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    diagramInstance.nodes[0].ports[0].offset = {
      x: 1,
      y: 1
    };
  }
}
</script>
<style>
  @import
  "https://ej2.syncfusion.com/vue/documentation/../../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/ports/ports-cs2" %}

### Appearance

- The shape of port can be changed by using its shape property. To explore the different types of port shapes, refer to Port Shapes. If you need to render a custom shape, then you can set shape as path and define path using path data property of port.
- The appearance of ports can be customized by using [strokeColor](#),

[strokeWidth](#), and [fill](#) properties of the port.

- Customize the port size by using the [width](#) and [height](#) properties of port.
- The ports [visibility](#) property allows you to define, when the port should be visible.

The following code illustrates how to change the appearance of port.

### **APP.VUE**

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, PortVisibility } from '@syncfusion/ej2-vue-
diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
  },
  // Initialize port collection
  ports: [{
    offset: {
      x: 1,
      y: 0.5
    },
    visibility: PortVisibility.Visible,
    //Set the style for the port
    style: {
      fill: 'red',
      strokeWidth: 2,
      strokeColor: 'black'
    },
    width: 12,
    height: 12,
    // Sets the shape of the port as Circle
    shape: 'Circle'
  }
  ]
  }
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
  }
</script>
<style>
```

```
@import "../../../node_modules/@syncfusion/ej2-vue-  
diagrams/styles/material.css";  
</style>
```

```
{% previewsample "page.domainurl/code-snippet/diagram/ports/ports-cs3" %}
```

### Offset

The offset property of port is used to align the port based on fractions. 0 represents top/left corner, 1 represents bottom/right corner, and 0.5 represents half of width/height.

### Constraints

The constraints property allows to enable/disable certain behaviors of ports. For more information about port constraints, refer to [Port Constraints](#).

### Constraints in Vue Diagram component

Constraints are used to enable/disable certain behaviors of the diagram, nodes and connectors. Constraints are provided as flagged enumerations, so that multiple behaviors can be enabled/disabled using Bitwise operators (&, |, ~, <<, etc.).

To know more about Bitwise operators, refer to [Bitwise Operations](#).

### Diagram constraints

Diagram constraints allow to enable or disable the following behaviors:

- Page editing
- Bridging
- Zoom and pan
- Undo/redo
- Tooltip

The following example illustrates how to disable page editing using the diagram constraints.

```
`javascript  
export default {  
  name: 'app'  
  data() {  
    return {  
      width: "100%",  
      height: "350px",  
      constraints: DiagramConstraints.Default & ~DiagramConstraints.PageEditable  
    }  
  }  
}
```

For more information about diagram constraints, refer to [DiagramConstraints](#).

### Node constraints

Node constraints allows to enable or disable the following behaviors of node. They are as follows:

- Selection
- Deletion
- Drag
- Resize
- Rotate
- Connect
- Shadow
- Tooltip

The following example illustrates how to disable rotation using the node constraints.

```
`javascript
let nodes = [{
  id: "node1",
  height: 60,
  offsetX: 300,
  offsetY: 80,
  constraints: NodeConstraints.Default & ~NodeConstraints.Rotate,
  annotations: [{
    content: "start"
  }]
}]

export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
```

For more information about node constraints, refer to [NodeConstraints](#).

### Connector constraints

Connector constraints allow to enable or disable certain behaviors of connectors.

- Selection
- Deletion
- Drag
- Segment editing
- Tooltip
- Bridging

The following code illustrates how to disable selection by using connector constraints.

```
`javascript
let connectors = [{
  id: 'connector1',
  type: 'Straight',
  sourcePoint: {
    x: 100,
    y: 100
  },
  targetPoint: {
    x: 200,
    y: 200
  },
  constraints: ConnectorConstraints.Default & ~ConnectorConstraints.Select
}]

export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      connectors: connectors,
    }
  }
}
```

For more information about connector constraints, refer to [ConnectorConstraints](#).

### Port constraints

You can enable or disable certain behaviors of port. They are as follows:

- Connect
- ConnectOnDrag

The following code illustrates how to disable creating connections with a port.

```
`javascript
let nodes = [{
  id: 'connector1',
  type: 'Straight',
  sourcePoint: {
    x: 100,
    y: 100
  },
  targetPoint: {
    x: 200,
    y: 200
  },
  ports: [{
    constraints: PortConstraints.None
  }]
}]

export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
```

For more information about port constraints, refer to [PortConstraints](#).

#### Annotation constraints

You can enable or disable read-only mode for the annotations by using the annotation constraints.

The following code illustrates how to enable read-only mode for the annotations.

```
`javascript
let nodes = [{
  id: 'connector1',
  type: 'Straight',
  sourcePoint: {
    x: 100,
    y: 100
  },
  targetPoint: {
    x: 200,
    y: 200
  },
  annotations: [{
    id: 'anotation_1',
    content: 'annotation',
    constraints: AnnotationConstraints.ReadOnly,
  }]
}]

export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
    }
  }
}
```

For more details about annotation constraints, refer to [AnnotationConstraints](#).

### Selector constraints

Selector visually represents the selected elements with certain editable thumbs. The visibility of the thumbs can be controlled with selector constraints. The part of selector is categorized as follows:

- Resizer
- Rotator
- User handles

The following code illustrates how to hide rotator.

```
`javascript
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      selectedItems: {
        constraints: SelectorConstraints.All & ~SelectorConstraints.Rotate
      }
    }
  }
}
```

For more information about selector constraints, refer to [SelectorConstraints](#).

### Snap constraints

Snap constraints control the visibility of gridlines and enable/disable snapping. Snap constraints allow to set the following behaviors.

- Show only horizontal or vertical gridlines.
- Show both horizontal and vertical gridlines.
- Snap to either horizontal or vertical gridlines.
- Snap to both horizontal and vertical gridlines.

The following code illustrates how to show only horizontal gridlines.

```
`javascript
export default {
  name: 'app'
```

```
data() {  
  return {  
    width: "100%",  
    height: "350px",  
    snapSettings: {  
      constraints: SnapConstraints.ShowHorizontalLines  
    }  
  }  
}
```

For more information about snap constraints, refer to [SnapConstraints](#).

### Boundary constraints

Boundary constraints defines a boundary for the diagram inside which the interaction should be done. Boundary constraints allow to set the following behaviors.

- Infinite boundary
- Diagram sized boundary
- Page sized boundary

The following code illustrates how to limit the interaction done inside a diagram within a page.

```
`javascript  
export default {  
  name: 'app'  
  data() {  
    return {  
      width: "100%",  
      height: "350px",  
      pageSettings: {  
        boundaryConstraints: 'Page'  
      }  
    }  
  }  
}
```

For more information about selector constraints, refer to [BoundaryConstraints](#).

### Inherit behaviors

Some of the behaviors can be defined through both the specific object (node/connector) and diagram. When the behaviors are contradictorily defined through both, the actual behavior is set through inherit options.

The following code example illustrates how to inherit the line bridging behavior from the diagram model.

```
`javascript
Diagram.Inject(ConnectorBridging);
let connectors[] = [{
  id: 'connector1',
  type: 'Straight',
  sourcePoint: {
    x: 100,
    y: 100
  },
  targetPoint: {
    x: 200,
    y: 200
  },
  constraints: ConnectorConstraints.Default & ConnectorConstraints.InheritBridging
}];
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      connectors: connectors,
      constraints: DiagramConstraints.Default | DiagramConstraints.Bridging
    }
  }
}
```

### Bitwise operations

Bitwise operations are used to manipulate the flagged enumerations [enum]. In this section, Bitwise operations are illustrated by using node constraints. The same is applicable while working with node constraints, connector constraints, or port constraints.

#### Add operation

You can add or enable multiple values at a time by using Bitwise ‘|’ (OR) operator.

```
`javascript
```

```
node.constraints = NodeConstraints.Select | NodeConstraints.Rotate;
```

```
,
```

In the previous example, you can do both the selection and rotation operation.

#### Remove Operation

You can remove or disable values by using Bitwise ‘&~’ (XOR) operator.

```
`javascript
```

```
node.constraints = node.constraints & ~(NodeConstraints.Rotate);
```

```
,
```

In the previous example, rotation is disabled but other constraints are enabled.

#### Check Operation

You can check any value by using Bitwise ‘&’ (AND) operator.

```
`javascript
```

```
if ((node.constraints & (NodeConstraints.Rotate)) == (NodeConstraints.Rotate));
```

```
,
```

In the previous example, check whether the rotate constraints are enabled in a node. When node constraints have rotate constraints, the expression returns a rotate constraint.

### Interaction in Vue Diagram component

#### Selection

Selector provides a visual representation of selected elements. It behaves like a container and allows to update the size, position, and rotation angle of the selected elements through interaction and by using program. Single or multiple elements can be selected at a time.

#### Single selection

An element can be selected by clicking that element. During single click, all previously selected items are cleared. The following image shows how the selected elements are visually represented.

- While selecting the diagram elements, the following events can be used to do your customization.
- When selecting/unselecting the diagram elements, the [selectionChange](#) event gets triggered.

### Selecting a group

When a child element of any group is clicked, its contained group is selected instead of the child element. With consecutive clicks on the selected element, selection is changed from top to bottom in the hierarchy of parent group to its children.

### Multiple selection

Multiple elements can be selected with the following ways:

- Ctrl+Click

During single click, any existing item in the selection list be cleared, and only the item clicked recently is there in the selection list. To avoid cleaning the old selected item, Ctrl key must be on hold when clicking.

- Selection rectangle/rubber band selection

Clicking and dragging the diagram area allows to create a rectangular region. The elements that are covered under the rectangular region are selected at the end.

#### Select/Unselect elements using program

The client-side methods [select](#) and [clearSelection](#) help to select or clear the selection of the elements at runtime. The following code example illustrates how to select or clear the selection of an item using program.

Get the current selected items from the [nodes](#) and [connectors](#) collection of the [selectedItems](#) property of the diagram model.

#### Select entire elements in diagram programmatically

The client-side method [selectAll](#) used to select all the elements such as nodes/connectors in the diagram. Refer to the following link which shows how to use [selectAll](#) method on the diagram.

#### Drag

- An object can be dragged by clicking and dragging it. When multiple elements are selected, dragging any one of the selected elements move every selected element.
- When you drag the elements in the diagram, the [positionChange](#) event gets triggered and to do customization in this event.

## Resize

- Selector is surrounded by eight thumbs. When dragging these thumbs, selected items can be resized.
- When one corner of the selector is dragged, opposite corner is in a static position.
- When a node is resized, the [sizeChange](#) event gets triggered.

Note: While dragging and resizing, the objects are snapped towards the nearest objects to make better alignments. For better alignments, refer to **Snapping**.

## Customize the resize-thumb

You can change the size of the node resize thumb and the connector end point handle by using the **handleSize** property. The appearance such as fill, stroke, and stroke width of the node resize thumb and connector end point handle can be customized by overriding the **e-diagram-resize-handle** and **e-diagram-endpoint-handle** classes respectively.

## APP.VUE

```
<template>
  <div id="app">
```

```

    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' :selectedItems='selectedItems' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, Diagram, NodeModel, SelectorConstraints } from
'@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
    // Text(label) added to the node
  }]
  export default {
    name: 'app',
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
        selectedItems: { handleSize : 40 }
      }
    }
  }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/interaction/resizeThumb-cs1" %}

### Rotate

- A rotate handler is placed above the selector. Clicking and dragging the handler in a circular direction lead to rotate the node.
- The node is rotated with reference to the static pivot point.
- Pivot thumb (thumb at the middle of the node) appears while rotating the node to represent the static point.

### Connection editing

- Each segment of a selected connector is editable with some specific handles/thumbs.

Note: For connector editing, you have to inject the [ConnectorEditing](#) module.

### End point handles

Source and target points of the selected connectors are represented with two handles. Clicking and dragging those handles help you to adjust the source and target points.

- If you drag the connector end points, then the following events can be used to do your customization.
- When the connector source point is changed, the [sourcePointChange](#) event gets triggered.
- When the connector target point is changed, the [targetPointChange](#) event gets triggered.
- When you connect connector with ports/node or disconnect from it, the [connectionChange](#) event gets triggered.

### Straight segment editing

- End point of each straight segment is represented by a thumb that enables to edit the segment.
- Any number of new segments can be inserted into a straight line by clicking, when Shift and Ctrl keys are pressed (Ctrl+Shift+Click).

- Straight segments can be removed by clicking the segment end point, when Ctrl and Shift keys are pressed (Ctrl+Shift+Click).

### Orthogonal thumbs

- Orthogonal thumbs allow you to adjust the length of adjacent segments by clicking and dragging it.
- When necessary, some segments are added or removed automatically, when dragging the segment. This is to maintain proper routing of orthogonality between segments.

### Bezier thumbs

- Bezier segments are annotated with two thumbs to represent the control points. Control points of the curve can be configured by clicking and dragging the control thumbs.

### Drag and drop nodes over other elements

Diagram provides support to drop a node/connector over another node/connector. The [drop](#) event is raised to notify that an element is dropped over another one and it is disabled, by default. It can be enabled with the `constraints` property.

### User handles

- User handles are used to add some frequently used commands around the selector. To create user handles, define and add them to the [userHandles](#) collection of the [selectedItems](#) property.
- The `name` property of user handle is used to define the name of the user handle and is further used to find the user handle at runtime and do any customization.

### Alignment

User handles can be aligned relative to the node boundaries. It has [margin](#), [offset](#), [side](#), [horizontalAlignment](#), and [verticalAlignment](#) settings. It is quite tricky when all four alignments are used together but gives more control over alignment.

### Offset

The [offset](#) property of [userHandles](#) is used to align the user handle based on fractions. 0 represents top/left corner, 1 represents bottom/right corner, and 0.5 represents half of width/height.

### Side

The [side](#) property of [userHandles](#) is used to align the user handle by using the [Top](#), [Bottom](#), [Left](#), and [Right](#) options.

### Horizontal and vertical alignments

The [horizontalAlignment](#) property of [userHandles](#) is used to set how the user handle is horizontally aligned at the position based on the [offset](#). The [verticalAlignment](#) property is used to set how user handle is vertically aligned at the position.

### Margin

Margin is an absolute value used to add some blank space in any one of its four sides. The [userHandles](#) can be displaced with the [margin](#) property.

### Notification for the mouse button clicked

The diagram component notifies the mouse button clicked. For example, whenever the right mouse button is clicked, the clicked button is notified as right. Mouse click is notified with,

Notification	Description
Left	When the left mouse button is clicked, left is notified
Middle	When the mouse wheel is clicked, middle is notified
Right	When the right mouse button is clicked, right is notified

```
<template>
```

```
<div id="app">
```

```
<ejs-diagram id="diagram" :width='width' :height='height' :nodes='nodes' :click="click"></ejs-diagram>
```

```
</div>
```

```
</template>
```

```
<script>
```

```
import Vue from 'vue';
```

```
import { DiagramPlugin, DiagramTools } from '@syncfusion/ej2-vue-diagrams';
```

```
Vue.use(DiagramPlugin);
```

```
let nodes = [{
```

```
// Position of the node
```

```
offsetX: 250,
offsetY: 250,
// Size of the node
width: 100,
height: 100,
style: {
  fill: '#6BA5D7',
  strokeColor: 'white'
},
// Text(label) added to the node
}]
export default {
  name: 'app',
  data() {
    return {
      width: "100%",
      height: "700px",
      nodes: nodes,
      click: (args) => {
        //Obtains the button clicked
        let clickNotify = args.button
      }
    }
  },
}
```

</script>

,

### Appearance

The appearance of the user handle can be customized by using the [size](#), [borderColor](#), [backgroundColor](#), [visible](#), [pathData](#), and [pathColor](#) properties of the [userHandles](#).

### APP.VUE

```
<template>
  <div id="app">
```

```

    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' :getCustomTool='getCustomTool'
:selectedItems='selectedItems'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, NodeModel
, MoveTool, BasicShapeModel, UserHandleModel, randomId,
SelectorConstraints, cloneObject } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let diagramInstance: Diagram;
  let shape: BasicShapeModel = {
    type: 'Basic',
    shape: 'Rectangle'
  };
  function getTool(action: string): ToolBase {
    let tool: ToolBase | any;
    if (action === "clone") {
      tool = new CloneTool(diagramInstance.commandHandler);
    }
    return tool;
  }
  class CloneTool extends MoveTool {
    public mouseDown(args: MouseEventArgs): void {
      let newObject: any;
      if (diagramInstance.selectedItems.nodes.length > 0) {
        newObject =
cloneObject(diagramInstance.selectedItems.nodes[0]) as NodeModel;
      } else {
        newObject =
cloneObject(diagramInstance.selectedItems.connectors[0]) as ConnectorModel;
      }
      newObject.id += randomId();
      diagramInstance.paste([newObject]);
      args.source = diagramInstance.nodes[diagramInstance.nodes.length
- 1] as IElement;
      args.sourceWrapper = args.source.wrapper;
      super.mouseDown(args);
      this.inAction = true;
    }
  }
  let nodes = [{
    id: 'node',
    offsetX: 100,
    offsetY: 100,
    shape: shape
  }]
  let handles: UserHandleModel[] = [{

### Zoom pan

- When a large diagram is loaded, only certain portion of the diagram is visible. The remaining portions are clipped. Clipped portions can be explored by scrolling the scrollbars or panning the diagram.
- Diagram can be zoomed in or out by using Ctrl + mouse wheel.
- When the diagram is zoomed or panned, the [scrollChange](#) event gets triggered.

### Zoom pan status

Diagram provides the support to notify the pan status of the zoom pan tool. When ever the diagram is panning the [scrollChange](#) event is triggered and hence the pan status can be obtained. The pan status is notified with Start, Progress, and Completed.

Pan Status	Description
Start	When the mouse is clicked and dragged the status is notified as start.
Progress	When the mouse is in motion the status is notified as progress.
Completed	When panning is stopped the status is notified with completed.

```

<template>
<div id="app">
  <ejs-diagram id="diagram" :width='width' :height='height' :nodes='nodes' :tool='tools'
  :scrollChange="scrollChange"></ejs-diagram>
</div>
</template>
<script>
import Vue from 'vue';

```

```
import { DiagramPlugin, DiagramTools } from '@syncfusion/ej2-vue-diagrams';
Vue.use(DiagramPlugin);
let nodes = [{
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  style: {
    fill: '#6BA5D7',
    strokeColor: 'white'
  },
  // Text(label) added to the node
}]
export default {
  name: 'app',
  data() {

## Keyboard

Diagram provides support to interact with the elements with key gestures. By default, some in-built commands are bound with a relevant set of key combinations.

The following table illustrates those commands with the associated key values.

Shortcut Key	Command	Description
----- ----- -----		
Ctrl + A	<code>selectAll</code>	Select all nodes/connectors in the diagram.
Ctrl + C	<code>copy</code>	Copy the diagram selected elements.
Ctrl + V	<code>paste</code>	Pastes the copied elements.
Ctrl + X	<code>cut</code>	Cuts the selected elements.
Ctrl + Z	<code>undo</code>	Reverses the last editing action performed on the diagram.
Ctrl + Y	<code>redo</code>	Restores the last editing action when no other actions have occurred since the last undo on the diagram.
Delete	<code>delete</code>	Deletes the selected elements.
Ctrl/Shift + Click on object		Multiple selection (Selector binds all selected nodes/connectors).
Up Arrow	<code>nudge("up")</code>   <code>nudgeUp</code>	Moves the selected elements towards up by one pixel.
Down Arrow	<code>nudge("down")</code>   <code>nudgeDown</code>	Moves the selected elements towards down by one pixel.
Left Arrow	<code>nudge("left")</code>   <code>nudgeLeft</code>	Moves the selected elements towards left by one pixel.
Right Arrow	<code>nudge("right")</code>   <code>nudgeRight</code>	Moves the selected elements towards right by one pixel.
Ctrl + MouseWheel	<code>zoom</code>	Zoom (Zoom in/Zoom out the diagram).
F2	<code>startLabelEditing</code>	Starts to edit the label of selected element.
Esc	<code>endLabelEditing</code>	Sets the label mode as view and stops editing.

## Tools in Vue Diagram component

### Drawing tools

Drawing tool allows you to draw any kind of node/connector during runtime by clicking and dragging on the diagram page.

## Shapes

To draw a shape, set the JSON of that shape to the drawType property of the diagram and activate the drawing tool by using the [tool](#) property. The following code example illustrates how to draw a rectangle at runtime.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
      :getNodeDefaults='getNodeDefaults'></ejs-diagram>
    </div>
  </template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, DiagramTools, BasicShapeModel, NodeModel } from
  '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        getNodeDefaults: (obj) => {
          obj.height = 15;
          obj.width = 15;
          obj.borderWidth = 1;
          obj.style = {
            fill: '#6BA5D7',
            strokeWidth: 2,
            strokeColor: '#6BA5D7'
          };
          return obj;
        },
      }
    }
    mounted: function() {
      let diagramInstance: Diagram;
      let diagramObj: any = document.getElementById("diagram");
      diagramInstance = diagramObj.ej2_instances[0];
      let drawingshape: BasicShapeModel = { type: 'Basic', shape:
      'Rectangle' };
      let node: NodeModel = {
        shape: drawingshape
      };
      diagramInstance.drawingObject = node;
      //To draw an object once, activate draw once
      diagramInstance.tool = DiagramTools.DrawOnce;
      diagramInstance.dataBind();
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/diagram/Tools/shape-cs1" %}
```

## Path

The following code example illustrates how to draw a path.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
      :getNodeDefaults='getNodeDefaults'></ejs-diagram>
    </div>
  </template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, DiagramTools, BasicShapeModel, NodeModel } from
  '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        getNodeDefaults: (obj) => {
          obj.height = 15;
          obj.width = 15;
          obj.borderWidth = 1;
          obj.style = {
            fill: '#6BA5D7',
            strokeWidth: 2,
            strokeColor: '#6BA5D7'
          };
          return obj;
        },
      }
    }
    mounted: function() {
      let diagramInstance: Diagram;
      let diagramObj: any = document.getElementById("diagram");
      diagramInstance = diagramObj.ej2_instances[0];
      let node: NodeModel = {
        id: "Path",
        style: { fill: "#f8e172" },
        annotations: [{
          content: "Path"
        }],
        shape: {
          type: 'Path',
          data: 'M13.560 67.524 L 21.941 41.731 L 0.000 25.790 L
27.120 25.790 L 35.501 0.000 L 43.882 25.790 L 71.000 25.790 L 49.061 41.731
L 57.441 67.524 L 35.501 51.583 z'
        } as PathModel
      };
      diagramInstance.drawingObject = node;
    }
  }
}
```

```

        //To draw an object once, activate draw once
        diagramInstance.tool = DiagramTools.DrawOnce;
        diagramInstance.dataBind();
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/Tools/path-cs1" %}

### Connectors

To draw connectors, set the JSON of the connector to the drawType property. The drawing [tool](#) can be activated by using the tool property. The following code example illustrates how to draw a straight line connector.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
        :getNodeDefaults='getNodeDefaults'></ejs-diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { DiagramPlugin, DiagramTools, BasicShapeModel, ConnectorModel }
    from '@syncfusion/ej2-vue-diagrams';
    Vue.use(DiagramPlugin);
    export default {
        name: 'app'
        data() {
            return {
                width: "100%",
                height: "350px",
                getNodeDefaults: (obj) => {
                    obj.height = 15;
                    obj.width = 15;
                    obj.borderWidth = 1;
                    obj.style = {
                        fill: '#6BA5D7',
                        strokeWidth: 2,
                        strokeColor: '#6BA5D7'
                    };
                    return obj;
                },
            },
        },
        mounted: function() {
            let diagramInstance: Diagram;
            let diagramObj: any = document.getElementById("diagram");
            diagramInstance = diagramObj.ej2_instances[0];
            let connectors: ConnectorModel = {
                id: 'connector1',

```

```

        type: 'Straight',
        segments: [{ type: "polyline" }]
    }
    diagramInstance.drawingObject = connectors;
    //To draw an object once, activate draw once
    diagramInstance.tool = DiagramTools.DrawOnce;
    diagramInstance.dataBind();
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/Tools/connector-cs1" %}

### Text

Diagram allows you to create a textNode, when you click on the diagram page. The following code illustrates how to draw a text.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
        :getNodeDefaults='getNodeDefaults'></ejs-diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { DiagramPlugin
    , DiagramTools, BasicShapeModel, TextModel, NodeModel } from '@syncfusion/ej2-
    vue-diagrams';
    Vue.use(DiagramPlugin);
    export default {
        name: 'app'
        data() {
            return {
                width: "100%",
                height: "350px",
                getNodeDefaults: (obj) => {
                    obj.height = 15;
                    obj.width = 15;
                    obj.borderWidth = 1;
                    obj.style = {
                        fill: '#6BA5D7',
                        strokeWidth: 2,
                        strokeColor: '#6BA5D7'
                    };
                    return obj;
                },
            }
        }
        mounted: function() {
            let diagramInstance: Diagram;

```

```

    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    let node: NodeModel = {
        shape: {
            type: 'Text',
        } as TextModel
    };
    diagramInstance.drawingObject = node;
    //To draw an object once, activate draw once
    diagramInstance.tool = DiagramTools.DrawOnce;
    diagramInstance.dataBind();
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/Tools/text-cs1" %}

Once you activate the TextTool, perform label editing of a node/connector.

### Polygon shape

Diagram allows to create the polygon shape by clicking and moving the mouse at runtime on the diagram page.

The following code illustrates how to draw a polygon shape.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
        :getNodeDefaults='getNodeDefaults'></ejs-diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { DiagramPlugin
    ,DiagramTools,BasicShapeModel,BasicShapeModel,NodeModel} from
    '@syncfusion/ej2-vue-diagrams';
    Vue.use(DiagramPlugin);
    export default {
        name: 'app'
        data() {
            return {
                width: "100%",
                height: "350px",
                getNodeDefaults: (obj) => {
                    obj.height = 15;
                    obj.width = 15;
                    obj.borderWidth = 1;
                    obj.style = {
                        fill: '#6BA5D7',
                        strokeWidth: 2,
                        strokeColor: '#6BA5D7'
                    }
                }
            }
        }
    }

```

```

        };
        return obj;
    },
    }
}
mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    let drawingshape: BasicShapeModel = { type: 'Basic', shape:
'Polygon' };
    //JSON to create a polygon
    let node: NodeModel = {
        shape: drawingshape
    };
    diagramInstance.drawingObject = node;
    //To draw an object once, activate draw once
    diagramInstance.tool = DiagramTools.DrawOnce;
    diagramInstance.dataBind();
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/Tools/polygon-cs1" %}

### Polyline Connector

Diagram allows to create the polyline segments with straight lines and angled vertices at the control points by clicking and moving the mouse at runtime on the diagram page.

The following code illustrates how to draw a polyline connector.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
:getNodeDefaults='getNodeDefaults'></ejs-diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { DiagramPlugin, DiagramTools, ConnectorModel } from
'@syncfusion/ej2-vue-diagrams';
    Vue.use(DiagramPlugin);
    export default {
        name: 'app'
        data() {
            return {
                width: "100%",
                height: "350px",
                getNodeDefaults: (obj) => {
                    obj.height = 15;

```

```

        obj.width = 15;
        obj.borderWidth = 1;
        obj.style = {
            fill: '#6BA5D7',
            strokeWidth: 2,
            strokeColor: '#6BA5D7'
        };
        return obj;
    },
}
}
mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    //JSON to create a polyline
    let connector: ConnectorModel = { id: 'connector1', type:
'Polyline' };
    diagramInstance.drawingObject = connector;
    //To draw an object once, activate draw once
    diagramInstance.tool = DiagramTools.DrawOnce;
    diagramInstance.dataBind();
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/Tools/polyline-cs1" %}

### Tool selection

There are some functionalities that can be achieved by clicking and dragging on the diagram surface. They are as follows.

- Draw selection rectangle: MultipleSelect tool
- Pan the diagram: Zoom pan
- Draw nodes/connectors: DrawOnce/DrawOnce

As all the three behaviors are completely different, you can achieve only one behavior at a time based on the tool that you choose. When more than one of those tools are applied, a tool is activated based on the precedence given in the following table.

Precedence	Tools	Description
1st	ContinuesDraw	Allows you to draw the nodes or connectors continuously. Once it is activated, you cannot perform any other interaction in the diagram.
2nd	DrawOnce	Allows you to draw a single node or connector. Once you complete the DrawOnce action, SingleSelect, and MultipleSelect tools are automatically enabled.

|3rd|ZoomPan|Allows you to pan the diagram. When you enable both the SingleSelect and ZoomPan tools, you can perform the basic interaction as the cursor hovers node/connector. Panning is enabled when cursor hovers the diagram.|

|4th|MultipleSelect|Allows you to select multiple nodes and connectors. When you enable both the MultipleSelect and ZoomPan tools, cursor hovers the diagram. When panning is enabled, you cannot select multiple nodes.|

|5th|SingleSelect|Allows you to select individual nodes or connectors.|

|6th|None|Disables all tools.|

Set the desired [tool](#) to the tool property of the diagram model. The following code illustrates how to enable Zoom pan in the diagram

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :getNodeDefaults='getNodeDefaults'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, DiagramTools, BasicShapeModel, ConnectorModel }
  from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        getNodeDefaults: (obj) => {
          obj.height = 15;
          obj.width = 15;
          obj.borderWidth = 1;
          obj.style = {
            fill: '#6BA5D7',
            strokeWidth: 2,
            strokeColor: '#6BA5D7'
          };
          return obj;
        },
      }
    }
    mounted: function() {
      let diagramInstance: Diagram;
      let diagramObj: any = document.getElementById("diagram");
      diagramInstance = diagramObj.ej2_instances[0];
      let connectors: ConnectorModel = {
        id: 'connector1',
        type: 'Straight',
        segments: [{ type: "polyline" }]
      }
      diagramInstance.drawingObject = connectors;
    }
  }
}
```

```

        //To draw an object once, activate draw once
        diagramInstance.tool = DiagramTools.DrawOnce | DiagramTools.ZoomPan;
        diagramInstance.dataBind();
    }
}
</script>
<style>
    @import "../../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/Tools/connector-cs2" %}

## Events

[elementDraw](#) event is triggered when node or connector is drawn using drawing tool.

## APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
        :getNodeDefaults='getNodeDefaults' :elementDraw="elementDraw"></ejs-diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { DiagramPlugin, DiagramTools, BasicShapeModel, ConnectorModel,
    IElementDrawEventArgs } from '@syncfusion/ej2-vue-diagrams';
    Vue.use(DiagramPlugin);
    export default {
        name: 'app'
        data() {
            return {
                width: "100%",
                height: "350px",
                getNodeDefaults: (obj) => {
                    obj.height = 15;
                    obj.width = 15;
                    obj.borderWidth = 1;
                    obj.style = {
                        fill: '#6BA5D7',
                        strokeWidth: 2,
                        strokeColor: '#6BA5D7'
                    };
                },
                return obj;
            },
            elementDraw: (args) => {
                {
                    console.log("Event Triggered")
                }
            }
        }
        mounted: function() {
            let diagramInstance: Diagram;
            let diagramObj: any = document.getElementById("diagram");
            diagramInstance = diagramObj.ej2_instances[0];

```

```

    let connectors: ConnectorModel = {
      id: 'connector1',
      type: 'Straight',
      segments: [{ type: "Straight" }]
    }
    diagramInstance.drawingObject = connectors;
    //To draw an object once, activate draw once
    diagramInstance.tool = DiagramTools.DrawOnce;
    diagramInstance.dataBind();
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/Tools/connector-cs3" %}

### Freehand Drawing

Diagram has support for free-hand drawing to draw anything on the diagram page independently. Free-hand drawing will be enabled by using the drawingObject property and setting its value to Freehand.

The following code illustrates how to draw a freehand drawing.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :getNodeDefaults='getNodeDefaults'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, DiagramTools, BasicShapeModel, ConnectorModel }
  from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        getNodeDefaults: (obj) => {
          obj.height = 15;
          obj.width = 15;
          obj.borderWidth = 1;
          obj.style = {
            fill: '#6BA5D7',
            strokeWidth: 2,
            strokeColor: '#6BA5D7'
          };
          return obj;
        },
      },
    }
  }

```

```

    }
    mounted: function() {
      let diagramInstance: Diagram;
      let diagramObj: any = document.getElementById("diagram");
      diagramInstance = diagramObj.ej2_instances[0];
      let connectors: ConnectorModel = {
        id: 'connector1',
        type: 'Freehand'
      }
      diagramInstance.drawingObject = connectors;
      //To draw an object once, activate draw once
      diagramInstance.tool = DiagramTools.DrawOnce;
      diagramInstance.dataBind();
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/Tools/connector-cs4" %}

### Grid lines in Vue Diagram component

Gridlines are the pattern of lines drawn behind the diagram elements. It provides a visual guidance while dragging or arranging the objects on the diagram surface.

The model's [snapSettings](#) property is used to customize the gridlines and control the snapping behavior in the diagram.

#### Customize the gridlines visibility

The [snapSettings.snapConstraints](#) enables you to show/hide the gridlines. The following code example illustrates how to show or hide gridlines.

If you need to enable snapping, then inject snapping module into the diagram.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :snapSettings='snapSettings' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import {
    DiagramPlugin, SnapSettingsModel, SnapConstraints, Snapping, Diagram } from
    '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  Diagram.Inject(Snapping);
  let snapSettings: SnapSettingsModel = {
    // Display both Horizontal and Vertical gridlines
    constraints: SnapConstraints.ShowLines };
  export default {
    name: 'app'
  }

```

```

        data() {
            return {
                width: "100%",
                height: "350px",
                snapSettings: snapSettings
            }
        }
    }
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/gridlines/gridlines-cs1" %}

### Appearance

The appearance of the gridlines can be customized by using a set of predefined properties.

- The [horizontalGridLines](#) and the [verticalGridLines](#) properties allow to customize the appearance of the horizontal and vertical gridlines respectively.
- The horizontal gridlines [lineColor](#) and [lineDashArray](#) properties are used to customizes the line color and line style of the horizontal gridlines.
- The vertical gridlines [lineColor](#) and [lineDashArray](#) properties are used to customizes the line color and line style of the vertical gridlines.

The following code example illustrates how to customize the appearance of gridlines.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
        :snapSettings='snapSettings' ></ejs-diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import {
        DiagramPlugin, SnapSettingsModel, SnapConstraints, Snapping, Diagram } from
        '@syncfusion/ej2-vue-diagrams';
    Vue.use(DiagramPlugin);
    Diagram.Inject(Snapping);
    let snapSettings: SnapSettingsModel = {
        // Define the Constraints for gridlines and snapping
        constraints: SnapConstraints.ShowLines,
        // Defines the horizontalGridlines for SnapSettings
        horizontalGridlines: {
            // Sets the line color of gridlines
            lineColor: 'blue',
            // Defines the lineDashArray of gridlines
            lineDashArray: '2 2'
        },
        // Defines the verticalGridlines for SnapSettings
        verticalGridlines: {

```

```

        lineColor: 'blue',
        lineDashArray: '2 2'
    });
    export default {
        name: 'app'
        data() {
            return {
                width: "100%",
                height: "350px",
                snapSettings:snapSettings
            }
        }
    }
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/gridlines/gridlinesAppearance-cs1" %}

### Line Intervals

Thickness and the space between gridlines can be customized by using horizontal gridlines's [linesInterval](#) and vertical gridlines's [linesInterval](#) properties. In the lines interval collections, values at the odd places are referred as the thickness of lines and values at the even places are referred as the space between gridlines.

The following code example illustrates how to customize the thickness of lines and the line intervals.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
        :snapSettings='snapSettings' ></ejs-diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import {
    DiagramPlugin, SnapSettingsModel, SnapConstraints, Snapping, Diagram } from
    '@syncfusion/ej2-vue-diagrams';
    Vue.use(DiagramPlugin);
    Diagram.Inject(Snapping);
    let snapSettings: SnapSettingsModel = {
        constraints: SnapConstraints.ShowLines,
        horizontalGridlines: {
            // Sets the lineIntervals of Gridlines
            lineIntervals: [1.25, 14, 0.25, 15, 0.25, 15, 0.25, 15, 0.25, 15],
            lineColor: 'blue',
            lineDashArray: '2 2'
        },
        verticalGridlines: {
            // Sets the lineIntervals of Gridlines
            lineIntervals: [1.25, 14, 0.25, 15, 0.25, 15, 0.25, 15, 0.25, 15],
            lineColor: 'blue',

```

```

        lineDashArray: '2 2'
    });
    export default {
      name: 'app'
      data() {
        return {
          width: "100%",
          height: "350px",
          snapSettings:snapSettings
        }
      }
    }
  </script>
  <style>
    @import "../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
  </style>

```

{% previewsample "page.domainurl/code-snippet/diagram/gridlines/gridlineIntervals-cs1" %}

## Snapping

### Snap To Lines

This feature allows the diagram objects to snap to the nearest intersection of gridlines while being dragged or resized. This feature enables easier alignment during layout or design.

Snapping to gridlines can be enabled/disabled with the [snapSettings.snapConstraints](#). The following code example illustrates how to enable/disable the snapping to gridlines.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' :snapSettings='snapSettings' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import {
    DiagramPlugin, SnapSettingsModel, SnapConstraints, Snapping, Diagram } from
    '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  Diagram.Inject(Snapping);
  let nodes = [{
    id: 'node1',
    style:{fill:'#6BA5D7',strokeColor:'#6BA5D7'},
    width: 100,
    height: 100,
    offsetX: 100,
    offsetY: 100,
  }]
  let snapSettings: SnapSettingsModel = {
    // Enables the object to snap with both horizontal and Vertical
    gridlines
    constraints: SnapConstraints.SnapToLines | SnapConstraints.ShowLines
  }

```

```

export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
      snapSettings: snapSettings
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/gridlines/snapping-cs1" %}

### Customization of Snap Intervals

By default, the objects are snapped towards the nearest gridline. The gridline or position towards where the diagram object snaps can be customized with the horizontal gridlines's [snapInterval](#) and the vertical gridlines's [snapInterval](#) properties.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes'
    :snapSettings='snapSettings' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import {
    DiagramPlugin, SnapSettingsModel, SnapConstraints, Snapping, Diagram } from
    '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  Diagram.Inject(Snapping);
  let nodes = [{
    id: 'node1',
    width: 100,
    style: { fill: '#6BA5D7', strokeColor: '#6BA5D7' },
    height: 100,
    offsetX: 100,
    offsetY: 100
  }]
  let snapSettings: SnapSettingsModel = {
    horizontalGridlines: {
      // Defines the snap interval for object
      snapIntervals: [10]
    },
    verticalGridlines: {
      snapIntervals: [10]
    }
  },

```

```

    constraints: SnapConstraints.All
  }
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
        snapSettings:snapSettings
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/gridlines/snapintervals-cs1" %}

### Snap To Objects

The snap-to-object provides visual cues to assist with aligning and spacing Diagram elements. A node can be snapped with its neighboring objects based on certain alignments. Such alignments are visually represented as smart guides.

The [snapObjectDistance](#) property allows you to define minimum distance between the selected object and the nearest object.

The [snapAngle](#) property allows you to define the snap angle by which the object needs to be rotated.

[snapConstraints](#) property allow you to enable or disable the certain features of the snapping , refer to [snapConstraints](#)

The [snapLineColor](#) property allows you to define the color of the snapline.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes'
    :snapSettings='snapSettings' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import {
  DiagramPlugin, SnapSettingsModel, SnapConstraints, Snapping, Diagram } from
  '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  Diagram.Inject(Snapping);
  let nodes = [{
    id: 'node1',
    style:{fill:'#6BA5D7',strokeColor:'#6BA5D7'},
    width: 100,
    height: 100,

```

```

        offsetX: 100,
        offsetY: 100
      },
      {
        id: 'node2',
        style: { fill: '#6BA5D7', strokeColor: '#6BA5D7' },
        width: 100,
        height: 100,
        offsetX: 300,
        offsetY: 100
      }
    ]
  }
  let snapSettings: SnapSettingsModel = {
    // Enable snap to object constraint
    constraints: SnapConstraints.SnapToObject | SnapConstraints.ShowLines,
    // Sets the Snap object distance
    snapObjectDistance: 10,
    // Snap Angle for object
    snapAngle: 10,
    // Set the Snapline color
    snapLineColor: 'red'
  }
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        snapSettings: snapSettings,
        nodes: nodes,
      }
    }
  }
</script>
<style>
  @import "../../../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/gridlines/snapobjects-cs1" %}

## Page settings in Vue Diagram component

Page settings enable to customize the appearance, width, and height of the diagram page.

### Page size and appearance

- The size and appearance of the diagram pages can be customized with the page settings property.
- The [width](#) and [height](#) properties of page settings define the size of the page and based on the size, the [orientation](#) will be set for the page. In addition to that, the appearance of the page can be customized with [source](#) and set of appearance specific properties.
- The [color](#) property is used to customize the background color and border color of the page.
- The [margin](#) property is used to define the page margin.
- To explore those properties, refer to [Page Settings](#).

**APP.VUE**

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' :getNodeDefaults='getNodeDefaults'
:connectors='connectors'
:pageSettings='pageSettings' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, PageSettings } from '@syncfusion/ej2-vue-
diagrams';
  Vue.use(DiagramPlugin);
  let connectors = [{
    id: 'connector1',
    style: { strokeColor: '#6BA5D7', fill: '#6BA5D7', strokeWidth: 2 },
    targetDecorator: { style: { fill: '#6BA5D7', strokeColor: '#6BA5D7'
} },
    sourceID: 'node1',
    targetID: 'node2',
  }]
  let nodes = [{
    id: 'node1',
    width: 100,
    height: 100,
    offsetX: 100,
    offsetY: 100,
    annotations: [{
      content: 'Node1'
    }]
  },
  {
    id: 'node2',
    width: 100,
    height: 100,
    offsetX: 300,
    offsetY: 350,
    annotations: [{
      content: 'Node3'
    }]
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
        getNodeDefaults: (node) => {
          node.height = 100;
          node.width = 100;
          node.style.fill = '#6BA5D7';
          node.style.strokeColor = 'white';
          return node;
        },

```

```

        connectors: connectors,
        pageSettings: {
          // Sets the PageOrientation for the diagram to page
          orientation: 'Landscape',
          // Sets the Page Break for diagram
          showPageBreaks: true,
          // Defines the background color and image of diagram
          background: {
            color: 'grey'
          },
          // Sets the width for the Page
          width: 300,
          // Sets the height for the Page
          height: 300,
          // Sets the space to be left between an annotation and its
          parent node/connector
          margin: {
            left: 10,
            top: 10,
            bottom: 10
          },
        },
      },
    },
  ],
},
</script>
<style>

  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/page-settings/pagesettings-cs1" %}

### Set background image

Stretch and align the background image anywhere over the diagram area. The [source](#) property of [background](#) allows you to set the path of the image. The [scale](#) and the [align](#) properties help to stretch/align the background images.

The following code illustrates how to stretch and align the background image.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
      :pageSettings='pageSettings' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, PageSettings } from '@syncfusion/ej2-vue-
  diagrams';
  Vue.use(DiagramPlugin);
  export default {
    name: 'app'
    data() {

```

```

        return {
            width: "100%",
            height: "350px",
            pageSettings: {
                orientation: 'Landscape',
                showPageBreaks: true,
                // Defines the background Image source
                background: {
                    source:
'https://www.w3schools.com/images/w3schools_green.jpg',
                    // Defines the scale values for the background image
                    scale: 'Meet',
                    // Defines the align values for the background image
                    align: 'XMinYMin'
                },
                width: 300,
                height: 300,
                margin: {
                    left: 10,
                    top: 10,
                    bottom: 10
                },
            },
        }
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/page-settings/BGImage-cs1" %}

### Multiple page and page breaks

When multiple page is enabled, the size of the page dynamically increases or decreases in multiples of page width and height and completely fits diagram within the page boundaries. Page breaks is used as a visual guide to see how pages are split into multiple pages.

The [multiplePage](#) and [showPageBreak](#) properties of page settings allow you to enable/disable multiple pages and page breaks respectively.

The following code illustrates how to enable multiple page and page break lines.

### APP.VUE

```

<template>
    <div id="app">

### Boundary constraints

The diagram provides support to restrict/customize the interactive region, out of which the elements cannot be dragged, resized, or rotated. The [boundaryConstraints](#) property of page settings allows you to customize the interactive region. To explore the boundary constraints, refer to [Boundary Constraints](#).

The following code example illustrates how to define boundary constraints with respect to the page.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' :getNodeDefaults='getNodeDefaults'
    :connectors='connectors'
    :pageSettings='pageSettings' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, PageSettings } from '@syncfusion/ej2-vue-
  diagrams';
  Vue.use(DiagramPlugin);
  let connectors = [{
    id: 'connector1',
    style: { strokeColor: '#6BA5D7', fill: '#6BA5D7', strokeWidth: 2 },
    targetDecorator: { style: { fill: '#6BA5D7', strokeColor: '#6BA5D7'
    } },
    sourcePoint: {
      x: 300,
      y: 100
    },
    targetPoint: {
      x: 400,
      y: 100
    }
  } ],
  let nodes = [
    {
      id: 'node1',
      width: 150,
      height: 100,
      offsetX: 100,

```

```

        offsetY: 100,
      },
      {
        id: 'node2',
        width: 80,
        height: 130,
        offsetX: 200,
        offsetY: 200,
      }
    ]
  },
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
        getNodeDefaults: (node) => {
          node.height = 100;
          node.width = 100;
          node.style.fill = '#6BA5D7';
          node.style.strokeColor = 'white';
          return node;
        },
        connectors: connectors,
        pageSettings: {
          // Sets the BoundaryConstraints to page
          boundaryConstraints: 'Page',
          background: {
            color: 'grey'
          },
          width: 400,
          height: 400,
          showPageBreaks: true,
        }
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/page-settings/boundaryconstraints-cs1" %}

### Scroll settings in Vue Diagram component

The diagram can be scrolled by using the vertical and horizontal scrollbars. In addition to the scrollbars, mousewheel can be used to scroll the diagram.

Diagram's [scrollSettings](#) enable you to read the current scroll status, view port size, current zoom, and zoom factor. It also allows you to scroll the diagram programmatically.

### Get current scroll status

Scroll settings allow you to read the scroll status, [viewPortWidth](#), [viewPortHeight](#), and [currentZoom](#) with a set of properties. To explore those properties, see [Scroll Settings](#).

### Define scroll status

Diagram allows you to pan the diagram before loading, so that any desired region of a large diagram is made to view. You can programmatically pan the diagram with the [horizontalOffset](#) and [verticalOffset](#) properties of scroll settings. The following code illustrates how to set pan the diagram programmatically.

In the following example, the vertical scroll bar is scrolled down by 50px and horizontal scroll bar is scrolled to right by 100px.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
scrollSettings='scrollSettings'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        scrollSettings: {
          horizontalOffset: 100,
          verticalOffset: 50
        }
      }
    }
  }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/diagram/scroll-settings/scroll-cs1" %}

### Update scroll status

You can programmatically change the scroll offsets at runtime by using the client-side method `update`. The following code illustrates how to change the scroll offsets and zoom factor at runtime.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
scrollSettings='scrollSettings'></ejs-diagram>
  </div>
```

```

</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
      }
    }
    mounted: function() {
      let diagramInstance: Diagram;
      let diagramObj: any = document.getElementById("diagram");
      diagramInstance = diagramObj.ej2_instances[0];
      //Updates scroll settings
      diagramInstance.scrollSettings.horizontalOffset = 200;
      diagramInstance.scrollSettings.verticalOffset = 30
      diagramInstance.dataBind();
    }
  }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/scroll-settings/scrollSettings-cs1" %}

### AutoScroll

Autoscroll feature automatically scrolls the diagram, whenever the node or connector is moved beyond the boundary of the diagram. So that, it is always visible during dragging, resizing, and multiple selection operations. Autoscroll is automatically triggered when any one of the following is done towards the edges of the diagram.

- Node dragging, resizing
- Connection editing
- Rubber band selection
- Label dragging

The diagram client-side event [ScrollChange](#) gets triggered when the autoscroll (scrollbars) is changed and you can do your own customization in this event.

The autoscroll behavior in your diagram can be enabled/disabled by using the [canAutoScroll](#) property of the diagram. The following code example illustrates how to set autoscroll.

### APP.VUE

```

<template>
  <div id="app">

```

```

    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' :connectors= 'connectors' :scrollSettings='scrollSettings'
:getNodeDefaults='getNodeDefaults'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'Start',
    width: 140,
    height: 50,
    offsetX: 300,
    offsetY: 50,
    annotations: [{
      id: 'label1',
      content: 'Start'
    }],
    shape: {
      type: 'Flow',
      shape: 'Terminator'
    }
  }];
  let connectors: ConnectorModel[] = [{
    id: 'connector1', sourcePoint: { x: 300, y: 100 }, targetPoint: { x:
450, y: 200 },
    style: {
      strokeColor: '#6BA5D7',
      strokeWidth: 2
    },
    targetDecorator: {
      style: {
        fill: '#6BA5D7',
        strokeColor: '#6BA5D7'
      }
    }
  }];
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
        connectors: connectors,
        scrollSettings: {
          canAutoScroll: true,
          scrollLimit: 'Infinity',
        },
        getNodeDefaults: (node) => {
          node.height = 100;
          node.width = 100;
          node.style.fill = '#6BA5D7';
          node.style.strokeColor = 'white';
          return node;
        }
      }
    }
  }

```

```

    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/scroll-settings/scrollSettings-cs2" %}

### Autoscroll border

The autoscroll border is used to specify the maximum distance between the object and diagram edge to trigger autoscroll. The default value is set as 15 for all sides (left, right, top, and bottom) and it can be changed by using the [autoScrollBorder](#) property of page settings. The following code example illustrates how to set autoscroll border.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' :scrollSettings='scrollSettings'
:getNodeDefaults='getNodeDefaults'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'Start',
    width: 140,
    height: 50,
    offsetX: 300,
    offsetY: 50,
    annotations: [{
      id: 'label1',
      content: 'Start'
    }],
    shape: {
      type: 'Flow',
      shape: 'Terminator'
    }
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
        scrollSettings: {
          canAutoScroll: true,
          scrollLimit: 'Infinity',
          autoScrollBorder: {

```

```

        left: 100,
        right: 100,
        top: 100,
        bottom: 100
      },
    },
    getNodeDefaults: (node) => {
      node.height = 100;
      node.width = 100;
      node.style.fill = '#6BA5D7';
      node.style.strokeColor = 'white';
      return node;
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/scroll-settings/autoScroll-cs1" %}

### Scroll limit

The scroll limit allows you to define the scrollable region of the diagram. It includes the following options:

- Allows to scroll in all directions without any restriction.
- Allows to scroll within the diagram content.
- Allows to scroll within the specified scrollable area.
- The [scrollLimit](#) property of scroll settings helps to limit the scrolling.

The scrollSettings [scrollableArea](#) allow to extend the scrollable region that is based on the scroll limit.

The following code example illustrates how to specify the scroll limit.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' :scrollSettings='scrollSettings'
    :getNodeDefaults='getNodeDefaults'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'Start',
    width: 140,
    height: 50,
    offsetX: 300,

```

```

        offsetY: 50,
        annotations: [{
            id: 'label1',
            content: 'Start'
        }],
        shape: {
            type: 'Flow',
            shape: 'Terminator'
        }
    }
}
export default {
    name: 'app'
    data() {
        return {
            width: "100%",
            height: "350px",
            nodes: nodes,
            // set the autoScrollBorder
            scrollSettings: {
                canAutoScroll: true,
                //Sets the scroll limit
                scrollLimit: 'infinity'
            },
            getNodeDefaults: (node) => {
                node.height = 100;
                node.width = 100;
                node.style.fill = '#6BA5D7';
                node.style.strokeColor = 'white';
                return node;
            }
        }
    }
}
</script>
<style>
    @import "../../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/scroll-settings/scrollLimit-cs1" %}

### Scroll padding

[padding](#) property of scroll settings allows you to extend the scrollable region that is based on the scroll limit.

The following code example illustrates how to set scroll padding to diagram region.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
        :nodes='nodes' :scrollSettings='scrollSettings' ></ejs-diagram>
    </div>
</template>
<script>

```

```

import Vue from 'vue';
import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
Vue.use(DiagramPlugin);
let nodes = [{
  id: 'Start',
  width: 100, height: 100,
  offsetX: 350, offsetY: 350,
  shape: {
    type: 'Flow',
    shape: 'Terminator'
  }
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
      // set the autoScrollBorder
      scrollSettings: {
        canAutoScroll: true,
        scrollLimit: 'Infinity',
        //Sets the scroll limit
        padding: { right: 50, bottom: 50 }
      },
    }
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/scroll-settings/scrollLimit-cs2" %}

### Scrollable Area

Scrolling beyond any particular rectangular area can be restricted by using the [scrollableArea](#) property of scroll settings. To restrict scrolling beyond any custom region, set the [scrollLimit](#) as "limited". The following code example illustrates how to customize scrollable area.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
      :nodes='nodes' :scrollSettings='scrollSettings'
      :getNodeDefaults='getNodeDefaults'></ejs-diagram>
    </div>
  </template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{

```

```

    id: 'Start',
    width: 140,
    height: 50,
    offsetX: 300,
    offsetY: 50,
    annotations: [{
      id: 'label1',
      content: 'Start'
    }],
    shape: {
      type: 'Flow',
      shape: 'Terminator'
    }
  ]
}
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
      // set the autoScrollBorder
      scrollSettings: {
        canAutoScroll: true,
        //Sets the scroll limit
        scrollLimit: 'infinity',
        //Sets the scrollable Area
        scrollableArea: {
          x: 0,
          y: 0,
          width: 500,
          height: 500
        }
      },
      getNodeDefaults: (node) => {
        node.height = 100;
        node.width = 100;
        node.style.fill = '#6BA5D7';
        node.style.strokeColor = 'white';
        return node;
      }
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/scroll-settings/scrollArea-cs1" %}

#### UpdateViewPort

The [updateViewPort](#) method is used to update the diagram page and view size at runtime.

## Data binding in Vue Diagram component

- Diagram can be populated with the **nodes** and **connectors** based on the information provided from an external data source.
- Diagram exposes its specific data-related properties allowing you to specify the data source fields from where the node information has to be retrieved from.
- The [dataManager](#) property is used to define the data source either as a collection of objects or as an instance of **DataManager** that needs to be populated in the diagram.
- The [ID](#) property is used to define the unique field of each JSON data.
- The [parentId](#) property is used to defines the parent field which builds the relationship between ID and parent field.
- The [root](#) property is used to define the root node for the diagram populated from the data source.
- To explore those properties, see [DataSourceSettings](#).
- Diagram supports two types of data binding. They are:
  1. Local data
  2. Remote data

### Local data

Diagram can be populated based on the user defined JSON data (Local Data) by mapping the relevant data source fields.

To map the user defined JSON data with diagram, configure the fields of [dataSourceSettings](#). The following code example illustrates how to bind local data with the diagram.

### APP.VUE

```
<template>

### Remote data

You can bind the diagram with remote data by using `[dataManager]`.

It uses two different classes: `DataManager` for processing and `Query` for serving data. `DataManager` communicates with data source and `Query` generates data queries that are read by the [dataManager](#).

To learn more about data manager, refer to [Data Manager](#).

To bind remote data to the diagram, configure the fields of [dataSourceSettings](#). The following code illustrates how to bind remote data to the diagram.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :tool='tool' :getNodeDefaults='getNodeDefaults' :snapSettings='snapSettings'

```

```

:getConnectorDefaults='getConnectorDefaults' :layout='layout'
:dataSourceSettings='dataSourceSettings' ></ejs-diagram>
</div>
</template>
<script>
  import Vue from 'vue';

## CRUD

This feature allows you to read the data source and perform add or edit or delete the data in data source at runtime.

### Read DataSource

- This feature allows you to define the nodes and connectors collection in the data source and connectionDataSource respectively.
- You can set the data collection in the model's dataSourceSettings [dataManager](#) property. The nodes will be generated based on the data specified in the data source.
- You can set the connector collection in the model's dataSourceSettings [connectionDataSource](#) property.
- The dataSourceSettings connectionDataSource [dataManager](#) property is used to set the data source for the connection data source items.
- If you have a data (data will be set in the dataSource property) with parent relationship in the database and also defined the connector in the connectionDataSource simultaneously, then the connectors set in the connectionDataSource will be considered as a priority to render the connector.
- The dataSourceSettings [crudAction's read](#) property specifies the method, which is used to read the data source and its populate the nodes in the diagram.

- The connectionDataSource crudAction's [read](#) specifies the method, which is used to read the data source and its populates the connectors in the diagram.
- The dataSourceSettings's [id](#) and connectionDataSource's [id](#) properties are used to define the unique field of each JSON data.
- The connectionDataSource's [sourceID](#) and [targetID](#) properties are used to set the sourceID and targetID for connection data source item.
- The connectionDataSource's [sourcePointX](#), [sourcePointY](#), [targetPointX](#), and [targetPointY](#) properties are used to define the sourcePoint and targetPoint values for connector from data source.
- The dataSourceSettings crudAction's [customFields](#) property is used to maintain the additional information for nodes.
- Similarly, connectionDataSource's crudAction's [customFields](#) is used to maintain the additional information for connectors.

### How to perform Editing at runtime

- The dataSourceSettings crudAction object allows you to define the method, which is used to get the changes done in the data source defined for shapes from the client-side to the server-side.
- Similarly, the connectionDataSource crudAction object allows you to define the method, which is used to get the changes done in the data source defined for connectors from the client-side to the server-side.

### InsertData

- The dataSourceSettings crudAction's [create](#) property specifies the method, which is used to get the nodes added from the client-side to the server-side.
- The connectionDataSource crudAction's [create](#) specifies the method, which is used to get the connectors added from the client-side to the server-side.
- The following code example illustrates how to send the newly added or inserted data from the client to server-side.

```
`javascript
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      connectors: connectors,
      dataSourceSettings: {
        crudAction: {
          //Url which triggers the server side AddNodes method
```

```

create: 'https://ej2services.syncfusion.com/development/web-services/api/Crud/AddNodes',
},
connectionDataSource: {
  crudAction: {
    //Url which triggers the server side AddConnectors method
    create: 'https://ej2services.syncfusion.com/development/web-services/api/Crud/AddConnectors',
  }
}
}
}
}
}
}
mounted: function() {
  let diagramInstance: Diagram;
  let diagramObj: any = document.getElementById("diagram");
  diagramInstance = diagramObj.ej2_instances[0];
  //Sends the inserted nodes/connectors from client side to the server side through the URL which is
  //specified in server side.
  diagramInstance.insertData();
}
}
,

```

### UpdateData

- The dataSourceSettings crudAction's [update](#) property specifies the method, which is used to get the modified nodes from the client-side to the server-side.
- The connectionDataSource crudAction's [update](#) specifies the method, which is used to get the modified connectors from the client-side to the server-side.
- The following code example illustrates how to send the updated data from the client to the server side.

```

`javascript
export default {
  name: 'app'
  data() {
    return {
      width: "100%",

```

```

height: "350px",
connectors: connectors,
dataSourceSettings: {
  crudAction: {
    //Url which triggers the server side UpdateNodes method
    update: 'https://ej2services.syncfusion.com/development/web-services/api/Crud/UpdateNodes',
  },
  connectionDataSource: {
    crudAction: {
      //Url which triggers the server side UpdateConnectors method
      update: 'https://ej2services.syncfusion.com/development/web-services/api/Crud/UpdateConnectors',
    }
  }
}
}
}
}
}
}
}
mounted: function() {
  let diagramInstance: Diagram;
  let diagramObj: any = document.getElementById("diagram");
  diagramInstance = diagramObj.ej2_instances[0];
  //Sends the updated nodes/connectors from client side to the server side through the URL which is
  //specified in server side.
  diagramInstance.updateData();
}
}
`

```

### DeleteData

- The dataSourceSettings crudAction's [destroy](#) property specifies the method, which is used to get the deleted nodes from the client-side to the server-side.
- The connectionDataSource crudAction's [destroy](#) specifies the method, which is used to get the deleted connectors from the client-side to the server-side.

```

`javascript
export default {
  name: 'app'
}

```

```
data() {
  return {
    width: "100%",
    height: "350px",
    connectors: connectors,
    dataSourceSettings: {
      crudAction: {
        //Url which triggers the server side DeleteNodes method
        destroy: 'https://ej2services.syncfusion.com/development/web-services/api/Crud/DeleteNodes',
      },
      connectionDataSource: {
        crudAction: {
          //Url which triggers the server side DeleteConnectors method
          destroy: 'https://ej2services.syncfusion.com/development/web-services/api/Crud/DeleteConnectors',
        }
      }
    }
  }
},
mounted: function() {
  let diagramInstance: Diagram;
  let diagramObj: any = document.getElementById("diagram");
  diagramInstance = diagramObj.ej2_instances[0];
  //Sends the deleted nodes/connectors from client side to the server side through the URL which is
  //specified in server side.
  diagramInstance.removeData();
}
```

#### See Also

- [How to arrange the diagram nodes and connectors using varies layout](#)

## Automatic layout in Vue Diagram component

Diagram provides support to auto-arrange the nodes in the diagram area that is referred as **Layout**. It includes the following layout modes:

### Layout modes

- Hierarchical layout
- Organization chart
- Radial tree
- Symmetric layout
- Mind Map layout
- Complex hierarchical tree layout

### Hierarchical layout

The hierarchical tree layout arranges nodes in a tree-like structure, where the nodes in the hierarchical layout may have multiple parents. There is no need to specify the layout root. To arrange the nodes in a hierarchical structure, specify the layout [type](#) as hierarchical tree. The following example shows how to arrange the nodes in a hierarchical structure.

Note: If you want to use hierarchical tree layout in diagram, you need to inject HierarchicalTree in the diagram.

</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/automatic-layout/HierarchicalLayout-cs1" %}

### Radial tree layout

The radial tree layout arranges nodes on a virtual concentric circle around a root node. Sub-trees formed by the branching of child nodes are located radially around the child nodes. This arrangement result in an ever-expanding concentric arrangement with radial proximity to the root node indicating the node level in the hierarchy. The layout [root](#) property can be used to define the root node of the layout. When no root node is set, the algorithm automatically considers one of the diagram nodes as the root node.

To arrange nodes in a radial tree structure, set the [type](#) of the layout as **RadialTree**. The following code illustrates how to arrange the nodes in a radial tree structure.

Note: If you want to use radial tree layout in diagram, you need to inject DataBinding and RadialTree in the diagram.

### Organizational Chart

An organizational chart is a diagram that displays the structure of an organization and relationships. To create an organizational chart, the [type](#) of layout should be set as an **OrganizationalChart**.

The following code example illustrates how to create an organizational chart.

#### APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
:getNodeDefaults='getNodeDefaults'
:getConnectorDefaults='getConnectorDefaults' :layout='layout'
:dataSourceSettings='dataSourceSettings' ></ejs-diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { DiagramPlugin, Diagram, HierarchicalTree,
DataBinding, DiagramTools, NodeModel } from '@syncfusion/ej2-vue-diagrams';
    import { DataManager, Query } from "@syncfusion/ej2-data";
    Diagram.Inject(DataBinding, HierarchicalTree);
    Vue.use(DiagramPlugin);

```

```

{% previewsample "page.domainurl/code-snippet/diagram/automatic-layout/OrganizationalChart-cs1"
%}

```

Organizational chart layout starts parsing from root and iterate through all its child elements. The `getLayoutInfo` method provides necessary information of a node's children and the way to arrange (direction, orientation, offsets, etc.) them. The arrangements can be customized by overriding this function as explained.

### GetLayoutInfo

Set chart orientations, chart types, and offset to be left between parent and child nodes by overriding the method, `diagram.layout.getLayoutInfo`. The `getLayoutInfo` method is called to configure every subtree of the organizational chart. It takes the following arguments.

- node: Parent node to that options are to be customized.
- options: Object to set the customizable properties.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'

{% previewsample "page.domainurl/code-snippet/diagram/automatic-layout/GetLayoutInfo-cs1" %}

The following table illustrates the properties that “options” argument takes.

Property	Description
Default Value	
-----	-----
-----	-----
-----	-----
options.assistants	By default, the collection is empty. When any of the child nodes have to be set as <b>Assistant</b> , you can remove from children collection and have to insert into assistants collection.
Empty array	
options.orientation	Gets or sets the organizational chart orientation.
SubTreeOrientation.Vertical	
options.type	Gets or sets the chart organizational chart type.
For horizontal chart orientation:SubTreeAlignments.Center and for vertical chart orientation:SubTreeAlignments.Alternate	
options.offset	Offset is the horizontal space to be left between parent and child nodes.
20 pixels applicable only for vertical chart orientations.	
options.hasSubTree	Gets whether the node contains subtrees.
Boolean	
options.level	Gets the depth of the node from layout root.
Number	
options.enableRouting	By default, connections are routed based on the chart type and orientations. This property gets or sets whether default routing is to be enabled or disabled.
	true

| options.rows | Sets the number of rows on which the child nodes will be arranged. Applicable only for balanced type horizontal tree. | Number |

The following table illustrates the different chart orientations and chart types.

Orientation	Type	Description
Example		
-----	-----	-----
-----	-----	
Horizontal	Left	Arranges the child nodes horizontally at the left side of the parent.

|

| Right | Arranges the child nodes horizontally at the right side of the parent. |

|

| Center | Arranges the children like standard tree layout orientation. |

|

| Balanced | Arranges the leaf level child nodes in multiple rows. |

| Vertical | Left | Arranges the children vertically at the left

side of the parent. |

| Right | Arranges the children vertically at the right side of the parent. |

|

| Alternate | Arranges the children vertically at both left and right sides of the parent. |

|

The following code example illustrates how to set the vertical right arrangement to the leaf level trees.

### Assistant

Assistants are child item that have a different relationship with the parent node. They are laid out in a dedicated part of the tree. A node can be specified as an assistant of its parent by adding it to the `assistants` property of the argument "options".

The following code example illustrates how to add assistants to layout.

### APP.VUE

```

<template>

{% previewsample "page.domainurl/code-snippet/diagram/automatic-layout/Assistant-cs1" %}

### Symmetric layout

The symmetric layout has been formed using nodes position by closer together or pushing them further apart. This is repeated iteratively until the system comes to an equilibrium state.

The layout's [springLength](#) defined as how long edges should be, ideally. This will be the resting length for the springs. Edge attraction and vertex repulsion forces to be defined by using layout's [springFactor](#), the more sibling nodes repel each other. The relative positions do not change any more from one iteration to the next. The number of iterations can be specified by using layout's [maxIteration](#).

The following code illustrates how to arrange the nodes in a radial tree structure.

Note: If you want to use symmetric layout in diagram, you need to inject SymmetricLayout in the diagram.

### Mind Map layout

A mind map is a diagram that displays the nodes as a spider diagram organizes information around a central concept. To create mind map, the [type](#) of layout should be set as **MindMap**.

### Tree Orientation in layout

An [Orientation](#) of a `MindMapTreeLayout` is used to arrange the tree layout according to a specific direction. By default, the orientation is set to Horizontal. The following table outlines the various orientation types available:

Orientation Type	Description
Horizontal	Aligns the tree layout from left to right
Vertical	Aligns the tree layout from top to bottom

**Note:** If you want to use mind map layout in diagram, you need to inject MindMap in the diagram.

The following code example illustrates how to create an mindmap layout.

### Complex hierarchical tree

Complex hierarchical tree layout is the extended version of the hierarchical tree layout. The child had been two or more parents. To create a complex hierarchical tree, the [type](#) of layout should be set as **ComplexHierarchicalTree**.

Note: If you want to use Complex hierarchical layout in diagram, you need to inject **ComplexHierarchicalTree** in the diagram.

The following code example illustrates how to create a complex hierarchical tree.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
        :nodes='nodes' :connectors='connectors'
        :getNodeDefaults='getNodeDefaults'
        :getConnectorDefaults='getConnectorDefaults' :layout='layout' ></ejs-
diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { DiagramPlugin,Diagram,DataBinding, ConnectorModel, NodeModel,
DiagramConstraints, ComplexHierarchicalTree } from '@syncfusion/ej2-vue-
diagrams';
    import { DataManager,Query } from "@syncfusion/ej2-data";
    Diagram.Inject(DataBinding, ComplexHierarchicalTree);

```

```
Vue.use(DiagramPlugin);
let nodes = [{
  id: 'node1',
  width: 70,
  height: 70,
  annotations: [{
    content: 'node1'
  }]
},

    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/automatic-layout/Complex-cs1" %}

### Line Distribution

Line distribution is used to arrange the connectors without overlapping in automatic layout. In some cases, the automatic layout connectors connecting to the nodes will be overlapped with one another. So user can decide whether the segment of each connector from a single parent node should be same point or different point. The [connectionPointOrigin](#) property of layout is used to enable or disable the line distribution in layout. By default connectionPointOrigin will be [SamePoint](#).

The following code example illustrates how to create a complex hierarchical tree with line distribution.

Note: If you want to use line distribution in diagram layout, you need to inject [LineDistribution](#) module in the diagram.

### APP.VUE

```

<template>

{% previewsample "page.domainurl/code-snippet/diagram/automatic-layout/LineDistribution-cs1" %}

### Linear Arrangement

Linear arrangement is used to linearly arrange the child nodes in layout, which means the parent node is placed in the center corresponding to its children. When line distribution is enabled, linear arrangement is also activated by default. The [arrangement](#) property of layout is used to enable or disable the linear arrangement in layout. By default arrangement will be **Nonlinear**.

Note: If you want to use linear arrangement in diagram layout, you need to inject LineDistribution module in the diagram. Linear arrangement is applicable only for complex hierarchical tree layout.

The following code illustrates how to allow a linear arrangement in diagram layout.

```

export default {
  name: 'app',
  data() {
    return {
      width: "100%",
      height: "590px",
      layout: {
        type: 'ComplexHierarchicalTree',

```

```
//To arrange a child nodes in a linear manner
arrangement: ChildArrangement.Linear,
horizontalSpacing: 40, verticalSpacing: 40,
orientation: 'TopToBottom'
},
}
},
provide: {
  diagram: [DataBinding, ComplexHierarchicalTree, LineDistribution]
},
},
,
```

#### *Prevent connectors overlay*

The below constraints prevents the connector segments overlapping nodes with a complex hierarchical layout.

```
,
export default {
  name: 'app',
  data() {
    return {
      width: "100%",
      height: "590px",
      layout: {
        //this prevents connector segments overlapping
        enableRouting: true
      },
    },
  },
  provide: {
    diagram: [DataBinding, ComplexHierarchicalTree, LineDistribution]
  },
},
,
```

### Customize layout

Orientation, spacings, and position of the layout can be customized with a set of properties.

To explore layout properties, refer to [Layout Properties](#).

### Layout bounds

Diagram provides support to align the layout within any custom rectangular area. For more information about bounds, refer to [bounds](#).

### Layout alignment

The layout can be aligned anywhere over the layout bounds/viewport using the [horizontalAlignment](#) and [verticalAlignment](#) properties of the layout.

The following code illustrates how to align the layout at the top-left of the layout bounds.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
      :getNodeDefaults='getNodeDefaults'
      :getConnectorDefaults='getConnectorDefaults' :layout='layout'
      :dataSourceSettings='dataSourceSettings' ></ejs-diagram>
    </div>
  </template>
<script>
  import Vue from 'vue';

</style>
```

```
{% previewsample "page.domainurl/code-snippet/diagram/automatic-layout/Layout-cs1" %}
```

### Layout spacing

Layout provides support to add space horizontally and vertically between the nodes. The [horizontalSpacing](#) and [verticalSpacing](#) properties of the layout allows you to set the space between the nodes in horizontally and vertically.

### Layout margin

Layout provides support to add some blank space between the layout bounds/viewport and the layout. The [margin](#) property of the layout allows you to set the blank space.

The following code illustrates how to set the layout margin.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :getNodeDefaults='getNodeDefaults'

{% previewsample "page.domainurl/code-snippet/diagram/automatic-layout/LayoutMargin-cs1" %}

### Layout orientation

The layout orientation can be used to arrange the layout based on the direction. There are different orientation types that are defined in the following table.

Orientation	Description
-----   -----	
TopToBottom	Aligns the layout from top to bottom. All the roots are placed at top of diagram.
LeftToRight	Aligns the layout from left to right. All the roots are placed at left of diagram.
BottomToTop	Aligns the layout from bottom to top. All the roots are placed at bottom of the diagram.
RightToLeft	Aligns the layout from right to left. All the roots are placed at right of the diagram.

Diagram provides support to customize the [orientation](#) of layout. You can set the desired orientation using `layout.orientation`.

Note: In the diagram the default orientation is `TopToBottom`.

The following code illustrates how to arrange the nodes in a `BottomToTop` orientation.

{% previewsample "page.domainurl/code-snippet/diagram/automatic-layout/LayoutOrientation-cs1" %}

#### Fixed node

Layout provides support to arrange the nodes with reference to the position of a fixed node and set it to the [fixedNode](#) of the layout property. This is helpful when you try to expand/collapse a node. It might be expected that the position of the double-clicked node should not be changed.

#### APP.VUE

```

### [Expand and collapse](#)

Diagram allows to expand/collapse the subtrees of a layout. The node's `isExpanded` property allows you to expand/collapse its children. The following code example shows how to expand/collapse the children of a node.

### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :getNodeDefaults='getNodeDefaults'
    :getConnectorDefaults='getConnectorDefaults' :layout='layout'
    :dataSourceSettings='dataSourceSettings' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';

```

```

        return connector;
    }
}
},
provide: {
    diagram: [DataBinding, HierarchicalTree]
},
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/automatic-layout/ExpandAndCollapse-cs1"  
 %}

In the previous example, while expanding/collapsing a node, it is set as fixed node in order to prevent it from repositioning.

#### [Refresh layout](#)

Diagram allows to refresh the layout at runtime. To refresh the layout, refer to Refresh layout.

#### [setNodeTemplate](#)

The setNodeTemplate function is provided for the purpose of customizing nodes. It will be called for each node on node initialization. In this function, the node style and its properties can be customized and can bind the custom JSON with node.

#### **APP.VUE**

### Accessibility in Vue Diagram component

Diagram provides built-in compliance with the [WAI-ARIA](#) specifications. WAI-ARIA Accessibility supports are achieved through the attributes like `aria-label`. It helps to provides information about elements in a document for assistive technology.

The accessibility compliance for the diagram component is outlined below.

Accessibility Criteria	Compatibility
<hr/>	
<a href="#">WCAG 2.2 Support</a>	<code>&lt;img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="intermediate"&gt;</code>
<a href="#">Section 508 Support</a>	<code>&lt;img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="intermediate"&gt;</code>
<a href="#">Screen Reader Support</a>	<code>&lt;img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"&gt;</code>
<a href="#">Right-To-Left Support</a>	<code>&lt;img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"&gt;</code>
<a href="#">Color Contrast</a>	<code>&lt;img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"&gt;</code>
<a href="#">Mobile Device Support</a>	<code>&lt;img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"&gt;</code>
<a href="#">Keyboard Navigation Support</a>	<code>&lt;img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="intermediate"&gt;</code>
<a href="#">Accessibility Checker Validation</a>	<code>&lt;img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"&gt;</code>
<a href="#">Axe-core Accessibility Validation</a>	<code>&lt;img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"&gt;</code>
<code>&lt;style&gt;</code>	
<code>.post .post-content img {</code>	
<code>display: inline-block;</code>	
<code>margin: 0.5em 0;</code>	
<code>}</code>	
<code>&lt;/style&gt;</code>	
<code>&lt;div&gt;&lt;img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"&gt; - All features of the component meet the requirement.&lt;/div&gt;</code>	
<code>&lt;div&gt;&lt;img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"&gt; - Some features of the component do not meet the requirement.&lt;/div&gt;</code>	

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The Diagram component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Diagram component:

| Attributes | Purpose |

| --- | --- |

| **aria-label** | Provides an accessible name for the Diagram Objects. |

### Aria-label

Attribute provides the text label with some default description for below elements in diagram.

<!-- markdownlint-disable MD033 -->

Element	Default description
ResizeNorthWest	Thumb to resize the selected object on the top-left corner.
ResizeNorthEast	Thumb to resize the selected object on the top-right side direction.
ResizeSouthWest	Thumb to resize the selected object on the bottom-left side direction.
ResizeSouthEast	Thumb to resize the selected object on the bottom-right side direction.
ResizeNorth	Thumb to resize the selected object on the top side direction.
ResizeSouth	Thumb to resize the selected object on the bottom side direction.
ResizeWest	Thumb to resize the selected object on the left side direction.
ResizeEast	Thumb to resize the selected object on the right side direction.
ConnectorSourceThumb	Thumb to move the source point of the connector.
ConnectorTargetThumb	Thumb to move the target point of the connector.
RotateThumb	Thumb to rotate the selected object.

### Mobile device support

Syncfusion Diagram component are more user-friendly and accessible to individuals using mobile devices, including those with disabilities. These are designed to be responsive, adaptable to various screen sizes and orientations, and touch-friendly.

### Screen Reader Support

The Diagram component supports and its information was dictated properly by the screen readers based on the ARIA attributes and content.

### Keyboard navigation support

Syncfusion Diagram component support keyboard navigation, allowing users who rely on alternate methods to effortlessly navigate and interact with the component.

### Keyboard interaction

The Diagram component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Diagram component.

| **Command** | **Action** |

| --- | --- |

| Ctrl + A | Select All |

| Ctrl + X | Cut |

| Ctrl + C | Copy |

| Ctrl + V | Paste |

| Ctrl + Z | Undo |

| Ctrl + Y | Redo |

| Delete | Delete |

| Up Arrow | Move selected object to up |

| Down Arrow | Move selected object to down |

| Left Arrow | Move selected object to left |

| Right Arrow | Move selected object to right |

| Enter | Start Annotation Edit |

| Escape | End Annotation Edit |

### Ensuring accessibility

The Diagram component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Diagram component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Diagram component with accessibility tools.

### Commands in Vue Diagram component

<!-- markdownlint-disable MD010 -->

There are several commands available in the diagram as follows.

- Alignment commands
- Spacing commands
- Sizing commands
- Clipboard commands
- Grouping commands
- Z-order commands

- Zoom commands
- Nudge commands
- FitToPage commands
- Undo/Redo commands

### Align

Alignment commands enable you to align the selected or defined objects such as nodes and connectors with respect to the selection boundary. Refer to [align](#) commands which shows how to use align methods in the diagram.

<!-- markdownlint-disable MD033 -->

| Parameters | Description |

|:-----| :-----: |

| [`Alignment`

`Options`](https://ej2.syncfusion.com/vue/documentation/api/diagram/alignmentOptions#AlignmentOptions) |`

Defines the specific direction, with respect to which the objects to be aligned. The accepted values of the argument "alignment options" are as follows.

**Left** Aligns all the selected objects at the left of the selection boundary.

**Right** Aligns all the selected objects at the right of the selection boundary.

**Center** Aligns all the selected objects at the center of the selection boundary.

**Top** Aligns all the selected objects at the top of the selection boundary.

**Bottom** Aligns all the selected objects at the bottom of the selection boundary.

**Middle** Aligns all the selected objects at the middle of the selection boundary.

|

| **Objects** | <p align="left">Defines the objects to be aligned. This is an optional parameter. By default, all the nodes and connectors in the selected region of the diagram gets aligned.</p> |

| [`Alignment`

`Mode`](https://ej2.syncfusion.com/vue/documentation/api/diagram/alignmentMode#AlignmentMode)`

|

Defines the specific mode, with respect to which the objects to be aligned. This is an optional parameter. The default alignment mode is `'Object'`.

The accepted values of the argument "alignment mode" are as follows.

**Object** Aligns the objects based on the first object in the selected list.

**Selector** Aligns the objects based on the selection boundary.

### Distribute

The [Distribute](#) commands enable to place the selected objects on the page at equal intervals from each other. The selected objects are equally spaced within the selection boundary.

The factor to distribute the shapes [DistributeOptions](#) are listed as follows:

- RightToLeft: Distributes the objects based on the distance between the right and left sides of the adjacent objects.
- Left: Distributes the objects based on the distance between the left sides of the adjacent objects.

- Right: Distributes the objects based on the distance between the right sides of the adjacent objects.
- Center: Distributes the objects based on the distance between the center of the adjacent objects.
- BottomToTop: Distributes the objects based on the distance between the bottom and top sides of the adjacent objects.
- Top: Distributes the objects based on the distance between the top sides of the adjacent objects.
- Bottom: Distributes the objects based on the distance between the bottom sides of the adjacent objects.
- Middle: Distributes the objects based on the distance between the vertical center of the adjacent objects.

The following code example illustrates how to execute the space commands.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin ,NodeModel,ConnectorModel} from '@syncfusion/ej2-
vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [
    {
      id: 'node1',
      width: 90,
      height: 60,
      offsetX: 100,
      offsetY: 100,
      style: {
        fill: '#6BA5D7',
        strokeColor: 'white',
        strokeWidth: 1
      },
    },
    {
      id: 'node2',
      width: 90,
      height: 60,
      offsetX: 240,
      offsetY: 100,
      style: {
        fill: '#6BA5D7',
        strokeColor: 'white',
        strokeWidth: 1
      },
    },
    {
      id: 'node3',
```

```

        width: 90,
        height: 60,
        offsetX: 170,
        offsetY: 150,
        style: {
            fill: '#6BA5D7',
            strokeColor: 'white',
            strokeWidth: 1
        },
    },
];
export default {
    name: 'app'
    data() {
        return {
            width: "100%",
            height: "350px",
            nodes: nodes
        }
    }
    mounted: function() {
        let diagramInstance: Diagram;
        let diagramObj: any = document.getElementById("diagram");
        diagramInstance = diagramObj.ej2_instances[0];
        let selArray: (NodeModel | ConnectorModel)[] = [];
        selArray.push(diagramInstance.nodes[0],
        diagramInstance.nodes[1], diagramInstance.nodes[2]);
        //Selects the nodes
        diagramInstance.select(selArray);
        //Distributes space between the nodes
        diagramInstance.distribute('RightToLeft',
        diagramInstance.selectedItems.nodes);
    }
}

    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/commands/distribute-cs1" %}

### Sizing

Sizing [sameSize](#) commands enable to equally size the selected nodes with respect to the first selected object.

[SizingOptions](#) are as follows:

- Width: Scales the width of the selected objects.
- Height: Scales the height of the selected objects.
- Size: Scales the selected objects both vertically and horizontally.

The following code example illustrates how to execute the size commands.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin ,NodeModel,ConnectorModel} from '@syncfusion/ej2-
vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [
    {
      id: 'node1',
      width: 90,
      height: 60,
      offsetX: 100,
      offsetY: 100,
      style: {
```

```

        fill: '#6BA5D7',
        strokeColor: 'white',
        strokeWidth: 1
      },
    },
  ],
  {
    id: 'node2',
    width: 100,
    height: 60,
    offsetX: 100,
    offsetY: 170,
    style: {

```

### Clipboard

Clipboard commands are used to cut, copy, or paste the selected elements. Refer to the following link which shows how to use clipboard methods in the diagram.

- Cuts the selected elements from the diagram to the diagram's clipboard, [cut](#).
- Copies the selected elements from the diagram to the diagram's clipboard, [copy](#).
- Pastes the diagram's clipboard data (nodes/connectors) into the diagram, [paste](#).

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' :connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin ,NodeModel,ConnectorModel} from '@syncfusion/ej2-
vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'node1',
    width: 90,
    height: 60,
    offsetX: 100,
    offsetY: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white',
      strokeWidth: 1
    },
  },
```

```

    },
    {
      id: 'node2',
      width: 90,
      height: 60,
      offsetX: 240,
      offsetY: 100,
      style: {
        fill: '#6BA5D7',
        strokeColor: 'white',
        strokeWidth: 1
      },
    },
  ],
];

let connectors = [{
  id: 'connector1',
  sourceID: 'node1',
  targetID: 'node2',
  style: {
    strokeColor: '#6BA5D7',
    fill: '#6BA5D7',
    strokeWidth: 2,
    targetDecorator: {
      style: {
        fill: '#6BA5D7',
        strokeColor: '#6BA5D7'
      }
    }
  }
}]

export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
      connectors: connectors
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    diagramInstance.select([diagramInstance.nodes[0],
diagramInstance.nodes[1], diagramInstance.connectors[0]]);
    //copies the selected nodes
    diagramInstance.copy();
    //pastes the copied objects
    diagramInstance.paste(diagramInstance.copy() as (NodeModel |
ConnectorModel) []);
  }
}
</script>

```

### Grouping

**Grouping commands** are used to group/ungroup the selected elements on the diagram. Refer to the following link which shows how to use grouping commands in the diagram.

[Group](#) the selected nodes and connectors in the diagram.

[Ungroup](#) the selected nodes and connectors in the diagram.

The following code illustrates how to execute the grouping commands.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
      :nodes='nodes' :connectors='connectors' ></ejs-diagram>
    </div>
  </template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin ,NodeModel,ConnectorModel} from '@syncfusion/ej2-
vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'node1',
    width: 100,

### Z-Order command

**Z-Order commands** enable you to visually arrange the selected objects such as nodes and connectors on the page.

### *bringToFront* command

The [bringToFront](#) command visually brings the selected element to front over all the other overlapped elements. The following code illustrates how to execute the `bringToFront` command.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin ,NodeModel,ConnectorModel} from '@syncfusion/ej2-
vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'node1',
    width: 90,
    height: 60,
    offsetX: 100,
    offsetY: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white',
      strokeWidth: 1
    },
  },
  {
    id: 'node2',
    width: 90,
    height: 60,
    offsetX: 240,
    offsetY: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white',
      strokeWidth: 1
    },
  },
  {
    id: 'node3',
    width: 90,
    height: 60,
    offsetX: 160,
    offsetY: 90,
    style: {
```

```

        fill: '#6BA5D7',
        strokeColor: 'white',
        strokeWidth: 1
      },
    ],
  };
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
    mounted: function() {
      let diagramInstance: Diagram;
      let diagramObj: any = document.getElementById("diagram");
      diagramInstance = diagramObj.ej2_instances[0];
      let selArray: (NodeModel)[] = [];
      selArray.push(diagramInstance.nodes[2]);
      //Selects the nodes
      diagramInstance.select(selArray);
      //Brings to front
      diagramInstance.bringToFront();
    }
  }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/commands/bringfront-cs1" %}

#### [sendToBack command](#)

The [sendToBack](#) command visually moves the selected element behind all the other overlapped elements. The following code illustrates how to execute the `sendToBack` command.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' ></ejs-diagram>
  </div>

        selArray.push(diagramInstance.nodes[1]);
        //Selects the nodes
        diagramInstance.select(selArray);
        //Moves forward
        diagramInstance.moveForward();
    }
}
</script>
<style>
    @import "../../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/commands/moveforward-cs1" %}

#### [sendBackward command](#)

The [sendBackward](#) command visually moves the selected element behind the underlying element. The following code illustrates how to execute the `sendBackward` command.

#### **APP.VUE**

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
        :nodes='nodes' ></ejs-diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { DiagramPlugin ,NodeModel,ConnectorModel} from '@syncfusion/ej2-
    vue-diagrams';
    Vue.use(DiagramPlugin);
    let nodes = [{
        id: 'node1',
        width: 90,
        height: 60,
        offsetX: 100,
        offsetY: 100,
        style: {
            fill: '#6BA5D7',
            strokeColor: 'white',
            strokeWidth: 1
        },
    },
    {
        id: 'node2',
        width: 90,
        height: 60,
        offsetX: 180,
        offsetY: 100,
        style: {
            fill: '#6BA5D7',
            strokeColor: 'white',

```

```

        strokeWidth: 1
      },
    ]];
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
      }
    }
    mounted: function() {
      let diagramInstance: Diagram;
      let diagramObj: any = document.getElementById("diagram");
      diagramInstance = diagramObj.ej2_instances[0];
      let selArray: (NodeModel)[] = [];
      selArray.push(diagramInstance.nodes[1]);
      diagramInstance.select(selArray);
      //Sends backward
      diagramInstance.sendBackward();
    }
  }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/commands/sendbackward-cs1" %}

### Zoom

The [zoom](#) command is used to zoom-in and zoom-out the diagram view.

The following code illustrates how to zoom-in/zoom out the diagram.

,

```

<template>
<div id="app">
  <ejs-diagram id="diagram" :width='width' :height='height' ></ejs-diagram>
</div>
</template>
<script>
import Vue from 'vue';
import { DiagramPlugin ,NodeModel,ConnectorModel} from '@syncfusion/ej2-vue-diagrams';
Vue.use(DiagramPlugin);
export default {
  name: 'app'

```

```

data() {
  return {
    width: "100%",
    height: "350px",
  }
}

mounted: function() {
  let diagramInstance: Diagram;
  let diagramObj: any = document.getElementById("diagram");
  diagramInstance = diagramObj.ej2_instances[0];
  diagramInstance.zoom(1.2, {
    x: 100,
    y: 100
  });
}
}

</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>

```

### Nudge command

The [nudge](#) commands move the selected elements towards up, down, left, or right by 1 pixel.

[NudgeDirection](#) nudge command moves the selected elements towards the specified direction by 1 pixel, by default.

The accepted values of the argument "direction" are as follows:

- Up: Moves the selected elements towards up by the specified delta value.
- Down: Moves the selected elements towards down by the specified delta value.
- Left: Moves the selected elements towards left by the specified delta value.
- Right: Moves the selected elements towards right by the specified delta value.

The following code illustrates how to execute nudge command.

```

<template>
<div id="app">

```

```

<ejs-diagram id="diagram" :width='width' :height='height' ></ejs-diagram>
</div>
</template>
<script>
import Vue from 'vue';
import { DiagramPlugin ,NodeModel,ConnectorModel} from '@syncfusion/ej2-vue-diagrams';
Vue.use(DiagramPlugin);
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    diagramInstance.nudge('Right');
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>
`

```

### Nudge by using arrow keys

The corresponding arrow keys are used to move the selected elements towards up, down, left, or right direction by 1 pixel.

Nudge commands are particularly useful for accurate placement of elements.

### BringIntoView

The [bringIntoView](#) command brings the specified rectangular region into the viewport of the diagram.

The following code illustrates how to execute the `bringIntoView` command.

```
,  
  
<template>  
<div id="app">  
<ejs-diagram id="diagram" :width='width' :height='height' ></ejs-diagram>  
</div>  
</template>  
<script>  
import Vue from 'vue';  
import { DiagramPlugin ,NodeModel,ConnectorModel,Rect} from '@syncfusion/ej2-vue-diagrams';  
Vue.use(DiagramPlugin);  
export default {  
  name: 'app'  
  data() {  
    return {  
      width: "100%",  
      height: "350px",  
    }  
  }  
  mounted: function() {  
    let diagramInstance: Diagram;  
    let diagramObj: any = document.getElementById("diagram");  
    diagramInstance = diagramObj.ej2_instances[0];  
    //Brings the specified rectangular region of the Diagram content to the viewport of the page.  
    let bound: Rect = new Rect(200, 400, 500, 400);  
    diagramInstance.bringIntoView(bound);  
  }  
}  
</script>  
<style>  
@import "../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
```

</style>

,

### BringToCenter

The [bringToCenter](#) command brings the specified rectangular region of the diagram content to the center of the viewport.

The following code illustrates how to execute the `bringToCenter` command.

,

```
<template>
```

```
<div id="app">
```

```
<ejs-diagram id="diagram" :width='width' :height='height' ></ejs-diagram>
```

```
</div>
```

```
</template>
```

```
<script>
```

```
import Vue from 'vue';
```

```
import { DiagramPlugin ,NodeModel,ConnectorModel,Rect} from '@syncfusion/ej2-vue-diagrams';
```

```
Vue.use(DiagramPlugin);
```

```
export default {
```

```
  name: 'app'
```

```
  data() {
```

```
    return {
```

```
      width: "100%",
```

```
      height: "350px",
```

```
    }
```

```
  }
```

```
  mounted: function() {
```

```
    let diagramInstance: Diagram;
```

```
    let diagramObj: any = document.getElementById("diagram");
```

```
    diagramInstance = diagramObj.ej2_instances[0];
```

```
    //Brings the specified rectangular region of the Diagram content to the center of the viewport.
```

```
    let bound: Rect = new Rect(200, 400, 500, 400);
```

```
    diagramInstance.bringToCenter(bound);
```

```
  }
```

```
}
```

```
</script>
```

```
<style>
@import "../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>
`
```

### FitToPage command

The [fitToPage](#) command helps to fit the diagram content into the view with respect to either width, height, or at the whole.

The [mode](#) parameter defines whether the diagram has to be horizontally/vertically fit into the viewport with respect to width, height, or entire bounds of the diagram.

The [region](#) parameter defines the region that has to be drawn as an image.

The [margin](#) parameter defines the region/bounds of the diagram content that is to be fit into the view.

The [canZoomIn](#) parameter enables/disables zooming to fit the smaller content into a larger viewport.

The [customBounds](#) parameter the custom region that has to be fit into the viewport.

The following code illustrates how to execute **FitToPage** command.

```
`
<template>
<div id="app">
<ejs-diagram id="diagram" :width='width' :height='height' ></ejs-diagram>
</div>
</template>
<script>
import Vue from 'vue';
import { DiagramPlugin ,NodeModel,ConnectorModel,Rect} from '@syncfusion/ej2-vue-diagrams';
Vue.use(DiagramPlugin);
export default {
name: 'app'
data() {
return {
width: "100%",
height: "350px",
}
}
mounted: function() {
let diagramInstance: Diagram;
```

```

let diagramObj: any = document.getElementById("diagram");
diagramInstance = diagramObj.ej2_instances[0];
//fit the diagram to the page with respect to mode and region
diagramInstance.fitToPage({
  mode: 'Page',
  region: 'Content',
  margin: {
    bottom: 50
  },
  canZoomIn: false
});
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>
`

```

### Command manager

Diagram provides support to map/bind command execution with desired combination of key gestures. Diagram provides some built-in commands.

[CommandManager](#) provides support to define custom commands. The custom commands are executed, when the specified key gesture is recognized.

### Custom command

To define a custom command, specify the following properties:

- [execute](#): A method to be executed.
- [canExecute](#): A method to define whether the command can be executed at the moment.
- [gesture](#): A combination of [keys](#) and [KeyModifiers](#).
- [parameter](#): Defines any additional parameters that are required at runtime.
- [name](#): Defines the name of the command.

To explore the properties of custom commands, refer to [Commands](#).

The following code example illustrates how to define a custom command.

```

`
<template>
<div id="app">

```

```
<ejs-diagram id="diagram" :width='width' :height='height' :commandManager='commandManager'
></ejs-diagram>
</div>
</template>
<script>
import Vue from 'vue';
import { DiagramPlugin ,Keys,KeyModifiers} from '@syncfusion/ej2-vue-diagrams';
Vue.use(DiagramPlugin);
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      commandManager: {
        commands: [{
          name: 'customCopy',
          parameter: 'node',
          //Method to define whether the command can be executed at the current moment
          canExecute: function() {
            //Defines that the clone command can be executed, if and only if the selection list is not empty.
            if (diagramInstance.selectedItems.nodes.length > 0 || diagramInstance.selectedItems.connectors.length
            > 0) {
              return true;
            }
            return false;
          },
          //Command handler
          execute: function() {
            //Logic to clone the selected element
            diagramInstance.copy();
            diagramInstance.paste();
            diagramInstance.dataBind();
          },
        }
      ]
    }
  }
}
```

//Defines that the clone command has to be executed on the recognition of key press.

```
gesture: {
  key: Keys.G,
  keyModifiers: KeyModifiers.Shift | KeyModifiers.Alt
}
}},
},
}
}

mounted: function() {
  let diagramInstance: Diagram;
  let obj: any = document.getElementById("diagram");
  diagramInstance = obj.ej2_instances[0];
}
}

</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>
`
```

### Modify the existing command

When any one of the default commands is not desired, they can be disabled. To change the functionality of a specific command, the command can be completely modified.

The following code example illustrates how to disable a command and how to modify the built-in commands.

```
`
<template>
<div id="app">
<ejs-diagram id="diagram" :width='width' :height='height' :commandManager='commandManager'
></ejs-diagram>
</div>
</template>
<script>
import Vue from 'vue';
```

```
import {
  DiagramPlugin,
  Keys,
  KeyModifiers
} from '@syncfusion/ej2-vue-diagrams';
Vue.use(DiagramPlugin);
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      commandManager: {
        commands: [
          {
            name: 'nudgeUp',
            canExecute: function () {
              return false;
            },
            gesture: {
              key: Keys.Up,
            }
          },
          {
            name: 'nudgeDown',
            canExecute: function () {
              return false;
            },
            gesture: {
              key: Keys.Down,
            }
          },
          {
```

```

name: 'nudgeRight',
canExecute: function () {
return false;
},
gesture: {
key: Keys.Right,
}
}
]
},
}
}
mounted: function() {
let diagramInstance: Diagram;
let obj: any = document.getElementById("diagram");
diagramInstance = obj.ej2_instances[0];
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>
`

```

### Undo redo in Vue Diagram component

Diagram tracks the history of actions that are performed after initializing the diagram and provides support to reverse and restore those changes.

#### Undo and redo

Diagram provides built-in support to track the changes that are made through interaction and through public APIs. The changes can be reverted or restored either through shortcut keys or through commands.

Note: If you want to use Undo-Redo in diagram, you need to inject UndoRedo in the diagram.

### Undo/redo through shortcut keys

Undo/redo commands can be executed through shortcut keys. Shortcut key for undo is Ctrl+z and shortcut key for redo is Ctrl+y.

### Undo/redo through public APIs

The client-side methods [undo](#) and [redo](#) help you to revert/restore the changes. The following code example illustrates how to undo/redo the changes through script.

```
`javascript
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    // Reverts the last action performed
    diagramInstance.undo();
    // Restores the last undone action
    diagramInstance.redo();
  }
}
```

When a change in the diagram is reverted or restored (undo/redo), the historyChange event gets triggered.

### Group multiple changes

History list allows to revert or restore multiple changes through a single undo/redo command. For example, revert/restore the fill color change of multiple elements at a time.

The client-side method [startGroupAction](#) is used to notify the diagram to start grouping the changes. The client-side method [endGroupAction](#) is used to notify to stop grouping the changes. The following code illustrates how to undo/redo fillColor change of multiple elements at a time.

### APP.VUE

```
<template>
```

```

<div id="app">
  <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' :getNodeDefaults='getNodeDefaults' ></ejs-diagram>
</div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin ,UndoRedo,Diagram} from '@syncfusion/ej2-vue-
diagrams';
  Diagram.Inject(UndoRedo);
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'Start',
    width: 140,
    height: 50,
    offsetX: 300,
    offsetY: 50,
    annotations: [{
      id: 'labell',
      content: 'Start'
    }],
    shape: {
      type: 'Flow',
      shape: 'Terminator'
    }
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
        getNodeDefaults: (node) => {
          node.height = 100;
          node.width = 100;
          node.style.fill = '#6BA5D7';
          node.style.strokeColor = 'white';
          return node;
        },
      }
    }
    mounted: function() {
      let diagramInstance: Diagram;
      let diagramObj: any = document.getElementById("diagram");
      diagramInstance = diagramObj.ej2_instances[0];
      //Start to group the changes
      diagramInstance.startGroupAction();
      //Makes the changes
      let color: string[] = ['black', 'red', 'green', 'yellow']
      for (var i = 0; i < color.length; i++) {
        // Updates the fillColor for all the child elements.
        diagramInstance.nodes[0].style.fill = color[i];
        diagramInstance.dataBind();
      }
      //Ends grouping the changes
      diagramInstance.endGroupAction();
    }
  }

```

```

    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

```
{% previewsample "page.domainurl/code-snippet/diagram/undo-redo/undo-redo-cs1" %}
```

#### *Track custom changes*

Diagram provides options to track the changes that are made to custom properties. For example, in case of an employee relationship diagram, track the changes in the employee information. The historyList of the diagram enables you to track such changes.

The following example illustrates how to track such custom property changes.

Before changing the employee information, save the existing information to historyList by using the client-side method push of historyList.

The historyList canLog method can be used which takes a history entry as argument and returns whether the specific entry can be added or not.

The following code example illustrates how to save the existing property values.

```

`javascript
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    //Creates a custom entry
    let entry: HistoryEntry = {
      undoObject: diagramInstance.nodes[0];
    };
    // adds that to history list
    diagramInstance.historyList.push(entry);

```

```

diagramInstance.dataBind();
}
}
,

```

### canLog

canLog in the history list, which takes a history entry as argument and returns whether the specific entry can be added or not.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes'
:getNodeDefaults='getNodeDefaults'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin,UndoRedo ,Diagram, HistoryEntry} from
'@syncfusion/ej2-vue-diagrams';
  Diagram.Inject(UndoRedo);
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'Start',
    width: 140,
    height: 50,
    offsetX: 300,
    offsetY: 50,
    annotations: [{
      id: 'labell',
      content: 'Start'
    }],
    shape: {
      type: 'Flow',
      shape: 'Terminator'
    }
  }]
  export default {
    name: 'app',
    data() {
      return {
        width: "100%",
        height: "350px",
        nodes: nodes,
        getNodeDefaults: (node) => {
          node.height = 100;
          node.width = 100;
          node.style.fill = '#6BA5D7';
          node.style.strokeColor = 'white';
          return node;
        },
      }
    },
  },

```

```

    mounted: function() {
      let diagramInstance: Diagram;
      let diagramObj: any = document.getElementById("diagram");
      diagramInstance = diagramObj.ej2_instances[0];
      // canLog decide whether the entry add or not in history List
      diagramInstance.historyManager.canLog = function(entry:
HistoryEntry) {
        entry.cancel = true;
        return entry;
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/undo-redo/undo-redo-cs2" %}

#### [Track undo/redo actions](#)

The historyList undoStack property is used to get the collection of undo actions which should be performed in the diagram.

The undoStack/redoStack is the read-only property.

```

`javascript
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    //get the collection of undoStack objects
    let undoStack = diagramInstance.historyList.undoStack;
    //get the collection of redoStack objects
    let redoStack = diagramInstance.historyList.redoStack;
  }
}

```

```

}
`

```

### History change event

The [historyChange](#) event triggers, whenever the interaction of the node and connector is take place.

```

`javascript
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    diagramInstance.historyChange = (arg: IHistoryChangeArgs) => {
      //causes of history change
      let cause: string = arg.cause;
    }
  }
}
`

```

### Stack limit

The [stackLimit](#) property of history manager is used to limits the number of actions to be stored on the history manager.

### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes'
:getNodeDefaults='getNodeDefaults'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';

```

```

import { DiagramPlugin,UndoRedo ,Diagram} from '@syncfusion/ej2-vue-
diagrams';
Diagram.Inject(UndoRedo);
Vue.use(DiagramPlugin);
let nodes = [{
  id: 'Start',
  width: 140,
  height: 50,
  offsetX: 300,
  offsetY: 50,
  annotations: [{
    id: 'label1',
    content: 'Start'
  }],
  shape: {
    type: 'Flow',
    shape: 'Terminator'
  }
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
      getNodeDefaults: (node) => {
        node.height = 100;
        node.width = 100;
        node.style.fill = '#6BA5D7';
        node.style.strokeColor = 'white';
        return node;
      },
      historyManager:{
        stackLimit:2
      }
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/undo-redo/undo-redo-cs3" %}

### Retain selection

You can retain a selection at undo/redo operation by using the client-side API Method called **updateSelection**. Using this method, we can select a diagram objects.

`ts

```
let diagramInstance: DiagramComponent;
```

```
ReactDOM.render( < DiagramComponent id = "diagram" ref={diagram => diagramInstance = diagram}
```

```

width = {
  '100%'
}
height = {
  '600px'
}
nodes = {
  nodes
}
/>, document.getElementById("diagram") );
// history change event
diagramInstance.updateSelection: (object: NodeModel, diagram: Diagram) => {
  let selArr = [];
  selArr.push(object)
  diagram.select(selArr);
},
`

```

## Virtualization in Vue Diagram component

### Virtualization in Diagram

Virtualization is the process of loading the diagramming objects available in the visible area of the Diagram control, that is, only the diagramming objects that lie within the ViewPort of the Scroll Viewer are loaded (remaining objects are loaded only when they come into view).

This feature gives an optimized performance while loading and dragging items to the Diagram that consists of many Nodes and Connectors.

The following code illustrates how to enable Virtualization mode in the diagram.

```

`javascript
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      connectors: connectors,
    }
  }
}
//Enable virtualization in diagram
`

```

```
constraints: DiagramConstraints.Default | DiagramConstraints.Virtualization
```

```
}
```

```
}
```

```
}
```

```
,
```

## Serialization in Vue Diagram component

**Serialization** is the process of saving and loading for state persistence of the diagram.

### Save

The diagram is serialized as string while saving. The client-side method, [saveDiagram](#) helps to serialize the diagram as a string. The following code illustrates how to save the diagram.

```
`html
<template>
<div id="app">
<ejs-diagram ref="diagramObject" id="diagram" :width='width' :height='height'></ejs-diagram>
</div>
</template>
<script>
export default {
name: 'app'
data() {
return {
width: "100%",
height: "350px",
}
},
mounted: function() {
let diagramInstance: Diagram = this.$refs.diagramObject.ej2Instances;
let saveData: string;
//returns serialized string of the Diagram
saveData = diagramInstance.saveDiagram();
}
}
</script>
`
```

This string can be converted to JSON data and stored for future use. The following snippet illustrates how to save the serialized string into local storage.

```
`javascript
//Saves the string in to local storage
localStorage.setItem('fileName', saveData);
saveData = localStorage.getItem('fileName');
`
```

Diagram can also be saved as raster or vector image files. For more information about saving the diagram as images, refer to [Print and Export](#).

#### Load

Diagram is loaded from the serialized string data by client-side method, [loadDiagram](#).

The following code illustrates how to load the diagram from serialized string data.

```
`html
<template>
<div id="app">
<ejs-diagram ref="diagramObject" id="diagram" :width='width' :height='height'></ejs-diagram>
</div>
</template>
<script>
export default {
name: 'app'
data() {
return {
width: "100%",
height: "350px",
}
},
mounted: function() {
let diagram: Diagram = this.$refs.diagramObject.ej2Instances;
//Loads the Diagram from saved json data
diagram.loadDiagram(saveData);
}
}
</script>
```

`

Note: Before loading a new diagram, existing diagram is cleared.

#### Prevent default values

The [preventDefaults](#) property of `serializationSettings` is used to simplifying the saved JSON object without adding the default properties that are presented in the diagram.

The following code illustrates how to simplify the JSON object.

`ts

```
let diagram: Diagram = new Diagram({
  serializationSettings: { preventDefaults: true },
});
```

#### Export in Vue Diagram component

Diagram provides support to export its content as image/svg files. The client-side method [exportDiagram](#) helps to export the diagram. The following code illustrates how to export the diagram as image.

Note: To use Print and Export, you need to inject `PrintAndExport` in the diagram.

<!-- markdownlint-disable MD033 -->

```
`javascript
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      tool: DiagramTools.DrawOnce || DiagramTools.ZoomPan,
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    let options: IExportOptions = {};
    options.mode = 'Download';
    diagramInstance.exportDiagram(options);
  }
}
```

```

}
`

```

### Exporting options

Diagram provides support to export the desired region of the diagram to desired formats.

#### File Name

[FileName](#) is the name of the file to be downloaded. By default, the file name is set to **Diagram**.

#### Format

[Format](#) is to specify the type/format of the exported file. By default, the diagram is exported as .jpg format. You can export diagram to the following formats:

- JPG
- PNG
- BMP
- SVG

```

`javascript
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      tool: DiagramTools.DrawOnce || DiagramTools.ZoomPan,
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    let options: IExportOptions = {};
    options.mode = 'Download';
    options.format = 'SVG';
    diagramInstance.exportDiagram(options);
  }
}
`

```

### Margin

[Margin](#) specifies the amount of space that has to be left around the diagram.

<!-- markdownlint-disable MD033 -->

```
`javascript
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      tool: DiagramTools.DrawOnce || DiagramTools.ZoomPan,
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    let options: IExportOptions = {};
    options.mode = 'Download';
    options.margin = {
      left: 10,
      right: 10,
      top: 10,
      bottom: 10
    };
    options.fileName = 'format';
    options.format = 'SVG';
    diagramInstance.exportDiagram(options);
  }
}
```

### Mode

[Mode](#) specifies whether the diagram will be exported as files or get base64 data (ImageURL/SVG). The export options are as follows:

- Download: Exports and downloads the diagram as image/SVG.
- Data: return a base64 string.

The following code example illustrates how to export the diagram as raw data.

```
`javascript
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      tool: DiagramTools.DrawOnce || DiagramTools.ZoomPan,
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    let options: IExportOptions = {};
    options.mode = 'Data';
    options.margin = {
      left: 10,
      right: 10,
      top: 10,
      bottom: 10
    };
    options.fileName = 'format';
    options.format = 'SVG';
    let base64data = diagramInstance.exportDiagram(options);
  }
}
```

### Region

You can export any particular [region](#) of the diagram and it is categorized into three types as follows.

- PageSettings
- Content
- CustomBounds

### PageSettings

Diagram is exported based on the given PageSettings width and height. The Properties available in page settings are as follows.

- width
- height
- margin
- orientation
- boundaryConstraints
- background
- multiplePage
- showPageBreaks
- fitOptions

### boundaryConstraints

Defines the editable region of the diagram.

- Infinity - Allow the interactions to take place at infinite height and width.
- Diagram - Allow the interactions to take place around the diagram's height and width.
- Page - Allow the interactions to take place around the page's height and width.

### multiplePage

While setting multiple pages as false, the diagram is exported as a single image and while setting multiple pages as true, the diagram is exported as a separate image based on width and height.

The following code example illustrates how to export the region occupied by the diagram elements.

```
`javascript
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      tool: DiagramTools.DrawOnce || DiagramTools.ZoomPan,
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
```

```

let diagramObj: any = document.getElementById("diagram");
diagramInstance = diagramObj.ej2_instances[0];
let options: IExportOptions = {};
options.mode = 'Download';
options.margin = {
left: 10,
right: 10,
top: 10,
bottom: 10
};
options.fileName = 'format';
options.format = 'SVG';
options.region = 'Content';
diagram.exportDiagram(options);
}
}
`

```

### Content

The diagram content alone will be exported as an image.

The following code example illustrates how to export the region occupied by the diagram elements.

```

`javascript
var diagram = new ej.diagrams.Diagram({
width: 1500, height: 1500
}, '#element');
var options = {};
options.mode = 'Download';
options.margin = { left: 10, right: 10, top: 10, bottom: 10};
options.fileName = 'format';
options.format = 'SVG';
options.region = 'PageSettings';
diagram.exportDiagram(options);
`

```

### Custom bounds

Diagram provides support to export any specific region of the diagram by using [bounds](#).

The following code example illustrates how to export the region occupied by the diagram elements.

```
`javascript
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      tool: DiagramTools.DrawOnce || DiagramTools.ZoomPan,
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    let options: IExportOptions = {};
    options.mode = 'Download';
    options.margin = {
      left: 10,
      right: 10,
      top: 10,
      bottom: 10
    };
    options.fileName = 'region';
    options.format = 'SVG';
    options.region = 'CustomBounds';
    options.bounds.x = 10;
    options.bounds.y = 10;
    options.bounds.height = 100;
    options.bounds.width = 100;
    diagramInstance.exportDiagram(options);
  }
}
```

,

### Export diagram with stretch option

Diagram provides support to export the diagram as image for [stretch](#) option. The exported images will be clearer but larger in file size.

The following code example illustrates how to export the region occupied by the diagram elements.

```
`javascript
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      tool: DiagramTools.DrawOnce || DiagramTools.ZoomPan,
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    let options: IExportOptions = {};
    options.mode = 'Download';
    options.margin = {
      left: 10,
      right: 10,
      top: 10,
      bottom: 10
    };
    options.fileName = 'region';
    options.format = 'SVG';
    options.region = 'Content';
    options.stretch = 'Stretch';
    diagram.exportDiagram(options);
  }
}
```

## Print

The client-side method [print](#) helps to print the diagram as image.

Name	Type	Description
region	enum	Sets the region of the diagram to be printed.
bounds	object	Prints any custom region of diagram.
stretch	enum	Resizes the diagram content to fill its allocated space and printed.
multiplePage	boolean	Prints the diagram into multiple pages.
pageWidth	number	Sets the page width of the diagram while printing the diagram into multiple pages.
pageHeight	number	Sets the page height of the diagram while printing the diagram into multiple pages.
pageOrientation	enum	Sets the orientation of the page.

The following code example illustrates how to export the region occupied by the diagram elements.

```

`javascript
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      tool: DiagramTools.DrawOnce || DiagramTools.ZoomPan,
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    let options: IExportOptions = {};
    options.mode = 'Download';
    options.region = 'PageSettings';
    options.multiplePage = true;
    options.pageHeight = 300;
  }
}

```

```
options.pageWidth = 300;
diagram.print(options);
}
}
,
```

### Limitations

We have a limitation in exporting the image with HTML and Native node. So, Syncfusion Essential PDF library is used, which supports HTML Content to Image conversion by using the advanced Qt WebKit rendering engine. You can refer to the following KB link for more details.

[<https://www.syncfusion.com/kb/13298/how-to-print-or-export-the-html-and-native-node-into-image-format>]

### Tooltip in Vue Diagram component

<!-- markdownlint-disable MD010 -->

In Graphical User Interface (GUI), the tooltip is a message that is displayed when mouse hovers over an element. The diagram provides tooltip support while dragging, resizing, rotating a node, and when the mouse hovers any diagram element.

#### Default tooltip

By default, diagram displays a tooltip to provide the size, position, and angle related information while dragging, resizing, and rotating. The following images illustrate how the diagram displays the node information during an interaction.

Drag	Resize	Rotate

#### Common tooltip for all nodes and connectors

The diagram provides support to show tooltip when the mouse hovers over any node/connector.

To show tooltip on mouse over, the [tooltip](#) property of diagram model needs to be set with the tooltip [content](#) and [position](#) as shown in the following example.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
      :nodes='nodes'
      :tooltip='tooltip' :constraints='constraints'></ejs-diagram>
```

```

    </div>
  </template>
  <script>
    import Vue from 'vue';
    import { DiagramPlugin, DiagramConstraints } from '@syncfusion/ej2-vue-
    diagrams';
    Vue.use(DiagramPlugin);
    let nodes = [{
      id: "node1",
      height: 60,
      offsetX: 300,
      offsetY: 80,
      annotations: [{
        content: "start"
      }]
    }]
    export default {
      name: 'app'
      data() {
        return {
          width: "100%",
          height: "350px",
          constraints: DiagramConstraints.Default |
DiagramConstraints.Tooltip,
          nodes: nodes,
          tooltip: {
            content: 'Nodes',
            position: 'TopLeft'
          }
        }
      }
    }
  </script>
  <style>
    @import "../../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
  </style>

```

{% previewsample "page.domainurl/code-snippet/diagram/tooltip/tooltip-cs1" %}

#### Disable tooltip at runtime

The tooltip on mouse over can be disabled by assigning the [tooltip](#) property as `null`. The following code example illustrates how to disable the mouse over tooltip at runtime.

```

`javascript
export default {
  name: 'app'
  data () {
    return {
      width: "100%",
      height: "350px",

```

tooltip: null

```
}
}
}
,
```

### Tooltip for a specific node/connector

The tooltip can be customized for each node and connector. Remove the **InheritTooltip** option from the [constraints](#) of that node/connector. The following code example illustrates how to customize the tooltip for individual elements.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes'
:tooltip='tooltip' :constraints='constraints'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, DiagramConstraints } from '@syncfusion/ej2-vue-
diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: "node1",
    height: 60,
    offsetX: 300,
    offsetY: 80,
    annotations: [{
      content: "start"
    }]
  }]
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        constraints: DiagramConstraints.Default |
DiagramConstraints.Tooltip,
        nodes: nodes,
        //Defines mouse over tooltip for a node
        tooltip: {
          //Sets the content of the Tooltip
          content: 'Node1',
          //Sets the position of the Tooltip
          position: 'BottomRight',
          //Sets the tooltip position relative to the node
          relativeMode: 'Object'
        },
      }
    }
  }
}
```

```

    }
  </script>
  <style>
    @import ".../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
  </style>

```

```
{% previewsample "page.domainurl/code-snippet/diagram/tooltip/tooltip-cs2" %}
```

### Tooltip for Ports

The tooltip feature has been implemented to support Ports, providing the ability to display information or descriptions when the mouse hovers over them.

To display tooltips on mouseover, set the desired tooltip [content](#) by utilizing the [tooltip](#) property.

Tooltips for Ports can be enabled or disabled using the [PortConstraints](#) Tooltip property.

```

`ts
let ports: [{
  offset: {x: 1,y: 0.5},
  tooltip: {content: 'Port Tooltip'},
  //enable Port Tooltip Constraints
  constraints: PortConstraints.Default | PortConstraints.ToolTip,
  //disable Port Tooltip Constraints
  constraints: PortConstraints.Default ~& PortConstraints.ToolTip
}]
`

```

Dynamic modification of tooltip content is supported, allowing you to change the displayed tooltip content during runtime.

```

`ts
{
  //change tooltip content at run time
  diagram.nodes[0].ports[0].tooltip.content = 'New Tooltip Content';
  diagram.databind;
}
`

```

The following image illustrates how the diagram displays tooltips during an interaction with ports:

Here, the code provided below demonstrates the port tooltip Interaction.

#### **APP.VUE**

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes'
    ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, PortVisibility, PointPortModel, PortConstraints }
from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: "node1",
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    // Initialize port collection
    ports: [{
      // Sets the position for the port
      offset: {
        x: 0.5,
        y: 0.5
      },
      visibility: PortVisibility.Visible,
      shape: 'Circle',
    }],
  }];
```

```

        tooltip: {content: 'Port Tootip', relativeMode: 'Object',
position: 'TopRight'},
        constraints: PortConstraints.Default | PortConstraints.ToolTip
    ]]
    ]]
    export default {
        name: 'app',
        data() {
            return {
                width: "100%",
                height: "350px",
                nodes: nodes,
            }
        }
    }
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/tooltip/tooltip-cs7" %}

### Tooltip template content

Any text or image can be added to the tooltip, by default. To customize the tooltip layout or to create your own visualized element on the tooltip, template can be used.

The following code example illustrates how to add formatted HTML content to the tooltip.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes'
        :tooltip='tooltip' :constraints='constraints'></ejs-diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { DiagramPlugin,DiagramConstraints } from '@syncfusion/ej2-vue-
diagrams';
    Vue.use(DiagramPlugin);
    let nodes = [{
        id: "node1",
        height: 60,
        offsetX: 300,
        offsetY: 80,
        annotations: [{
            content: "start"
        }]
    }]
    function getContent(): HTMLElement {
        let tooltipContent: HTMLElement = document.createElement('div');
        tooltipContent.innerHTML = '<div style="background-color: #f4f4f4;
color: black; border-width:1px;border-style: solid;border-color: #d3d3d3;

```

```

border-radius: 8px;white-space: nowrap;"> <span style="margin: 10px;">
Tooltip !!! </span> </div>';
    return tooltipContent;
  }
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "350px",
        constraints: DiagramConstraints.Default |
DiagramConstraints.Tooltip,
        nodes: nodes,
        //Defines mouse over tooltip for a node
        tooltip: {
          //Sets the content of the Tooltip
          content: getContent(),
          //Sets the position of the Tooltip
          position: 'TopLeft',
          //Sets the tooltip position relative to the node
          relativeMode: 'Object'
        },
      },
    },
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/tooltip/tooltip-cs3" %}

### Tooltip alignments

#### *Tooltip relative to object*

The diagram provides support to show tooltip around the node/connector that is hovered by the mouse. The tooltip can be aligned by using the [position](#) property of the tooltip.

The [relativeMode](#) property of the tooltip defines whether the tooltip has to be displayed around the object or at the mouse position.

The following code example illustrates how to position the tooltip around object.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes'
:tooltip='tooltip' :constraints='constraints'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin,DiagramConstraints } from '@syncfusion/ej2-vue-
diagrams';

```

```

Vue.use(DiagramPlugin);
let nodes = [{
  id: "node1",
  height: 60,
  offsetX: 300,
  offsetY: 80,
  annotations: [{
    content: "start"
  }]
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      constraints: DiagramConstraints.Default |
DiagramConstraints.Tooltip,
      nodes: nodes,
      //Defines mouse over tooltip for a node
      tooltip: {
        content: 'Node1',
        //Sets the alignment properties
        position: 'BottomRight',
        //Sets to show tooltip around the element
        relativeMode: 'Object',
      },
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/tooltip/tooltip-cs4" %}

#### Tooltip relative to mouse position

To display the tooltip at mouse position, need to set **mouse** option to the [relativeMode](#) property of the tooltip.

The following code example illustrates how to show tooltip at mouse position.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes'
:tooltip='tooltip' :constraints='constraints'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, DiagramConstraints } from '@syncfusion/ej2-vue-
diagrams';

```

```

Vue.use(DiagramPlugin);
let nodes = [{
  id: "node1",
  height: 60,
  offsetX: 300,
  offsetY: 80,
  annotations: [{
    content: "start"
  }]
}]
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      constraints: DiagramConstraints.Default |
DiagramConstraints.Tooltip,
      nodes: nodes,
      //Defines mouse over tooltip for a node
      tooltip: {
        content: 'Node1',
        //Sets to show tooltip at mouse position
        relativeMode: 'Mouse',
      },
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/tooltip/tooltip-cs5" %}

### Tooltip animation

To animate the tooltip, a set of specific animation effects are available, and it can be controlled by using the [animation](#) property. The animation property also allows you to set delay, duration, and various other effects of your choice.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes'
:tooltip='tooltip' :constraints='constraints'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, DiagramConstraints } from '@syncfusion/ej2-vue-
diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{

```

```

        id: "node1",
        height: 60,
        offsetX: 300,
        offsetY: 80,
        annotations: [{
            content: "start"
        }]
    }]
    export default {
        name: 'app'
        data() {
            return {
                width: "100%",
                height: "350px",
                constraints: DiagramConstraints.Default |
DiagramConstraints.Tooltip,
                nodes: nodes,
                //Defines mouse over tooltip for a node
                tooltip: {
                    content: 'Node1',
                    position: 'BottomCenter',
                    relativeMode: 'Object',
                    animation: {
                        //Animation settings to be applied on the Tooltip,
                        while it is being shown over the target.
                        open: {
                            //Animation effect on the Tooltip is applied
                        during open and close actions.
                            effect: 'ZoomIn',
                            //Duration of the animation that is completed
                        per animation cycle.
                            duration: 1000,
                            //Indicating the waiting time before animation
                        begins.
                            delay: 0
                        },
                        //Animation settings to be applied on the Tooltip,
                        when it is closed.
                        close: {
                            effect: 'ZoomOut',
                            duration: 500,
                            delay: 0
                        }
                    }
                },
            },
        },
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/tooltip/tooltip-cs6" %}

## User handle in Vue Diagram component

- User handles are used to add some frequently used commands around the selector. To create user handles, define and add them to the [userHandles](#) collection of the [selectedItems](#) property.
- The name property of user handle is used to define the name of the user handle and its further used to find the user handle at runtime and do any customization.

### Alignment

User handles can be aligned relative to the node boundaries. It has [margin](#), [offset](#), [side](#), [horizontalAlignment](#), and [verticalAlignment](#) settings. It is quite tricky when all four alignments are used together but gives more control over alignment.

#### Offset for user handle

The [offset](#) property of [userHandles](#) is used to align the user handle based on fractions. 0 represents top/left corner, 1 represents bottom/right corner, and 0.5 represents half of width/height.

#### Side

The [side](#) property of [userHandles](#) is used to align the user handle by using the [Top](#), [Bottom](#), [Left](#), and [Right](#) options.

#### Horizontal and vertical alignments

The [horizontalAlignment](#) property of [userHandles](#) is used to set how the user handle is horizontally aligned at the position based on the [offset](#). The [verticalAlignment](#) property is used to set how user handle is vertically aligned at the position.

#### Margin for user handle

Margin is an absolute value used to add some blank space in any one of its four sides. The [userHandles](#) can be displaced with the [margin](#) property.

### Appearance

The appearance of the user handle can be customized by using the [size](#), [borderColor](#), [backgroundColor](#), [visible](#), [pathData](#), and [pathColor](#) properties of the [userHandles](#).

## APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' :getCustomTool='getCustomTool'
:selectedItems='selectedItems'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, NodeModel
, MoveTool, BasicShapeModel, UserHandleModel, randomId,
SelectorConstraints, cloneObject } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let diagramInstance: Diagram;
  let shape: BasicShapeModel = {
    type: 'Basic',
    shape: 'Rectangle'
  };
  function getTool(action: string): ToolBase {
```

```

    let tool: ToolBase | any;
    if (action === "clone") {
        tool = new CloneTool(diagramInstance.commandHandler);
    }
    return tool;
}

### Fixed user handles

The fixed user handles are used to add some frequently used commands around the node and connector even without selecting it.

### Initialization an fixed user handles

To create the fixed user handles, define and add them to the collection of nodes and connectors property. The following code example used to create an fixed user handles for the nodes and connectors.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-diagram id="diagram" :width='width' :height='height'
        :nodes='nodes' ></ejs-diagram>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
    Vue.use(DiagramPlugin);
    let nodes = [{
        offsetX: 250,
        offsetY: 250,
        width: 100,
        height: 100,
        style: {
            fill: '#6BA5D7',
            strokeColor: 'white'
        },
    },
    // A fixed user handle is created and stored in fixed user handle
    collection of Node.
    fixedUserHandles: [{margin: { right: 20 },pathData: 'M60.3,18H27.5c-
    3,0-5.5,2.4-5.5,5.5v38.2h5.5V23.5h32.7V18z M68.5,28.9h-30c-3,0-5.5,2.4-
    5.5,5.5v38.2c0,3,2.4,5.5,5.5,5.5h30c3,0,5.5-2.4,5.5-
    5.5V34.4C73.9,31.4,71.5,28.9,68.5,28.9z M68.5,72.5h-30V34.4h30V72.5z' }]
    }]
    export default {
        name: 'app'
    }

```

```
data() {  
  return {  
    width: "100%",  
    height: "350px",  
    nodes: nodes,  
  }  
}  
}  
</script>  
<style>  
  @import "../node_modules/@syncfusion/ej2-vue-  
    diagrams/styles/material.css";  
</style>
```

{% previewsample "page.domainurl/code-snippet/diagram/interaction/FixedUserHandle-cs1" %}

### Customization

- The id property of fixed user handle is used to define the unique identification of the fixed user handle and it is further used to add custom events to the fixed user handle.
- The fixed user handle can be positioned relative to the node and connector boundaries. It has offset, padding and cornerRadius settings. It is used to position and customize the fixed user handle.
- The `Padding` is used to leave the space that is inside the fixed user handle between the icon and the border.
- The corner radius allows to create fixed user handles with rounded corners. The radius of the rounded corner is set with the `cornerRadius` property.

Note: The PathData needs to be provided to render fixed user handle.

### Size

Diagram allows you set size for the fixed user handles by using the `width` and `height` property. The default value of the width and height property is 10.

### Style

- You can change the style of the fixed user handles with the specific properties of `borderColor`, `borderWidth`, and background color using the `handleStrokeColor`, `handleStrokeWidth`, and `fill` properties, and the icon `borderColor`, and `borderWidth` using the `iconStrokeColor` and `iconStrokeWidth`.
- The fixed user handle's `iconStrokeColor` and `iconStrokeWidth` property used to change the stroke color and stroke width of the given `pathData`.
- The fixed user handle `handleStrokeColor` and, `fill` properties are used to define the background color and border color of the userhandle and the `handleStrokeWidth` property is used to define the border width of the fixed user handle.
- The `visible` property of the fixed user handle enables or disables the visibility of fixed user handle.

The following code explains how to customize the appearance of the fixed user handles.

**APP.VUE**

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
      :nodes='nodes' :connectors='connectors' ></ejs-diagram>
    </div>
  </template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    offsetX: 150,
    offsetY: 150,
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
  },
  // A fixed user handle is created and stored in fixed user handle
  // collection of Node.
  {
    fixedUserHandles: [{offset: { x: 0, y: 0 },margin: { right: 20 },
    width: 20, height: 20,

padding:{left:3,right:3,top:3,bottom:3},iconStrokeColor:'white',fill:'black'
, id: 'user1', pathData: 'M60.3,18H27.5c-3,0-5.5,2.4-

  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/interaction/CustomizingFixedUserHandle-cs1" %}

Note: The Fixed user handle id should need to be unique.

### Customizing the node fixed user handle

- The node fixed user handle can be aligned relative to the node boundaries. It has **margin** and **offset** settings. It is quite useful to position the node fixed userhandle and used together and gives you more control over the node fixed user handle positioning.

#### Margin for the node fixed user handle

Margin is an absolute value used to add some blank space in any one of its four sides. The fixed user handle can be displaced with the **margin** property.

#### Offset for the node fixed user handle

The **offset** property of fixed user handle is used to align the user handle based on the **x** and **y** points. (0,0) represents the top or left corner and (1,1) represents the bottom or right corner.

The following table shows all the possible alignments visually shows the fixed user handle positions.

Offset	Margin	Output
(0,0)	Right = 20	

The following code explains how to customize the node fixed user handle.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let nodes = [{
    offsetX: 250,
    offsetY: 250,
    width: 100,
    height: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
  },
  // A fixed user handle is created and stored in fixed user handle
collection of Node.
    fixedUserHandles: [{offset: { x: 0, y: 0 },margin: { right: 20 },
width: 20, height: 20,
      id: 'user1', pathData: 'M60.3,18H27.5c-3,0-5.5,2.4-
5.5,5.5v38.2h5.5V23.5h32.7V18z M68.5,28.9h-30c-3,0-5.5,2.4-
5.5,5.5v38.2c0,3,2.4,5.5,5.5,5.5h30c3,0,5.5-2.4,5.5-
5.5V34.4C73.9,31.4,71.5,28.9,68.5,28.9z M68.5,72.5h-30V34.4h30V72.5z' }]
  ]
  export default {
    name: 'app'
    data() {
```

```
        return {
            width: "100%",
            height: "350px",
            nodes: nodes,
        }
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/diagram/interaction/NodeFixedUserHandle-cs1" %}

Customizing the connector fixed user handle

- The connector fixed user handle can be aligned relative to the connector boundaries. It has alignment, displacement and offset settings. It is useful to position the connector fixed userhandle and used together and gives you more control over the connector fixed user handle positioning.
- The `offset` and `alignment` properties of fixed user handle allows you to align the connector fixed user handles to the segments.

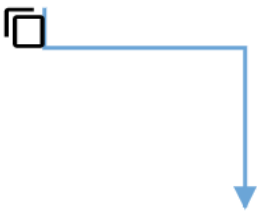

Offset for the connector fixed user handle

The `offset` property of connector fixed user handle is used to align the user handle based on fractions. 0 represents the connector source point, 1 represents the connector target point, and 0.5 represents the center point of the connector segment.

Alignment

The connector’s fixed user handle can be aligned over its segment path using the `alignment` property of fixed user handle.

The following table shows all the possible alignments visually shows the fixed user handle positions.

Offset	Alignment	Output
-----	-----	-----
		
0   Before		

### Displacement

- The **displacement** property allows you to specify the space to be left from the connector segment based on the x and y value provided.

The following table shows all the possible alignments visually shows the fixed user handle positions.

Displacement	Alignment	Output
-----	-----	-----

Note: Displacement will not be done if the alignment is set to be center.

The following code explains how to customize the connector fixed user handle.

#### **APP.VUE**

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:connectors='connectors' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  let connectors = [{
    id: "connector1",
    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7',
      strokeWidth: 2
    },
    targetDecorator: {
      style: {
        fill: '#6BA5D7',
        strokeColor: '#6BA5D7'
      }
    },
    sourcePoint: {
      x: 100,
      y: 100
    },
    targetPoint: {
      x: 200,
      y: 200
    }
  }];
```

```

    }, type: 'Orthogonal', // A fixed user handle is created and stored in
    fixedUserHandles: [{ offset: 0.5, width: 20, alignment: 'Before',

#### Tooltip support for User Handle

The diagram provides support to show tooltip when the mouse hovers over any user handle.

To show tooltip on mouse over, the [tooltip](#) property of diagram model needs to be set with the tooltip [content](#) and [position](#) as shown in the following example.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' :constraints='constraints'
    :selectedItems='selectedItems'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, NodeModel
  , MoveTool, BasicShapeModel, UserHandleModel, randomId, NodeConstraints,
  DiagramConstraints, SelectorConstraints, cloneObject } from '@syncfusion/ej2-
  vue-diagrams';
  Vue.use(DiagramPlugin);
  let diagramInstance;
  let nodes = [{
    id: 'node',
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node

```

```

        width: 100,
        height: 100,
        style: { fill: '#6BA5D7', strokeColor: 'white' },
        tooltip: { content: 'node1', position: 'BottomRight', relativeMode:
'Object' },
        constraints: NodeConstraints.Default | NodeConstraints.Tooltip,
    }}
    let handles = [{
        name: 'clone', pathData: 'M60.3,18H27.5c-3,0-5.5,2.4-
5.5,5.5v38.2h5.5V23.5h32.7V18z M68.5,28.9h-30c-3,' +
        '0-5.5,2.4-5.5,5.5v38.2c0,3,2.4,5.5,5.5,5.5h30c3,0,5.5-2.4,5.5-

        'M68.5,72.5h-30V34.4h30V72.5z',
        visible: true, offset: 0, side: 'Bottom', margin: { top: 0, bottom:
0, left: 0, right: 0 },
        tooltip: { content: 'handle1', position: 'BottomRight',
relativeMode: 'Object' }
    }];
    export default {
        name: 'app',
        data() {
            return {
                width: "100%",
                height: "350px",
                nodes: nodes,
                constraints: DiagramConstraints.Default |
DiagramConstraints.Tooltip,
                selectedItems: {
                    constraints: SelectorConstraints.All,userHandles:
handles
                }
            }
        },
    }
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/interaction/UserHandle-cs3" %}

## Style in Vue Diagram component

### Customizing the connector end point handle

Use the following CSS to customize the connector end point handle.

```

`scss
.e-diagram-endpoint-handle {
    fill: red;
    stroke: green;
}
`

```

### Customizing the connector end point handle when connected

Use the following CSS to customize the connector end point handle when connected.

```
`scss
.e-diagram-endpoint-handle.e-connected {
  fill: red;
  stroke: green;
}
`
```

### Customizing the connector end point handle when disabled

Use the following CSS to customize the connector end point handle when disabled.

```
`scss
.e-diagram-endpoint-handle.e-disabled {
  fill: red;
  opacity: 1;
  stroke: green;
}
`
```

### Customizing the bezier connector handle

Use the following CSS to customize the bezier handle properties.

```
`scss
.e-diagram-bezier-handle {
  fill: red;
  stroke: green;
}
`
```

### Customizing the bezier connector line

Use the following CSS to customize the bezier line properties.

```
`scss
.e-diagram-bezier-line {
  stroke: black;
}
`
```

### Customizing the resize handle

Use the following CSS to customize the resize handle.

```
`scss
.e-diagram-resize-handle {
  fill: white;
  opacity: 1;
  stroke: white;
}
`
```

#### Customizing the selector pivot line

Use the following CSS to customize the line between the selector and rotate handle.

```
`scss
.e-diagram-pivot-line {
  stroke: red;
}
`
```

#### Customizing the selector border

Use the following CSS to customize the selector border.

```
`scss
.e-diagram-border {
  stroke: red;
}
`
```

#### Customizing the rotate handle

Use the following CSS to customize the rotate handle properties.

```
`scss
.e-diagram-rotate-handle {
  fill: red;
  stroke: green;
}
`
```

#### Customizing the symbolpalette while hovering

Use the following CSS to customize the symbolpalette while hovering.

```
`scss
.e-symbolpalette .e-symbol-hover:hover {
  background: red;
}
```

```
}  
,
```

#### [Customizing the symbolpalette when selected](#)

Use the following CSS to customize the symbolpalette when selected.

```
`scss  
  
.e-symbolpalette .e-symbol-selected {  
  background: white;  
}  
,
```

#### [Customizing the ruler](#)

Use the following CSS to customize the ruler properties.

```
`scss  
  
.e-diagram .e-ruler {  
  background-color: red;  
  font-size: 13px;  
}  
,
```

#### [Customizing the ruler overlap](#)

Use the following CSS to ruler overlap properties.

```
`scss  
  
.e-diagram .e-ruler-overlap {  
  background-color: red;  
}  
,
```

#### [Customizing the text edit](#)

Use the following CSS to customize the text edit properties.

```
`scss  
  
.e-diagram .e-diagram-text-edit {  
  background: white;  
  border-color: red;  
  border-style: dashed;  
  border-width: 1px;  
  box-sizing: content-box;  
  color: black;
```

```
min-width: 50px;
}
```

### Customizing the text edit on selection

Use the following CSS to customize the text edit on selection properties.

```
`scss
.e-diagram-text-edit::selection {
background: red;
color: green;
}
```

### Ruler in Vue Diagram component

The Ruler provides a horizontal and vertical guide for measuring in the Diagram control. The Ruler can be used to measure the diagram objects, indicate positions, and align diagram elements. This is especially useful in creating scale models.

#### Adding Rulers to the Diagram

- The [rulerSettings](#) property is used to control the visibility and appearance of the ruler in the diagram.
- The RulerSettings [showRulers](#) property is used to show or hide the rulers in the diagram.
- The RulerSettings [horizontalRuler](#) and [verticalRuler](#) properties are used to customize the rulers appearance in the diagram.

The following code shows how to add a ruler to the diagram.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:rulerSettings='rulerSettings'></ejs-diagram>
  </div>
</template>
<script>
import Vue from 'vue';
import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
Vue.use(DiagramPlugin);
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "600px",
      rulerSettings: {
        showRulers: true
      }
    }
  }
}
```

```

    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  diagrams/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/diagram/ruler/ruler-cs1" %}

### Customizing the Ruler

By default, the ruler segments are arranged based on pixel values.

- The HorizontalRuler's [interval](#) property allows you to define the interval between ruler segments and the [segmentWidth](#) property allows you to define the segment width of the ruler. Similarly, you can use the VerticalRuler's [interval](#) and [segmentWidth](#) properties are used to define the interval and segment width of the vertical ruler
- The HorizontalRuler's [tickAlignment](#) property is used to align the ruler tick either left or right side of the ruler. The VerticalRuler's [tickAlignment](#) property is used to align the ruler tick either top or bottom side of the ruler.
- The HorizontalRuler's [arrangeTick](#) and VerticalRuler's [arrangeTick](#) function is provided for the purpose of customizing the appearance of ruler ticks. It will be called for each tick rendering.
- The HorizontalRuler's [markerColor](#) and VerticalRuler's [markerColor](#) properties are used to define the ruler marker color and marker will be shown when performing the interaction in the diagram.

The following code shows how the diagram ruler can be customized.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :rulerSettings='rulerSettings' ></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin } from '@syncfusion/ej2-vue-diagrams';
  Vue.use(DiagramPlugin);
  export default {
    name: 'app'
    data() {
      return {
        width: "100%",
        height: "600px",
        rulerSettings: {
          showRulers: true, horizontalRuler:{interval:8,
segmentWidth:100, thickness:25,
tickAlignment:"LeftOrTop"},verticalRuler:{interval:10, segmentWidth:150,
thickness:35, tickAlignment:"RightOrBottom"}
        }
      }
    }
  }

```

```
    }  
  }  
</script>  
<style>  
  @import "../node_modules/@syncfusion/ej2-vue-  
diagrams/styles/material.css";  
</style>
```

{% previewsample "page.domainurl/code-snippet/diagram/ruler/ruler-cs2" %}

Note : The MarkerColor property can be customized using the [marker](#) CSS style.

### Layers in Vue Diagram component

**Layer** is used to organize related shapes on a diagram control. A layer is a named category of shapes. By assigning shapes to different layers, you can selectively view, remove, and lock different categories of shapes.

In diagram, [Layers](#) provide a way to change the properties of all shapes that have been assigned to that layer. The following properties can be set.

- Visible
- Lock
- Objects
- AddInfo

#### Visible

The layer's [visible](#) property is used to control the visibility of the elements assigned to the layer.

```
`javascript  
let nodes = [{  
  id: 'node1',  
  width: 100,  
  height: 100,  
  offsetX: 100,  
  offsetY: 100,  
  annotations: [{  
    content: 'Default Shape'  
  }]  
},  
{  
  id: 'node2',  
  width: 100,  
  height: 100,
```

```
offsetX: 300,
offsetY: 100,
shape: {
  type: 'Path',
  data:
'M540.3643,137.9336L546.7973,159.7016L570.3633,159.7296L550.7723,171.9366L558.9053,194.9966L
540.3643,' +
'179.4996L521.8223,194.9966L529.9553,171.9366L510.3633,159.7296L533.9313,159.7016L540.3643,1
37.9336z'
},
annotations: [{
  content: 'Path Element'
}]
}
];

let connectors: ConnectorModel[] = [{
  id: 'connector1',
  type: 'Straight',
  sourcePoint: {
    x: 100,
    y: 300
  },
  targetPoint: {
    x: 200,
    y: 400
  },
}];

export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
```

```

layers: [{
  id: 'layer1',
  visible: true,
  objects: ['node1', 'node2', 'connector1']
}]
}
}}
`

```

### Lock

The layer's [lock](#) property is used to prevent or allow changes to the elements dimension and position.

```
`javascript
```

```

let nodes = [{
  id: 'node1',
  width: 100,
  height: 100,
  offsetX: 100,
  offsetY: 100,
  annotations: [{
    content: 'Default Shape'
  }]
},
{
  id: 'node2',
  width: 100,
  height: 100,
  offsetX: 300,
  offsetY: 100,
  shape: {
    type: 'Path',
    data:
'M540.3643,137.9336L546.7973,159.7016L570.3633,159.7296L550.7723,171.9366L558.9053,194.9966L
540.3643,' +
'179.4996L521.8223,194.9966L529.9553,171.9366L510.3633,159.7296L533.9313,159.7016L540.3643,1
37.9336z'

```

```
},
annotations: [{
  content: 'Path Element'
}]
}
];

let connectors: ConnectorModel[] = [{
  id: 'connector1',
  type: 'Straight',
  sourcePoint: {
    x: 100,
    y: 300
  },
  targetPoint: {
    x: 200,
    y: 400
  },
}];

export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
      layers: [{
        id: 'layer1',
        visible: true,
        objects: ['node1'],
        lock: true
      },
      {
        id: 'layer2',
```

```

visible: true,
objects: ['node2', 'connector1'],
lock: false
}}
}
}}
,

```

### Objects

The layer's [objects](#) property defines the diagram elements to the layer.

```

`javascript
let nodes = [{
id: 'node1',
width: 100,
height: 100,
offsetX: 100,
offsetY: 100,
annotations: [{
content: 'Default Shape'
}]
},
{
id: 'node2',
width: 100,
height: 100,
offsetX: 300,
offsetY: 100,
shape: {
type: 'Path',
data:
'M540.3643,137.9336L546.7973,159.7016L570.3633,159.7296L550.7723,171.9366L558.9053,194.9966L
540.3643,' +
'179.4996L521.8223,194.9966L529.9553,171.9366L510.3633,159.7296L533.9313,159.7016L540.3643,1
37.9336z'
},

```

```
annotations: [{
  content: 'Path Element'
}]
}
];
let connectors: ConnectorModel[] = [{
  id: 'connector1',
  type: 'Straight',
  sourcePoint: {
    x: 100,
    y: 300
  },
  targetPoint: {
    x: 200,
    y: 400
  },
}];
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
      layers: [{
        id: 'layer1',
        visible: true,
        objects: ['node1', 'node2', 'connector1'],
        lock: true
      }]
    }
  }
}
```

### AddInfo

The [addInfo](#) property of layers allow you to maintain additional information to the layers.

The following code illustrates how to add additional information to the layers.

```
`javascript
let nodes = [{
  id: 'node1',
  width: 100,
  height: 100,
  offsetX: 100,
  offsetY: 100,
  annotations: [{
    content: 'Default Shape'
  }]
},
{
  id: 'node2',
  width: 100,
  height: 100,
  offsetX: 300,
  offsetY: 100,
  shape: {
    type: 'Path',
    data:
'M540.3643,137.9336L546.7973,159.7016L570.3633,159.7296L550.7723,171.9366L558.9053,194.9966L
540.3643,' +
'179.4996L521.8223,194.9966L529.9553,171.9366L510.3633,159.7296L533.9313,159.7016L540.3643,1
37.9336z'
  },
  annotations: [{
    content: 'Path Element'
  }]
}
];

let connectors: ConnectorModel[] = [{
```

```

id: 'connector1',
type: 'Straight',
sourcePoint: {
  x: 100,
  y: 300
},
targetPoint: {
  x: 200,
  y: 400
},
});
let addInfo: Object = { Description: 'Layer1' };
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
      nodes: nodes,
      layers: [{
        id: 'layer1',
        visible: true,
        objects: ['node1', 'node2', 'connector1'],
        addInfo: addInfo
      }]
    }
  }
}

```

#### *Add layer at runtime*

Layers can be added at runtime by using the [addLayer](#) public method.

The layer's [ID](#) property defines the ID of the layer, and its further used to find the layer at runtime and do any customization.

The following code illustrates how to add a layer.

```
`javascript
```

```
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    // add the layers to the existing diagram layer collection
    diagram.addLayer({
      id: 'newlayer',
      objects: [],
      visible: true,
      lock: false,
      zIndex: -1
    }, [{
      type: 'Straight',
      sourcePoint: {
        x: 100,
        y: 300
      },
      targetPoint: {
        x: 200,
        y: 400
      }
    }]);
  }
}
```

### *Remove layer at runtime*

Layers can be removed at runtime by using the [removeLayer](#) public method.

The following code illustrates how to remove a layer.

```
`javascript
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    // remove the diagram layers
    diagram.removeLayer([diagram.model.layers[i]]);
  }
}
```

### *moveObjects*

Objects of the layers can be moved by using the [moveObjects](#) public method.

The following code illustrates how to move objects from one layer to another layer from the diagram.

```
`javascript
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
    }
  }
  mounted: function() {
```

```

let diagramInstance: Diagram;
let diagramObj: any = document.getElementById("diagram");
diagramInstance = diagramObj.ej2_instances[0];
// move the objects of diagram layers
diagram.moveObjects(['connector1', 'layer2'];
}
}
`

```

#### *bringLayerForward*

Layers can be moved forward at runtime by using the [bringLayerForward](#) public method.

The following code illustrates how to bring forward to layer.

```

`javascript
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    // move the layer forward
    diagram.bringLayerForward('layer1');
  }
}
`

```

#### *sendLayerBackward*

Layers can be moved backward at runtime by using the [sendLayerBackward](#) public method.

The following code illustrates how to send backward to layer.

```

`javascript
export default {

```

```
name: 'app'
data() {
  return {
    width: "100%",
    height: "350px",
  }
}
mounted: function() {
  let diagramInstance: Diagram;
  let diagramObj: any = document.getElementById("diagram");
  diagramInstance = diagramObj.ej2_instances[0];
  // move the layer backward
  diagram.sendLayerBackward('layer1');
}
},
```

#### *cloneLayer*

Layers can be cloned with its object by using the [cloneLayer](#) public method.

The following code illustrates how to bring forward to layer.

```
`javascript
export default {
  name: 'app'
  data() {
    return {
      width: "100%",
      height: "350px",
    }
  }
  mounted: function() {
    let diagramInstance: Diagram;
    let diagramObj: any = document.getElementById("diagram");
    diagramInstance = diagramObj.ej2_instances[0];
    // clone a layer with its object
```

```
diagram.cloneLayer('layer2');  
}  
}  
`
```

#### [getActiveLayer](#)

To get the active layers back in diagram, use the [getActiveLayer](#) public method.

The following code illustrates how to bring forward to layer.

```
`javascript  
export default {  
  name: 'app'  
  data() {  
    return {  
      width: "100%",  
      height: "350px",  
    }  
  }  
  mounted: function() {  
    let diagramInstance: Diagram;  
    let diagramObj: any = document.getElementById("diagram");  
    diagramInstance = diagramObj.ej2_instances[0];  
    // gets the active layer back  
    diagram.getActiveLayer();  
  }  
}  
`
```

#### [setActiveLayer](#)

Set the active layer by using the [setActiveLayer](#) public method.

The following code illustrates how to bring forward to layer.

```
`javascript  
export default {  
  name: 'app'  
  data() {  
    return {  
      width: "100%",  
    }  
  }  
}
```

```

height: "350px",
}
}
mounted: function() {
let diagramInstance: Diagram;
let diagramObj: any = document.getElementById("diagram");
diagramInstance = diagramObj.ej2_instances[0];
// set the active layer
//@param layerName defines the name of the layer which is to be active layer
diagram.setActiveLayer('layer2');
}
}
`

```

### Context menu in Vue Diagram component

<!-- markdownlint-disable MD010 -->

In graphical user interface (GUI), a context menu is a type of menu that appears when you perform right-click operation. Nested level of context menu items can be created.

Diagram provides some in-built context menu items and allows to define custom menu items through the [contextMenuSettings](#) property.

#### Customize context menu

The [show](#) property helps you to enable/disable the context menu. Diagram provides some default context menu items to ease the execution of some frequently used commands.

The following code illustrates how to enable the default context menu items.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
      :nodes='nodes' :connectors='connectors'
      :contextMenuSettings='contextMenuSettings'></ejs-diagram>
    </div>
  </template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, DiagramContextMenu, Diagram } from
  '@syncfusion/ej2-vue-diagrams';
  Diagram.Inject(DiagramContextMenu);
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'node1',
    width: 100,
    height: 100,
    offsetX: 100,

```

```

      offsetY: 100,
      style: {
        fill: '#6BA5D7',
        strokeColor: 'white',
        strokeWidth: 1
      },
      annotations: [{
        id: 'label1',
        content: 'Rectangle1',
        offset: {
          x: 0.5,
          y: 0.5
        },
        style: {
          color: 'white'
        }
      }]
    },
    {
      id: 'node2',
      width: 100,
      height: 100,
      offsetX: 300,
      offsetY: 100,
      style: {
        fill: '#6BA5D7',
        strokeColor: 'white',
        strokeWidth: 1
      },
      annotations: [{
        id: 'label2',
        content: 'Rectangle2',
        offset: {
          x: 0.5,
          y: 0.5
        },
        style: {
          color: 'white'
        }
      }]
    }
  ];
  let connectors = [{
    id: 'connector1',
    sourceID: 'node1',
    targetID: 'node2',
    type: 'Straight',
    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7',
      strokeWidth: 2,
      targetDecorator: {
        style: {
          fill: '#6BA5D7',
          strokeColor: '#6BA5D7'
        }
      }
    }
  }]
}

```

```

    ]]
    export default {
      name: 'app'
      data() {
        return {
          width: "100%",
          height: "350px",
          nodes: nodes,
          connectors: connectors,
          contextMenuSettings: {
            show: true,
          }
        }
      }
    }
  </script>
  <style>
    @import "../node_modules/@syncfusion/ej2-vue-
    diagrams/styles/material.css";
  </style>

```

{% previewsample "page.domainurl/code-snippet/diagram/contextmenu/events-cs1" %}

Context menu can be defined for individual node with the desired context menu items.

- Apart from the default context menu items, define some additional context menu items. Those additional items have to be defined and added to the [items](#) property of the context menu.
- Set text and ID for context menu item using the context menu [text](#) and [ID](#) properties respectively.
- Set an image for the context menu item using the context menu [url](#) property.
- The [iconCss](#) property defines the class/multiple classes separated by a space for the menu item that is used to include an icon. Menu item can include font icon and sprite image.
- The [target](#) property used to set the target to show the menu item.
- The [separator](#) property defines the horizontal lines that are used to separate the menu items. You cannot select the separators. You can enable separators to group the menu items using the [separator](#) property.

The following code example illustrates how to add custom context menu items.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
    :nodes='nodes' :connectors='connectors'
    :contextMenuSettings='contextMenuSettings'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import {
    DiagramPlugin, DiagramContextMenu, Diagram, DiagramBeforeMenuOpenEventArgs }
  from '@syncfusion/ej2-vue-diagrams';
  Diagram.Inject(DiagramContextMenu);

```

```
Vue.use(DiagramPlugin);
let nodes = [{
  id: 'node1',
  width: 100,
  height: 100,
  offsetX: 100,
  offsetY: 100,
  style: {
    fill: '#6BA5D7',
    strokeColor: 'white',
    strokeWidth: 1
  },
  annotations: [{
    id: 'label1',
    content: 'Rectangle1',
    offset: {
      x: 0.5,
      y: 0.5
    },
    style: {
      color: 'white'
    }
  }]
},
{
  id: 'node2',
  width: 100,
  height: 100,
  offsetX: 300,
  offsetY: 100,
  style: {
    fill: '#6BA5D7',
    strokeColor: 'white',
    strokeWidth: 1
  },
  annotations: [{
    id: 'label2',
    content: 'Rectangle2',
    offset: {
      x: 0.5,
      y: 0.5
    },
    style: {
      color: 'white'
    }
  }]
}
];
let connectors = [{
  id: 'connector1',
  sourceID: 'node1',
  targetID: 'node2',
  type: 'Straight',
  style: {
    strokeColor: '#6BA5D7',
    fill: '#6BA5D7',
    strokeWidth: 2,
    targetDecorator: {
```

```

        style: {
            fill : '#6BA5D7',
            strokeColor : '#6BA5D7'
        }
    }
}
} ]
export default {
    name: 'app'
    data() {
        return {
            width: "100%",
            height: "350px",
            nodes: nodes,
            connectors: connectors,
            contextMenuSettings: {
                //Enables the context menu
                show: true,
                // Defines the custom context menu items
                items: [{
                    // Text to be displayed
                    text: 'Save',
                    //Sets the id for the item
                    id: 'save',
                    //ContextMenu can be visible based on the target in
                    which you open the ContextMenu.
                    target: '.e-elementcontent',
                    // Sets the css icons for the item
                    iconCss: 'e-save'
                },
                {
                    text: 'Load',
                    id: 'load',
                    target: '.e-elementcontent',
                    iconCss: 'e-load'
                },
                {
                    text: 'Clear',
                    id: 'clear',
                    target: '.e-elementcontent',
                    iconCss: 'e-clear'
                }
            ],
            // Hides the default context menu items
            showCustomMenuOnly: false,
        }
    }
}
</script>
<style>
    @import
    "https://ej2.syncfusion.com/vue/documentation/../../node_modules/@syncfusion/ej2-vue-diagrams/styles/material.css";
</style>

```

```
{% previewsample "page.domainurl/code-snippet/diagram/contextmenu/default-cs1" %}
```

To display the custom context menu items alone, set the [showCustomMenuOnly](#) property to true.

### Template Support for Context menu

- Diagram provides template support for context menu. The context menu items can be customized by using the `contextMenuBeforeItemRender` event. The `contextMenuBeforeItemRender` event triggers while rendering each menu item.
- In the following sample, the menu item is rendered with key code for specified action in Context Menu using the template. Here, the key code is specified for the cut and copy at right corner of the menu items by adding a span element in the `contextMenuBeforeItemRender` event.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-diagram id="diagram" :width='width' :height='height'
:nodes='nodes' :connectors='connectors'
:contextMenuSettings='contextMenuSettings'></ejs-diagram>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DiagramPlugin, DiagramContextMenu, Diagram ,
MenuEventArgs, } from '@syncfusion/ej2-vue-diagrams';
  Diagram.Inject(DiagramContextMenu);
  Vue.use(DiagramPlugin);
  let nodes = [{
    id: 'node1',
    width: 100,
    height: 100,
    offsetX: 100,
    offsetY: 100,
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white',
      strokeWidth: 1
    },
    annotations: [{
      id: 'labell1',
      content: 'Rectangle1',
      offset: {
        x: 0.5,
        y: 0.5
      },
      style: {
        color: 'white'
      }
    }
  ]
},
{
  id: 'node2',
  width: 100,
  height: 100,
```

```

      offsetX: 300,
      offsetY: 100,
      style: {
        fill: '#6BA5D7',
        strokeColor: 'white',
        strokeWidth: 1
      },
      annotations: [{
        id: 'label2',
        content: 'Rectangle2',
        offset: {
          x: 0.5,
          y: 0.5
        },
        style: {
          color: 'white'
        }
      }]
    }
  ];

  let connectors = [{
    id: 'connector1',
    sourceID: 'node1',
    targetID: 'node2',
    type: 'Straight',
    style: {
      strokeColor: '#6BA5D7',

{% previewsample "page.domainurl/code-snippet/diagram/contextmenu/custom-cs1" %}

### Symbol palette in Vue Diagram component

The **SymbolPalette** displays a collection of palettes. The Palette shows a set of nodes and connectors. It allows to drag and drop the nodes and connectors into the Diagram.

### Create symbol palette

- The [width](#) and [height](#) property of the symbolpalette allows to define the size of the symbolpalette.

```
`javascript
export default {
  name: 'app'
  data() {
    return {
      //Defines how many palettes can be at expanded mode at a time
      expandMode: "Multiple",
      //Defines the palette collection
      palettes: [{
        //Sets the id of the palette
        id: 'flow',
        //Sets whether the palette expands/collapse its children
        expanded: true,
        //Adds the palette items to palette
        symbols: flowshapes,
        //Sets the header text of the palette
        title: 'Flow Shapes',
        iconCss: 'e-ddb-icons e-flow'
      },
      {
        id: 'basic',
        expanded: true,
        symbols: basicShapes,
        title: 'Basic Shapes',
        iconCss: 'e-ddb-icons e-basic'
      },
      {
        id: 'connectors',
        expanded: true,
        symbols: connectorSymbols,
```

```

title: 'Connectors',
iconCss: 'e-ddb-icons e-connector'
}
],
palettewidth: "100%",
paletteheight: "700px",
symbolHeight: 60,
symbolWidth: 60,
}
}
}
,

```

<!-- markdownlint-disable MD010 -->

### Add palettes to SymbolPalette

A palette allows to display a group of related symbols and it textually annotates the group with its header.

Palettes [palettes](#) can be added as a collection of symbol groups.

The collection of predefined symbols can be added in palettes using [symbols](#) property.

To initialize a palette, define a JSON object with the property [id](#) that is unique id is set to the palettes.

The following code example illustrates how to define a palette and how its added to symbol palette.

### APP.VUE

```

<template>
  <div id="app">

### Customize the Palette Header

Palettes can be annotated with its header texts.

The [title](#) displayed as the header text of palette.

The [expanded](#) property of palette allows to expand/collapse its palette items.

The [height](#) property of palette sets the height of the symbol group.

The [iconCss](#) property sets the content of the symbol group.

The [description](#) defines the text to be displayed and how that is to be handled in getSymbolInfo.

Also, we can embed any HTML element into a palette header by defining the getSymbolInfo property.

Following code example illustrates how to customize palette headers.

### APP.VUE

### Restrict expansion of the palette panel

The symbol palette panel can be restricted from getting expanded. The `[cancel]` argument of the `[paletteExpanding]` property defines whether the palette's panel should be expanded or collapsed. By default, the panel is expanded. This restriction can be done for each of the palettes in the symbol palette as desired.

In the following code example, the basic shapes palette is restricted from getting collapsed whereas the swimlane shapes palette can be expanded or collapsed.

### APP.VUE

### Stretch the symbols into the palette

The [fit](#) property defines whether the symbol has to be fit inside the size, that is defined by the symbol palette. For example, When we resize the rectangle in the symbol, ratio of the rectangle size has to be

maintained rather changing into square shape. The following code example illustrates how to customize the symbol size.

### APP.VUE

### Default Settings

While adding more number of symbols such as nodes and connectors to the palette, you can define the default settings for those objects through [getNodeDefaults](#) property of defaultSettings allows to define the default settings for nodes and [getConnectorDefaults](#) property of defaultSettings allows to define the default settings for connectors.

#### Adding symbol description for symbols in the palette

The diagram provides support to add symbol description below each symbol of a palette. This descriptive representation of each symbol will enhance the details of the symbol visually. The height and width of the symbol description can also be set individually.

- The property `getSymbolInfo`, can be used to add the symbol description at runtime.

The following code is an example to set a symbol description for symbols in the palette.

#### APP.VUE

```

<template>
    <div id="app">
        <ejs-symbolpalette id="symbolpalette" :expandMode='expandMode'
        :palettes='palettes' :width='palettewidth' :height='paletteheight'
        :symbolHeight='symbolHeight' :symbolWidth='symbolWidth'
        :getSymbolInfo='getSymbolInfo'
        ></ejs-symbolpalette>
    </div>
</template>
<script>
    import Vue from 'vue';

### Tooltip for symbols in symbol palette

The Symbol palette supports displaying tooltips when mouse hovers over the symbols. You can customize the tooltip for each symbol in the symbol palette.

### Default tooltip for symbols

When hovering over symbols in the symbol palette, the default tooltip displays the symbol's ID.

Refer to the image below for an illustration of the tooltip behavior in the symbol palette.

### Custom tooltip for symbols

To customize the tooltips for symbols in the symbol palette, assign a custom tooltip to the 'Tooltip' content property of each symbol. Once you define the custom tooltip, enable the Tooltip constraints for each symbol, ensuring that the tooltips are displayed when users hover over them.

Here, the code provided below demonstrates how to define tooltip content to symbols within a symbol palette.

#### [How to provide different tooltip for Symbol palette and diagram elements.](#)

Differentiate the tooltips between symbols in the symbol palette and dropped nodes by utilizing the `dragEnter` event. When a custom tooltip is defined for a symbol, it will be displayed for both the symbol and the dropped node in the diagram canvas. However, to provide distinct tooltips for symbols in the palette and dropped nodes, capture the `dragEnter` event and assign specific tooltips dynamically.

When a symbol is dragged from the symbol palette and enters the diagram canvas, the `[DragEnter]` [IDragEnterEventArgs](#) event is triggered. Within this event, you can define a new tooltip for the dropped node. By assigning custom tooltip content to the `Tooltip` property of the node, you can provide a distinct tooltip that is specific to the dropped node.

The following image illustrates the differentiation of tooltips displayed in the Symbol Palette and the Diagram.

The following code snippet will demonstrate how to define two different tooltip for symbol in the symbol palette and dropped node in the diagram canvas.

```
`ts
let diagram: Diagram = new Diagram({
width: '100%', height: '500px',
connectors: connectors, nodes: nodes,
//event to change tooltip content while dragging symbols into Diagram
dragEnter: dragEnter,
});
diagram.appendTo('#diagram');
function dragEnter(args:IDragEnterEventArgs)
{
//enable tooltip constraints for the dragged symbol
args.dragItem.constraints = NodeConstraints.Default | NodeConstraints.Tooltip;
//change the tooltip content of the dragged symbol
args.dragItem.tooltip.content='This is Diagram Tooltip';
}
`
```

#### Palette Interaction

Palette interaction notifies the element enter, leave, and dragging of the symbols into the diagram.

### DragEnter

[DragEnter] [IDragEnterEventArgs](#) notifies when the element enter into the diagram from symbol palette.

### DragLeave

[DragLeave] [IDragLeaveEventArgs](#) notifies when the element leaves from the diagram.

### DragOver

[DragOver] [IDragOverEventArgs](#) notifies when an element drag over another diagram element.

Note: The diagram provides support to cancel the drag and drop operation from the symbol palette to the diagram when the ESC key is pressed.

## Overview in Vue Diagram component

Overview control allows you to see a preview or an overall view of the entire content of a diagram. This helps you to look at the overall picture of a large diagram and also to navigate, pan, or zoom, on a particular position of the page.

When you work on a very large diagram, you may not know the part you are actually working on, or navigation from one part to another might be difficult. One solution for navigation is to zoom out the entire diagram and find where you are. Then, you can zoom in a particular area you want to. This solution is not suitable when you need some frequent navigation.

Overview control solves these problems by showing a preview, that is, an overall view of the entire diagram. A rectangle indicates viewport of the diagram. Navigation becomes easy by dragging this rectangle.

### Create overview

The `sourceID` property of overview should be set with the corresponding diagram ID for the overall view.

The `width` and `height` properties of the overview allow you to define the size of the overview.

The following code illustrates how to create overview.

### Zoom and Pan

In overview, the view port of the diagram is highlighted with a red colored rectangle. Diagram can be zoomed/panned by interacting with that. You can interact with overview as follows:

- Resize the rectangle: Zooms in/out the diagram.
- Drag the rectangle: Pans the diagram.
- Click at a position: Navigates to the clicked region.
- Choose a particular region by clicking and dragging: Navigates to the specified region.

The following image shows how the diagram is zoomed/panned with overview.

### How to load EJ1 diagram in EJ2 diagram

To load EJ1 JSON data in an EJ2 diagram, follow these steps.

1. Import and inject the EJ1SerializationModule as shown in the following code example.

```

`html
<template>
<div id="app">
<ejs-diagram ref="diagramObject" id="diagram" :width='width':height='height'></ejs-diagram>
</div>
</template>
<script>
export default {
name: 'app'
data() {
return {
width: "100%",
height: "350px",
}
},
}
</script>
`

```

2. Load the EJ1 JSON data using the diagram loadDiagram method and set the second parameter to true.

```
`html
<script>
export default {
  mounted: function() {
    let diagram = document.getElementById("diagram").ej2_instances[0];
    let ej1Data = {"JSONData"}; //Replace JSONData with your EJ1 JSON data
    //Load the EJ1 JSON and pass a boolean value as true.
    diagram.loadDiagram(ej1Data, true);
  }
}
</script>
`
```

## Dialog

### Getting Started

This section explains how to create a simple Dialog and how to configure the Dialog component.

#### Prerequisites

[System requirements for Syncfusion Vue UI components](#)

#### Dependencies

The list of dependencies required to use the Dialog component in your application is given below:

```
`javascript
|-- @syncfusion/ej2-vue-popups
|-- @syncfusion/ej2-vue-base
|-- @syncfusion/ej2-vue-buttons
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-buttons
`
```

#### Get Started with Vue CLI

You can use [Vue CLI](#) to setup your vue applications.

To install Vue CLI use the following command.

```
`bash
npm install -g @vue/cli
`
```

Start a new project using below Vue CLI command.

```
`bash
vue init webpack-simple quickstart
cd quickstart
npm install
`
```

### Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](https://www.npmjs.com) registry. You can choose the component that you want to install. For this application, we are going to use Dialog component.

To install Dialog component, use the following command

```
`bash
npm install @syncfusion/ej2-vue-popups --save
`
```

### Registering Vue Component

For Registering Vue Component two ways are available. They are as follows.

- `Vue.use()`
- `Vue.component()`

#### Using `Vue.use()`

Import the Component Plugin from the EJ2 Vue Package and register the same using `Vue.use()` with Component Plugin as its argument.

Refer the code snippet given below.

```
`ts
import { DialogPlugin } from '@syncfusion/ej2-vue-popups';
Vue.use(DialogPlugin);
`
```

By Registering Component Plugin in Vue, all child directives are also globally registered.

#### Using `Vue.component()`

Import the Component and Component Plugin from EJ2 Vue Package, register the same using the `Vue.component()` with name of Component from Component Plugin and the EJ2 Vue Component as its arguments.

Refer the code snippet given below.

```
`ts
import { DialogComponent, DialogPlugin } from '@syncfusion/ej2-vue-popups';
Vue.component(DialogPlugin.name, DialogComponent);
`
```

By using `Vue.component()`, only the EJ2 Vue Component is registered. Child directives needs to be registered separately.

#### Creating Vue sample

Add the EJ2 Vue Dialog using `<ejs-dialog>` to the `<template>` section of the `App.vue` file in `src` directory, the content attribute of the Dialog component is provided as name in data option in the `<script>` section.

```
,  
  
<template>  
<div id="app">  
<ejs-dialog :header="Dialog" :content="content" ></ejs-dialog>  
</div>  
</template>  
  
<script>  
import Vue from 'vue';  
import { DialogPlugin } from '@syncfusion/ej2-vue-popups';  
Vue.use(DialogPlugin);  
export default {  
  name: 'app',  
  data () {  
    return {  
      content: 'The dialog component is used to display information and get input from the user.'  
    }  
  }  
}  
</script>  
,
```

#### Adding CSS reference

Add Dialog component's styles as given below in `<style>` section of the `App.vue` file.

```
,  
  
<style>  
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";  
</style>
```

The [Custom Resource Generator \(CRG\)](#) is an online web tool, which can be used to generate the custom script and styles for a set of specific components.

This web tool is useful to combine the required component scripts and styles in a single file.

### Running the application

Now run the `npm run dev` command in the console, it will build your application and open in the browser.

### APP.VUE

```
<template>
  <div>
    <div id="target" class="control-section">
      <ejs-dialog :target='target' :width='width' :content='content'>
        </ejs-dialog>
      </div>
    </div>
  </template>
<script>
import Vue from "vue";
import { DialogPlugin } from '@syncfusion/ej2-vue-popups';
Vue.use(DialogPlugin);
export default {
  data: function() {
    return {
      target: "#target",
      width: '335px',
      content: 'This is a Dialog with content.'
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
.control-section {
  height: 100%;
  min-height: 200px;
}
</style>
```

```
{% previewsample "page.domainurl/code-snippet/dialog/getting-started-cs1" %}
```

In the dialog control, max-height is calculated based on the dialog target element height. If the target property is not configured, the document.body is considered as a target. Therefore, to show a dialog in proper height, you need to add min-height to the target element.

If the dialog is rendered based on the body, then the dialog will get the height based on its body element height. If the height of the dialog is larger than the body height, then the dialog's height will not be set. For this scenario, we can set the CSS style for the html and body to get the dialog height.

```
html, body {
```

height: 100%;

}

,

### Modal dialog

A modal shows an overlay behind the Dialog. So, the user should interact the Dialog compulsory before interacting with the remaining content in an application.

While the user clicks the overlay, the action can be handled through the [overlayClick](#) event. In the below sample, the Dialog close action is performed while clicking on the overlay.

When the modal dialog is opened, the Dialog's target scrolling will be disabled. The scrolling will be enabled again once close the Dialog.

### APP.VUE

```
<template>
  <div>
    <div id="modalTarget" class="control-section; position:relative"
style="height:350px;">
      <!-- Render Button to open the modal Dialog -->
      <ejs-button id='modalbtn' v-
on:click.native="modalBtnClick">Open</ejs-button>
      <!-- Render modal Dialog -->
      <ejs-dialog ref="modalDialog" :isModal='isModal' :header='header'
:target='target' :width='width' :animationSettings='animationSettings'
:content='content' :open="modalDlgOpen" :close="modalDlgClose"
:overlayClick="overlayClick">
        </ejs-dialog>
      </div>
    </div>
  </template>
<script>
import Vue from 'vue';
import { DialogPlugin } from '@syncfusion/ej2-vue-popups';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(DialogPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return {
      target: "#modalTarget",
      width: '335px',
      header: 'Software Update',
      content: 'Your current software version is up to date.',
      isModal: true,
      animationSettings: { effect: 'None' }
    }
  },
  mounted: function(){
    document.getElementById('modalbtn').focus();
  },
  methods: {
    modalBtnClick: function() {
      this.$refs.modalDialog.show();
    }
  }
}
```

```

        modalDlgClose: function() {
            document.getElementById('modalbtn').style.display = '';
        },
        modalDlgOpen: function() {
            document.getElementById('modalbtn').style.display = 'none';
        },
        overlayClick: function() {
            this.$refs.modalDialog.hide();
        }
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
#app {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.control-section {
    height: 100%;
    min-height: 200px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/dialog/modal-cs1" %}

### Enable header

The Dialog header can be enabled by adding the header content as text or HTML content through the [header](#) property.

### APP.VUE

```

<template>
  <div>
    <div id="target" class="control-section; position:relative"
    style="height:350px;">
      <!-- Render Dialog -->
      <ejs-dialog ref="headerDialog" :header='header' :target='target'
      :width='width' :content='content'>
        </ejs-dialog>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { DialogPlugin } from '@syncfusion/ej2-vue-popups';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(DialogPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return {

```

```

        target: "#target",
        width: '335px',
        header: 'Dialog header',
        content: 'This is a Dialog with header.'
    }
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
#app {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.control-section {
    height: 100%;
    min-height: 200px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/dialog/header-cs1" %}

### Enable footer

The Dialog provides built-in support to render the buttons on the footer (for ex: 'OK' or 'Cancel' buttons). Each Dialog button allows the user to perform any action while clicking on it.

The primary button will be focused automatically on open the Dialog, and add the `click` event to handle the actions

When the Dialog initialize with more than one primary buttons, the first primary button gets focus on open the Dialog.

The below sample is rendered with button and its click event.

### APP.VUE

```

<template>
  <div>
    <div id="target" class="control-section; position:relative"
    style="height:350px;">
      <!-- Render Button to open the Dialog -->
      <ejs-button id='dlgbtn' v-on:click.native="btnClick">Open</ejs-
button>
      <!-- Render Dialog -->
      <ejs-dialog ref="footerDialog" :header='header' :target='target'
:width='width' :buttons='buttons' :content='content' :open="dlgOpen"
:close="dlgClose">
        </ejs-dialog>
    </div>
  </div>
</template>
<script>

```

```

import Vue from "vue";
import { DialogPlugin } from '@syncfusion/ej2-vue-popups';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(DialogPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return {
      target: "#target",
      width: '335px',
      header: 'Dialog',
      content: 'This is a Dialog with button and primary button.',
      buttons: [{ click: this.dlgButtonClick, buttonModel: { content:
'OK', isPrimary: true } },
        { click: this.dlgButtonClick, buttonModel: { content: 'Cancel'
}}]
    }
  },
  mounted: function() {
    document.getElementById('dlgbtn').focus();
  },
  methods: {
    btnClick: function() {
      this.$refs.footerDialog.show();
    },
    dlgClose: function() {
      document.getElementById('dlgbtn').style.display = '';
    },
    dlgOpen: function() {
      document.getElementById('dlgbtn').style.display = 'none';
    },
    dlgButtonClick: function() {
      this.$refs.footerDialog.hide();
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
#app {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
.control-section {
  height: 100%;
  min-height: 200px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/dialog/footer-cs1" %}

### Draggable

The Dialog supports to drag within its target container by grabbing the Dialog header, which allows the user to reposition the Dialog dynamically.

The Dialog can be draggable only when the Dialog header is enabled. From **16.2.x** version, enabled draggable support for modal dialog also.

### APP.VUE

```
<template>
  <div id="target" class="control-section">
    <ejs-dialog :header="header" :content="content"
:allowDragging="draggable" :target='target' :width='width'> </ejs-dialog>
  </div>
</template>
<script>
import Vue from 'vue';
import { DialogPlugin } from '@syncfusion/ej2-vue-popups';
Vue.use(DialogPlugin);
export default {
  data : function() {
    return {
      target: '#target',
      width: '300px',
      header: 'Dialog',
      draggable: true,
      content: 'This is a Dialog with drag enabled.'
    }
  }
}
</script>
<style>
@import "../../../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
#app {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
.control-section {
  min-height: 355px;
  margin: 10px;
}
</style>
```

```
{% previewsample "page.domainurl/code-snippet/dialog/draggable-cs1" %}
```

### Positioning

The Dialog can be positioned using the [position](#) property by providing the X and Y co-ordinates. It can be positioned inside the target of the container or **<body>** of the element based on the given X and Y values.

for X is: left, center, right (or) any offset value

for Y is: top, center, bottom (or) any offset value

The below example demonstrates the different Dialog positions.

### APP.VUE

```
<template>
  <div>
    <div id="target" class="control-section">
      <ejs-button id="dialogBtn" v-on:click.native="buttonClick">Open
Dialog</ejs-button>
      <ejs-dialog id='defaultDialog' header='Choose a Dialog Position'
showCloseIcon='true' :position='position' :footerTemplate='footerTemplate'
width='406px' ref='dialogObj'
      target='#target' :open='dialogOpen' :close='dialogClose'
closeOnEscape='false'>
        <table style='width:371px' id='poschange'>
          <tr>
            <td><ejs-radiobutton id='radio1' label='Left Top'
value='left top' name='xy' :change='changePosition' ></ejs-radiobutton></td>
            <td><ejs-radiobutton id='radio2' label='Center Top'
value='center top' name='xy' :change='changePosition'></ejs-
radiobutton></td>
            <td><ejs-radiobutton id='radio3' label='Right Top'
value='right top' name='xy' :change='changePosition'></ejs-radiobutton></td>
          </tr>
          <tr>
            <td><ejs-radiobutton id='radio4' label='Left Center'
value='left center' name='xy' :change='changePosition' ></ejs-
radiobutton></td>
            <td><ejs-radiobutton id='radio5' checked='true'
label='Center Center' value='center center' name='xy'
:change='changePosition' ></ejs-radiobutton></td>
            <td><ejs-radiobutton id='radio6' label='Right Center'
value='right center' name='xy' :change='changePosition' ></ejs-
radiobutton></td>
          </tr>
          <tr>
            <td><ejs-radiobutton id='radio7' label='Left Bottom'
value='left bottom' name='xy' :change='changePosition' ></ejs-
radiobutton></td>
            <td><ejs-radiobutton id='radio8' label='Center Bottom'
value='center bottom' name='xy' :change='changePosition' ></ejs-
radiobutton></td>
            <td><ejs-radiobutton id='radio9' label='Right Bottom'
value='right bottom' name='xy' :change='changePosition' ></ejs-
radiobutton></td>
          </tr>
        </table>
      </ejs-dialog>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { DialogPlugin } from '@syncfusion/ej2-vue-popups';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
```

```

import { RadioButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(DialogPlugin);
Vue.use(ButtonPlugin);
Vue.use(RadioButtonPlugin);
export default {
  data: function() {
    return {
      footerTemplate: '<span id="posvalue" style="float:left;margin-left:8px;padding:10px;">Position: { X: "Center", Y: "Center" }</span>',
      position: { X: 'center', Y: 'center' }
    },
    methods: {
      buttonClick: function(args){
        this.$refs.dialogObj.show();
      },
      changePosition: function(event) {
        this.$refs.dialogObj.position = { X: event.value.split(" ")[0], Y: event.value.split(" ")[1] };
        document.getElementById('posvalue').innerHTML = 'Position: {X: "' + event.value.split(" ")[0] + '", Y: "' + event.value.split(" ")[1] + '"}';

## Getting Started with the Vue Dialog Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue Dialog component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

[System requirements for Syncfusion Vue UI components](#)

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm create vite@latest
```

```
`
```

or

```
`bash
```

```
yarn create vite
```

```
,
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as `my-project` for this article.

```
`bash
```

```
? Project name: » my-project
```

```
,
```

2. Select `Vue` as the framework. It will create a Vue 3 project.

```
`bash
```

```
? Select a framework: » - Use arrow-keys. Return to submit.
```

```
Vanilla
```

```
Vue
```

```
React
```

```
Preact
```

```
Lit
```

```
Svelte
```

```
Others
```

```
,
```

3. Choose `JavaScript` as the framework variant to build this Vite project using JavaScript and Vue.

```
`bash
```

```
? Select a variant: » - Use arrow-keys. Return to submit.
```

```
JavaScript
```

```
TypeScript
```

```
Customize with create-vue ↗
```

```
Nuxt ↗
```

```
,
```

4. Upon completing the aforementioned steps to create the `my-project`, run the following command to install its dependencies:

```
`bash
```

```
cd my-project
```

```
npm install
`
or
`bash
cd my-project
yarn install
`
```

Now that `my-project` is ready to run with default settings, let's add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue Dialog component](#) as an example. To use the Vue Dialog component in the project, the `@syncfusion/ej2-vue-popups` package needs to be installed using the following command:

```
`bash
npm install @syncfusion/ej2-vue-popups --save
`
or
`bash
yarn add @syncfusion/ej2-vue-popups
`
```

#### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, `Material` theme is applied using CSS styles, which are available in installed packages. The necessary `Material` CSS styles for the Dialog component and its dependents were imported into the `<style>` section of `src/App.vue` file.

#### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

### Add Syncfusion Vue component

Follow the below steps to add the Vue Dialog component using **Composition API** or **Options API**:

1.First, import and register the Dialog component in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<script setup>
import { DialogComponent as EjsDialog } from "@syncfusion/ej2-vue-popups";
</script>
```

#### **OPTIONS API (~SRC/APP.VUE)**

```
<script>
import { DialogComponent } from "@syncfusion/ej2-vue-popups";
//Component registration
export default {
  name: "App",
  components: {
    "ejs-dialog": DialogComponent,
  }
}
</script>
```

2.In the **template** section, define the Dialog component with the [dataSource](#) property and column definitions.

#### **~/SRC/APP.VUE**

```
<template>
<div>
<div id="target" class="control-section">
<ejs-dialog :target="target" :width="width" :content="content">
</ejs-dialog>
</div>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<template>
<div>
<div id="target" class="control-section">
<ejs-dialog :target="data[0].target" :width="data[0].width"
:content="data[0].content">
</ejs-dialog>
</div>
</div>
</template>
<script setup>
import { DialogComponent as EjsDialog } from "@syncfusion/ej2-vue-popups";
```

```
const data = [{ target: "#target",
width: "335px",
content: "This is a Dialog with content."}],
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
.control-section {
height: 100%;
min-height: 200px;
}
</style>
```

### **OPTIONS API (~SRC/APP.VUE)**

```
<template>
<div>
<div id="target" class="control-section">
<ejs-dialog :target="target" :width="width" :content="content">
</ejs-dialog>
</div>
</div>
</template>
<script>
import { DialogComponent } from "@syncfusion/ej2-vue-popups";
export default {
name: "App",
components: {
"ejs-dialog": DialogComponent,
},
data: function () {
return {
target: "#target",
width: "335px",
content: "This is a Dialog with content.",
};
},
methods: {},
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
.control-section {
height: 100%;
min-height: 200px;
}
</style>
```

### **Run the project**

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
`
```

or

```
`bash
```

```
yarn run dev
```

```
`
```

The output will appear as follows:

This is a Dialog with content

You can refer to our [Vue dialog](#) feature tour page for its groundbreaking feature representations. You can also explore our [Vue dialog example](#) that shows you how to render the dialog in Vue.

### Template in Vue Dialog component

In Dialog the template support is provided to the header, content and footer sections. So any text or HTML content can be appending in these sections.

#### Header

The Dialog header content can be provided through the [header](#) property, and it will allow both text and any HTML content as a string. Also in header, close button is provided as built-in support, and this can be enabled through the [showCloseIcon](#) property.

#### Footer

The Dialog footer can be enabled by adding built-in [buttons](#) or providing any HTML string through the [footerTemplate](#).

The [buttons](#) and [footerTemplate](#) properties can't be used at the same time.

#### Content

The Dialog content can be updated by providing any HTML string through the [content](#).

The below example demonstrates the usage of header, footer and content template in the Dialog.

#### **APP.VUE**

```
<template>
  <div>
    <div id="target" class="control-section; position:relative"
style="height:350px;">
      <!-- Render Button to open the Dialog -->
      <ejs-button id='modalBtn' v-on:click.native="btnClick">Open
Dialog</ejs-button>
```

```

        <!-- Render Dialog -->
        <ejs-dialog id='dialog' ref="templateDialog"
:header='headerTemplate' :target='target' :height='height' :width='width'
:footerTemplate='footerTemplate' :showCloseIcon='true'
:animationSettings='animationSettings' :content='contentTemplate'
:open="dlgOpen" :close="dlgClose">
        </ejs-dialog>
    </div>
</div>
</template>
<script>
import Vue from "vue";
import { DialogPlugin } from '@syncfusion/ej2-vue-popups';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { isNullOrUndefined } from '@syncfusion/ej2-base';
Vue.use(DialogPlugin);
Vue.use(ButtonPlugin);
var footerTemplateVue = Vue.component("demo", {
    template: '<span> <input id="inVal" class="e-input" type="text"
placeholder="Enter your message here!"/><button id="sendButton" class="e-
control e-btn e-primary sendButton" data-ripple="true">Send</button>
</span>',
    data() {
        return {
            data: {}
        };
    }
});
var headerTemplateVue = Vue.component("demo1", {
    template: '<span> <div title="Nancy"
class="e-icon-settings dlg-template"> Nancy </div></span>',
    data() {
        return {
            data: {}
        };
    }
});
var contentTemplateVue = Vue.component("demo2", {
    template: '<div><div class="dialogContent"> <span
class="dialogText">Greetings Nancy! When will you share me the source files
of the project?</span></div></div>',
    data() {
        return {
            data: {}
        };
    }
});
export default {
    data: function() {
        return {
            target: '#target',
            height: '75%',
            width: '435px',
            footerTemplate: function () {
                return { template: footerTemplateVue }
            }
        };
    }
};

```

```

        },
        headerTemplate: function () {
            return { template: headerTemplateVue }
        },
        contentTemplate: function () {
            return { template: contentTemplateVue }
        },
        animationSettings: { effect: 'None' }
    }
},
mounted: function() {
    document.getElementById('modalBtn').focus();
},
methods: {

### Animation in Vue Dialog component

The Dialog can be animated during the open and close actions. Also, user can customize animation's **delay**, **duration** and **effect**.

<!-- markdownlint-disable MD033 -->

delay	The Dialog animation will start with the mentioned delay
duration	Specifies the animation duration to complete with one animation cycle
effect	<p>Specifies the animation effects of Dialog open and close actions effect.</p> <p>List of supported animation effects:            'Fade'   'FadeZoom'   'FlipLeftDown'   'FlipLeftUp'   'FlipRightDown'   'FlipRightUp'              'FlipXDown'   'FlipXUp'   'FlipYLeft'   'FlipYRight'   'SlideBottom'   'SlideLeft'   'SlideRight'              'SlideTop'   'Zoom'   'None'</p> <p>If the user sets 'Fade' effect, then the Dialog will open with 'FadeIn' effect and close with 'FadeOut' effect</p>

In the below sample, **Zoom** effect is enabled. So, The Dialog will open with **ZoomIn** and close with **ZoomOut** effects.

## Resize in Vue Dialog component

The Dialog supports resizing feature. To resize the dialog, we have to select and resize it by using its handle (grip) or hovering on any of the edges or borders of the dialog within the sample container.

The resizable dialog can be created by setting the [enableResize](#) property to true, which is used to change the size of a dialog dynamically and view its content with expanded mode. The [resizeHandles](#) property can also be configured for all the which directions in which the dialog should be resized. When you configure the target property along with the [enableResize](#) property, the dialog can be resized within its specified target container.

### APP.VUE

```

<template>
  <div id="target" class="control-section">
    <ejs-dialog :header="header" :content="content" :enableResize='true'
    :resizeHandles='resizeHandles' :allowDragging="draggable" :target='target'
    :width='width'> </ejs-dialog>
  </div>

```

```

</template>
<script>
import Vue from 'vue';
import { DialogPlugin } from '@syncfusion/ej2-vue-popups';
Vue.use(DialogPlugin);
export default {
  data : function() {
    return {
      target: '#target',
      width: '300px',
      header: 'Dialog',
      resizeHandles: ['All'],
      draggable: true,
      content: 'This is a Dialog with resize enabled.'
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
#app {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
.control-section {
  min-height: 355px;
  margin: 10px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/dialog/resize-cs1" %}

### Dialog utility in Vue Dialog component

The dialog component provides built-in utility functions to render the alert and confirm dialogs with the minimal code.

The following options are used as an argument on calling the utility functions:

Options	Description
title	Specifies the title of dialog like the <a href="#">header</a> property.
content	Specifies the value that can be displayed in dialog's content area like the <a href="#">content</a> property.
isModal	Specifies the Boolean value whether the dialog can be displayed as modal or non-modal. For more details, refer to the <a href="#">isModal</a> property.
position	Specifies the value where the alert or confirm dialog is positioned within the document. For more details, refer to the <a href="#">position</a> property { X: 'center', Y: 'center'}

| okButton | Configures the OK button that contains button properties with the click events.

okButton:{ icon:'prefix icon to the button', cssClass:'custom class to the button', click: 'action for OK button click', text: 'Yes' // <-- Default value is 'OK' }

| cancelButton | Configures the Cancel button that contains button properties with the click events.

cancelButton:{ icon:'prefix icon to the button', cssClass:'custom class to the button', click: 'action for 'Cancel' button click', text: 'No' // <-- Default value is 'Cancel' }

| isDraggable | Specifies the value whether the alert or confirm dialog can be dragged by the user. |

| showCloseIcon | When set to true, the close icon is shown in the dialog component. |

| closeOnEscape | When set to true, you can close the dialog by pressing ESC key. |

| animationSettings | Specifies the animation settings of the dialog component. |

| cssClass | Specifies the CSS class name that can be appended to the dialog. |

| zIndex | Specifies the order of the dialog, that is displayed in front or behind of another component. |

| open | Event which is triggered after the dialog is opened. |

| close | Event which is triggered after the dialog is closed. |

### Alert dialog

An alert dialog box is used to display warning like messages to the users. Use the following code to render a simple alert dialog in an application.

#### APP.VUE

```
<template>
  <div>
    <center><ejs-button ref='button' id="dialogbtn" cssClass="e-info" v-
on:click.native="dialogBtnClick">Open Alert Dialog</ejs-button></center>
  </div>
</template>
<script>
import Vue from 'vue';
import { DialogUtility } from '@syncfusion/ej2-popups';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(ButtonPlugin);
Vue.use(DialogUtility);
export default {
  data: function() {
    return { }
  },
  methods: {
    dialogBtnClick: function() {
      DialogUtility.alert('This is an Alert Dialog!');
    }
  }
}
</script>
<style>
@import "../..../node_modules/@syncfusion/ej2-vue-
popups/styles/material.css";
#app {
  color: #008cff;
}
```

```

        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
</style>

```

{% previewsample "page.domainurl/code-snippet/dialog/dialog-utility-alert-cs2" %}

*Render an alert dialog with options*

### **APP.VUE**

```

<template>
  <div>
    <center><ejs-button ref='button' id="dialogbtn" cssClass="e-info" v-
on:click.native="dialogBtnClick">Open Alert Dialog</ejs-button></center>
  </div>
</template>
<script>
import Vue from 'vue';
import { DialogUtility } from '@syncfusion/ej2-popups';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(ButtonPlugin);
Vue.use(DialogUtility);
export default {
  data: function() {
    return { }
  },
  methods: {
    dialogBtnClick: function() {
      DialogUtility.alert({
        title: 'Alert Dialog',
        content: "This is an Alert Dialog!",
        okButton: { text: 'OK', click: this.okClick },
        showCloseIcon: true,
        closeOnEscape: true,
        animationSettings: { effect: 'Zoom' }
      });
    },
    okClick: function() {
      alert('you clicked OK button');
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
popups/styles/material.css";
  #app {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
  }

```

```
}
</style>
```

{% previewsample "page.domainurl/code-snippet/dialog/dialog-utility-alert1-cs2" %}

### Confirm dialog

A confirm dialog displays a specified message along with 'OK' and 'Cancel' button.

#### APP.VUE

```
<template>
  <div>
    <center><ejs-button ref='button' id="dialogbtn" cssClass="e-info" v-
on:click.native="dialogBtnClick">Open Confirm Dialog</ejs-button></center>
  </div>
</template>
<script>
import Vue from 'vue';
import { DialogUtility } from '@syncfusion/ej2-popups';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(ButtonPlugin);
Vue.use(DialogUtility);
export default {
  data: function() {
    return { }
  },
  methods: {
    dialogBtnClick: function() {
      DialogUtility.confirm('This is a Confirmation Dialog!');
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-vue-
popups/styles/material.css";
#app {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/dialog/dialog-utility-confirm-cs2" %}

### Render a confirmation dialog with options

#### APP.VUE

```
<template>
  <div>
    <center><ejs-button ref='button' id="dialogbtn" cssClass="e-info" v-
on:click.native="dialogBtnClick">Open Confirm Dialog</ejs-button></center>
  </div>
```

```

</template>
<script>
import Vue from 'vue';
import { DialogUtility } from '@syncfusion/ej2-popups';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(ButtonPlugin);
Vue.use(DialogUtility);
export default {
  data: function() {
    return { }
  },
  methods: {
    dialogBtnClick: function() {
      // Initialize and render Confirm dialog with options
      DialogUtility.confirm({
        title: ' Confirmation Dialog',
        content: "This is a Confirmation Dialog!",
        okButton: { text: 'OK', click: this.okClick },
        cancelButton: { text: 'Cancel', click: this.cancelClick },
        showCloseIcon: true,
        closeOnEscape: true,
        animationSettings: { effect: 'Zoom' }
      });
    },
    okClick: function() {
      alert('you clicked OK button');
    },
    cancelClick: function() {
      alert('you clicked Cancel button');
    }
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  #app {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/dialog/dialog-utility-confirm1-cs2" %}

### Close utility dialog

When rendering an Alert and Confirmation dialog through utility methods, You can close the dialog using the following ways.

- By pressing the escape key if the [closeOnEscape](#) property is enabled.
- By clicking the close button if the [showCloseIcon](#) property is enabled.

You can also manually close the Dialogs by creating an instance to the dialog and call the [hide](#) method.

Below sample demonstrates the different ways of hiding the utility dialog.

#### APP.VUE

```
<template>
  <div>
    <center><ejs-button ref='button' id="dialogbtn" cssClass="e-info" v-
on:click.native="dialogBtnClick">Open Confirm Dialog</ejs-button></center>
  </div>
</template>
<script>
import Vue from 'vue';
import { DialogUtility } from '@syncfusion/ej2-popups';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(ButtonPlugin);
Vue.use(DialogUtility);
let DialogObj = undefined;
export default {
  data: function() {
    return { }
  },
  methods: {
    dialogBtnClick: function() {
      // Initialize and render Confirm dialog with options
      DialogObj = DialogUtility.confirm({
        title: 'Confirmation Dialog',
        content: "This is a Confirmation Dialog!",
        okButton: { text: 'OK', click: this.okClick },
        cancelButton: { text: 'Cancel', click: this.cancelClick },
        showCloseIcon: true,
        closeOnEscape: true,
        animationSettings: { effect: 'Zoom' }
      });
    },
    okClick: function() {
      alert('you clicked OK button');
    },
    cancelClick: function() {
      //Hide the dialog
      DialogObj.hide();
    }
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
popups/styles/material.css";
  #app {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
  }
</style>
```

```
</style>
```

```
{% previewsample "page.domainurl/code-snippet/dialog/dialog-utility-confirm1-cs3" %}
```

### Style in Vue Dialog component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the dialog header

Use the following CSS to customize the dialog header properties.

```
`css
.e-dialog .e-dlg-header {
color: green;
font-size: 20px;
font-weight: normal;
}
`
```

#### Customizing the dialog content

Use the following CSS to customize the dialog content properties.

```
`css
.e-dialog .e-dlg-content {
color: red;
font-size: 10px;
font-weight: normal;
line-height: normal;
}
`
```

#### Customizing modal dialog overlay

Use the following CSS to customize the modal dialog overlay.

```
`css
.e-dlg-overlay {
background-color: slategray;
opacity: 0.6;
}
`
```

#### Customizing the dialog resize icon

Use the following CSS to customize the dialog resize icon.

```
`css
/ To change the icon content /
.e-dialog .e-south-east::before, .e-dialog .e-south-west::before {
content: '\f047';
}
/ To set the icon pack /
.e-dialog .e-resize-handle {
font: normal normal normal 14px/1 FontAwesome;
}
`
```

The above CSS demonstration uses the font awesome icon.

#### Customizing the dialog close button

Use the following CSS to customize the dialog close button.

```
`css
/ To specify font size and color /
.e-dialog .e-btn .e-btn-icon.e-icon-dlg-close {
font-size: 12px;
color: red;
}
`
```

#### Customizing the dialog footer button

Use the following CSS to customize the dialog footer button.

```
`css
/ To specify font color, background color and border color /
.e-btn.e-flat.e-primary, .e-css.e-btn.e-flat.e-primary {
background-color: transparent;
border-color: transparent;
color: blue;
}
`
```

### Localization in Vue Dialog component

**Localization** library allows to localize the default text content of Dialog. In Dialog, The close button's tooltip text alone will be localize based on culture.

| Locale key | en-US (default) |

|-----|-----|

| close | Close |

### Loading translations

To load translation object in an application use `load` function of `L10n` class.

In the below sample, `French` culture is set to Dialog and change the close button's tooltip text.

### APP.VUE

```
<template>
  <div>
    <div id="target" class="control-section; position:relative"
style="height:350px;">
      <!-- Render Button to open the Dialog -->
      <ejs-button id='modalbtn' v-on:click.native="btnClick">Open</ejs-
button>
      <!-- Render Dialog -->
      <ejs-dialog ref="localeDialog" :header='header' :target='target'
:width='width' :locale='locale' :showCloseIcon='true'
:animationSettings='animationSettings' :content='content' :open="dlgOpen"
:close="dlgClose">
        </ejs-dialog>
      </div>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { DialogPlugin } from '@syncfusion/ej2-vue-popups';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { L10n } from '@syncfusion/ej2-base';
Vue.use(DialogPlugin);
Vue.use(ButtonPlugin);
L10n.load({
  'fr-BE': {
    'dialog': {
      'close': "Fermer"
    }
  }
});
export default {
  data: function() {
    return {
      target: '#target',
      width: '335px',
      header: 'Dialogue',
      content: 'Dialogue avec la culture française.',
      animationSettings: { effect: 'None' },
      locale: 'fr-BE'
    }
  },
  mounted: function(){
    document.getElementById('modalbtn').focus();
  },
  methods: {
    btnClick: function() {
      this.$refs.localeDialog.show();
    }
  }
}
```

```

    },
    dlgClose: function() {
      document.getElementById('modalbtn').style.display = '';
    },
    dlgOpen: function() {
      document.getElementById('modalbtn').style.display = 'none';
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
#app {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
.control-section {
  height: 100%;
  min-height: 200px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/dialog/locale-cs1" %}

### Accessibility in Vue Dialog component

The Dialog component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Dialog component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) |  |

| [Section 508 Support](#) |  |

| [Screen Reader Support](#) |  |

| [Right-To-Left Support](#) |  |

| [Color Contrast](#) |  |

| [Mobile Device Support](#) |  |

```
| Keyboard Navigation Support |  |  
| Accessibility Checker Validation |  |  
| Axe-core Accessibility Validation |  |  
<style>  
.post .post-content img {  
display: inline-block;  
margin: 0.5em 0;  
}  
</style>  
<div> - All  
features of the component meet the requirement.</div>  
<div> - Some features of the component do not meet the requirement.</div>  
<div> - The  
component does not meet the requirement.</div>
```

### WAI-ARIA attributes

The Dialog characterized with complete ARIA Accessibility support which helps to accessible by on-screen readers and other assistive technology devices. This component designed with the reference of the guidelines document given in [WAI ARAI Accessibility Practices](#).

The Dialog component uses the **Dialog** role and following ARIA properties to its element based on its state.

### | Property | Functionalities |

| --- | --- |

| aria-describedby | It indicates the Dialog content description is notified to the user through assistive technologies. |

| aria-labelledby | The Dialog title is notified to the user through assistive technologies. |

| aria-modal | For modal dialog it's value is true and non-modal dialog its value is false |

| aria-grabbed | Enable the draggable Dialog and starts dragging it is value is true and stopping the drag its value is false |

### Keyboard interaction

Keyboard interaction of Dialog component has designed based on [WAI-ARIA Practices](#) described for Dialog. User can use the following shortcut keys to interact with the Dialog.

<!-- markdownlint-disable MD033 -->

Keyboard shortcuts	Actions
--------------------	---------

Esc	Closes the Dialog. This functionality can be controlled by using <a href="#">closeOnEscape</a>
Enter	When the Dialog button or any input (except text area) is in focus state, when pressing the Enter key, the click event associated with the primary button or button will trigger. Enter key is not working when the Dialog content contains any text area with initial focus
Ctrl + Enter	When the Dialog content contains text area and it is in focus state, and press the Ctrl + Enter key to call the click event function associated with primary button
Tab	Focus will be changed within the Dialog elements
Shift + Tab	The Focus will be changed previous focusable element within the Dialog elements. When focusing a first focusable element in the Dialog, then press the shift + tab key, it will change the focus to last focusable element

**APP.VUE**

## How To

Create nested dialog in Vue Dialog component

A Dialog can be nested within another Dialog. The below sample contains parent and child Dialog (inner Dialog).

### Step 1:

Create two div elements with id `#dialog` and `#innerDialog`.

### Step 2:

Initialize the Dialog as mentioned in the below sample.

### Step 3:

Set the inner Dialog target as `#dialog`.

### APP.VUE

```
<template>
  <div>
    <div id="target" class="col-lg-12 control-section"
      style="padding:10px;position:relative;">
      <ejs-button id='dlgbtn' v-on:click.native="buttonClick">Open
      Dialog</ejs-button>
      <ejs-dialog ref='dialogObj' :visible="true" header='First Dialog'
      showCloseIcon='true' :animationSettings='animationSettings' width='330px'
      height='260px'
        target='#target' content='<p>This is the first dialog and acts
as a parent dialog, you can open the second (child) dialog by clicking
"Next".</p>' :buttons='dlgButton' :open='dialogOpen' :close='dialogClose'>
        </ejs-dialog>
      <ejs-dialog ref='secondDialog' :visible="false" header='Second
      Dialog' :isModal='isModal' showCloseIcon='true' allowDragging='true'
      :animationSettings='animationSettings' width='285px' height='215px'
        target='#target' content='<p>This is the second dialog and act
as a child dialog.</p>' :buttons='dlg2Button'>

### Position the dialog on center of the page on scrolling in Vue Dialog component

By default, when scroll the page/container Dialog also scrolled along with the page/container. When a user expects to display the Dialog in the same position without scrolling achieving this in sample level as like below. Here added **e-fixed** class to Dialog element and prevent the scrolling.

#### APP.VUE

```

<template>
  <div>
    <div id="target" class="control-section; position:relative">
      <div>
        <b>JavaScript:</b><br />
        JavaScript is a high-level, dynamic, untyped, and interpreted
        programming language. It has been standardized in the ECMAScript
        language specification. Alongside HTML and CSS, it is one of the
        three essential technologies of World Wide Web
      </div>
    </div>
  </div>
</template>

```

content production; the majority of websites employ it and it **is** supported by all modern Web browsers without plug-ins. JavaScript **is** prototype-based with first-class **functions**, making it a multi-paradigm language, supporting **object** - oriented , imperative, and functional programming styles.

```
<br /><br /><br />
```

```
<b>MVC:</b><br />
```

Model-view-controller (MVC) **is** a software architecture pattern which separates the representation of information **from** the user's interaction with it. The model consists of application data, business rules, logic, and functions. A view can be any output representation of data, such **as** a chart or a diagram. Multiple views of the same data are possible, such **as** a bar chart **for** management and a tabular view **for** accountants. The controller mediates input, converting it to commands **for** the model or view. The central ideas behind MVC are code reusability and **in** addition to dividing the application **into** three kinds of components, the MVC design defines the interactions between them.

A controller can send commands to its associated view to change the view's presentation of the model (e.g., by scrolling through a document). It can also send commands to the model to update the model's state (e.g., editing a document).

A model notifies its associated views and controllers when there has been a change **in** its state. This notification allows the views to produce updated output, and the controllers to change the available **set** of commands. A passive implementation of MVC omits these notifications, because the application does not require them or the software platform does not support them.

A view requests **from** the model the information that it needs to generate an output representation to the user.

### Load dialog content using ajax in Vue Dialog component

You can load dialog's content dynamically from external source like external file using AJAX library. The AJAX library can make the request and load dialog's content using its `success` event. Refer the following link to learn about how to load dialog content using AJAX.

#### [AJAX Content](#)

### Render a dialog without header in Vue Dialog component

The dialog can be rendered without header by setting the [header](#) property value as empty string or null. By default, dialog is rendered without header.

#### APP.VUE

```
<template>
  <div>
    <div id="target" class="control-section; position:relative"
    style="height:350px;">
      <!-- Render Button to open the Dialog -->
      <ejs-button id='dlgbtn' v-on:click.native="btnClick">Open
Dialog</ejs-button>
      <!-- Render Dialog -->
      <ejs-dialog ref="footerDialog" :target='target' :width='width'
:buttons='buttons' :content='content' :close="dlgClose">
      </ejs-dialog>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DialogPlugin } from '@syncfusion/ej2-vue-popups';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(DialogPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return {
      target: "#target",
      width: '250px',
      content: 'This is a dialog without header.',

### Display a dialog with custom position in Vue Dialog component

By default, the dialog is displayed in the center of the target container. The dialog position can be set using the [position](#) property by providing custom X and Y coordinates.

The dialog can be positioned inside the target based on the given X and Y values.

#### APP.VUE

```

<template>
  <div>
    <div id="target" class="control-section">
      <ejs-dialog id='firstDialog' header='Position-01'
        :position='position' width='360px' ref='dialogObj'
        target='#target' :content='content' :closeOnEscape='false'>
      </ejs-dialog>
      <ejs-dialog ref="secondDialog" header='Position-02'
        :height='height1' :target='target' width='360px' :position='position1'
        :content='content1'>
      </ejs-dialog>
    </div>
  </div>
</template>

```

```

    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DialogPlugin } from '@syncfusion/ej2-vue-popups';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(DialogPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return {
      target: "#target",
      height: '120px',
      content: 'The dialog is positioned at {X: 160, Y: 14}
coordinates.',
      position: { X: 420, Y: 14 },
      height1: '120px',
      content1: 'The dialog is positioned at {X: 160, Y: 240}
coordinates',
      position1: { X: 420, Y: 240 }
    }
  },
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
#app {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
.control-section {
  height: 100%;
  min-height: 200px;
}
#defaultDialog table,
#defaultDialog th,
#defaultDialog td {
  border: 1px solid #D8D8D8;
  border-collapse: collapse;

### Prevent the focus on the first element in Vue Dialog component

By default, the dialog focuses on the first elements of the content area which can be active and focusable. You can prevent this default focusing behavior using the [open](#) event and by enabling the `preventFocus` argument.

Bind the open event and enable the `preventFocus` argument within an event like the below sample.

#### APP.VUE

```

<template>
  <div>
    <div id="dialogTarget" class="control-section; position:relative"
      style="height:300px;">

```

```

        <!-- Render Button to open the Dialog -->
        <ejs-button id='dlgbtn' v-on:click.native="dialogBtnClick">Open
Dialog</ejs-button>
        <!-- Render Dialog -->
        <ejs-dialog id="dialog" ref="Dialog" :header='header'
:target='target' :width='width' :buttons='buttons' :open="onOpen">
            <div class='form-group'><label for='email'>Email:</label>
                <input type='email' class='form-control' id='email'>
            </div>
            <div class='form-group'>
                <label for='comment'>Password:</label>
                <input type='password' class='form-control' id='password'>
            </div>
        </ejs-dialog>
    </div>
</div>
</template>
<script>

[Read all the values from dialog on button click in Vue Dialog component](#)

You can read the dialog element values by binding the action handler to the footer buttons. The buttons property provides the options to bind events to the action buttons. For detailed information about buttons, refer to the [footer](#) section.

In the below sample, value of input elements within the dialog has been checked in the footer button click event and send the values as the content of confirmation dialog.

### Customize the dialog appearance in Vue Dialog component

You can customize the dialog appearance by providing dialog template as string or HTML element to the [content](#) property. In the following sample, dialog is customized as error window appearance.

#### APP.VUE

```

<template>
  <div>
    <div id="dialogTarget" class="control-section; position:relative"
style="height:300px;">
      <center><ejs-button ref='button' id="dialogbtn" cssClass="e-info" v-
on:click.native="dialogBtnClick">Open</ejs-button></center>
      <ejs-dialog id="dialog" ref="Dialog" :header='header'
:showCloseIcon='showCloseIcon' :target='target' :width='width'
:buttons='buttons' :animationSettings='animationSettings' :visible='visible'
:content='content'>
        </ejs-dialog>
      </div>
    </div>
  </template>
<script>
import Vue from 'vue';
import { DialogPlugin } from '@syncfusion/ej2-vue-popups';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(DialogPlugin);

```

```

Vue.use(ButtonPlugin);
export default {
  data: function() {
    return {
      header: 'File and Folder Rename',
      content: "<div class = 'dialog-content'><div class='msg-wrapper col-lg-12'><span class='e-icons close-icon col-lg-2'></span>" +
        "<span class='error-msg col-lg-10'>Can not rename 'pictures' because a file or folder with that name already exists </span>" +
        "</div><div class='error-detail col-lg-8'><span>Specify a different name</span> </div></div>",
      showCloseIcon: true,
      visible: false,
      buttons: [{
        buttonModel: { isPrimary: true, content: 'close' }, click:
function() {
          this.hide();
        }
      }],
      target: document.querySelector('body'),
      width: '400px',
      animationSettings: { effect: 'Zoom' }
    }
  },
  methods: {
    dialogBtnClick: function() {
      this.$refs.Dialog.show();
    }
  }
}
</script>
<style>
@import "../../../node_modules/@syncfusion/ej2-vue-popups/styles/bootstrap.css";
@import

    }
    .close-icon:before {
        content: '\e7e9';
        font-size: 26px;
        color: #d9534f;
        position: relative;
        left: 5px;
    }
    .e-dialog .e-footer-content {
        background-color: #f8f8f8;
    }
    .e-dialog, .e-dialog .e-dlg-header-content {
        background-color: #d9edf7;
    }
    .e-dialog {
        padding: 3px;
    }
    .e-dialog .e-dlg-header-content {
        padding: 10px;
    }
    .e-dialog .e-footer-content {
        padding: 8px 12px;
    }
    .e-dialog .e-dlg-content {
        padding: 15px 0px 0px;
    }
</style>

```

{% previewsample "page.domainurl/code-snippet/dialog/custom-dialog-cs1" %}

### Close dialog while click on outside of dialog in Vue Dialog component

By default, dialog can be closed by pressing Esc key and clicking the close icon on the right of dialog header. It can also be closed by clicking outside of the dialog using hide method.

Set the [CloseOnEscape](#) property value to false to prevent closing of the dialog when pressing Esc key.

In the following sample, dialog is closed when clicking outside the dialog area using [hide](#) method.

### APP.VUE

```

<template>
  <div>
    <div id="dialogTarget" class="control-section; position:relative" v-
on:click.self="btnClick" style="height:350px;">
      <center><ejs-button ref='button' id="dialogbtn" cssClass="e-info" v-
on:click.native="dialogBtnClick">Open</ejs-button></center>

```

```

    <ejs-dialog id="dialog" ref="Dialog" :header='header'
:showCloseIcon='showCloseIcon' :target='target' :width='width'
:buttons='buttons' :animationSettings='animationSettings' :visible='visible'
:content='content' :closeOnEscape='closeOnEscape'>
    </ejs-dialog>
  </div>
</div>
</template>
<script>
import Vue from 'vue';
import { DialogPlugin } from '@syncfusion/ej2-vue-popups';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(DialogPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return {
      header: 'Delete Multiple Items',
      content: "Are you sure you want to permanently delete all of
these items?",
      showCloseIcon: true,
      visible: false,
      buttons: [{ buttonModel: { isPrimary: true, content: 'Yes' },
click: this.btnClick }, { buttonModel: { content: 'No' }, click:
this.btnClick }],
      target: document.body,
      height: 'auto',
      width: '300px',
      animationSettings: { effect: 'Zoom' },
      closeOnEscape: true
    }
  },
  methods: {
    dialogBtnClick: function() {
      this.$refs.Dialog.show();
    },
    btnClick: function() {
      this.$refs.Dialog.hide();
    }
  }
}
</script>
<style>

### Add an icons to dialog buttons in Vue Dialog component

You can add icons to the dialog buttons using the [buttons](#) property or [footerTemplate](#) property . For detailed information about dialog buttons, refer to the [documentation](#) section.

In the following sample, dialog footer buttons are customized with icons using `buttons` property.

#### APP.VUE

```
<template>
  <div>
    <div id="target">
      <center><ejs-button ref='button' id="dialogbtn" cssClass="e-info" v-
on:click.native="dialogBtnClick">Open</ejs-button></center>
      <ejs-dialog id="dialog" ref="Dialog" :header='header'
:showCloseIcon='showCloseIcon' :target='target' :width='width'
:buttons='buttons' :animationSettings='animationSettings' :visible='visible'
:content='content' :closeOnEscape='closeOnEscape'>
        </ejs-dialog>
      </div>
    </div>
  </template>
<script>
import Vue from 'vue';
import { DialogPlugin } from '@syncfusion/ej2-vue-popups';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(DialogPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return {
      header: 'Delete Multiple Items',
      content: "Are you sure you want to permanently delete all of
these items?",
      showCloseIcon: true,
      visible: false,
      buttons: [{ buttonModel: { isPrimary: true, content: 'Yes',
iconCss: 'e-icons e-ok-icon' }, click: this.btnClick }, { buttonModel: {
content: 'No', iconCss: 'e-icons e-close-icon' }, click: this.btnClick }],
      target: document.body,
      height: 'auto',
      width: '300px',
      animationSettings: { effect: 'Zoom' },
      closeOnEscape: true
    }
  },
  methods: {
    dialogBtnClick: function() {
      this.$refs.Dialog.show();
    },
    btnClick: function() {
      this.$refs.Dialog.hide();
    }
  }
}
</script>
<style>
@import "../../../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
```

```
#app {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
#target {
  height: 100%;
  min-height: 350px;
}
.e-ok-icon::before {
  content: '\e7ff';
}
.e-close-icon::before {
  content: '\e825';
}
</style>
```

{% previewsample "page.domainurl/code-snippet/dialog/template-buttons-cs1" %}

In the following sample, dialog footer buttons are customized with icons using `footerTemplate` property.

### APP.VUE

```
<template>
  <div>
    <div id="target">
      <center><ejs-button ref='button' id="dialogbtn" cssClass="e-info" v-
on:click.native="dialogBtnClick">Open</ejs-button></center>
      <ejs-dialog id="dialog" ref="Dialog" :header='header'
:showCloseIcon='showCloseIcon' :target='target' :width='width'
:animationSettings='animationSettings' :footerTemplate='footer'
:visible='visible' :content='content' :closeOnEscape='closeOnEscape'>
        </ejs-dialog>
      </div>
    </div>
  </div>
</template>
<script>

### Add a minimize maximize buttons in Vue Dialog component

Vue Dialog allows end users to either minimize or maximize the Dialog component. You can add minimize and maximize custom buttons near the close icon in the Dialog header using the

[headerTemplate](#) property and handle the actions in the button click events, as shown in the following sample.

#### APP.VUE

```
<template>
  <div>
    <div id="target">
      <center><ejs-button ref='button' id="dialogbtn" cssClass="e-info" v-
on:click.native="dialogBtnClick">Open</ejs-button></center>
      <ejs-dialog id="dialog" ref="Dialog" :header='headerTemplate'
:showCloseIcon='showCloseIcon' :target='target' :width='width'
:buttons='buttons' :animationSettings='animationSettings' :visible='visible'
:content='content' :closeOnEscape='closeOnEscape' :created="created">
        </ejs-dialog>
      </div>
    </div>
  </template>
<script>
import Vue from 'vue';
import { DialogPlugin } from '@syncfusion/ej2-vue-popups';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(DialogPlugin);
Vue.use(ButtonPlugin);
var headerTemplateVue = Vue.component("demo1", {
  template: '<span><span class="title">Dialog</span><span class="e-icons
sf-icon-Maximize" id="max-btn" title="Maximize" ></span><span class="e-icons
sf-icon-Minimize" id="min-btn" title="Minimize"></span></span>',
  data() {
    return {
      data: {}
    };
  }
});
var isFullScreen;
var dialogOldPosition;
export default {
  data: function() {
    return {
      headerTemplate: function () {
        return { template: headerTemplateVue }
      },
      content: "This is a dialog with minimize and maximize buttons",
      showCloseIcon: true,
      visible: false,
      buttons: [{ buttonModel: { isPrimary: true, content: 'Yes',
iconCss: 'e-icons e-ok-icon' }, click: this.btnClick }, { buttonModel: {
content: 'No', iconCss: 'e-icons e-close-icon' }, click: this.btnClick }],
      target: document.body,
      height: 'auto',
      width: '300px',
      animationSettings: { effect: 'Zoom' },
      closeOnEscape: true,
    }
  },
  methods: {
    created: function () {
```

```

        document.getElementById("min-btn").addEventListener("click",
this.minimize);
        document.getElementById("max-btn").addEventListener("click",
this.maximize);
    },
    dialogBtnClick: function() {
        this.$refs.Dialog.show();
    },

### Setting max height to the dialog in Vue Dialog component

By default, the maxHeight for the Dialog is calculated based on the target. If the target is not specified externally, the Dialog consider the body as target and will calculate the maxHeight based on it. We have an option to set the maxHeight of the Dialog in the [beforeOpen](#) event.

#### APP.VUE

```

<template>
  <div>
    <div id="target" class="control-section; position:relative"
    style="height:360px;">
      <!-- Render Button to open the Dialog -->
      <ejs-button id='dlgbtn' v-on:click.native="btnClick">Open
Dialog</ejs-button>
      <!-- Render Dialog -->
      <ejs-dialog ref="footerDialog" :header='header' :target='target'
:width='width' :buttons='buttons' :visible='visible'
:showCloseIcon='showCloseIcon' :content='content' :close="dlgClose"
:beforeOpen='onBeforeOpen'>
      </ejs-dialog>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DialogPlugin } from '@syncfusion/ej2-vue-popups';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(DialogPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return {

## DocumentEditor

### Overview

The Document Editor component is used to create, edit, view, and print Word documents in web applications. All the user interactions and editing operations that run purely in the client-side provides much faster editing experience to the users.

### Key Features

- [Opens](#) the native Syncfusion Document Text (\*.sfdt) format documents in the client-side.
- [Saves the documents](#) in the client-side as Syncfusion Document Text (.sfdt) and Word document (.docx).
- Supports document elements like text, [image](#), [table](#), fields, [bookmark](#), [shapes](#), [section](#), [header](#) and [footer](#).

- Supports the commonly used fields like [hyperlink](#), page number, page count, and table of contents.
- Supports formats like [text](#), [paragraph](#), [bullets and numbering](#), [table](#), [page settings](#), etc.
- Provides support to create, edit, and apply [paragraph and character styles](#).
- Provides support to [find and replace](#) text within the document.
- Supports all the common editing and formatting operations along with [undo and redo](#).
- Provides support to [cut](#), [copy](#), and [paste](#) rich text contents within the component. Also allows pasting simple text to and from other applications.
- Provides support to insert, and edit [form fields](#).
- Provides support to insert, and edit [comments](#).
- Provides support to perform [spell checking](#) for any input text
- Allows user interactions like [zoom](#), [scroll](#), select contents through touch, mouse, and keyboard.
- Provides intuitive UI options like context menu, [dialogs](#), and [navigation pane](#).
- [Localizes](#) all the static text to any desired language.
- Allows to create a lightweight Word viewer using module injection to view and [prints](#) Word documents.
- Provides a [server-side helper library](#) to open the Word documents like DOCX, DOC, WordML, RTF, and Text, by converting it to SFDT file format.

### Supported Web platforms

- [Javascript\(ES5\)](#)
- [Javascript](#)
- [Angular](#)
- [React](#)
- [Vue](#)
- [ASP.NET Core](#)
- [ASP.NET MVC](#)
- [Blazor](#)

### *Supported platforms for server-side dependencies*

You can deploy web APIs for server-side dependencies of Document Editor component in the following platforms.

- [ASP.NET Core](#)
- [ASP.NET MVC](#)
- [Java](#)

To know more about server-side dependencies, refer this [page](#).

### Which operations require server-side interaction

- Open file formats other than SFDT
- Paste with formatting
- Restrict editing
- Spellcheck
- Save as file formats other than SFDT and DOCX

Note: If you don't require the above functionalities then you can deploy as pure client-side component without any server-side interactions.

### Getting Started with the Vue DocumentEditor Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLI](#) and integrating the Syncfusion Vue Document Editor component

#### Prerequisites

##### [System requirements for Syncfusion Vue UI components](#)

#### Dependencies

The list of dependencies required to use the Document Editor component in your application is given below:

```
`javascript
|-- @syncfusion/ej2-vue-documenteditor
|-- @syncfusion/ej2-vue-base
|-- @syncfusion/ej2-documenteditor
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-compression
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-dropdowns
|-- @syncfusion/ej2-file-utils
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-splitbuttons
|-- @syncfusion/ej2-charts
`
```

#### *Server side dependencies*

The Document Editor component requires server-side interactions for the following operations:

- [Open file formats other than SFDT](#)
- [Paste with formatting](#)
- [Restrict editing](#)
- [Spellcheck](#)
- [Save as file formats other than SFDT and DOCX](#)

Note: If you don't require the above functionalities then you can deploy as pure client-side component without any server-side interactions.

To know about server-side dependencies, please refer this [page](#).

### Setting up the Vue 2 project

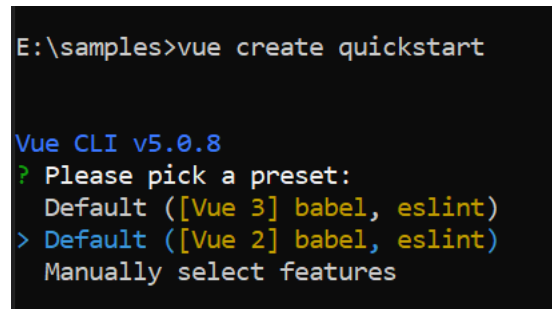

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```
`bash
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
`
```

or

```
`bash
yarn global add @vue/cli
vue create quickstart
cd quickstart
yarn run serve
`
```

When creating a new project, choose the option `Default ([Vue 2] babel, eslint)` from the menu.

```
E:\samples>vue create quickstart

Vue CLI v5.0.8
? Please pick a preset:
  Default ([Vue 3] babel, eslint)
> Default ([Vue 2] babel, eslint)
  Manually select features
```

Once the `quickstart` project is set up with default settings, proceed to add Syncfusion components to the project.

### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.npmjs.com). To use Vue components, install the required npm package.

This article uses the [Vue Document editor component](#) as an example. Install the `@syncfusion/ej2-vue-documenteditor` package by running the following command:

```
`bash
npm install @syncfusion/ej2-vue-documenteditor --save
`
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-documenteditor
```

,

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the **Material** theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Document Editor component and its dependents were imported into the `<style>` section of **src/App.vue** file.

,

```
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
```

,

Document editor has different themes, please refer to [Supported themes](#) section.

### Add Syncfusion Vue component

You can add **DocumentEditorContainer** component with predefined toolbar and properties pane options or **DocumentEditor** component with customize options.

Starting from **v19.3.0.x**, we have optimized the accuracy of text size measurements such as to match Microsoft Word pagination for most Word documents. This improvement is included as default behavior along with an optional API [to disable it and retain the document pagination behavior of older versions](#).

### DocumentEditor Component

Document Editor Component is used to create, view and edit word documents. In this, you can customize the UI options based on your requirements to modify the document.

### Registering DocumentEditor Component

You can register the Document Editor component in your application by using the **Vue.use()**.

Refer to the code example given below.

```
`ts
```

```
import { DocumentEditorPlugin } from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorPlugin);
,
```

Registering `DocumentEditorPlugin` in vue, will register the Document Editor component along with its required child directives globally.

#### Adding DocumentEditor Component

Add the Vue Document Editor by using `<ejs-documenteditor>` selector in `<template>` section of the `App.vue` file.

```
,
<template>
<div id="app">
<ejs-documenteditor :serviceUrl='serviceUrl' :isReadOnly='false' :enablePrint='true'
:enableSfdtExport='true' :enableSelection='true' :enableContextMenu='true' :enableSearch='true'
:enableOptionsPane='true' :enableWordExport='true' :enableTextExport='true' :enableEditor='true'
:enableImageResizer='true' :enableEditorHistory='true' :enableHyperlinkDialog='true'
:enableTableDialog='true' :enableBookmarkDialog='true' :enableTableOfContentsDialog='true'
:enablePageSetupDialog='true' :enableStyleDialog='true' :enableListDialog='true'
:enableParagraphDialog='true' :enableFontDialog='true' :enableTablePropertiesDialog='true'
:enableBordersAndShadingDialog='true' :enableTableOptionsDialog='true' height="370px"> </ejs-
documenteditor>
</div>
</template>
<script>
import Vue from 'vue';
import { DocumentEditorPlugin, DocumentEditorComponent, Print, SfdtExport, WordExport, TextExport,
Selection, Search, Editor, ImageResizer, EditorHistory, ContextMenu, OptionsPane, HyperlinkDialog,
TableDialog, BookmarkDialog, TableOfContentsDialog, PageSetupDialog, StyleDialog, ListDialog,
ParagraphDialog, BulletsAndNumberingDialog, FontDialog, TablePropertiesDialog,
BordersAndShadingDialog, TableOptionsDialog, CellOptionsDialog, StylesDialog } from '@syncfusion/ej2-
vue-documenteditor';
Vue.use(DocumentEditorPlugin);
export default {
data () {
return {
serviceUrl:'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/'
},
provide: {
//Inject require modules.
```

DocumentEditor: [Print, SfdtExport, WordExport, TextExport, Selection, Search, Editor, ImageResizer, EditorHistory, ContextMenu, OptionsPane, HyperlinkDialog, TableDialog, BookmarkDialog, TableOfContentsDialog, PageSetupDialog, StyleDialog, ListDialog, ParagraphDialog, BulletsAndNumberingDialog, FontDialog, TablePropertiesDialog, BordersAndShadingDialog, TableOptionsDialog, CellOptionsDialog, StylesDialog]

```
}
}
}
</script>
```

The Document Editor requires server-side interactions for the following operations:

- \* Paste with formatting
- \* Restrict editing
- \* Spell check

Refer to this [link](#) to configure the web service and set the [serviceUrl](#).

Run the DocumentEditor application

The Vue Document Editor application is configured to compile and run the application in a browser. Use the following command to run the application.

```
`bash
npm run dev
```

Output will be displayed as follows.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-documenteditor id="container6" height="370px" style="width:
100%" :serviceUrl='serviceUrl' :isReadOnly='false' :enablePrint='true'
:enableSfdtExport='true' :enableSelection='true' :enableContextMenu='true'
:enableSearch='true' :enableOptionsPane='true' :enableWordExport='true'
:enableTextExport='true' :enableEditor='true' :enableImageResizer='true'
:enableEditorHistory='true' :enableHyperlinkDialog='true'
:enableTableDialog='true' :enableBookmarkDialog='true'
:enableTableOfContentsDialog='true' :enablePageSetupDialog='true'
:enableStyleDialog='true' :enableListDialog='true'
:enableParagraphDialog='true' :enableFontDialog='true'
:enableTablePropertiesDialog='true' :enableBordersAndShadingDialog='true'
:enableTableOptionsDialog='true'></ejs-documenteditor>
  </div>
</template>
<script>
```

```

import Vue from 'vue'
import { DocumentEditorPlugin, DocumentEditorComponent, Print,
SfdtExport, WordExport, TextExport, Selection, Search, Editor, ImageResizer,
EditorHistory, ContextMenu, OptionsPane, HyperlinkDialog, TableDialog,
BookmarkDialog, TableOfContentsDialog, PageSetupDialog, StyleDialog,
ListDialog, ParagraphDialog, BulletsAndNumberingDialog, FontDialog,
TablePropertiesDialog, BordersAndShadingDialog, TableOptionsDialog,
CellOptionsDialog, StylesDialog } from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorPlugin);
export default {
  data() {
    return {
      serviceUrl: 'https://ej2services.syncfusion.com/production/web-
services/api/documenteditor/'
    };
  },
  provide: {
    //Inject require modules.
    DocumentEditor: [Print, SfdtExport, WordExport, TextExport,
Selection, Search, Editor, ImageResizer, EditorHistory, ContextMenu,
OptionsPane, HyperlinkDialog, TableDialog, BookmarkDialog,
TableOfContentsDialog, PageSetupDialog, StyleDialog, ListDialog,
ParagraphDialog, BulletsAndNumberingDialog, FontDialog,
TablePropertiesDialog, BordersAndShadingDialog, TableOptionsDialog,
CellOptionsDialog, StylesDialog]
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/document-editor/getting-started-cs2" %}

#### [DocumentEditorContainer Component](#)

DocumentEditorContainer Component is also used to create, view and edit word document. But here, you can use predefined toolbar and properties pane to view and modify word document.

#### [Registering DocumentEditorContainer Component](#)

You can register the DocumentEditorContainer component in your application by using the `Vue.use()`.

Refer to the code example given below.

`ts

```
import { DocumentEditorContainerPlugin } from '@syncfusion/ej2-vue-documenteditor';
```

```
Vue.use(DocumentEditorContainerPlugin);
```

,

Registering `DocumentEditorContainerPlugin` in vue, will register the DocumentEditorContainer component along with its required child directives globally.

### Adding DocumentEditorContainer Component

Add the Vue DocumentEditorContainer by using `<ejs-documenteditorcontainer>` selector in `<template>` section of the `App.vue` file.

```
,

<template>
<div id="app">
<ejs-documenteditorcontainer height="590px" :serviceUrl='serviceUrl' :enableToolbar='true'> </ejs-
documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';

import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent,Toolbar } from
'@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
data(){
return { serviceUrl:'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/' }
},
provide: {
//Inject require modules.
DocumentEditorContainer: [Toolbar]
}
}
</script>
,
```

### Run the DocumentEditorContainer application

The Vue DocumentEditorContainer application is configured to compile and run the application in a browser. Use the following command to run the application.

```
`bash
npm run dev
,
```

DocumentEditorContainer output will be displayed as follows.

### **APP.VUE**

```
<template>
```

```

<div id="app">
  <ejs-documenteditorcontainer ref='documenteditor'
:serviceUrl='serviceUrl' height="590px" id='container'
:enableToolbar='true'></ejs-documenteditorcontainer>
</div>
</template>
<script>
  import Vue from 'vue';
  import { DocumentEditorContainerPlugin,
DocumentEditorContainerComponent,Toolbar} from '@syncfusion/ej2-vue-
documenteditor';
  Vue.use(DocumentEditorContainerPlugin);
  export default {
    data() {
      return {
serviceUrl:'https://ej2services.syncfusion.com/production/web-
services/api/documenteditor/' };
    },
    provide: {
      //Inject require modules.
      DocumentEditorContainer: [Toolbar]
    }
  }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/document-editor/getting-started-cs3" %}

## Frequently Asked Questions

- [How to customize tool bar.](#)
- [How to resize Document editor component.](#)

## Getting Started with Syncfusion Document Editor Component in Vue 3

This section explains how to use Document Editor component in Vue 3 application.

### Prerequisites

#### [System requirements for Syncfusion Vue UI components](#)

#### Creating Vue application using Vue CLI

The easiest way to create a Vue application is to use the [Vue CLI](#). Vue CLI versions above [4.5.0](#) are mandatory for creating applications using Vue 3. Use the following command to uninstall older versions of the Vue CLI.

```
`bash
```

```
npm uninstall vue-cli -g
```

```
,
```

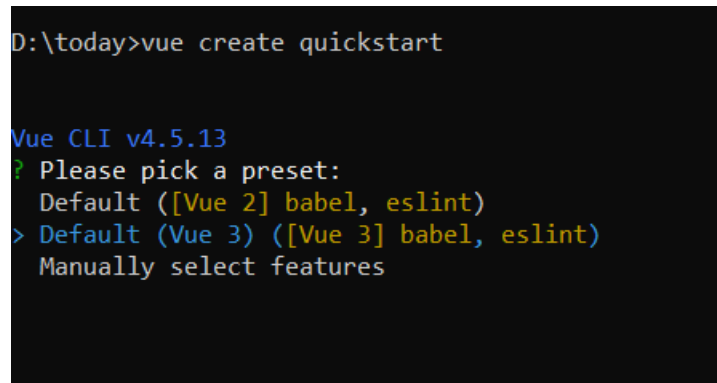

Use the following commands to install the latest version of Vue CLI.

```
`bash
npm install -g @vue/cli
npm install -g @vue/cli-init
`
```

Create a new project using the command below.

```
`bash
vue create quickstart
`
```

Initiating a new project prompts us to choose the type of project to be used for the current application. Select the option **Default (Vue 3)** from the menu.

```
D:\today>vue create quickstart

Vue CLI v4.5.13
? Please pick a preset:
  Default ([Vue 2] babel, eslint)
> Default (Vue 3) ([Vue 3] babel, eslint)
  Manually select features
```

### Adding Syncfusion DocumentEditor package in the application

Syncfusion Vue packages are maintained in the [npmjs.com](https://www.npmjs.com) registry.

The Document Editor component will be used in this example. To install it use the following command.

```
`bash
npm install @syncfusion/ej2-vue-documenteditor --save
`
```

The **--save** will instruct NPM to include the Document Editor package inside the **dependencies** section of the **package.json**.

### Adding CSS reference

Add Document editor component's styles as given below in **<style>** section of the **src/App.vue** file.

```
`
<style>

@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';

`
```

```

@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
`

```

Document editor has different themes, please refer to [supported themes](#) section.

### Adding Component

Starting from v19.3.0.x, we have optimized the accuracy of text size measurements such as to match Microsoft Word pagination for most Word documents. This improvement is included as default behavior along with an optional API [to disable it and retain the document pagination behavior of older versions](#).

#### Adding DocumentEditor component in the application

Document Editor Component is used to create, view and edit word documents. In this, you can customize the UI options based on your requirements to modify the document.

You have completed all the necessary configurations needed for rendering the Syncfusion Vue component. Now, you are going to add the Document Editor component using following steps.

**Step 1:** Import the Document Editor component in the `<script>` section of the `src/App.vue` file.

```

<script>

import { DocumentEditorComponent, Print, SfdtExport, WordExport, TextExport, Selection, Search,
Editor, ImageResizer, EditorHistory, ContextMenu, OptionsPane, HyperlinkDialog, TableDialog,
BookmarkDialog, TableOfContentsDialog, PageSetupDialog, StyleDialog, ListDialog, ParagraphDialog,
BulletsAndNumberingDialog, FontDialog, TablePropertiesDialog, BordersAndShadingDialog,
TableOptionsDialog, CellOptionsDialog, StylesDialog } from '@syncfusion/ej2-vue-documenteditor';

</script>
`

```

**Step 2:** Register the Document Editor Container component in your application.

```

`js
import { DocumentEditorComponent } from '@syncfusion/ej2-vue-documenteditor';

//Component registration
export default {
  name: "App",
  components: {
    'ejs-documenteditor' : DocumentEditorComponent

```

```

}
}
,

```

In the above code snippet, you have registered DocumentEditorContainer.

**Step 3:** Add the component definition in template section.

```

,

```

```

<template>

<ejs-documenteditor :serviceUrl='serviceUrl' :isReadOnly='false' :enablePrint='true'
:enableSfdtExport='true' :enableSelection='true' :enableContextMenu='true' :enableSearch='true'
:enableOptionsPane='true' :enableWordExport='true' :enableTextExport='true' :enableEditor='true'
:enableImageResizer='true' :enableEditorHistory='true' :enableHyperlinkDialog='true'
:enableTableDialog='true' :enableBookmarkDialog='true' :enableTableOfContentsDialog='true'
:enablePageSetupDialog='true' :enableStyleDialog='true' :enableListDialog='true'
:enableParagraphDialog='true' :enableFontDialog='true' :enableTablePropertiesDialog='true'
:enableBordersAndShadingDialog='true' :enableTableOptionsDialog='true'> </ejs-documenteditor>

</template>
,

```

**Step 4:** Declare the bound properties `serviceUrl` in the `script` section.

```

`js
data () {
return {
serviceUrl:'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/'
}
},
provide: {
DocumentEditor: [Print, SfdtExport, WordExport, TextExport, Selection, Search, Editor, ImageResizer,
EditorHistory, ContextMenu, OptionsPane, HyperlinkDialog, TableDialog, BookmarkDialog,
TableOfContentsDialog, PageSetupDialog, StyleDialog, ListDialog, ParagraphDialog,
BulletsAndNumberingDialog, FontDialog, TablePropertiesDialog, BordersAndShadingDialog,
TableOptionsDialog, CellOptionsDialog, StylesDialog]
}
,

```

**Step 5:** Summarizing the above steps, update the `src/App.vue` file with following code.

```

,

```

```

<template>

<ejs-documenteditor :serviceUrl='serviceUrl' :isReadOnly='false' :enablePrint='true'
:enableSfdtExport='true' :enableSelection='true' :enableContextMenu='true' :enableSearch='true'

```

```

:enableOptionsPane='true' :enableWordExport='true' :enableTextExport='true' :enableEditor='true'
:enableImageResizer='true' :enableEditorHistory='true' :enableHyperlinkDialog='true'
:enableTableDialog='true' :enableBookmarkDialog='true' :enableTableOfContentsDialog='true'
:enablePageSetupDialog='true' :enableStyleDialog='true' :enableListDialog='true'
:enableParagraphDialog='true' :enableFontDialog='true' :enableTablePropertiesDialog='true'
:enableBordersAndShadingDialog='true' :enableTableOptionsDialog='true'> </ejs-documenteditor>
</template>

<script>

import { DocumentEditorComponent, Print, SfdtExport, WordExport, TextExport, Selection, Search,
Editor, ImageResizer, EditorHistory, ContextMenu, OptionsPane, HyperlinkDialog, TableDialog,
BookmarkDialog, TableOfContentsDialog, PageSetupDialog, StyleDialog, ListDialog, ParagraphDialog,
BulletsAndNumberingDialog, FontDialog, TablePropertiesDialog, BordersAndShadingDialog,
TableOptionsDialog, CellOptionsDialog, StylesDialog } from '@syncfusion/ej2-vue-documenteditor';

//Component registration
export default {
name: 'App',
components: {
// Declaring component
'ejs-documenteditor' : DocumentEditorComponent
},
data () {
return {
serviceUrl:'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/'
};
},
provide: {
DocumentEditor: [Print, SfdtExport, WordExport, TextExport, Selection, Search, Editor, ImageResizer,
EditorHistory, ContextMenu, OptionsPane, HyperlinkDialog, TableDialog, BookmarkDialog,
TableOfContentsDialog, PageSetupDialog, StyleDialog, ListDialog, ParagraphDialog,
BulletsAndNumberingDialog, FontDialog, TablePropertiesDialog, BordersAndShadingDialog,
TableOptionsDialog, CellOptionsDialog, StylesDialog]
}
}
</script>

<style>

@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';

```

```
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
`
```

#### Running the DocumentEditor application

Run the application using the following command.

```
`bash
npm run serve
`
```

Web server will be initiated, Open the quick start app in the browser at port `localhost:8080`.

#### Adding DocumentEditorContainer component in the application

Document Editor Container Component is also used to create, view and edit word document. But here, you can use predefined toolbar and properties pane to view and modify word document.

You have completed all the necessary configurations needed for rendering the Syncfusion Vue component. Now, you are going to add the DocumentEditorContainer component using following steps.

**Step 1:** Import the DocumentEditorContainer component in the `<script>` section of the `src/App.vue` file.

```
<script>
import { DocumentEditorContainerComponent, Toolbar } from '@syncfusion/ej2-vue-documenteditor';
```

```
</script>
```

**Step 2:** Register the DocumentEditorContainer component in your application.

```
`js
import { DocumentEditorContainerComponent, Toolbar } from '@syncfusion/ej2-vue-documenteditor';
//Component registration
export default {
  name: "App",
  components: {
    'ejs-documenteditorcontainer' : DocumentEditorContainerComponent
  }
}
```

In the above code snippet, you have registered DocumentEditorContainer.

**Step 3:** Add the component definition in template section.

```
<template>
<ejs-documenteditorcontainer :serviceUrl='serviceUrl' :enableToolbar='true'> </ejs-
documenteditorcontainer>
</template>
```

**Step 4:** Declare the bound properties `serviceUrl` in the `script` section.

```
`js
data () {
  return {
    serviceUrl:'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/'
  };
},
provide: {
  DocumentEditorContainer: [Toolbar]
}
```

**Step 5:** Summarizing the above steps, update the `src/App.vue` file with following code.

```

,

<template>
<ejs-documenteditorcontainer :serviceUrl='serviceUrl' :enableToolbar='true'> </ejs-
documenteditorcontainer>
</template>
<script>
import { DocumentEditorContainerComponent, Toolbar } from '@syncfusion/ej2-vue-documenteditor';
//Component registration
export default {
name: 'App',
components: {
// Declaring component
'ejs-documenteditorcontainer' : DocumentEditorContainerComponent
},
data () {
return {
serviceUrl:'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/'
};
},
provide: {
DocumentEditorContainer: [Toolbar]
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';

```

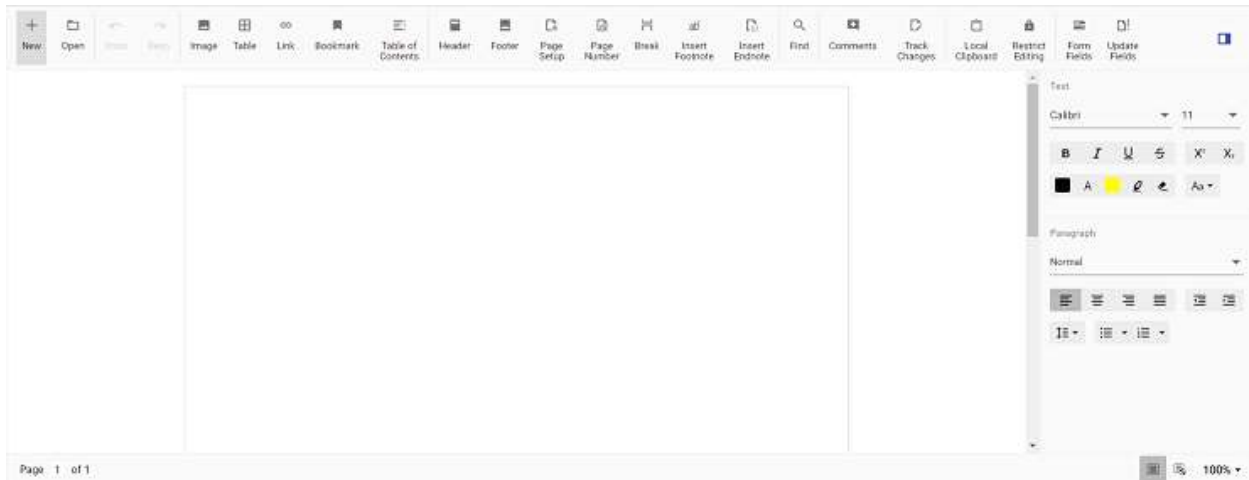

```
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
,
```

### Running the DocumentEditorContainer application

Run the application using the following command.

```
`bash
npm run serve
,
```

Web server will be initiated, Open the quick start app in the browser at port [localhost:8080](http://localhost:8080).

### Feature module in Vue Document editor component

Document Editor features are segregated into individual feature-wise modules to enable selective referencing. By default, the Document Editor displays the document in read-only mode. The required modules should be injected to extend its functionality. The following are the selective modules of Document Editor that can be included as required:

- **Print** - Prints the document.
- **SfdtExport** - Exports the document as Syncfusion Document Text (.SFDT) file.
- **Selection** - Selects a portion of the document and copy it to the clipboard.
- **Search** - Searches specific text and navigate between the results.
- **WordExport** - Exports the document as Word Document (.DOCX) file.
- **TextExport** - Exports the document as Text Document (.TXT) file.
- **Editor** - Performs all kind of editing operations.
- **EditorHistory** - Maintains the history of editing operations so that you can perform undo and redo at any time.
- User interface options such as context menu, options pane, image resizer, and dialog are available as individual modules.

In addition to injecting the required modules in your application, enable corresponding properties to extend the functionality for a Document Editor instance.

Refer to the following table.

| Module | Dependent modules to be injected for extending the functionality of Document Editor in your application | Property to enable the functionality for a Document Editor instance |

|---|---|---|

|Print|Print|<ejs-documenteditor :enablePrint='true'></ejs-documenteditor>|

|SfdtExport|SfdtExport|<ejs-documenteditor :enableSfdtExport='true'></ejs-documenteditor>|

|Selection|Selection|<ejs-documenteditor :enableSelection='true'></ejs-documenteditor>|

|Search|Selection, Search|<ejs-documenteditor :enableSearch='true'></ejs-documenteditor>|

|WordExport|SfdtExport, WordExport|<ejs-documenteditor :enableWordExport='true'></ejs-documenteditor>|

|TextExport|SfdtExport, TextExport|<ejs-documenteditor :enableTextExport='true'></ejs-documenteditor>|

|Editor|Selection, Editor|<ejs-documenteditor :isReadOnly='false' :enableEditor='true'></ejs-documenteditor>|

|EditorHistory|Selection, Editor, EditorHistory|<ejs-documenteditor :isReadOnly='false' :enableEditor='true' :enableEditorHistory='true'></ejs-documenteditor>|

|OptionsPane(Find)|Selection, Search, OptionsPane|<ejs-documenteditor :enableSearch='true' :enableOptionsPane='true'></ejs-documenteditor>|

|OptionsPane(Find and Replace)|Selection, Search, Editor, OptionsPane|<ejs-documenteditor :isReadOnly='false' :enableEditor='true' :enableSearch='true' :enableOptionsPane='true'></ejs-documenteditor>|

|ContextMenu|Selection, ContextMenu|<ejs-documenteditor :enableSelection='true' :enableContextMenu='true'></ejs-documenteditor>|

|ImageResizer|Selection, Editor, ImageResizer|<ejs-documenteditor :isReadOnly='false' :enableEditor='true' :enableImageResizer='true'></ejs-documenteditor>|

|HyperlinkDialog|Selection, Editor, HyperlinkDialog|<ejs-documenteditor :isReadOnly='false' :enableEditor='true' :enableHyperlinkDialog='true'></ejs-documenteditor>|

|TableDialog|Selection, Editor, TableDialog|<ejs-documenteditor :isReadOnly='false' :enableEditor='true' :enableTableDialog='true'></ejs-documenteditor>|

|FontDialog|Selection, Editor, FontDialog|<ejs-documenteditor :isReadOnly='false' :enableEditor='true' :enableFontDialog='true'></ejs-documenteditor>|

|ParagraphDialog|Selection, Editor, ParagraphDialog|<ejs-documenteditor :isReadOnly='false' :enableEditor='true' :enableParagraphDialog='true'></ejs-documenteditor>|

|BookmarkDialog|Selection, Editor, BookmarkDialog|<ejs-documenteditor :isReadOnly='false' :enableEditor='true' :enableBookmarkDialog='true'></ejs-documenteditor>|

|PageSetupDialog|Selection, Editor, PageSetupDialog|<ejs-documenteditor :isReadOnly='false' :enableEditor='true' :enablePageSetupDialog='true'></ejs-documenteditor>|

```
|TableOfContentsDialog|Selection, Editor, TableOfContentsDialog|<ejs-documenteditor
:isReadOnly='false' :enableEditor='true' :enableTableOfContentsDialog='true'></ejs-
documenteditor>|
```

```
|ListDialog|Selection, Editor, ListDialog|<ejs-documenteditor :isReadOnly='false'
:enableEditor='true' :enableListDialog='true'></ejs-documenteditor>|
```

```
|TablePropertiesDialog|Selection, Editor, TablePropertiesDialog|<ejs-documenteditor
:isReadOnly='false' :enableEditor='true' :enableTablePropertiesDialog='true'></ejs-
documenteditor>|
```

```
|CellOptionsDialog|Selection, Editor, CellOptionsDialog|<ejs-documenteditor :isReadOnly='false'
:enableEditor='true' :enableTablePropertiesDialog='true'></ejs-documenteditor>|
```

```
|BordersAndShadingDialog|Selection, Editor, BordersAndShadingDialog|<ejs-documenteditor
:isReadOnly='false' :enableEditor='true' :enableBordersAndShadingDialog='true'></ejs-
documenteditor>|
```

```
|TableOptionsDialog|Selection, Editor, TableOptionsDialog|<ejs-documenteditor
:isReadOnly='false' :enableEditor='true' :enableTableOptionsDialog='true'></ejs-
documenteditor>|
```

```
|StylesDialog|Selection, Editor, StylesDialog,StyleDialog|<ejs-documenteditor
:isReadOnly='false' :enableEditor='true' :enableStyleDialog='true'
:enableStylesDialog='true'></ejs-documenteditor>|
```

```
|StyleDialog|Selection, Editor, StyleDialog|<ejs-documenteditor :isReadOnly='false'
:enableEditor='true' :enableStyleDialog='true'></ejs-documenteditor>|
```

```
|BulletsAndNumberingDialog|Selection, Editor, BulletsAndNumberingDialog|<ejs-documenteditor
:isReadOnly='false' :enableEditor='true' :enableStyleDialog='true'></ejs-documenteditor>|
```

These modules should be injected into the `provide` section and use `DocumentEditor` as a key of the object.

### Import in Vue Document editor component

In Document Editor, the documents are stored in its own format called **Syncfusion Document Text (SFDT)**.

The following example shows how to open SFDT data in Document Editor.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-documenteditor ref="documenteditor" id="container_1"
height="370px" style="width: 100%;display:block" ></ejs-documenteditor>
  </div>
</template>
<script>
  import Vue from 'vue'
  import { DocumentEditorPlugin } from '@syncfusion/ej2-vue-
documenteditor';
  Vue.use(DocumentEditorPlugin);
```

```

export default {
  data: function() {
    return {
    };
  },
  mounted: function() {
    let sfdt: string = `{
      "sections": [
        {
          "blocks": [
            {
              "inlines": [
                {
                  "characterFormat": {
                    "bold": true,
                    "italic": true
                  },
                  "text": "Hello World"
                }
              ]
            }
          ]
        },
        "headersFooters": {
        }
      ]
    }`;
    //Open the default document in Document Editor.
    this.$refs.documenteditor.open(sfdt);
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/document-editor/import-cs1" %}

### Import document from local machine

The following example shows how to import document from local machine.

#### APP.VUE

```

<template>
  <div id="app">
    <input type="file" ref="fileUpload" v-on:change="onFileUpload"
    accept=".sfdt" style="position:fixed; left:-100em" />
    <div>
      <button v-on:click='openFileButtonClickHandler'
      >Import</button>
    </div>
    <ejs-documenteditor ref="documenteditor" height="370px"
    style="width: 100%;display:block" ></ejs-documenteditor>
  </div>
</template>

```

```
<script>
  import Vue from 'vue'
  import { DocumentEditorPlugin } from '@syncfusion/ej2-vue-
documenteditor';
  Vue.use(DocumentEditorPlugin);
  export default {
    data: function() {
      return {
      };
    },
    methods: {
      openFileButtonClickHandler: function() {
        this.$refs.fileUpload.click();
      },
      onFileUpload: function(e) {
        if (e.target.files[0]) {
          let file = e.target.files[0];
          if (file.name.substr(file.name.lastIndexOf('.')) ===
'.sfdt') {
            let fileReader: FileReader = new FileReader();
            fileReader.onload = (e: any) => {
              let contents: string = e.target.result;
              //Open the default document in Document
Editor.

              this.$refs.documenteditor.open(contents);
            };
            fileReader.readAsText(file);
          }
        }
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/document-editor/import-sfdt-cs1" %}

### Convert word documents into SFDT

You can convert word documents into SFDT format using the .NET Standard library

[Syncfusion.EJ2.WordEditor.AspNet.Core](#) by the web API service implementation. This library helps you to convert word documents (.dotx,.docx,.docm,.dot,.doc), rich text format documents (.rtf), and text documents (.txt) into SFDT format.

Note: The Syncfusion Document Editor component's document pagination (page-by-page display) can't be guaranteed for all the Word documents to match the pagination of Microsoft Word application. For more information about [why the document pagination \(page-by-page display\) differs from Microsoft Word](#)

Please refer the following example for converting word documents into SFDT.

,

<template>

```

<input type="file" ref="fileUpload" v-on:change="onFileUpload"
accept=".dotx,.docx,.docm,.dot,.doc,.rtf,.txt,.xml,.sfdt" style="position:fixed; left:-100em" />
<div>
<div>
<button v-on:click='openFileButtonClickHandler'>Import</button>
</div>
<ejs-documenteditor ref="documenteditor" height="370px" style="width: 100%;display:block"></ejs-
documenteditor>
</div>
</template>
<script>
import Vue from 'vue'
import { DocumentEditorPlugin } from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorPlugin);
export default {
data: function() {
return {
};
},
methods: {
loadFile: function(file: File): void {
let ajax: XMLHttpRequest = new XMLHttpRequest();
ajax.open('POST', 'https://localhost:4000/api/documenteditor/Import', true);
ajax.onreadystatechange = () => {
if (ajax.readyState === 4) {
if (ajax.status === 200 || ajax.status === 304) {
// open SFDT text in document editor
this.$refs.documenteditor.open(ajax.responseText);
}
}
}
let formData: FormData = new FormData();
formData.append('files', file);
ajax.send(formData);

```

```

},
openFileButtonClickHandler: function() {
this.$refs.fileUpload.click();
},
onFileUpload: function(e) {
if (e.target.files[0]) {
let file = e.target.files[0];
if (file.name.substr(file.name.lastIndexOf('.')) === '.sfdt') {
let fileReader: FileReader = new FileReader();
fileReader.onload = (e: any) => {
let contents: string = e.target.result;
this.$refs.documenteditor.open(contents);
};
fileReader.readAsText(file);
}
}
}
}
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
`

```

Here's how to handle the server-side action for converting word document in to SFDT.

```

`c#
[AcceptVerbs("Post")]
public string Import(Microsoft.AspNetCore.Http.IFormCollection data)
{
if (data.Files.Count == 0)
return null;

System.IO.Stream stream = new System.IO.MemoryStream();
Microsoft.AspNetCore.Http.IFormFile file = data.Files[0];

```

```

int index = file.FileName.LastIndexOf('.');
string type = index > -1 && index < file.FileName.Length - 1 ?
file.FileName.Substring(index) : ".docx";
file.CopyTo(stream);
stream.Position = 0;
Syncfusion.EJ2.DocumentEditor.WordDocument document =
Syncfusion.EJ2.DocumentEditor.WordDocument.Load(stream, GetFormatType(type.ToLower()));
string sfdt = Newtonsoft.Json.JsonConvert.SerializeObject(document);
document.Dispose();
return sfdt;
}

internal static Syncfusion.EJ2.DocumentEditor.FormatType GetFormatType(string format)
{
if (string.IsNullOrEmpty(format))
throw new System.NotSupportedException("EJ2 DocumentEditor does not support this file format.");
switch (format.ToLower()) {
case ".dotx":
case ".docx":
case ".docm":
case ".dotm":
return Syncfusion.EJ2.DocumentEditor.FormatType.Docx;
case ".dot":
case ".doc":
return Syncfusion.EJ2.DocumentEditor.FormatType.Doc;
case ".rtf":
return Syncfusion.EJ2.DocumentEditor.FormatType.Rtf;
case ".txt":
return Syncfusion.EJ2.DocumentEditor.FormatType.Txt;
case ".xml":
return Syncfusion.EJ2.DocumentEditor.FormatType.WordML;
default:
throw new System.NotSupportedException("EJ2 DocumentEditor does not support this file format.");
}
}

```

```
}
,
```

To know about server-side action, please refer this [page](#).

### Compatibility with Microsoft Word

Syncfusion Document Editor is a minimal viable Word document viewer/editor product for web applications. As most compatible Word editor, the product vision is adding valuable feature sets of Microsoft Word, and not to cover 100% feature sets of Microsoft Word desktop application. You can even see the feature sets difference between Microsoft Word desktop and their Word online application. So kindly don't misunderstand this component as a complete replacement for Microsoft Word desktop application and expect 100% feature sets of it.

### How Syncfusion accepts the feature request for Document Editor

Syncfusion accepts new feature request as valid based on feature value and technological feasibility, then plan to implement unsupported features incrementally in future releases in a phase-by-phase manner.

### How to report the problems in Document Editor

You can report the problems with displaying, or editing Word documents in Document Editor component through [support forum](#), [Direct-Trac](#), or [feedback portal](#). Kindly share the Word document for replicating the problem easily in minimal time. If you have confidential data, you can replace it and attach the document.

### Why the document pagination differs from Microsoft Word

For your understanding about the Word document structure and the workflow of Word viewer/editor components, the Word document is a flow document in which content will not be preserved page by page; instead, the content will be preserved sequentially like a HTML file. Only the Word viewer/editor paginates the content of the Word document page by page dynamically, when opened for viewing or editing and this page-wise position information will not be preserved in the document level (it is Word file format specification standard). Syncfusion Document Editor component also does the same.

At present there is a known technical limitation related to slight difference in text size calculated using HTML element based text measuring approach. Even though the text size is calculated with correct font and font size values, the difference lies; it is as low as 0.00XX to 0. XXXX values compared to that of Microsoft Word application's display. Hence the document pagination (page-by-page display) can't be guaranteed for all the Word documents to match the pagination of Microsoft Word application.

### How Syncfusion address the document pagination difference compared to Microsoft Word

The following table illustrates the reasons for pagination (page-by-page display) difference compared to Microsoft Word in your documents and how Syncfusion address it.

Root causes	How is it solved?
Any mistake (wrong behavior handled) in lay outing the supported elements and formatting	Customer can report to Syncfusion support and track the status through bug report link. Syncfusion fixes the bugs in next possible weekly patch release and service pack or main releases.
Font missing in deployment environment	Customer can either report to Syncfusion support and get suggestion or solve it on their own by installing the missing fonts in their deployment environment.

|Any unsupported elements or formatting present in your document |Customer can report to Syncfusion support and track the status through feature request link. Syncfusion implements unsupported features incrementally in future releases based on feature importance, customer interest, efforts involved, and technological feasibility. Also, suggests alternate approach for possible cases. |

|Technical limitation related to framework For example, there is a known case with slight fractional difference in text size measured using HTML and Microsoft Word's display. |Customer can report to Syncfusion support and track the status through feature request link. Syncfusion does research about alternate approaches to overcome the technical limitation/behaviors and process it same as a feature. >Note: Here the challenge is, time schedule for implementation varies based on the alternate solution and its reliability. |

## Server side export in Vue Document editor component

### SFDT to DOCX export

Document Editor supports server-side export of **Syncfusion Document Text (.sfdt)** to Doc, DOCX, RTF, Txt, WordML, HTML formats using server-side helper **Syncfusion.EJ2.DocumentEditor** available in ASP.NET Core & ASP.NET MVC platform in the below NuGet's.

- [Syncfusion.EJ2.WordEditor.AspNet.Core](#)
- [Syncfusion.EJ2.WordEditor.AspNet.Mvc5](#)
- [Syncfusion.EJ2.WordEditor.AspNet.Mvc4](#)

Please refer the following code example.

```
`c#
//API controller for the conversion.
[HttpPost]
public void ExportSFDT([FromBody]SaveParameter data)
{
    Stream document = WordDocument.Save(data.content, FormatType.Docx);
    FileStream file = new FileStream("sample.docx", FileMode.OpenOrCreate, FileAccess.ReadWrite);
    document.CopyTo(file);
    file.Close();
    document.Close();
}

public class SaveParameter
{
    public string content { get; set; }
```

```
}
,
```

Please refer the client side example to serialize the sfdt and send to the server.

```
,
```

```
<template>
<div id="app">
<div>
<button v-on:click='exportBlob' >Save</button>
</div>
<ejs-documenteditor ref="documenteditor" :enableSfdtExport='true' :enableWordExport='true'
:enableSelection='true' :enableEditor='true' :isReadOnly='false' height="370px" style="width:
100%;"></ejs-documenteditor>
</div>
</template>
<script>
import Vue from 'vue'

import { DocumentEditorPlugin, Selection, Editor, SfdtExport, WordExport } from '@syncfusion/ej2-vue-
documenteditor';

Vue.use(DocumentEditorPlugin);

export default {
data: function() {
return {
};
},
provide: {
//Inject require modules.
DocumentEditor : [SfdtExport, WordExport, Selection, Editor]
}
methods: {
exportBlob: function() {
let http: XMLHttpRequest = new XMLHttpRequest();
http.open('POST', 'http://localhost:5000/api/documenteditor/ExportSFDT');
http.setRequestHeader('Content-Type', 'application/json;charset=UTF-8');
http.responseType = 'json';
```

```
//Serialize document content as SFDT.
let sfdt: any = { content: this.$refs.documenteditor.serialize() };
//Send the sfdt content to server side.
http.send(JSON.stringify(sfdt));
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
`
```

DocumentEditor object is available in DocumentEditorContainer component(DocumentEditor packaged with toolbar, status bar & properties pane) as [documentEditor](#)

### Export in Vue Document editor component

Document Editor exports the document into various known file formats in client-side such as Microsoft Word document (.docx), text document (.txt), and its own format called **Syncfusion Document Text (.sfdt)**.

We are providing two types of save APIs as mentioned below.

API name	Purpose
-----	-----
save(filename,FormatType):void	 FormatType: Sfdt or Docx or Txt   Creates the document with specified file name and format type. Then, the created file is downloaded in the client browser by default.
saveAsBlob(FormatType):Blob	Creates the document in specified format type and returns the created document as Blob. This blob can be uploaded to your required server, database, or file path.

### SFDT export

The following example shows how to export documents in Document Editor as Syncfusion document text (.sfdt).

### APP.VUE

```
<template>
  <div id="app">
    <div>
      <button v-on:click='saveAsSfdt' >Save</button>
    </div>
    <ejs-documenteditor ref="documenteditor"
:enableSfdtExport='true' :enableSelection='true' :enableEditor='true'
:isReadOnly='false' height="370px" style="width: 100%;"></ejs-
documenteditor>
  </div>
```

```

</template>
<script>
  import Vue from 'vue'
  import { DocumentEditorPlugin, Selection, Editor, SfdtExport } from
  '@syncfusion/ej2-vue-documenteditor';
  Vue.use(DocumentEditorPlugin);
  export default {
    data: function() {
      return {
      };
    },
    provide: {
      //Inject require modules.
      DocumentEditor : [SfdtExport, Selection, Editor]
    }
    methods: {
      saveAsSfdt: function() {
        //Download the current document in sfdt format.
        this.$refs.documenteditor.save('sample', 'Sfdt');
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  documenteditor/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/document-editor/export-cs1" %}

### Word export

The following example shows how to export the document as Word document (.docx).

Note: The Syncfusion Document Editor component's document pagination (page-by-page display) can't be guaranteed for all the Word documents to match the pagination of Microsoft Word application. For more information about [why the document pagination \(page-by-page display\) differs from Microsoft Word](#)

### APP.VUE

```

<template>
  <div id="app">
    <div>
      <button v-on:click='saveAsDocx' >Save</button>
    </div>
    <ejs-documenteditor ref="documenteditor"
    :enableSfdtExport='true' :enableWordExport='true' :enableSelection='true'
    :enableEditor='true' :isReadOnly='false' height="370px" style="width:
    100%;"></ejs-documenteditor>
  </div>
</template>
<script>
  import Vue from 'vue'
  import { DocumentEditorPlugin, Selection, Editor, SfdtExport,
  WordExport } from '@syncfusion/ej2-vue-documenteditor';
  Vue.use(DocumentEditorPlugin);

```

```

    export default {
      data: function() {
        return {
        };
      },
      provide: {
        //Inject require modules.
        DocumentEditor : [SfdtExport, WordExport, Selection, Editor]
      },
      methods: {
        saveAsDocx: function() {
          //Download the document in docx format.
          this.$refs.documenteditor.save('sample', 'Docx');
        }
      }
    }
  </script>
  <style>
    @import "../node_modules/@syncfusion/ej2-vue-
    documenteditor/styles/material.css";
  </style>

```

{% previewsample "page.domainurl/code-snippet/document-editor/export-cs2" %}

### Text export

The following example shows how to export document as text document (.txt).

### APP.VUE

```

<template>
  <div id="app">
    <div>
      <button v-on:click='saveAsTextDocument' >Save</button>
    </div>
    <ejs-documenteditor ref="documenteditor"
    :enableSfdtExport='true' :enableTextExport='true' :enableSelection='true'
    :enableEditor='true' :isReadOnly='false' height="370px" style="width:
    100%;"></ejs-documenteditor>
    </div>
  </template>
  <script>
    import Vue from 'vue'
    import { DocumentEditorPlugin, Selection, Editor, SfdtExport,
    TextExport } from '@syncfusion/ej2-vue-documenteditor';
    Vue.use(DocumentEditorPlugin);
    export default {
      data: function() {
        return {
        };
      },
      provide: {
        //Inject require modules.
        DocumentEditor : [SfdtExport, TextExport, Selection, Editor]
      },
      methods: {
        saveAsTextDocument: function() {

```

```

        //Download the current document as txt file.
        this.$refs.documenteditor.save('sample', 'Txt');
    }
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>

```

```
{% previewsample "page.domainurl/code-snippet/document-editor/export-cs3" %}
```

### Export as blob

Document Editor also supports API to store the document into a blob. Refer to the following sample to export document into blob in client-side.

```

<template>
<div id="app">
<div>
<button v-on:click='exportBlob' >Save</button>
</div>
<ejs-documenteditor ref="documenteditor" :enableSfdtExport='true' :enableWordExport='true'
:enableSelection='true' :enableEditor='true' :isReadOnly='false' height="370px" style="width:
100%;"></ejs-documenteditor>
</div>
</template>
<script>
import Vue from 'vue'
import { DocumentEditorPlugin, Selection, Editor, SfdtExport, WordExport } from '@syncfusion/ej2-vue-
documenteditor';
Vue.use(DocumentEditorPlugin);
export default {
data: function() {
return {
};
},
provide: {
//Inject require modules.
DocumentEditor : [SfdtExport, WordExport, Selection, Editor]

```

```

}
methods: {
  exportBlob: function() {
    //Export the document as Blob object.
    this.$refs.documenteditor.saveAsBlob('Docx').then((exportedDocument: Blob) => {
      // The blob can be processed further
    });
  }
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
`

```

For instance, to export the document as Rich Text Format file, implement an ASP.NET MVC web API controller using DocIO library by passing the DOCX blob. Refer to the following code example.

```

`c#
//API controller for the conversion.
[HttpPost]
public HttpResponseMessage ExportAsRtf()
{
  System.Web.HttpPostedFile data = HttpContext.Current.Request.Files[0];
  //Opens document stream
  WordDocument wordDocument = new WordDocument(data.InputStream);
  MemoryStream stream = new MemoryStream();
  //Converts document stream as RTF
  wordDocument.Save(stream, FormatType.Rtf);
  wordDocument.Close();
  stream.Position = 0;
  return new HttpResponseMessage() { Content = new StreamContent(stream) };
}
`

```

In client-side, you can consume this web service and save the document as Rich Text Format (.rtf) file. Refer to the following example.

```
`ts
function exportBlob() {
  documenteditor.saveAsBlob('Docx').then((exportedDocument: Blob) => {
    // The blob can be processed further
    let formData: FormData = new FormData();
    formData.append('fileName', 'sample.docx');
    formData.append('data', exportedDocument);
    //Send blob object to server.
    saveAsRtf(formData);
  });
}

function saveAsRtf(formData: FormData): void {
  let httpRequest: XMLHttpRequest = new XMLHttpRequest();
  httpRequest.open('POST', '/api/DocumentEditor/ExportAsRtf', true);
  httpRequest.onreadystatechange = () => {
    if (httpRequest.readyState === 4) {
      if (httpRequest.status === 200 || httpRequest.status === 304) {
        if (!navigator.msSaveBlob) {
          navigator.msSaveBlob(httpRequest.response, 'sample.rtf');
        } else {
          let downloadLink: HTMLAnchorElement =
            document.createElementNS('http://www.w3.org/1999/xhtml', 'a') as HTMLAnchorElement;
          download('sample.rtf', 'rtf', httpRequest.response, downloadLink, 'download' in downloadLink);
        }
      } else {
        console.error(httpRequest.response);
      }
    }
  }
  httpRequest.responseType = 'blob';
  httpRequest.send(formData);
}
```

```
//Download the rtf document.
```

```
function download(fileName: string, extension: string, buffer: Blob, downloadLink:
HTMLAnchorElement, hasDownloadAttribute: Boolean): void {
  if (hasDownloadAttribute) {
    downloadLink.download = fileName;
    let dataUrl: string = window.URL.createObjectURL(buffer);
    downloadLink.href = dataUrl;
    let event: MouseEvent = document.createEvent('MouseEvent');
    event.initEvent('click', true, true);
    downloadLink.dispatchEvent(event);
    setTimeout(() : void => {
      window.URL.revokeObjectURL(dataUrl);
      dataUrl = undefined;
    });
  } else {
    if (extension !== 'docx' && extension !== 'xlsx') {
      let url: string = window.URL.createObjectURL(buffer);
      let isPopupBlocked: Window = window.open(url, '_blank');
      if (!isPopupBlocked) {
        window.location.href = url;
      }
    }
  }
}
```

### Web services in Vue Document editor component

You can deploy web APIs for server-side dependencies of Document Editor component in the following platforms.

- [ASP.NET Core](#)
- [ASP.NET MVC](#)
- [Java](#)

### Which operations require server-side interaction

|Operations|When client-server communication will be triggered?|What type of data will be transferred between client and server?|

|-----|-----|-----|

|[Open file formats other than SFDT](#)|When opening the document other than SFDT (Syncfusion Document Editor's native file format), the server-side web API is invoked from client-side script. |**Client:** Sends the input file.<br>**Server:** Receives the input file and sends the converted SFDT back to the client.<br><br>The server-side web API internally extracts the content from the document (DOCX, DOC, WordML, RTF, HTML) using Syncfusion Word library (DocIO) and converts it into SFDT for opening the document in Document Editor. |

|[Paste with formatting](#)|When pasting the formatted content (HTML/RTF) received from system clipboard. For converting HTML/RTF to SFDT format.<br><br> **Note:** Whereas plain text received from system clipboard will be pasted directly in the client-side. |**Client:** Sends the input Html or Rtf string. <br>**Server:** Receives the input Html or Rtf string and sends the converted SFDT back to the client. |

|[Restrict editing](#)|When protecting the document, for generating hash. |**Client:** Sends the input data for hashing algorithm.<br> **Server:** Receives the input data for hashing algorithm and sends the result hash information back to the client. |

|[Spellcheck](#)(default)|When the spellchecker is enabled on client-side Document Editor, and it performs the spell check validation for words in the document. |**Client:** Sends the words (string) with their language for spelling validation.<br> **Server:** Receives the words (string) with their language for spelling validation and sends the validation result as JSON back to the client. |

|[SpellCheckByPage](#)|Document editor provides options to spellcheck page by page when loading the documents. By [enabling optimized spell check](#) in client-side, you can perform spellcheck page by page when loading the documents. |**Client:** Sends the words (string) with their language for spelling validation.<br> **Server:** Receives the words (string) with their language for spelling validation and sends the validation result as JSON back to the client. |

|[Save as file formats other than SFDT and DOCX](#) (optional API)|You can configure this API, if you want to save the document in file format other than DOCX and SFDT.<br><br> For saving the files as WordML, DOC, RTF, HTML, ODT, Text using Syncfusion Word library (DocIO) and PDF using Syncfusion Word (DocIO) and PDF libraries. |You can transfer document from client to server either as SFDT or DOCX format.<br><br>First option (SFDT):<br>**Client:** Sends the SFDT.<br>**Server:** Receives the SFDT and saves the converted document as any file format supported by [Syncfusion Word library \(DocIO\)](#) in server or sends the saved file to the client browser.<br><br>Second option (DOCX):<br>**Client:** Sends the DOCX file.<br>**Server:** Receives the DOCX file and saves the converted document as any file format supported by [Syncfusion Word library \(DocIO\)](#) in server or sends the saved file to the client browser. |

Note: If you don't require the above functionalities then you can deploy as pure client-side component without any server-side interactions.

Please refer the [example from GitHub](#) to configure the web service and set the [serviceUrl](#).

If your running web service Url is `http://localhost:62869/`, set the serviceUrl like below:

```
`ts
```

```
this.$refs.container.serviceUrl = "http://localhost:62869/api/documenteditor/";
```

```
,
```

### Required Web API structure

Please check below table for expected web API structure.

Expected method name	Parameters	Return type
----- ---- ----		
Import	Files(IFormCollection)  json(sfdd format)	
SystemClipboard	CustomerParameter: content(type string either rtf or html) and type(either .rtf or .html)  json(sfdd format)	
RestrictEditing	Parameter of type CustomRestrictParameter public class CustomRestrictParameter {     public string passwordBase64 { get; set; }     public string saltBase64 { get; set; }     public int spinCount { get; set; } }  result hash information	
SpellCheck(default)	Parameter: SpellCheckJsonData public class SpellCheckJsonData  {     public int LanguageID { get; set; }     public string TexttoCheck { get; set; }     public bool CheckSpelling { get; set; }     public bool CheckSuggestion { get; set; }     public bool AddWord { get; set; } }  Json type of Spellcheck containing details of spell checked word	
SpellCheckByPage	Parameter: SpellCheckJsonData public class SpellCheckJsonData  {     public int LanguageID { get; set; }     public string TexttoCheck { get; set; }     public bool CheckSpelling { get; set; }     public bool CheckSuggestion { get; set; }     public bool AddWord { get; set; } }  Json type of Spellcheck containing details of spell checked word   <b>Note:</b> Document editor provides options to spellcheck page by page when loading the documents. By <a href="#">enabling optimized spell check</a> in client-side, you can perform spellcheck page by page when loading the documents.	
Save(optional API)	parameter: SaveParameter  public class SaveParameter {     public string Content { get; set; }     public string FileName { get; set; } }  void(Save the file as file stream)	
ExportSFDT(optional API)	parameter: SaveParameter  public class SaveParameter {     public string Content { get; set; }     public string FileName { get; set; } }  FileStreamResult (to save the document in client-side)	
Export(optional API)	Files(IFormCollection)  FileStreamResult (to save the document in client-side)	

### Customize the expected method name

Document editor component provides an option to customize the expected method name for Import, SystemClipboard, RestrictEditing and SpellCheck using [serverActionSettings](#).

The following example code illustrates how to customize the method name using serverActionSettings.

,

```
<template>
<div id="app">
<ejs-documenteditorcontainer ref='documenteditor' :serviceUrl='serviceUrl'
:serverActionSettings='settings' height="590px" id='container' :enableToolbar='true'></ejs-
documenteditorcontainer>
</div>
</template>
```

```
<script>
import Vue from 'vue';

import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent, Toolbar } from
 '@syncfusion/ej2-vue-documenteditor';

Vue.use(DocumentEditorContainerPlugin);

export default {
  data() {
    return {
      serviceUrl: 'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
      // Customize the API name
      settings: {
        import: 'Import1',
        systemClipboard: 'SystemClipboard1',
        spellCheck: 'SpellCheck1',
        restrictEditing: 'RestrictEditing1'
      },
      provide: {
        // Inject required modules.
        DocumentEditorContainer: [Toolbar]
      }
    };
  }
};
</script>
```

#### Modify the XMLHttpRequest before request send

Document editor component provides an option to modify the XMLHttpRequest object (setting additional headers, if needed) using [beforeXmlHttpRequestSend](#) event and it gets triggered before a server request.

You can customize the required [XMLHttpRequest](#) properties.

The following example code illustrates how to modify the XMLHttpRequest using [beforeXmlHttpRequestSend](#).

```
<template>
<div id="app">
  <ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' height="590px" id='container'
    :enableToolbar='true'></ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';
```

```
import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent, Toolbar } from
 '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
  data() {
    return { serviceUrl: 'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/' };
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar]
  },
  mounted() {
    //Here, modifying the request headers
    this.$refs.container.headers = [{ syncfusion: 'true' }];
    // Below action, cancel all server-side interactions expect spell check
    this.$refs.container.beforeXmlHttpRequestSend = (
      args ) => {
      args.headers = this.$refs.container.headers;
      args.withCredentials = true;
      switch (args.serverActionType) {
        case 'Import':
        case 'RestrictEditing':
        case 'SystemClipboard':
          args.cancel = true;
          break;
      }
    };
  }
}
</script>
```

Note: Find the customizable serverActionType values are 'Import' | 'RestrictEditing' | 'SpellCheck' | 'SystemClipboard'.

## Server Deployment

### Word processor server docker image overview in Vue Document editor component

The Syncfusion **Word Processor (also known as Document Editor)** is a component with editing capabilities like Microsoft Word. It is used to create, edit, view, and print Word documents. It provides all the common word processing abilities, including editing text; formatting contents; resizing images and tables; finding and replacing text; importing, exporting, and printing Word documents; and using bookmarks and tables of contents.

This Docker image is the predefined Docker container of Syncfusion's Word Processor backend. You can deploy it quickly to your infrastructure.

Word Processor is a commercial product, and it requires a valid license to use it in a production environment ([request license or trial key](#)).

The Word Processor is supported in the JavaScript, Angular, React, Vue, ASP.NET Core, ASP.NET MVC, and Blazor platforms.

### Prerequisites

Have [Docker](#) installed in your environment:

- On Windows, install [Docker for Windows](#).
- On macOS, install [Docker for Mac](#).

### How to deploy Word Processor Docker image

**Step 1:** Pull the word-processor-server image from Docker Hub.

`console

```
docker pull syncfusion/word-processor-server
```

`

**Step 2:** Create the docker-compose.yml file with the following code in your file system.

`yaml

```
version: '3.4'
```

```
services:
```

```
word-processor-server:
```

```
image: syncfusion/word-processor-server:latest
```

```
environment:
```

[Provide your license key for activation](#)

```
SYNCFUSIONLICENSEKEY: YOURLICENSEKEY
```

```
ports:
```

- "6002:80"

`

**Step 3:** In a terminal tab, navigate to the directory where you've placed the docker-compose.yml file and execute the following.

```
`console
docker-compose up
`
```

Now the Word Processor server Docker instance runs in the localhost with the provided port number `http://localhost:6002`. Open this link in a browser and navigate to the Word Processor Web API control `http://localhost:6002/api/documenteditor`. It returns the default get method response.

**Step 4:** Append the Docker instance running the URL (`http://localhost:6002/api/documenteditor`) to the service URL in the client-side Word Processor control. For more information about how to get started with the Word Processor control, refer to this [getting started page](#).

*[How to configure spell checker dictionaries path in Docker compose file](#)*

**Step 1:** In the Docker compose file, mount the local directory as a container volume using the following code.

```
`yaml
version: '3.4'

services:
  word-processor-server:
    image: syncfusion/word-processor-server:latest
    environment:
      Provide your license key for activation
      SYNCFUSIONLICENSEKEY: YOURLICENSEKEY
    volumes:
```

- `./data:/app/data`

```
ports:
```

- `"6002:80"`
- ```
`
```

This YAML definition binds the data folder that is available in the Docker compose file directory.

**Step 2:** In the data folder, include the dictionary files (`.dic`, `.aff`) and JSON file. The JSON file should contain the language based dictionary file configuration in the following format.

```
`yaml
[
{
  "LanguageID": 1036,
```

```

"DictionaryPath": "fr_FR.dic",
"AffixPath": "fr_FR.aff",
"PersonalDictPath": "customDict.dic"
},
{
  "LanguageID": 1033,
  "DictionaryPath": "en_US.dic",
  "AffixPath": "en_US.aff",
  "PersonalDictPath": "customDict.dic"
}
]
`

```

Note: By default, the json file name should be "spellcheck.json". You can also use different file name by mounting the file name to 'SPELLCHECK/JSONFILENAME' attribute in Docker compose file as below,

`yaml

version: '3.4'

services:

word-processor-server:

image: syncfusion/word-processor-server:latest

environment:

[Provide your license key for activation](#)

SYNCFUSIONLICENSEKEY: YOURLICENSEKEY

SPELLCHECKDICTIONARYPATH: data

SPELLCHECKJSONFILENAME: spellcheck1.json

volumes:

- ./data:/app/data

ports:

- "6002:80"

`

**Step 3:** For handling the personal dictionary, place an empty .dic file (e.g., customDict.dic file) in the data folder.

**Step 4:** Provide the configured volume path to the environment variable like in the following in the Docker compose file.

```
`yaml
version: '3.4'
services:
  word-processor-server:
    image: syncfusion/word-processo -server:latest
    environment:
      Provide your license key for activation
      SYNCFUSION/LICENSEKEY: YOURLICENSEKEY
      SPELLCHECKDICTIONARYPATH: data
    volumes:
      • ./data:/app/data
    ports:
      • "6002:80"
```

#### *How to copy template Word documents to Docker image*

You can copy the required template Word documents into docker container while deploying the docker image to server. You can open these Word documents present in the server by passing the document path (name with relative path) to LoadDocument() web API.

Note: Place the word files in the data folder mentioned in the volumes section(i.e., C:/Docker/Data) of the docker-compose.yml file. All the files present in the folder path (C:/Docker/Data) mentioned in the volumes section of 'docker-compose.yml' file will be copied to the respective folder (/app/Data) of docker container. The Word documents copied to docker container can be processed using the 'LoadDocument' web API.

The following code example shows how to use LoadDocument() API in document editor.

```
<template>
<div id="app">
  <ejs-documenteditor ref="documenteditor" id="container_1" height='600px;'
  :enableSpellCheck='true'></ejs-documenteditor>
</div>
</template>
<script>
import Vue from 'vue'
import { DocumentEditorPlugin } from '@syncfusion/ej2-vue-documenteditor';
```

```

Vue.use(DocumentEditorPlugin);
export default {
  data: function () {
    return {
    };
  },
  mounted: function () {
    var dataContext = this;
    var uploadDocument = new FormData();
    uploadDocument.append('DocumentName', 'Getting Started.docx');
    var baseUrl = 'http://localhost:6002/api/documenteditor/LoadDocument';
    var httpRequest = new XMLHttpRequest();
    httpRequest.open('POST', baseUrl, true);
    httpRequest.onreadystatechange = function () {
      if (httpRequest.readyState === 4) {
        if (httpRequest.status === 200 || httpRequest.status === 304) {
          //Open the document in DocumentEditor
          this.$refs.documenteditor.ej2Instances.open(httpRequest.responseText);
        }
      }
    };
    httpRequest.send(uploadDocument);
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
`

```

Refer to these getting started pages to create a Word Processor in [Typescript](#), [React](#), [Vue](#), [ASP.NET MVC](#), [ASP.NET Core](#), and [Blazor](#).

## How to deploy word processor server docker container in azure app service in Vue Document editor component

### Prerequisites

- Have [Azure account](#) and [Azure CLI](#) setup in your environment.
- Run the following command to open the Azure login page. Sign into your [Microsoft Azure account](#).

,

az login

,

#### Step 1: Create a resource group.

Create a resource group using the [az group create](#) command.

The following example creates a resource group named documenteditorresourcegroup in the eastus location.

,

```
az group create --name documenteditorresourcegroup --location "East US"
```

,

#### Step 2: Create an Azure App Service plan.

Create an App Service plan in the resource group with the [az appservice plan create](#) command.

The following example creates an App Service plan named documenteditorappservice in the Standard pricing tier (--sku S1) and in a Linux container (--is-linux).

,

```
az appservice plan create --name documenteditorappservice --resource-group documenteditorresourcegroup --sku S1 --is-linux
```

,

#### Step 3: Create a Docker Compose app.

Create a multi-container [web app](#) in the documenteditorappservice App Service plan with the [az webapp create](#) command. The following command creates the web app using the provided Docker compose file. Please look into the section for getting started with Docker compose to create the Docker compose file for the document editor server and use the created Docker compose file here.

,

```
az webapp create --resource-group documenteditorresourcegroup --plan documenteditorappservice --name documenteditor-server --multicontainer-config-type compose --multicontainer-config-file documenteditor-server-compose.yml
```

,

#### Step 4: Browse to the app.

Browse to the deployed app at `http://<app_name>.azurewebsites.net`, i.e. `http://documenteditor-server.azurewebsites.net`. Browse this link and navigate to the Document Editor Web API control `http://documenteditor-server.azurewebsites.net/api/documenteditor`. It returns the default get method response.

Append the app service running the URL `http://documenteditor-server.azurewebsites.net/api/documenteditor/` to the service URL in the client-side Document Editor control. For more information about the Document Editor control, refer to this [getting started page](#).

For more information about the app container service, please look deeper into the [Microsoft Azure Container Service](#) for a production-ready setup.

How to deploy word processor server docker container in azure kubernetes service in Vue Document editor component

#### *Prerequisites*

- Have [Azure account](#) and [Azure CLI](#) setup in your environment.
- Run the following command to open the Azure login page. Sign into your [Microsoft Azure account](#).

az login

#### **Step 1:** Create a resource group.

Create a resource group using the [az group create](#) command.

The following example creates a resource group named `documenteditorresourcegroup` in the `eastus` location.

```
az group create --name documenteditorresourcegroup --location "East US"
```

#### **Step 2:** Create AKS cluster.

Use the [az aks create](#) command to create an AKS cluster. The following example creates a cluster named `documenteditorcluster` with one node.

```
az aks create --resource-group documenteditorresourcegroup --name documenteditorcluster --node-count 1
```

#### **Step 3:** Connect to the cluster.

Install the [kubect](#) into the workspace using the following command.

```
az aks install-cli
```

```
,
```

To configure kubectl to connect to your Kubernetes cluster, use the [az aks get-credentials](#) command. This command downloads credentials and configures the Kubernetes CLI to use them.

```
,
```

```
az aks get-credentials --resource-group documenteditorresourcegroup --name documenteditorcluster
```

```
,
```

#### **Step 4:** Create Kubernetes Services and Deployments

[Kubernetes Services](#) and [Deployments](#) can be configured in a file. To run the Document Editor server, you must define a Service and a Deployment `documenteditorserver`. To do this, create the `documenteditor-server.yml` file in the current directory using the following code.

```
`yaml
```

```
apiVersion: apps/v1
```

```
kind: Deployment
```

```
metadata:
```

```
labels:
```

```
app: documenteditorserver
```

```
name: documenteditorserver
```

```
spec:
```

```
replicas: 1
```

```
selector:
```

```
matchLabels:
```

```
app: documenteditorserver
```

```
strategy: {}
```

```
template:
```

```
metadata:
```

```
labels:
```

```
app: documenteditorserver
```

```
spec:
```

```
containers:
```

- `image: syncfusion/word-processor-server:latest`

```
name: documenteditorserver
```

```
ports:
```

- containerPort: 80

env:

- name: SYNCFUSIONLICENSEKEY

value: "YOURLICENSEKEY"

apiVersion: v1

kind: Service

metadata:

labels:

app: documenteditorserver

name: documenteditorserver

spec:

ports:

- port: 80

targetPort: 80

selector:

app: documenteditorserver

type: LoadBalancer

,

**Step 5:** To create all Services and Deployments needed to run the Document Editor server, execute the following.

```
`console
```

```
kubectl create -f ./documenteditor-server.yml
```

,

Run the following command to get the Kubernetes cluster deployed service details and copy the external IP address of the Document Editor service.

```
`console
```

```
kubectl get all
```

,

Browse the copied external IP address and navigate to the Document Editor Web API control `http://<external-ip>/api/documenteditor`. It returns the default get method response.

**Step 6:** Append the Kubernetes service running the URL `http://<external-ip>/api/documenteditor/` to the service URL in the client-side Document Editor control. For more information about the Document Editor control, refer to this [getting started page](#).

For more details about the Azure Kubernetes service, please look deeper into [Microsoft Azure Kubernetes Service](#) for a production-ready setup.

How to publish documenteditor web api application in azure app service from visual studio in Vue Document editor component

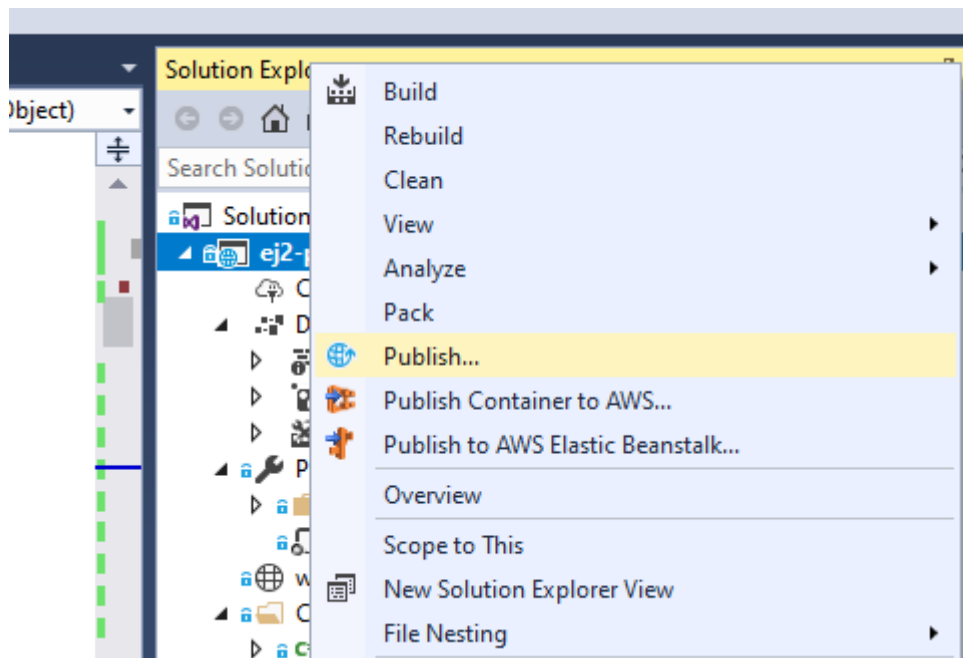

#### *Prerequisites*

- Visual Studio 2017 or 2019.
- An [Azure subscription](#).
- The Document Editor Web API controller application from [here](#).

Make sure you build the project using the Build > Build Solution menu command before following the deployment steps.

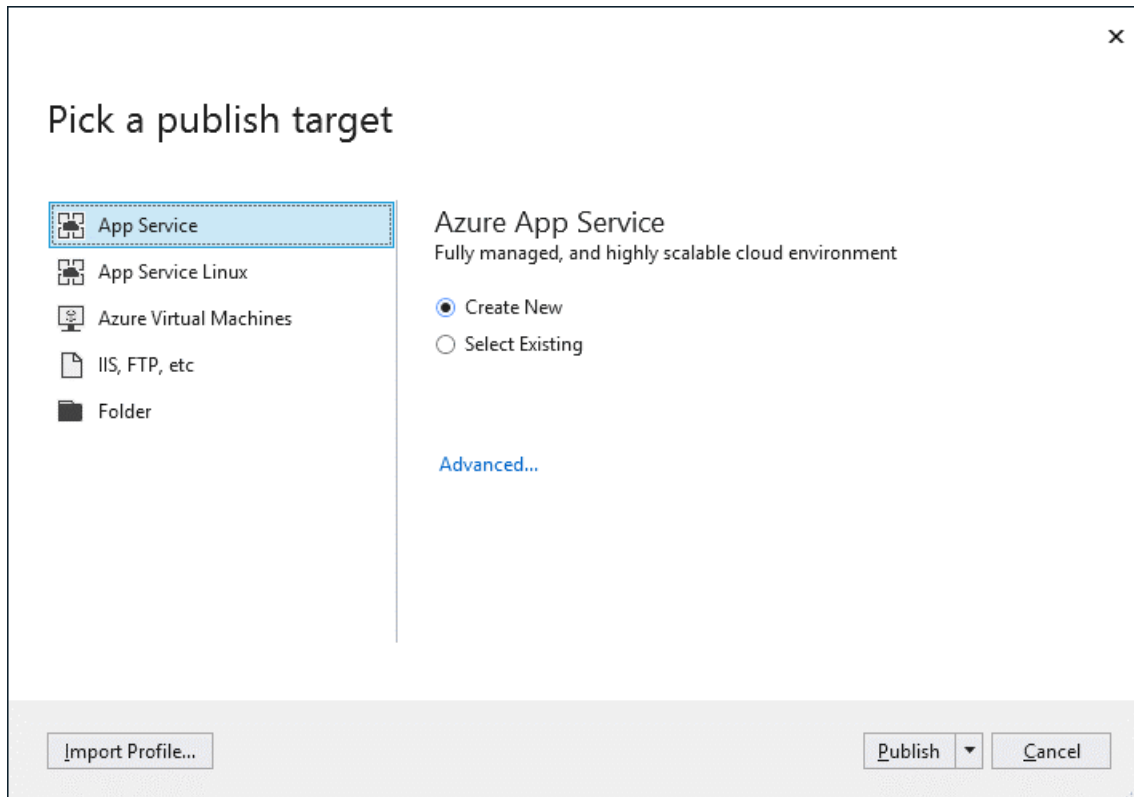

#### *Publish to Azure App Service*

**Step 1:** In Solution Explorer, right-click the project and click Publish (or use the Build > Publish menu item).

**Step 2:** If you have previously configured any publishing profiles, the Publish pane appears, in which case select Create new profile.

**Step 3:** In the Pick a publish target dialog box, select App Service.

**Step 4:** Select Publish. The Create App Service dialog box appears. Sign in with your Azure account, if necessary, and then the default app service settings populate the fields.

App Name  
ej2-documenteditor-server20200514102909

Subscription  
Microsoft Azure Enterprise

Resource Group  
cloud-shell-storage-centralindia (centralindia) [New...](#)

Hosting Plan  
ej2-documenteditor-server20200514102909P\* (South Centra [New...](#)

Application Insights  
None

Explore additional Azure services

- [Create a SQL Database](#)
- [Create a storage account](#)

Clicking the Create button will create the following Azure resources

- Hosting Plan - ej2-documenteditor-server202005141...
- App Service - ej2-documenteditor-server20200514102909

Export... [Create](#) [Cancel](#)

**Step 5:** Select Create. Visual Studio deploys the app to your Azure App Service, and the web app loads in your browser with the app name at `http://<app_name>.azurewebsites.net` (i.e. `http://ej2-documenteditor-server20200514102909.azurewebsites.net`).

**Step 6:** Navigate to Document Editor Web API control `http://ej2-documenteditor-server20200514102909.azurewebsites.net/api/documenteditor`. It returns the default get method response.

Append the app service running the URL `http://ej2-documenteditor-server20200514102909.azurewebsites.net/api/documenteditor` to the service URL in the client-side Document Editor control. For more information about how to get started with the Document Editor control, refer to this [getting started page](#).

For more information about the app container service, please look deeper into the [Microsoft Azure App Service](#) for a production-ready setup.

How to deploy documenteditor java web api in azure in Vue Document editor component

#### *Prerequisites*

Have [Azure account](#) and [Azure CLI](#) setup in your environment.

You can get the example [web service project from GitHub](#) and then perform the following steps to create the packages and host in azure app service.

**Step 1** Clean the package using following command.

```
`console
mvn clean package
`
```

**Step 2** Run the application locally using following command.

```
`console
mvn spring-boot:run
`
```

**Step 3** Build the package using following command.

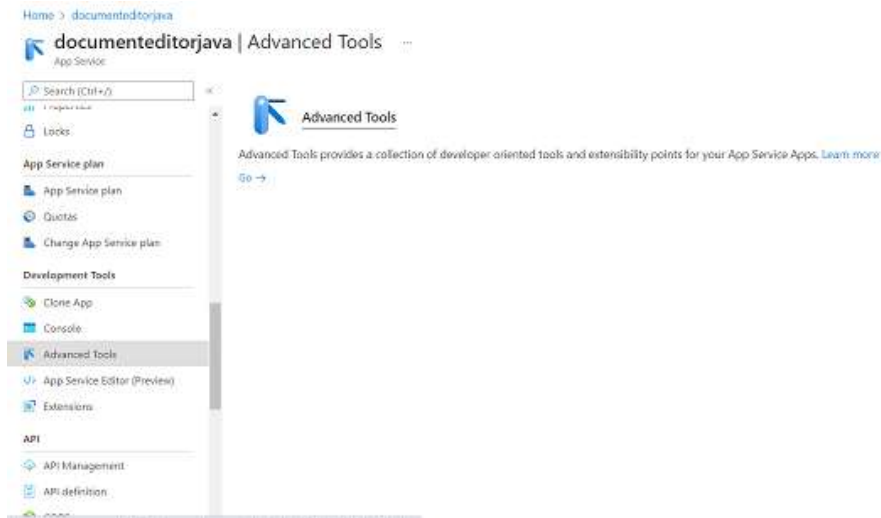

```
`console
mvn package
`
```

Above package generation command creates the `tomcat-0.0.1-SNAPSHOT.war` in the below location in the sample folder.

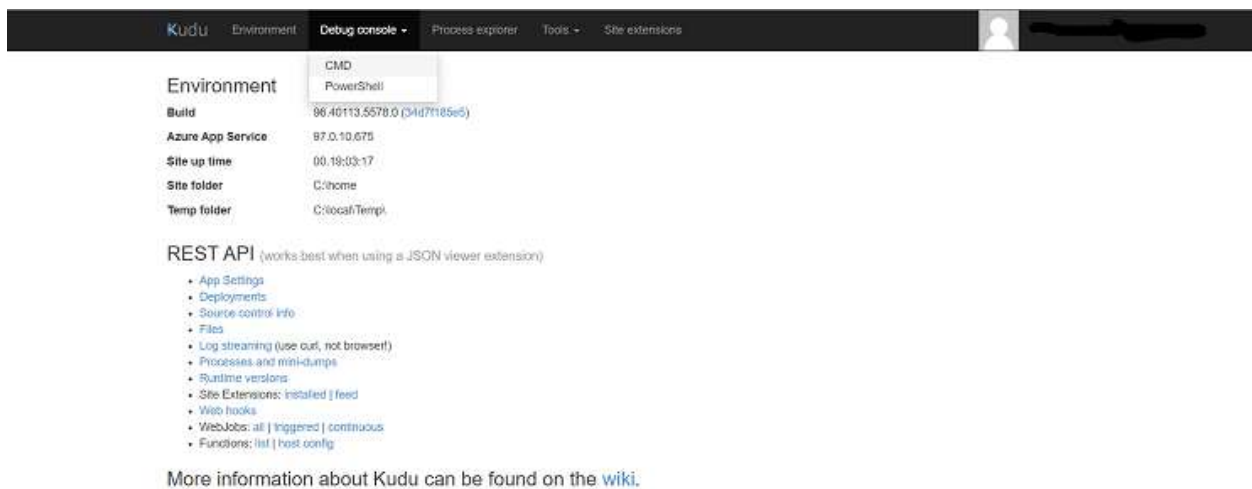

`target/tomcat-0.0.1-SNAPSHOT.war`

**Step 4:** Create a Azure app service with Java & Tomcat. For example, create the app services name as `documenteditorjava`.

**Step 5:** After creating app service, navigate to `Advanced Tools` options under `Development Tools`.

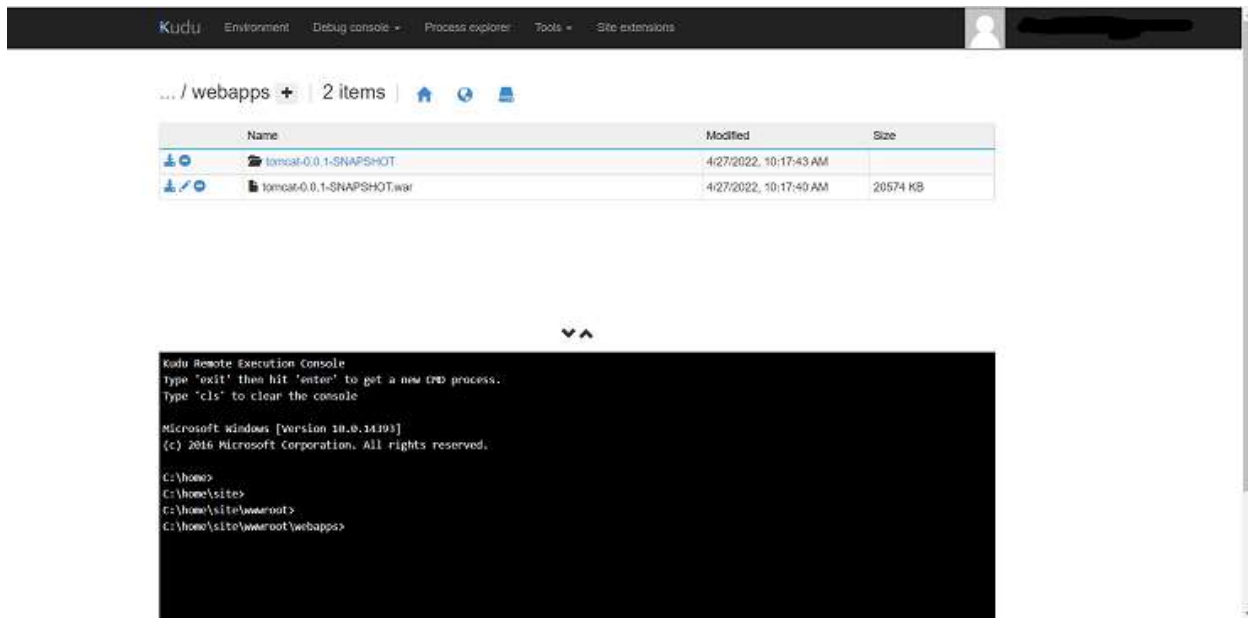

Then, click **Go** and select the **CMD** options under **Debug console**.

**Step 6:** Once the file manager is opened, please navigate to

site -> wwwroot -> webapps

**Step 7:** Now, upload the generated war file **tomcat-0.0.1-SNAPSHOT.war**. Uploaded war file gets extracted automatically, it will be uploaded like below:

### Step 8: Browse to the app.

Browse to the deployed app at [http://<app\\_name>.azurewebsites.net](http://<app_name>.azurewebsites.net), i.e. <http://documenteditorjava.azurewebsites.net>. Browse this link and it navigate to the Document Editor Web API control <http://documenteditorjava.azurewebsites.net/tomcat-0.0.1-SNAPSHOT>. It returns the default get method response.

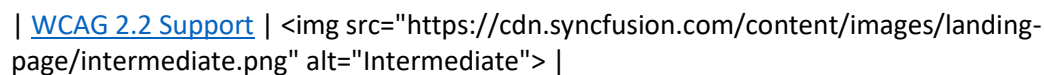

Append the app service running the URL <http://documenteditorjava.azurewebsites.net/tomcat-0.0.1-SNAPSHOT> to the service URL in the client-side Document Editor control. For more information about the Document Editor control, refer to this [getting started page](#).

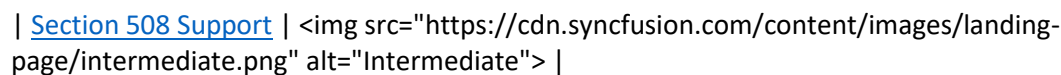

### Accessibility in Vue Document editor component

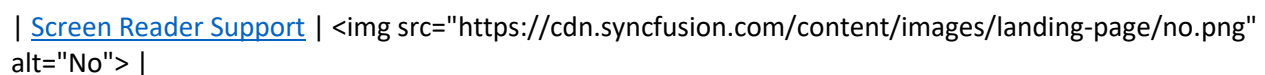

The accessibility compliance for the Document editor component is outlined below.

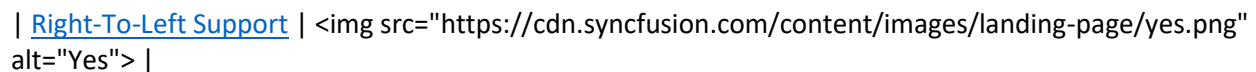

| Accessibility Criteria | Compatibility |

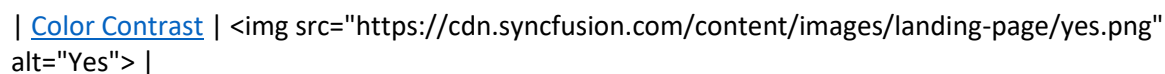

| -- | -- |

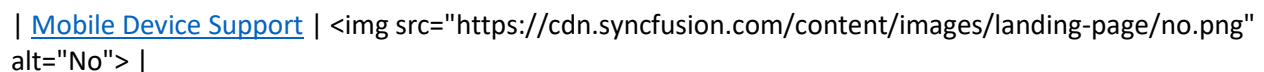

| [WCAG 2.2 Support](#) |  |

| [Section 508 Support](#) |  |

| [Screen Reader Support](#) |  |

| [Right-To-Left Support](#) |  |

| [Color Contrast](#) |  |

| [Mobile Device Support](#) |  |

```
| Keyboard Navigation Support |  |
| Accessibility Checker Validation |  |
| Axe-core Accessibility Validation |  |
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>
<div> - All
features of the component meet the requirement.</div>
<div> - Some features of the component do not meet the requirement.</div>
<div> - The
component does not meet the requirement.</div>
```

### Keyboard interaction

Document editor supports [keyboard shortcuts](#).

### Ensuring accessibility

The Document editor component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Document editor component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Document editor component with accessibility tools.

```
{% previewsample "https://ej2.syncfusion.com/accessibility/wordprocessor.html" %}
```

See also

- [Accessibility in Syncfusion Vue components](#)

### Collaborative Editing (preview)

Allows multiple users to work on the same document simultaneously. This can be done in real-time, so that collaborators can see the changes as they are made. Collaborative editing can be a great way to improve efficiency, as it allows team members to work together on a document without having to wait for others to finish their changes.

Note: Collaborative editing support is currently in preview mode only and is not yet ready for production environments.

### Prerequisites

The following are needed to enable collaborative editing in Document Editor.

- SignalR
- Microsoft SQL Server

### How to enable collaborative editing in client side

#### *Step 1: Enable collaborative editing in Document Editor*

To enable collaborative editing, inject `CollaborativeEditingHandler` and set the property `enableCollaborativeEditing` to true in the Document Editor, like in the code snippet below.

```
`javascript
<template>
  <div id="spinner">
    <ejs-documenteditorcontainer ref="doceditcontainer" :contentChange="onContentChange"
    :serviceUrl='serviceUrl'
    :enableToolbar='true' v-bind:created="onCreated">
  </ejs-documenteditorcontainer>
</div>
</template>
<script>
import { DocumentEditorContainerComponent, Toolbar, DocumentEditor } from '@syncfusion/ej2-vue-documenteditor';
import { CollaborativeEditingHandler } from '@syncfusion/ej2-documenteditor';
import { HubConnectionBuilder, HttpTransportType, HubConnectionState } from '@microsoft/signalr';
import { hideSpinner, showSpinner } from '@syncfusion/ej2-popups';
export default {
  name: 'App',
  components: {
    'ejs-documenteditorcontainer': DocumentEditorContainerComponent
  },
  data() {
    return {
      serviceUrl: 'http://localhost:5212/api/documenteditor/',
      collaborativeEditingServiceUrl: "http://localhost:5212/",
      collaborativeEditingHandler: null,
      connection: null,
```

```
};
},
provide: {
  DocumentEditorContainer: [Toolbar]
},
methods: {
  onCreated() {
    DocumentEditor.Inject(CollaborativeEditingHandler);
    // Enable collaborative editing in Document Editor.
    this.$refs.doceditcontainer.ej2Instances.documentEditor.enableCollaborativeEditing = true;
    this.initializeSignalR();
    this.loadDocumentFromServer();
  }
}
},
`
```

#### *Step 2: Configure SignalR to send and receive changes*

To broadcast the changes made and receive changes from remote users, configure SignalR like below.

```
`javascript
methods: {
  initializeSignalR() {
    // SignalR connection
    this.connection = new HubConnectionBuilder().withUrl(this.collaborativeEditingServiceUrl +
    'documenteditorhub', {
      skipNegotiation: true,
      transport: HttpTransportType.WebSockets
    }).withAutomaticReconnect().build();
    // Event handler for signalR connection
    this.connection.on('dataReceived', this.onDataRecived.bind(this));
    this.connection.onclose(async () => {
      if (this.connection && this.connection.state === HubConnectionState.Disconnected) {
        alert('Connection lost. Please relod the browser to continue.');
```

```
,
onDataRecived(action, data) {
  if (this.collaborativeEditingHandler) {
    if (action == 'connectionId') {
      // Update the current connection id to track other users
      this.connectionId = data;
    }
    // Apply the remote action in DocumentEditor
    this.collaborativeEditingHandler.applyRemoteAction(action, data);
  }
},
connectToRoom(data) {
  try {
    if (this.connection) {
      // start the connection.
      this.connection.start().then(() => {
        // Join the room.
        if (this.connection) {
          this.connection.send('JoinGroup', { roomName: data.roomName, currentUser: data.currentUser });
        }
        console.log('server connected!!!');
      });
    }
  } catch (err) {
    console.log(err);
    // Attempting to reconnect in 5 seconds
    setTimeout(this.connectToRoom, 5000);
  }
}
},
```

### *Step 3: Join SignalR room while opening the document*

When opening a document, we need to generate a unique ID for each document. These unique IDs are then used to create rooms using SignalR, which facilitates sending and receiving data from the server.

```
`javascript
methods: {
  openDocument(responseText, roomName) {
    showSpinner(document.getElementById('spinner'));
    let data = JSON.parse(responseText);
    if (this.$refs.doceditcontainer) {
      this.collaborativeEditingHandler =
        this.$refs.doceditcontainer.ej2Instances.documentEditor.collaborativeEditingHandlerModule;
      // Update the room and version information to collaborative editing handler.
      this.collaborativeEditingHandler.updateRoomInfo(roomName, data.version,
        this.collaborativeEditingServiceUrl + 'api/CollaborativeEditing/');
      // Open the document
      this.$refs.doceditcontainer.ej2Instances.documentEditor.open(data.sfdt);
      setTimeout(() => {
        if (this.$refs.doceditcontainer) {
          // connect to server using signalR
          this.connectToRoom({ action: 'connect', roomName: roomName, currentUser:
            this.$refs.doceditcontainer.currentUser });
        }
      });
    }
    hideSpinner(document.getElementById('spinner'));
  }
},
`
```

#### *Step 4: Broadcast current editing changes to remote users*

Changes made on the client-side need to be sent to the server-side to broadcast them to other connected users. To send the changes made to the server, use the method shown below from the document editor using the `contentChange` event.

```
`javascript
methods: {
  onContentChange(args) {
    if (this.collaborativeEditingHandler) {
      // Send the editing action to server
      this.collaborativeEditingHandler.sendActionToServer(args.operations)
    }
  }
}
```

```

}
},
}
`

```

How to enable collaborative editing in ASP.NET Core

#### *Step 1: Configure SignalR in ASP.NET Core*

We are using Microsoft SignalR to broadcast the changes. Please add the following configuration to your application's Program.cs file.

```

`csharp
using Microsoft.Azure.SignalR;

.....

builder.Services.AddSignalR();

.....

.....

.....

app.MapHub<DocumentEditorHub>("/documenteditorhub");

.....

.....
`

```

#### *Step 2: Configure SignalR hub to create room for collaborative editing session*

To manage groups for each document, create a folder named "Hub" and add a file named "DocumentEditorHub.cs" inside it. Add the following code to the file to manage SignalR groups using room names.

Join the group by using unique id of the document by using `JoinGroup` method.

```

`csharp
static Dictionary<string, ActionInfo> userManager = new Dictionary<string, ActionInfo>();
internal static Dictionary<string, List<ActionInfo>> groupManager = new Dictionary<string,
List<ActionInfo>>>();

// Join to the specified room name
public async Task JoinGroup(ActionInfo info)
{
    if (!userManager.ContainsKey(Context.ConnectionId))
    {
        userManager.Add(Context.ConnectionId, info);
    }
}

```

```
info.ConnectionId = Context.ConnectionId;
//Add the current connected use to the specified group
await Groups.AddToGroupAsync(Context.ConnectionId, info.RoomName);
if (groupManager.ContainsKey(info.RoomName))
{
    await Clients.Caller.SendAsync("dataReceived", "addUser", groupManager[info.RoomName]);
}
lock (groupManager)
{
    if (groupManager.ContainsKey(info.RoomName))
    {
        groupManager[info.RoomName].Add(info);
    }
    else
    {
        List<ActionInfo> actions = new List<ActionInfo>
        {
            info
        };
        groupManager.Add(info.RoomName, actions);
    }
}
// Notify other users in the group about new user joined the collaborative editing session.
Clients.GroupExcept(info.RoomName, Context.ConnectionId).SendAsync("dataReceived", "addUser",
info);
`

Handle user disconnection using SignalR.
`csharp
//Handle disconnection from group.
public override Task OnDisconnectedAsync(Exception? e)
{
    string roomName = userManager[Context.ConnectionId].RoomName;
```

```

if (groupManager.ContainsKey(roomName))
{
    groupManager[roomName].Remove(userManager[Context.ConnectionId]);
    if (groupManager[roomName].Count == 0)
    {
        groupManager.Remove(roomName);
        //If all user disconnected from current room. Auto save the change to source document.
        CollaborativeEditingController.UpdateOperationsToSourceDocument(roomName,
        "<<documentpath>>", false);
    }
}
if (userManager.ContainsKey(Context.ConnectionId))
{
    //Notify other user in the group about user exit the collaborative editing session
    Clients.OthersInGroup(roomName).SendAsync("dataReceived", "removeUser", Context.ConnectionId);
    Groups.RemoveFromGroupAsync(Context.ConnectionId, roomName);
    userManager.Remove(Context.ConnectionId);
}
return base.OnDisconnectedAsync(e);
}
,

```

*Step 3: Configure Microsoft SQL database connection string in application level*

Configure the SQL database that stores temporary data for the collaborative editing session. Provide the SQL database connection string in `appsettings.json` file.

```

`json
.....
"ConnectionStrings": {
  "DocumentEditorDatabase": "<SQL server connection string>"
}
.....
,

```

*Step 4: Configure Web API actions for collaborative editing**Import File*

1. When opening a document, create a database table to store temporary data for the collaborative editing session. 2. If the table already exists, retrieve the records from the table and apply them to the WordDocument instance using the `UpdateActions` method before converting it to the SFDT format.

```
`csharp
public string ImportFile([FromBody] FileInfo param)
{
    .....
    .....
    DocumentContent content = new DocumentContent();
    .....
    //Get source document from database/file system/blob storage
    WordDocument document = GetDocumentFromDatabase(param.fileName, param.documentOwner);
    .....
    //Get temporary records from database
    List<ActionInfo> actions = CreatedTable(param.fileName);
    if(actions!=null)
    {
        //Apply temporary data to the document.
        document.UpdateActions(actions);
    }
    string json = Newtonsoft.Json.JsonConvert.SerializeObject(document);
    content.version = 0;
    content.sfdt = json;
    return Newtonsoft.Json.JsonConvert.SerializeObject(content);
}
`
```

*Update editing records to database.*

Each edit operation made by the user is sent to the server and is pushed to the database. Each operation receives a version number after being inserted into the database.

After inserting the records to the server, the position of the current editing operation must be transformed against any previous editing operations not yet synced with the client using the `TransformOperation` method.

After performing the transformation, the current operation is broadcast to all connected users within the group.

```
`csharp
public async Task<ActionInfo> UpdateAction([FromBody] ActionInfo param)
{
    try
    {
        ActionInfo modifiedAction = AddOperationsToTable(param);
        //After transformation broadcast changes to all users in the group
        await _hubContext.Clients.Group(param.RoomName).SendAsync("dataReceived", "action",
            modifiedAction);
        return modifiedAction;
    }
    catch
    {
        return null;
    }
}

private ActionInfo AddOperationsToTable(ActionInfo action)
{
    int clientVersion = action.Version;
    string tableName = action.RoomName;
    .....
    .....
    .....
    .....

    List<ActionInfo> actions = GetOperationsQueue(tableName);
    foreach (ActionInfo info in actions)
    {
        if (!info.IsTransformed)
        {
            CollaborativeEditingHandler.TransformOperation(info, actions);
        }
    }
    action = actions[actions.Count - 1];
}
```

```

action.Version = updateVersion;
//Return the transformed operation to broadcast it to other clients.
return action;
}
`

```

#### Add Web API to get previous operation as a backup to get lost operations

On the client side, messages broadcasted using SignalR may be received in a different order, or some operations may be missed due to network issues. In these cases, we need a backup method to retrieve missing records from the database.

Using the following method, we can retrieve all operations after the last successful client-synced version and return all missing operations to the requesting client.

```

`csharp
public async Task<ActionInfo> UpdateAction([FromBody] ActionInfo param)
{
    try
    {
        ActionInfo modifiedAction = AddOperationsToTable(param);
        //After transformation broadcast changes to all users in the group
        await _hubContext.Clients.Group(param.RoomName).SendAsync("dataReceived", "action",
            modifiedAction);
        return modifiedAction;
    }
    catch
    {
        return null;
    }
}

private ActionInfo AddOperationsToTable(ActionInfo action)
{
    int clientVersion = action.Version;
    string tableName = action.RoomName;
    .....
    .....
    .....
    .....
}

```

```
List<ActionInfo> actions = GetOperationsQueue(table);
foreach (ActionInfo info in actions)
{
    if (!info.IsTransformed)
    {
        CollaborativeEditingHandler.TransformOperation(info, actions);
    }
}
action = actions[actions.Count - 1];
action.Version = updateVersion;
//Return the transformed operation to broadcast it to other clients.
return action;
}
```

Full version of the code discussed about can be found in below GitHub location.

Github Example: [Collaborative editing examples](#)

### Image in Vue Document editor component

Document Editor supports common raster format images like PNG, BMP, JPEG, SVG and GIF. You can insert an image file or online image in the document using the [insertImage\(\)](#) method. Refer to the following sample code.

The following example shows how to open bookmark dialog in Document Editor.

#### **APP.VUE**

```
<template>
  <div id="app">
    <input id="insertImageButton" ref="insertImageButton"
    style="position:fixed; left:-100em" type="file" v-on:change="onInsertImage"
    accept=".jpeg,.jpg,.png,.gif,.bmp">
    <div>
      <button v-on:click='insertImageButtonClick' >Insert
      Image</button>
    </div>
    <ejs-documenteditor ref="documenteditor"
    :enableSfdtExport='true' :enableWordExport='true' :enableSelection='true'
    :enableEditor='true' :isReadOnly='false' height="370px" style="width:
    100%;display:block" ></ejs-documenteditor>
  </div>
</template>
<script>
  import Vue from 'vue'
  import { DocumentEditorPlugin, Selection, Editor, SfdtExport,
  WordExport } from '@syncfusion/ej2-vue-documenteditor';
  Vue.use(DocumentEditorPlugin);
```

```

export default {
  data: function() {
    return {
    };
  },
  provide: {
    //Inject require modules.
    DocumentEditor : [SfdtExport, WordExport, Selection, Editor]
  },
  methods: {
    onInsertImage: function(args: any): void {
      if (navigator.userAgent.match('Chrome') ||
navigator.userAgent.match('Firefox') || navigator.userAgent.match('Edge') ||
navigator.userAgent.match('MSIE') || navigator.userAgent.match('.NET')) {
        let documenteditor =this.$refs.documenteditor;
        if (args.target.files[0]) {
          let path = args.target.files[0];
          let reader = new FileReader();
          reader.onload = function (frEvent: any) {
            let base64String = frEvent.target.result;
            let image = document.createElement('img');
            image.addEventListener('load', function () {
              //Insert image in Document Editor.

documenteditor.ej2Instances.editor.insertImage(base64String, this.width,
this.height);

            })
            image.src = base64String;
          };
          reader.readAsDataURL(path);
        }
        //Safari does not Support FileReader Class
      } else {
        let image = document.createElement('img');
        image.addEventListener('load', function () {
          //Insert image in Document Editor.

documenteditor.ej2Instances.editor.insertImage(args.target.value);
        })
        image.src = args.target.value;
      }
    },
    insertImageButtonClick: function() {
      this.$refs.insertImageButton.value = '';
      this.$refs.insertImageButton.click();
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>

```

```
{% previewsample "page.domainurl/code-snippet/document-editor/bookmark-cs2" %}
```

Image files will be internally converted to base64 string. Whereas, online images are preserved as URL.

Note: EMF and WMF images can't be inserted, but these types of images will be preserved in Document Editor when using ASP.NET MVC Web API.

#### Image resizing

Document Editor provides built-in image resizer that can be injected into your application based on the requirements. This allows you to resize the image by dragging the resizing points using mouse or touch interactions. This resizer appears as follows.

#### Changing size

Document Editor expose API to get or set the size of the selected image. Refer to the following sample code.

```
`ts  
this.$refs.documenteditor.ej2Instances.selection.imageFormat.width = 800;  
this.$refs.documenteditor.ej2Instances.selection.imageFormat.height = 800;  
`
```

Note: Images are stored and processed(read/write) as base64 string in Document Editor. The online image URL is preserved as a URL in Document Editor upon saving.

#### Text wrapping style

Text wrapping refers to how images fit with surrounding text in a document. Please [refer to this page](#) for more information about text wrapping styles available in Word documents.

#### Positioning the image

Document Editor preserves the position properties of the image and displays the image based on position properties. It does not support modifying the position properties. Whereas the image will be automatically moved along with text edited if it is positioned relative to the line or paragraph.

### Shapes in Vue Document editor component

Shapes are drawing objects that include a text box, rectangles, lines, curves, circles, etc. It can be preset or custom geometry. At present, Document Editor does not have support to insert shapes. However, if the document contains a shape while importing, it will be preserved properly.

#### Supported shapes

The Document Editor has preservation support for Text box, Rectangle, Rounded Rectangle and Line shapes.

Note: When using ASP.NET MVC service, the unsupported shapes will be converted as image and preserved as image.

#### Text box Shape

A text box is a rectangular area on the document where you can enter text. When you click in a text box, a flashing cursor will display indicating that you can begin typing. It allows you to enter multiple lines of text with all text formatting.

Adventure Works Cycles, the fictitious company on which the Adventure Works sample databases are based, is a large, multinational manufacturing company. The company manufactures and sells metal **Adventure Works Cycles** and composite bicycles to North American, European and Asian commercial markets. While its base operation is located in Bothell, Washington with 290 employees, several regional sales teams are located throughout their market base.

#### Shape Resizer

The Document Editor also supports a built-in shape resizer to resize the shapes present in the document. The shape resizer accepts both touch and mouse interactions.

### Text wrapping style

Text wrapping refers to how shapes fit with surrounding text in a document. Please [refer to this page](#) for more information about text wrapping styles available in Word documents.

### Positioning the shape

Document Editor preserves the position properties of the shape and displays the shape based on position properties. It does not support modifying the position properties. Whereas the shape will be automatically moved along with text edited if it is positioned relative to the line or paragraph.

### Text wrapping style in Vue Document editor component

Text wrapping refers to how images and shapes are fit with surrounding text in a document. Currently, Document Editor has only preservation support for image and textbox shape with below wrapping styles.

#### In-Line with Text

In this option, the image or shape is placed on the same line surrounding with text like any other word or letter. This image or shape will be automatically moved along with the text while editing, whereas the other options denote that the image or shape stays in a fixed position while the text shifts and wraps around it.

Adventure Works Cycles, the fictitious company on which the AdventureWorks sample databases are based, is a large, multinational manufacturing company. The company

manufactures and sells metal and composite bicycles to North American, European and Asian commercial markets. While its base operation is located in

#### In Front of Text

In this option, the image or shape is placed in front of the text. This can be used to place an image around some text or to add shape to highlight the part in a paragraph.

Adventure Works Cycles, the fictitious company on which the AdventureWorks sample databases are based, is a large manufacturing company. The company manufactures and sells metal and composite bicycles to North American, European and Asian commercial markets. While its base operation is located in Bothell, Washington with 290 employees, several regional sales representatives are located and shipped in throughout their market base.

Note: Starting from v18.2.0.x, the in front of wrapping styles are supported.

#### Top and Bottom

In this option, Text wraps above and below the image or shape. No text is to the left or right of the image or shape. This can be used for larger images or shapes that occupy most of the width in a document.

Note: Starting from v19.1.0.x, the top and bottom wrapping style is supported.

Adventure Works Cycles, the fictitious company on which the AdventureWorks sample databases are based, is a large, multinational manufacturing company. The company

manufactures and sells metal and composite bicycles to North American, European and Asian commercial markets. While its base operation is located in Bothell, Washington with 290

#### Behind

In this option, the image or shape is placed behind the text. This can be used when you need to add a watermark or background image to a document.

Adventure Works Cycles, the fictitious company on which the AdventureWorks sample databases are based, is a large, multinational manufacturing company. The company manufactures and sells metal and composite bicycles to North American, European and Asian commercial markets. While its base operation is located in Bothell, Washington with 290 employees, several regional sales teams and manufacturer and located and shipped in throughout their market base.

Note: Starting from v19.2.0.x, behind text wrapping styles are supported.

#### Square

In this option, Text wraps around the image or text box in a square shape.

Note: Tight and Through styles will be preserved as square wrapping style in Document Editor which is supported from v19.2.0.x.

Adventure Works Cycles, the fictitious company on which the Adventure Works sample databases are based, is a large, multinational manufacturing company. The company manufactures and sells metal and composite bicycles to North American, European and Asian commercial markets. While its base operation is located in Bothell, Washington with 290 employees, several regional sales teams are located throughout their market base.

#### Bookmark in Vue Document editor component

Bookmark is a powerful tool that helps you to mark a place in the document to find again easily. You can enter many bookmarks in the document and give each one a unique name to identify easily.

Document Editor provides built-in dialog to add, delete, and navigate bookmarks within the document. To add a bookmark, select a portion of text in the document. After that, jump to the location or add links to it within the document using built-in hyperlink dialog. You can also delete bookmarks from a document.

Bookmark names need to begin with a letter. They can include both numbers and letters, but not spaces. To separate the words, use an underscore.

Bookmark names starting with an underscore are called hidden bookmarks. For example, bookmarks generated for table of contents.

#### Add bookmark

Using [insertBookmark](#) method, Bookmark can be added to the selected text.

```
`c#
this.$refs.container.ej2Instances.documentEditor.editor.insertBookmark("Bookmark1");
`
```

#### Select Bookmark

You can select the bookmark in the document using [selectBookmark](#) method by providing Bookmark name to select as shown in the following code snippet.

```
`c#
this.$refs.container.ej2Instances.documentEditor.selection.selectBookmark("Bookmark1", true)
`
```

Note: Second parameter is optional parameter and it denotes is exclude bookmark start and end from selection. If true, excludes bookmark start and end from selection.

#### Delete Bookmark

You can delete bookmark in the document using [deleteBookmark](#) method as shown in the following code snippet.

```
`c#
this.$refs.container.ej2Instances.documentEditor.editor.deleteBookmark("Bookmark1");
`
```

#### Get Bookmark from document

You can get all the bookmarks in the document using [getBookmarks](#) method as shown in the following code snippet.

```
`c#
this.$refs.container.ej2Instances.documentEditor.getBookmarks(false);
`
```

Note: Parameter denotes is include hidden bookmarks. If false, ignore hidden bookmark.

#### Get Bookmark from selection

You can get bookmarks in current selection in the document using [getBookmarks](#) method as shown in the following code snippet.

```
`csharp
this.$refs.container.ej2Instances.documentEditor.selection.getBookmarks(false);
`
```

#### Replace bookmark content

You can replace bookmark content without removing the bookmark start and end for backtracking the bookmark content.

```
`csharp
```

```
this.$refs.container.ej2Instances.documentEditor.selection.selectBookmark("Bookmark1", true);
this.$refs.container.ej2Instances.documentEditor.editor.insertText('Hello World')
`
```

You can replace content by removing the bookmark start and end, thus the bookmark content can't be tracked in future.

```
`csharp
```

```
this.$refs.container.ej2Instances.documentEditor.selection.selectBookmark("Bookmark1");
this.$refs.container.ej2Instances.documentEditor.editor.insertText('Hello World')
`
```

### Show or Hide bookmark

You can show or hide the show square brackets around bookmarked items in Document editor component.

The following example code illustrates how to show or hide square brackets around bookmarked items.

```
`typescript
```

```
this.$refs.container.ej2Instances.documentEditorSettings.showBookmarks = true;
`
```

### Bookmark Dialog

The following example shows how to open bookmark dialog in Document Editor.

#### APP.VUE

```
<template>
  <div id="app">
    <div>
      <button v-on:click='showBookmarkDialog'>Open dialog</button>
    </div>
    <ejs-documenteditor ref="documenteditor" :enableSelection='true'
:isReadOnly='false' :enableEditor='true' :enableEditorHistory='true'
:enableBookmarkDialog='true' height="370px" style="width: 100%;"></ejs-
documenteditor>
  </div>
</template>
<script>
  import Vue from 'vue'
  import { DocumentEditorPlugin, Selection, Editor, SfdtExport,
EditorHistory, BookmarkDialog } from '@syncfusion/ej2-vue-documenteditor';
  Vue.use(DocumentEditorPlugin);
  export default {
    data: function() {
      return {
      };
    },
    provide: {
      //Inject require modules.
```

```

        DocumentEditor : [Selection, Editor, BookmarkDialog ,
EditorHistory, SfdtExport]
    }
    methods: {
        showBookmarkDialog: function() {
            //Open bookmark dialog.
            this.$refs.documenteditor.showDialog('Bookmark');
        }
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/document-editor/bookmark-cs1" %}

### Link in Vue Document editor component

Document Editor supports hyperlink field. You can link a part of the document content to Internet or file location, mail address, or any text within the document.

#### Navigate a hyperlink

Document Editor triggers 'requestNavigate' event whenever user clicks Ctrl key or tap a hyperlink within the document. This event provides necessary details about link type, navigation URL, and local URL (if any) as arguments, and allows you to easily customize the hyperlink navigation functionality.

#### Add the requestNavigate event for DocumentEditor

The following example illustrates how to add requestNavigate event for DocumentEditor.

#### APP.VUE

```

<template>
    <div id="app">
        <ejs-documenteditor ref="documenteditor" :enableSelection='true'
:isReadOnly='false' v-bind:requestNavigate="onRequestNavigate"
height="370px" style="width: 100%;"></ejs-documenteditor>
    </div>
</template>
<script>
    import Vue from 'vue'
    import { DocumentEditorPlugin, Selection, RequestNavigateEventArgs }
from '@syncfusion/ej2-vue-documenteditor';
    Vue.use(DocumentEditorPlugin);
    export default {
        data: function() {
            return {
            };
        },
        provide: {

```

```

        DocumentEditor : [Selection]
    }
    methods: {
        onRequestNavigate: function(args: RequestNavigateEventArgs) {
            if (args.linkType !== 'Bookmark') {
                let link: string = args.navigationLink;
                if (args.localReference.length > 0) {
                    link += '#' + args.localReference;
                }
                window.open(link);
                args.isHandled = true;
            }
        }
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/document-editor/link-cs1" %}

[Add the requestNavigate event for DocumentEditorContainer component](#)

The following example illustrates how to add requestNavigate event for DocumentEditorContainer component.

,

```

<template>
<div id="app">
<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' v-on:created="onCreated"
height="590px" id='container' :enableToolbar='true'></ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue'

import { DocumentEditorContainerPlugin, Selection, Editor, RequestNavigateEventArgs, Toolbar } from
'@syncfusion/ej2-vue-documenteditor';

Vue.use(DocumentEditorContainerPlugin);

export default {
data: function() {
return { serviceUrl:'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/'
};
},
provide: {

```

```

DocumentEditorContainer: [Toolbar],
},
methods: {
  onCreated() {
    // Add event listener for requestNavigate event to customize hyperlink navigation functionality
    this.$refs.container.ej2Instances.documentEditor.requestNavigate = function (args) {
      if (args.linkType !== 'Bookmark') {
        let link: string = args.navigationLink;
        if (args.localReference.length > 0) {
          link += '#' + args.localReference;
        }
        window.open(link);
        args.isHandled = true;
      }
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
`

```

If the selection is in hyperlink, trigger this event by calling `navigateHyperlink` method of `Selection` instance. Refer to the following example.

```
documenteditor.selection.navigateHyperlink();
```

#### Copy link

Document Editor copies link text of a hyperlink field to the clipboard if the selection is in hyperlink. Refer to the following example.

```
documenteditor .selection.copyHyperlink();
```

#### Add hyperlink

To create a basic hyperlink in the document, press `ENTER` / `SPACEBAR` / `SHIFT + ENTER` / `TAB` key after typing the address, for instance <http://www.google.com>. Document Editor automatically converts this address to a hyperlink field. The text can be considered as a valid URL if it starts with any of the following.

``http://`<br>```https://`<br>``file:///<br>``www.<br>``mailto:<br>`

Refer to the following example.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-documenteditor ref="documenteditor" :enableSelection='true'
    :isReadOnly='false' :enableEditor='true' v-
    bind:requestNavigate="onRequestNavigate" height="370px" style="width:
    100%;"></ejs-documenteditor>
  </div>
</template>
<script>
  import Vue from 'vue'
  import { DocumentEditorPlugin, Selection, Editor,
  RequestNavigateEventArgs } from '@syncfusion/ej2-vue-documenteditor';
  Vue.use(DocumentEditorPlugin);
  export default {
    data: function() {
      return {
      };
    },
    provide: {
      DocumentEditor : [Selection, Editor]
    },
    methods: {
      onRequestNavigate: function(args: RequestNavigateEventArgs) {
        if (args.linkType !== 'Bookmark') {
          let link: string = args.navigationLink;
          if (args.localReference.length > 0) {
            link += '#' + args.localReference;
          }
          window.open(link);
          args.isHandled = true;
        }
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
  documenteditor/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/document-editor/link-cs2" %}

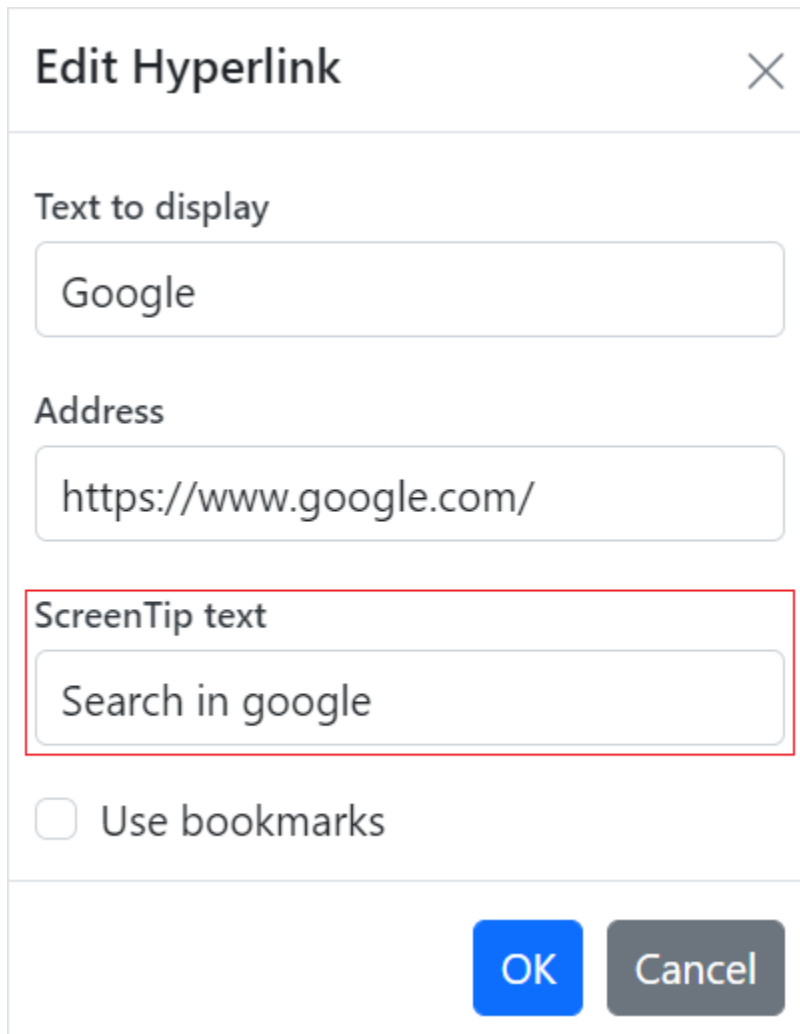

### Customize screen tip

You can customize the screen tip text for the hyperlink by using below sample code.

```
`ts
```

```
this.$refs.documenteditor.ej2Instances.insertHyperlink('https://www.google.com', 'Google', '<<Screen  
tip text>>');
```

Screen tip text can be modified through UI by using the [Hyperlink dialog](#)

### Remove hyperlink

To remove link from hyperlink in the document, press Backspace key at the end of a hyperlink. By removing the link, it will be converted as plain text. You can use `removeHyperlink` method of `Editor` instance if the selection is in hyperlink. Refer to the following example.

```
this.$refs.documenteditor.ej2Instances.editor.removeHyperlink();
```

### Hyperlink dialog

Document Editor provides dialog support to insert or edit a hyperlink. Refer to the following example.

**APP.VUE**

```

<template>
  <div id="app" style="height:330px">
    <div>
      <button v-on:click='showHyperlinkDialog' >Open
dialog</button>
    </div>
    <ejs-documenteditor ref="documenteditor" :enableSelection='true'
:isReadOnly='false' :enableEditor='true' :enableEditorHistory='true'
:enableHyperlinkDialog='true' :enableSfdtExport='true' height="370px"
style="width: 100%;"></ejs-documenteditor>
  </div>
</template>
<script>
  import Vue from 'vue'
  import { DocumentEditorPlugin, Selection, Editor, EditorHistory,
HyperlinkDialog, SfdtExport, RequestNavigateEventArgs } from
'@syncfusion/ej2-vue-documenteditor';
  Vue.use(DocumentEditorPlugin);
  export default {
    data: function() {
      return {
      };
    },
    provide: {
      DocumentEditor : [Selection, Editor, EditorHistory,
HyperlinkDialog, SfdtExport]
    },
    methods: {
      showHyperlinkDialog: function() {
        this.$refs.documenteditor.showDialog('Hyperlink');
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/document-editor/link-cs3" %}

You can use the following keyboard shortcut to open the hyperlink dialog if the selection is in hyperlink.

Key Combination	Description
-----------------	-------------

----- -----	
-------------	--

Ctrl + K	Open hyperlink dialog that allows you to create or edit hyperlink
----------	-------------------------------------------------------------------

## Table in Vue Document editor component

Tables are an efficient way to present information. Document Editor can display and edit the tables. You can select and edit tables through keyboard, mouse, or touch interactions. Document Editor exposes a rich set of APIs to perform these operations programmatically.

### Create a table

You can create and insert a table at cursor position by specifying the required number of rows and columns.

Refer to the following sample code.

```
`ts
this.$refs.documenteditor.ej2Instances.editor.insertTable(3,3);
`
```

The maximum size of row and column is limited to 32767 and 63 respectively.

### Insert rows

You can add a row (or several rows) above or below the row at cursor position by using the [insertRow](#) method. This method accepts the following parameters:

Parameter | Type | Description

left(optional) | boolean | This is optional and if omitted, it takes the value as false and inserts to the right of column at cursor position.

count(optional) | number | This is optional and if omitted, it takes the value as 1.

Refer to the following sample code.

```
`ts
//Insert a column to the right of the column at cursor position.
this.$refs.documenteditor.ej2Instances.editor.insertColumn();
//Insert a column to the left of the column at cursor position.
this.$refs.documenteditor.ej2Instances.editor.insertColumn(false);
//Insert two columns to the left of the column at cursor position.
this.$refs.documenteditor.ej2Instances.editor.insertColumn(false, 2);
`
```

### Select an entire table

If the cursor position is inside a table, you can select the entire table by using the following sample code.

```
`ts
this.$refs.documenteditor.ej2Instances.selection.selectTable();
`
```

### Select row

You can select the entire row at cursor position by using the following sample code.

```
`ts
```

```
this.$refs.documenteditor.ej2Instances.selection.selectRow();  
`
```

If current selection spans across cells of different rows, all these rows will be selected.

#### Select column

You can select the entire column at cursor position by using the following sample code.

```
`ts  
this.$refs.documenteditor.ej2Instances.selection.selectColumn();  
`
```

If current selection spans across cells of different columns, all these columns will be selected.

#### Select cell

You can select the cell at cursor position by using the following sample code.

```
`ts  
this.$refs.documenteditor.ej2Instances.selection.selectCell();  
`
```

#### Delete table

Document Editor allows you to delete the entire table. You can use the [deleteTable\(\)](#) method of editor instance, if selection is in table. Refer to the following sample code.

```
`ts  
this.$refs.documenteditor.ej2Instances.editor.deleteTable();  
`
```

#### Delete row

Document Editor allows you to delete the selected number of rows. You can use the [deleteRow\(\)](#) method of editor instance to delete the selected number of rows, if selection is in table. Refer to the following sample code.

```
`ts  
this.$refs.documenteditor.ej2Instances.editor.deleteRow();  
`
```

#### Delete column

Document Editor allows you to delete the selected number of columns. You can use the [deleteColumn\(\)](#) method of editor instance to delete the selected number of columns, if selection is in table. Refer to the following sample code.

```
`ts  
this.$refs.documenteditor.ej2Instances.editor.deleteColumn();  
`
```

### Merge cells

You can merge cells vertically, horizontally, or combination of both to a single cell. To vertically merge the cells, the columns within selection should be even in left and right directions. To horizontally merge the cells, the rows within selection should be even in top and bottom direction.

Refer to the following sample code.

```
`ts
this.$refs.documenteditor.ej2Instances.editor.mergeCells()
`
```

### Positioning the table

Document Editor preserves the position properties of the table and displays the table based on position properties. It does not support modifying the position properties. Whereas the table will be automatically moved along with text edited if it is positioned relative to the paragraph.

### How to work with tables

The following sample demonstrates how to delete the table row or columns, merge cells and how to bind the API with button.

```
<template>
<div id="app">
<div>
<ejs-toolbar v-bind:clicked='toolbarClickHandler'>
<e-items>
<e-item prefixIcon="e-de-icon-Table" tooltipText="Insert Table" id="table"></e-item>

## Table of contents in Vue Document editor component

The table of contents in a document is same as the list of chapters at the beginning of a book. It lists each heading in the document and the page number, where that heading starts with various options to customize the appearance.

### Inserting table of contents

Document Editor exposes an API to insert table of contents at cursor position programmatically. You can specify the settings for table of contents explicitly. Otherwise, the default settings will be applied.

[TableOfContentsSettings](#) contain the following properties:

- **startLevel:** Specifies the start level for constructing table of contents.
- **endLevel:** Specifies the end level for constructing table of contents.
- **includeHyperlink:** Specifies whether the link for headings is included.
- **includePageNumber:** Specified whether the page number of the headings is included.
- **rightAlign:** Specifies whether the page number is right aligned.
- **tabLeader:** Specifies the tab leader styles such as none, dot, hyphen, and underscore.
- **includeOutlineLevels:** Specifies whether the outline levels are included.

The following code illustrates how to insert table of content in Document Editor.

```
`ts
```

```
let tocSettings: TableOfContentsSettings =
```

```
{
```

```
startLevel: 1, endLevel: 3, includeHyperlink: true, includePageNumber: true, rightAlign: true
```

```
};
```

```
this.$refs.documenteditor.ej2Instances.editor.insertTableOfContents(tocSettings);
```

```
,
```

## APP.VUE

```
<template>
  <div style="width:100%;height:330px">
    <div>
      <button v-on:click='onInsertToc'>Insert TOC</button>
    </div>
    <ejs-documenteditor ref="documenteditor" :isReadOnly='true' v-

    this.$refs.documenteditor.open(sfdd);
  },
  onInsertToc: function() {
    //Table of contents settings.
    let tocSettings: TableOfContentsSettings =
    {
      startLevel: 1, endLevel: 3, includeHyperlink: true,
      includePageNumber: true, rightAlign: true
    }
  }
}

```

```

    };
    //Insert table of contents.

    this.$refs.documenteditor.ej2Instances.editor.insertTableOfContents(tocSettings);
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/document-editor/export-cs8" %}

### Update or edit table of contents

You can update or edit the table of contents using the built-in context menu shown up by right-clicking it. Refer to the following screenshot.

- **Update Field:** Updates the headings in table of contents with same settings by searching the entire document.
- **Edit Field:** Opens the built-in table of contents dialog and allows you to modify its settings.

You can also do it programmatically by using the exposed API. Refer to the following sample code.

```

`ts
let tocSettings: TableOfContentsSettings =
{
  startLevel: 1, endLevel: 3, includeHyperlink: true, includePageNumber: true, rightAlign: true
};

```

```
this.$refs.documenteditor.ej2Instances.editor.insertTableOfContents(tocSettings);  
`
```

Same method is used for inserting, updating, and editing table of contents. This will work based on the current element at cursor position and the optional settings parameter. If table of contents is present at cursor position, the update operation will be done based on the optional settings parameter. Otherwise, the insert operation will be done.

- [Table of contents dialog](#)

### Header footer in Vue Document editor component

Document editor supports headers and footers in its document. Each section in the document can have the following types of headers and footers:

- First page: Used only on the first page of the section.
- Even pages: Used on all even numbered pages in the section.
- Default: Used on all pages of the section, where first or even pages are not applicable or not specified.

You can define this by setting format properties of the corresponding section using the following sample code.

```
`javascript  
//Defines whether different header footer is required for first page of the section  
this.$refs.documenteditor.ej2Instances.selection.sectionFormat.differentFirstPage= true;  
//Defines whether different header footer is required for odd and even pages in the section  
this.$refs.documenteditor.ej2Instances.selection.sectionFormat.differentOddAndEvenPages= true;  
`
```

### Go to header footer region

Double click in header or footer region to move the selection into it. You can also do this by using the following code.

```
`javascript  
this.$refs.documenteditor.ej2Instances.selection.goToHeader();  
`  
  
`javascript  
this.$refs.documenteditor.ej2Instances.selection.goToFooter();  
`
```

### Link to previous

Link to previous is enabled by default when document has more than one section. If you're using different headers and footers such as different first page or different odd and even pages, they can't be linked together because they're all separate.

Before setting or getting the link to previous value, use the '[goToHeader](#)' or '[goToFooter](#)' API to move the current selection to the header or footer region.

You can get or set the default header footer link to previous value of a section at cursor position by using the following sample code.

```
`ts
this.$refs.container.ej2Instances.documentEditor.selection.sectionFormat.oddPageHeader.linkToPrevious = false;

this.$refs.container.ej2Instances.documentEditor.selection.sectionFormat.oddPageFooter.linkToPrevious = false;
`
```

In case the document has different header and footer types, such as different first page, odd, and even pages.

```
`ts
// Different first page
this.$refs.container.ej2Instances.documentEditor.selection.sectionFormat.firstPageHeader.linkToPrevious = false;

this.$refs.container.ej2Instances.documentEditor.selection.sectionFormat.firstPageFooter.linkToPrevious = false;

//Even page
this.$refs.container.ej2Instances.documentEditor.selection.sectionFormat.firstPageHeader.linkToPrevious = false;

this.$refs.container.ej2Instances.documentEditor.selection.sectionFormat.firstPageFooter.linkToPrevious = false;
`
```

Note: When there is more than one section in the document, the Link to Previous option becomes available. By default, this feature is disabled state in UI and set to return false for the first section.

### Header and footer distance

You can define the distance of header region content from the top of the page. Refer to the following sample code.

```
`javascript
this.$refs.documenteditor.ej2Instances.selection.sectionFormat.headerDistance= 36;
`
```

Same way, you can define the distance of footer region content from the bottom of the page. Refer to the following sample code.

```
`javascript
```

```
this.$refs.documenteditor.ej2Instances.selection.sectionFormat.footerDistace= 36;
```

```
,
```

### Close header footer region

Move the selection to the document body from header or footer region by double clicking or tapping the document area. You can also perform this by using the following sample code.

```
`javascript
```

```
this.$refs.documenteditor.ej2Instances.selection.closeHeaderFooter()
```

```
,
```

### Text format in Vue Document editor component

Document Editor supports several formatting options for text like bold, italic, font color, highlight color, and more. This section describes how to modify the formatting for selected text in detail.

#### Bold

The bold formatting for selected text can be get or set by using the following sample code.

```
`ts
```

```
//Gets the value for bold formatting of selected text.
```

```
let bold : boolean = this.$refs.documenteditor.ej2Instances.selection.characterFormat.bold;
```

```
//Sets bold formatting for selected text.
```

```
this.$refs.documenteditor.ej2Instances.selection.characterFormat.bold = true;
```

```
,
```

You can toggle the bold formatting based on existing value at selection. Refer to the following sample code.

```
`ts
```

```
this.$refs.documenteditor.ej2Instances.editor.toggleBold();
```

```
,
```

#### Italic

The Italic formatting for selected text can be get or set by using the following sample code.

```
`ts
```

```
//Gets the value for italic formatting of selected text.
```

```
let italic : boolean = this.$refs.documenteditor.ej2Instances.selection.characterFormat.italic;
```

```
//Sets italic formatting for selected text.
```

```
this.$refs.documenteditor.ej2Instances.selection.characterFormat.italic= true|false;
```

`

You can toggle the Italic formatting based on existing value at selection. Refer to the following sample code.

```
`ts
this.$refs.documenteditor.ej2Instances.editor.toggleItalic();
```

`

### Underline property

The underline style for selected text can be get or set by using the following sample code.

```
`ts
//Gets the value for underline formatting of selected text.
let underline : Underline = this.$refs.documenteditor.ej2Instances.selection.characterFormat.underline;
//Sets underline formatting for selected text.
this.$refs.documenteditor.ej2Instances.selection.characterFormat.underline='Single' | 'None';
```

`

You can toggle the underline style of selected text based on existing value at selection by specifying a value. Refer to the following sample code.

```
`ts
this.$refs.documenteditor.ej2Instances.editor.toggleUnderline('Single');
```

`

### Strikethrough property

The strikethrough style for selected text can be get or set by using the following sample code.

```
`ts
//Gets the value for strikethrough formatting of selected text.
let strikethrough : Strikethrough =
this.$refs.documenteditor.ej2Instances.selection.characterFormat.strikethrough;
//Sets strikethrough formatting for selected text.
this.$refs.documenteditor.ej2Instances.selection.characterFormat.strikethrough='Single' | 'Normal';
```

`

You can toggle the strikethrough style of selected text based on existing value at selection by specifying a value. Refer to the following sample code.

```
`ts
this.$refs.documenteditor.ej2Instances.editor.toggleStrikethrough();
```

`

### Superscript property

The selected text can be made superscript by using the following sample code.

```
`ts
//Gets the value for baselineAlignment formatting of selected text.
let baselineAlignment : BaselineAlignment =
this.$refs.documenteditor.ej2Instances.selection.characterFormat.baselineAlignment;
//Sets baselineAlignment formatting for selected text.
this.$refs.documenteditor.ej2Instances.selection.characterFormat.baselineAlignment='Superscript';
`
```

Toggle the selected text as superscript or normal using the following sample code.

```
`ts
this.$refs.documenteditor.ej2Instances.editor.toggleSuperscript();
`
```

### Subscript property

The selected text can be made subscript by using the following sample code.

```
`ts
//Gets the value for baselineAlignment formatting of selected text.
let baselineAlignment : BaselineAlignment =
this.$refs.documenteditor.ej2Instances.selection.characterFormat.baselineAlignment;
//Sets baselineAlignment formatting for selected text.
this.$refs.documenteditor.ej2Instances.selection.characterFormat.baselineAlignment='Subscript';
`
```

Toggle the selected text as subscript or normal using the following sample code.

```
`ts
this.$refs.documenteditor.ej2Instances.editor.toggleSubscript();
`
```

You can make a subscript or superscript text as normal using the following code.

```
`ts
this.$refs.documenteditor.ej2Instances.selection.characterFormat.baselineAlignment='Normal';
`
```

### Size

The size of selected text can be get or set using the following code.

```
`ts
//Gets the value for fontSize formatting of selected text.
let fontSize : number = this.$refs.documenteditor.ej2Instances.selection.characterFormat.fontSize;
//Sets fontSize formatting for selected text.
```

```
this.$refs.documenteditor.ej2Instances.selection.characterFormat.fontSize= 32;
、
```

### Color

The color of selected text can be get or set using the following code.

```
`ts
//Gets the value for fontColor formatting of selected text.
let fontColor : string = this.$refs.documenteditor.ej2Instances.selection.characterFormat.fontColor;
//Sets fontColor formatting for selected text.
this.$refs.documenteditor.ej2Instances.selection.characterFormat.fontColor= 'Pink';
this.$refs.documenteditor.ej2Instances.selection.characterFormat.fontColor= '#FFC0CB';
、
```

### Font

The font style of selected text can be get or set using the following sample code.

```
`ts
//Gets the value for fontFamily formatting of selected text.
let baselineAlignement : string =
this.$refs.documenteditor.ej2Instances.selection.characterFormat.fontFamily;
//Sets fontFamily formatting for selected text.
this.$refs.documenteditor.ej2Instances.selection.characterFormat.fontFamily= 'Arial';
、
```

### Highlight color

The highlight color of the selected text can be get or set using the following sample code.

```
`ts
//Gets the value for highlightColor formatting of selected text.
let highlightColor : HighlightColor =
this.$refs.documenteditor.ej2Instances.selection.characterFormat.highlightColor;
//Sets highlightColor formatting for selected text.
this.$refs.documenteditor.ej2Instances.selection.characterFormat.highlightColor= 'Pink';
、
```

### Toolbar with options for text formatting

Refer to the following example.

```
、
<template>
<div id="app">
<div>
```

```

<ejs-toolbar v-bind:clicked='toolbarClickHandler'>
<e-items>
<e-item prefixIcon="e-de-icon-Bold" tooltipText="Bold" id="bold"></e-item>
<e-item prefixIcon="e-de-icon-Italic" tooltipText="Italic" id="italic"></e-item>
<e-item prefixIcon="e-de-icon-Underline" tooltipText="Underline" id="underline"></e-item>
<e-item prefixIcon="e-de-icon-Strikethrough" tooltipText="Strikethrough" id="striketrough"></e-item>
<e-item prefixIcon="e-de-icon-Subscript" tooltipText="Subscript" id="subscript"></e-item>
<e-item prefixIcon="e-de-icon-Superscript" tooltipText="Superscript" id="superscript"></e-item>
<e-item type="Seperator"></e-item>
<e-item type="Input" :template="<ejs-colorpicker :value='#000000' :showButtons='true'

## Paragraph format in Vue Document editor component

Document Editor supports various paragraph formatting options such as text alignment, indentation, paragraph spacing, and more.

### Indentation

You can modify the left or right indentation of selected paragraphs using the following sample code.

```

`javascript
this.$refs.documenteditor.ej2Instances.selection.paragraphFormat.leftIndent= 24;
this.$refs.documenteditor.ej2Instances.selection.paragraphFormat.rightIndent= 24;
`

```

### Special indentation

You can define special indent for first line of the paragraph using the following sample code.

```

`javascript
this.$refs.documenteditor.ej2Instances.selection.paragraphFormat.firstLineIndent= 24;
`

```

### Increase indent

You can increase the left indent of selected paragraphs by a factor of 36 points using the following sample code.

```

`javascript

```

```
this.$refs.documenteditor.ej2Instances.editor.increaseIndent()
```

```
,
```

### Decrease indent

You can decrease the left indent of selected paragraphs by a factor of 36 points using the following sample code.

```
`javascript
```

```
this.$refs.documenteditor.ej2Instances.editor.decreaseIndent()
```

```
,
```

### Text alignment

You can get or set the text alignment of selected paragraphs using the following sample code.

```
`javascript
```

```
this.$refs.documenteditor.ej2Instances.selection.paragraphFormat.textAlignment= 'Center' | 'Left' |  
'Right' | 'Justify';
```

```
,
```

You can toggle the text alignment of selected paragraphs by specifying a value using the following sample code.

```
`javascript
```

```
this.$refs.documenteditor.ej2Instances.editor.toggleTextAlignment('Center' | 'Left' | 'Right' | 'Justify');
```

```
,
```

### Line spacing and its type

You can define the line spacing and its type for selected paragraphs using the following sample code.

```
`javascript
```

```
//Set line spacing type.
```

```
this.$refs.documenteditor.ej2Instances.selection.paragraphFormat.lineSpacingType='AtLeast';
```

```
//Set line spacing.
```

```
this.$refs.documenteditor.ej2Instances.selection.paragraphFormat.lineSpacing= 6;
```

```
,
```

### Paragraph spacing

You can define the spacing before or after the paragraph by using the following sample code.

```
`javascript
```

```
//Set before spacing.
```

```
this.$refs.documenteditor.ej2Instances.selection.paragraphFormat.beforeSpacing= 24;
```

```
//Set after spacing.
```

```
this.$refs.documenteditor.ej2Instances.selection.paragraphFormat.afterSpacing= 24;
```

```
,
```

You can also set automatic spacing before and after the paragraph by using the following sample code.

```
`ts
this.$refs.documenteditor.ej2Instances.selection.paragraphFormat.spaceBeforeAuto = true;
this.$refs.documenteditor.ej2Instances.selection.paragraphFormat.spaceAfterAuto = true;
`
```

Note: If auto spacing property is enabled, then value defined in the `beforeSpacing` and `afterSpacing` property will not be considered.

### Pagination properties

You can enable or disable the following pagination properties for the paragraphs in a Word document.

- Widow/Orphan control - whether the first and last lines of the paragraph are to remain on the same page as the rest of the paragraph when paginating the document.
- Keep with next - whether the specified paragraph remains on the same page as the paragraph that follows it while paginating the document.
- Keep lines together - whether all lines in the specified paragraphs remain on the same page while paginating the document.

The following example code illustrates how to enable or disable these pagination properties for the selected paragraphs.

```
`javascript
this.$refs.documenteditor.selection.paragraphFormat.widowControl = false;
this.$refs.documenteditor.selection.paragraphFormat.keepWithNext = true;
this.$refs.documenteditor.selection.paragraphFormat.keepLinesTogether = true;
`
```

### Paragraph Border

You can apply borders to the paragraphs in a Word document. Using borders, decorate the paragraphs to set them apart from other paragraphs in the document.

The following example code illustrates how to apply box border for the selected paragraphs.

```
`ts
// left
this.$refs.documenteditor.selection.paragraphFormat.borders.left.lineStyle = 'Single';
this.$refs.documenteditor.selection.paragraphFormat.borders.left.lineWidth = 3;
this.$refs.documenteditor.selection.paragraphFormat.borders.left.color = "#000000";
//right
this.$refs.documenteditor.selection.paragraphFormat.borders.right.lineStyle = 'Single';
this.$refs.documenteditor.selection.paragraphFormat.borders.right.lineWidth = 3;
this.$refs.documenteditor.selection.paragraphFormat.borders.right.color = "#000000";
```

```
//top
this.$refs.documenteditor.selection.paragraphFormat.borders.top.lineStyle = 'Single';
this.$refs.documenteditor.selection.paragraphFormat.borders.top.lineWidth = 3;
this.$refs.documenteditor.selection.paragraphFormat.borders.top.color = "#000000";
//bottom
this.$refs.documenteditor.selection.paragraphFormat.borders.bottom.lineStyle = 'Single';
this.$refs.documenteditor.selection.paragraphFormat.borders.bottom.lineWidth = 3;
this.$refs.documenteditor.selection.paragraphFormat.borders.bottom.color = "#000000";
`
```

Note: At present, the Document editor component displays all the border styles as single line. But you can apply any border style and get the proper display in Microsoft Word app when opening the exported Word document.

### Show or Hide Paragraph marks

You can show or hide the hidden formatting symbols like spaces, tab, paragraph marks, and breaks in Document editor component. These marks help identify the start and end of a paragraph and all the hidden formatting symbols in a Word document.

The following example code illustrates how to show or hide paragraph marks.

```
`ts
this.$refs.documenteditor.documentEditorSettings.showHiddenMarks = true;
`
```

### Toolbar with paragraph formatting options

The following sample demonstrates the paragraph formatting options using a toolbar.

```
<template>
<div id="app" style="height:330px">
<div>
<ejs-toolbar v-bind:clicked='toolbarButtonClick'>
<e-items>
<e-item prefixIcon='e-de-icon-AlignLeft' id='AlignLeft' tooltipText='Align Left'></e-item>
<e-item prefixIcon='e-de-icon-AlignCenter' id='Align Center' tooltipText='AlignCenter'></e-item>
<e-item prefixIcon='e-de-icon-AlignRight' id='Align Right' tooltipText='AlignRight'></e-item>
<e-item prefixIcon='e-de-icon-Justify' id='Justify' tooltipText='Justify'></e-item>
<e-item prefixIcon='e-de-icon-IncreaseIndent' id='IncreaseIndent'
tooltipText='Increase Indent'></e-item>
<e-item prefixIcon='e-de-icon-DecreaseIndent' id='DecreaseIndent'
```

```

tooltipText='Decrease Indent'></e-item>
<e-item type='Separator'></e-item>
<e-item prefixIcon='e-de-icon-ClearAll' id='ClearFormat' tooltipText='ClearFormatting'></e-item>
<e-item type='Separator'></e-item>
<e-item prefixIcon='e-de-e-paragraph-mark e-icons' id='ShowParagraphMark'
tooltipText='Show the hidden characters like spaces, tab, paragraph marks, and breaks.(Ctrl + *)'></e-
item>
</e-items>
</ejs-toolbar>
</div>

<ejs-documenteditor ref="documenteditor" v-bind:selectionChange='onSelectionChange'
:enableSelection='true'
:isReadOnly='false' :enableEditor='true' :enableEditorHistory='true' :enableSfdtExport='true'
:enableContextMenu='true' height="370px" style="width: 100%;"></ejs-documenteditor>
</div>
</template>
<script>

## Styles in Vue Document editor component

Styles are useful for applying a set of formatting consistently throughout the document. In document editor, styles are created and added to a document programmatically or via the built-in Styles dialog.

### Styles definition overview

A Style in document editor should have the following properties:

- **name**: Name of the style. All styles in a document have a unique name, which is used as an identifier when applying the style.
- **type**: Specifies the document elements that the style will target. For example, paragraph or character.
- **next**: Specifies that the current style inherits the style set to this property. This is how hierarchical styles are defined.
- **link**: Provides a relation between the paragraph and character style.
- **characterFormat**: Specifies the properties of paragraph and character style.
- **paragraphFormat**: Specifies the properties of paragraph style.
- **basedOn**: Specifies that the current style inherits the style set to this property. This is how hierarchical styles are defined. It can be optional.

The style type should match the inherited style type. For example, it is not possible to have a character style inherit a paragraph style.

### Default style

The default style for span and paragraph properties is normal. It internally inherits the default style of the document loaded or document editor component.

### Style hierarchy

Each style initially checks its local value for the property that is being evaluated and turns to the style it is based on. If no local value is found, it turns to its default style.

Style inheritance of different styles are listed as follows:

#### Character style

Character styles are based only on other character styles.

The inheritance is: Character properties are inherited from the base character style.

#### Paragraph style

Paragraph styles are based on other paragraph styles or on linked styles.

When a paragraph style is based on another paragraph style, the inheritance of the properties is as follows:

- Paragraph properties are inherited from the base paragraph style.
- Span properties are inherited from the base paragraph style.

When a paragraph style is based on a linked style, the inheritance of the properties is as follows:

- Paragraph properties are inherited from the paragraph style part in its base linked style.
- Span properties are inherited from the span style part in its base linked style.

#### *Linked style*

Linked styles are composite styles and their components are paragraph and character styles with link between them. To apply paragraph properties, take the properties from the linked paragraph style. Similarly, to apply character properties, take the properties from linked character style.

Linked styles are based on other linked styles or on paragraph styles.

When a linked style is based on a paragraph style, the hierarchy of the properties is as follows:

- Paragraph properties are inherited from the 'basedOn' paragraph style.
- Character properties are inherited from the 'basedOn' paragraph style.

When a linked style is based on another linked style, the hierarchy of the properties is as follows:

- Paragraph properties are inherited from the paragraph style part in its base linked style.
- Span properties are inherited from the span style part in its base linked style.

#### *Defining new styles*

New Styles are defined and added to the style collection of the document. In this way, they will be discovered by the default UI and applied to the parts of a document.

#### *Defining a character style*

The following example shows how to programmatically create a character style.

```
`ts
let styleJson: any = {
  "type": "Character",
  "name": "New CharacterStyle",
  "basedOn": "Default Paragraph Font",
  "characterFormat": {
    "fontSize": 16.0,
    "fontFamily": "Calibri Light",
    "fontColor": "#2F5496",
    "bold": true,
    "italic": true,
    "underline": "Single"
  }
};
```

```
this.$refs.documenteditor.ej2Instances.editor.createStyle(JSON.stringify(styleJson));  
、
```

### Defining a paragraph style

The following example shows how to programmatically create a paragraph style.

```
`ts  
  
let styleJson: any = {  
  "type": "Paragraph",  
  "name": "New ParagraphStyle",  
  "basedOn": "Normal",  
  "characterFormat": {  
    "fontSize": 16.0,  
    "fontFamily": "Calibri Light",  
    "fontColor": "#2F5496",  
    "bold": true,  
    "italic": true,  
    "underline": "Single"  
  },  
  "paragraphFormat": {  
    "leftIndent": 0.0,  
    "rightIndent": 0.0,  
    "firstLineIndent": 0.0,  
    "beforeSpacing": 12.0,  
    "afterSpacing": 0.0,  
    "lineSpacing": 1.0791666507720947,  
    "lineSpacingType": "Multiple",  
    "textAlignment": "Left",  
    "outlineLevel": "Level1"  
  }  
};  
  
this.$refs.documenteditor.ej2Instances.editor.createStyle(JSON.stringify(styleJson));  
、
```

### Defining a linked style

The following example shows how to programmatically create linked style.

```
`ts
```

```

let styleJson: any = {
  "type": "Paragraph",
  "name": "New Linked",
  "basedOn": "Normal",
  "next": "Normal",
  "link": "New Linked Char",
  "characterFormat": {
    "fontSize": 16.0,
    "fontFamily": "Calibri Light",
    "fontColor": "#2F5496"
  },
  "paragraphFormat": {
    "leftIndent": 0.0,
    "rightIndent": 0.0,
    "firstLineIndent": 0.0,
    "beforeSpacing": 12.0,
    "afterSpacing": 0.0,
    "lineSpacing": 1.0791666507720947,
    "lineSpacingType": "Multiple",
    "textAlignment": "Left",
    "outlineLevel": "Level1"
  }
};

this.$refs.documenteditor.ej2Instances.editor.createStyle(JSON.stringify(styleJson));

```

### Applying a style

The styles are applied using the **applyStyle** method of **Editor**, the parameter should be passed is the **Name** of the Style.

The styles of the **Character** type is applied to the currently selected part of the document. If there is no selection, the values that will be applied to the word at caret position. The styles of **Paragraph** type follow the same logic and are applied to all paragraphs in the selection or the current paragraph.

When there is no selection, styles of **Linked** type will change the values of the paragraph, and apply both the Paragraph and Character properties. When there is selection, Linked Style changes only the character properties of the selected text.

For example, the following line will apply the "New Linked" to the current paragraph.

```
`ts
this.$refs.documenteditor.ej2Instances.editor.applyStyle('New Linked');
//Clear direct formatting and apply the specified style
this.$refs.documenteditor.ej2Instances.editor.applyStyle('New Linked', true);
`
```

### Get Styles

You can get the styles in the document using the below code snippet.

```
`typescript
//Get paragraph styles
let paragraphStyles = this.$refs.documenteditor.ej2Instances.documentEditor.getStyles('Paragraph');
//Get character styles
let paragraphStyles = this.$refs.documenteditor.ej2Instances.documentEditor.getStyles('Character');
`
```

### Modify an existing style

You can modify a existing style with the specified style properties using [createStyle](#) method. If modifyExistingStyle parameter is set to `true` the style properties is updated to the existing style.

The following illustrate to modify an existing style.

```
`typescript
let styleJson: any = {
  "type": "Paragraph",
  "name": "Heading 1",
  "characterFormat": {
    "fontSize": 32,
    "fontFamily": "Calibri"
  }
};
this.$refs.documenteditor.ej2Instances.documentEditor.editor.createStyle(styleName, true);
`
```

If modifyExistingStyle parameter is set to true and a style already exists with same name, it modifies the specified properties in the existing style.

If modifyExistingStyle parameter is set to false and a style already exists with same name, it creates a new style with unique name by appending '\_1'. Hence, the newly style will not have the specified name.

If no style exists with same name, it creates a new style.

Footer

## List format in Vue Document editor component

Document Editor supports both the single-level and multilevel lists. Lists are used to organize data as step-by-step instructions in documents for easy understanding of key points. You can apply list to the paragraph either using supported APIs.

### Create bullet list

Bullets are usually used for unordered lists. To apply bulleted list for selected paragraphs, use the following method of 'Editor' instance.

```
applyBullet(bullet, fontFamily);
```

Parameter	Type	Description
bullet	string	Bullet character.
fontFamily	string	Bullet font family.

Refer to the following sample code.

```
`ts
```

```
this.$refs.documenteditor.ej2Instances.editor.applyBullet('\uf0b7', 'Symbol');
```

```
,
```

### Create numbered list

Numbered lists are usually used for ordered lists. To apply numbered list for selected paragraphs, use the following method of 'Editor' instance.

```
applyNumbering(numberFormat,listLevelPattern)
```

Parameter	Type	Description
numberFormat	string	“%n” representations in ‘numberFormat’ parameter will be replaced by respective list level’s value. “%1” will be displayed as “1”
listLevelPattern(optional)	string	Default value is 'Arabic'.

Refer to the following example.

```
`ts
```

```
this.$refs.documenteditor.ej2Instances.editor.applyNumbering('%1', 'UpRoman');
```

```
,
```

### Clear list

You can also clear the list formatting applied for selected paragraphs. Refer to the following sample code.

```
`ts
```

```
this.$refs.documenteditor.ej2Instances.editor.clearList();
```

```
,
```

### Working with lists

The following sample demonstrates how to create bullet and numbering lists in Document Editor.

,

```
<template>
<div style="width:100%;height:330px">
<div>
<ejs-toolbar v-bind:clicked='toolbarButtonClick'>
<e-items>
<e-item prefixIcon="e-de-ctnr-bullets e-icons" tooltipText="Bullets" id="Bullets"></e-item>
<e-item prefixIcon="e-de-ctnr-numbering e-icons" tooltipText="Numbering" id="Numbering"></e-item>
<e-item text="Clear" id="clearlist" tooltipText="Clear List"></e-item>
</e-items>
</ejs-toolbar>
</div>
<ejs-documenteditor ref="documenteditor" :enableSelection='true' :isReadOnly='false'
:enableEditor='true' :enableEditorHistory='true' :enableSfdtExport='true' height="370px" style="width:
100%;"></ejs-documenteditor>
</div>
</template>
<script>
import Vue from 'vue'

import { DocumentEditorPlugin, Selection, Editor, SfdtExport, EditorHistory } from '@syncfusion/ej2-
vue-documenteditor';

import { ToolbarPlugin } from "@syncfusion/ej2-vue-navigations";

Vue.use(DocumentEditorPlugin);

Vue.use(ToolbarPlugin);

export default {
data: function() {
return {
};
},
provide: {
DocumentEditor : [SfdtExport, EditorHistory, Selection, Editor]
}
}
```

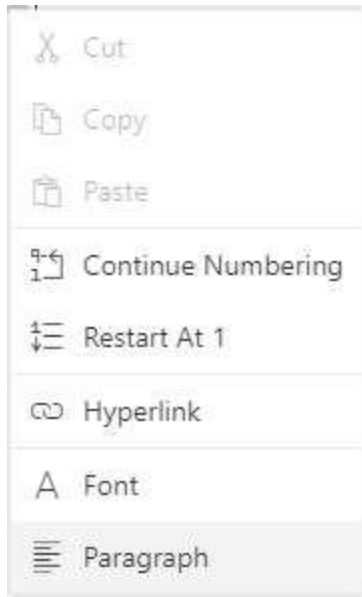

```

methods: {
  toolbarButtonClick: function(args) {
    switch (args.item.id) {
      case 'Bullets':
        //To create bullet list
        this.$refs.documenteditor.ej2Instances.editor.applyBullet('\uf0b7', 'Symbol');
        break;
      case 'Numbering':
        //To create numbering list
        this.$refs.documenteditor.ej2Instances.editor.applyNumbering('%1', 'UpRoman');
        break;
      case 'clearlist':
        //To clear list
        this.$refs.documenteditor.ej2Instances.editor.clearList();
        break;
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>

```

### Editing numbered list

Document Editor restarts the numbering or continue numbering for a numbered list. These options are found in the built-in context menu, if the list value is selected. Refer to the following screenshot.

See Also

- [List dialog](#)

### Table format in Vue Document editor component

Document editor customizes the formatting of table, or table cells such as table width, cell margins, cell spacing, background color, and table alignment. This section describes how to customize these formatting for selected cells, rows, or table in detail.

#### Cell margins

You can customize the cell margins by using the following sample code.

```
`ts
//To change the left margin
this.$refs.documenteditor.ej2Instances.selection.cellFormat.leftMargin=5.4;
//To change the right margin
this.$refs.documenteditor.ej2Instances.selection.cellFormat.rightMargin=5.4;
//To change the top margin
this.$refs.documenteditor.ej2Instances.selection.cellFormat.topMargin=5.4;
//To change the bottom margin
this.$refs.documenteditor.ej2Instances.selection.cellFormat.bottomMargin=5.4;
`
```

You can also define the default cell margins for a table. If the specific cell margin value is not defined explicitly in the cell formatting, the corresponding value will be retrieved from default cells margin of the table. Refer to the following sample code.

```
`ts
```

```
//To change the left margin
this.$refs.documenteditor.ej2Instances.selection.tableFormat.leftMargin=5.4;
//To change the right margin
this.$refs.documenteditor.ej2Instances.selection.tableFormat.rightMargin=5.4;
//To change the top margin
this.$refs.documenteditor.ej2Instances.selection.tableFormat.topMargin=5.4;
//To change the bottom margin
this.$refs.documenteditor.ej2Instances.selection.tableFormat.bottomMargin=5.4;
`
```

### Background color

You can explicitly set the background color of selected cells using the following sample code.

```
`ts
this.$refs.documenteditor.ej2Instances.selection.cellFormat.background='#E0E0E0';
`
```

Refer to the following sample code to customize the background color of the table.

```
`ts
this.$refs.documenteditor.ej2Instances.selection.tableFormat.background='#E0E0E0';
`
```

### Cell spacing

Refer to the following sample code to customize the spacing between each cell in a table.

```
`ts
this.$refs.documenteditor.ej2Instances.selection.tableFormat.cellSpacing=2;
`
```

### Cell vertical alignment

The content is aligned within a table cell to 'Top', 'Center', or 'Bottom'. You can customize this property of selected cells. Refer to the following sample code.

```
`ts
this.$refs.documenteditor.ej2Instances.selection.cellFormat.verticalAlignment='Bottom';
`
```

### Table alignment

The tables are aligned in document editor to 'Left', 'Right', or 'Center'. Refer to the following sample code.

```
`ts
this.$refs.documenteditor.ej2Instances.selection.tableFormat.tableAlignment='Center';
`
```

### Cell width

Set the desired width of table cells that will be considered when the table is layouted. Refer to the following sample code.

```
`ts
this.$refs.documenteditor.ej2Instances.selection.cellFormat.preferredWidthType='Point';
this.$refs.documenteditor.ej2Instances.selection.cellFormat.preferredWidth=100;
`
```

### Table width

You can set the desired width of a table in **Point** or **Percent** type. Refer to the following sample code.

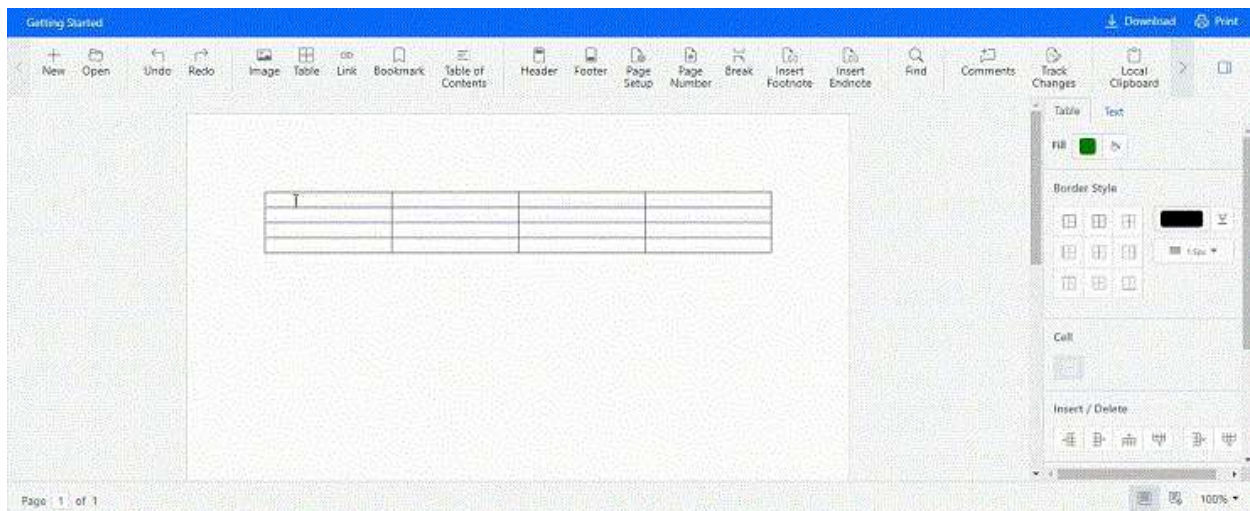

```
`ts
this.$refs.documenteditor.ej2Instances.selection.tableFormat.preferredWidthType='Point';
this.$refs.documenteditor.ej2Instances.selection.tableFormat.preferredWidth=300;
`
```

### Apply borders

Document editor exposes API to customize the borders for table cells by specifying the settings. Refer to the following sample code.

```
`ts
import { BorderSettings } from '@syncfusion/ej2-documenteditor';
//To apply border
let borderSettings: BorderSettings = {
type: 'AllBorders',
lineWidth: 12
};
this.$refs.documenteditor.ej2Instances.editor.applyBorders(borderSettings);
`
```

Please check below gif which illustrates how to apply border for selected cells through properties pane options - border color, line size and no border:

## Working with row formatting

Document editor allows various row formatting such as height and repeat header.

### Row height

You can customize the height of a table row as 'Auto', 'AtLeast', or 'Exactly'. Refer to the following sample code.

```
`ts
this.$refs.documenteditor.ej2Instances.selection.rowFormat.heightType='Exactly';
this.$refs.documenteditor.ej2Instances.selection.rowFormat.height=20;
`
```

### Header row

The header row describes the content of a table. A table can optionally have a header row. Only the first row of a table can be the header row. If the cursor position is at first row of the table, then you can define whether it as header row or not, using the following sample code.

```
`ts
this.$refs.documenteditor.ej2Instances.selection.rowFormat.isHeader=true;
`
```

### Allow row break across pages

This property is valid if a table row does not fit in the current page during table layout. It defines whether a table row can be allowed to break. If the value is false, the entire row will be moved to the start of next page. You can modify this property for selected rows using the following sample code.

```
`ts
this.$refs.documenteditor.ej2Instances.selection.rowFormat.allowRowBreakAcrossPages=false;
`
```

### Title

Document Editor expose API to get or set the table title of the selected table. Refer to the following sample code to set title.

```
`ts
```

```
this.$refs.documenteditor.ej2Instances.selection.tableFormat.title = 'Shipping Details';
```

```
,
```

#### Description

Document Editor expose API to get or set the table description of the selected image. Refer to the following sample code to set description.

```
`ts
```

```
this.$refs.documenteditor.ej2Instances.selection.tableFormat.description = 'Freight cost and shipping details';
```

```
,
```

See Also

- [Table properties dialog](#)

### Section format in Vue Document editor component

Document Editor supports various section formatting such as page size, page margins, and more.

#### Page size

You can get or set the size of a section at cursor position by using the following sample code.

```
`javascript
```

```
this.$refs.documenteditor.ej2Instances.selection.sectionFormat.pageWidth = 500;
```

```
this.$refs.documenteditor.ej2Instances.selection.sectionFormat.pageHeight = 600;
```

```
,
```

You can change the orientation of the page by swapping the values of page width and height respectively.

#### Page margins

Left and right page margin defines the gap between the document content from left and right side of the page respectively. Top and bottom page margins defines the gap between the document content from header and footer of the page respectively.

Refer to the following sample code.

```
`javascript
```

```
this.$refs.documenteditor.ej2Instances.selection.sectionFormat.leftMargin = 10;
```

```
this.$refs.documenteditor.ej2Instances.selection.sectionFormat.rightMargin = 10;
```

```
this.$refs.documenteditor.ej2Instances.selection.sectionFormat.bottomMargin = 10;
```

```
this.$refs.documenteditor.ej2Instances.selection.sectionFormat.topMargin = 10;
```

```
,
```

### Header distance

You can define the distance of header content from the top of the page by using the following sample code.

```
`javascript
this.$refs.documenteditor.ej2Instances.selection.sectionFormat.headerDistance = 72;
`
```

### Footer distance

You can define the distance of footer content from the bottom of the page by using the following sample code.

```
`javascript
this.$refs.documenteditor.ej2Instances.selection.sectionFormat.footerDistance = 72;
`
```

### Columns

You can define the number of columns, column width, and space between columns for the pages in a section.

The following code example illustrates how to define the two columns layout for the pages in a section.

```
`javascript
let column = new SelectionColumnFormat(this.$refs.documenteditor.ej2Instances.selection);
column.width = 216;
column.space = 36;
this.$refs.documenteditor.ej2Instances.selection.sectionFormat.columns = [column, column];
this.$refs.documenteditor.ej2Instances.selection.sectionFormat.lineBetweenColumns = true;
`
```

### Breaks

You can insert Column break. The following code indicate that the text following the column break will begin in the next column.

```
`javascript
this.$refs.documentEditor.ej2Instances.editor.insertColumnBreak();
`
```

You can insert next page section break to start the new section on the next page.

The following code example illustrates how to insert a next page section break.

```
`javascript
this.$refs.documentEditor.ej2Instances.editor.insertSectionBreak(SectionBreakType.NewPage);
`
```

You can insert continuous section break to start the new section on the same page

The following code example illustrates how to insert a continuous section break

```
`javascript
this.$refs.documentEditor.ej2Instances.editor.insertSectionBreak(SectionBreakType.Continuous);
`
```

See Also

[\\*Page setup dialog](#)

### Comments in Vue Document editor component

Document Editor allows you to add comments to documents. You can add, navigate and remove comments in code and from the UI.

#### Add a new comment

Comments can be inserted to the selected text.

```
`ts
this.$refs.documentEditor.ej2Instances.editor.insertComment("Test comment");
`
```

#### Comment navigation

Next and previous comments can be navigated using the below code snippet.

```
`ts
//Navigate to next comment
this.$refs.documentEditor.ej2Instances.selection.navigateNextComment();
//Navigate to previous comment
this.$refs.documentEditor.ej2Instances.selection.navigatePreviousComment();
`
```

#### Delete comment

Current comment can be deleted using the below code snippet.

```
`ts
this.$refs.documentEditor.ej2Instances.editor.deleteComment();
`
```

#### Delete all comment

All the comments in the document can be deleted using the below code snippet.

```
`ts
this.$refs.documentEditor.ej2Instances.editor.deleteAllComments();
`
```

#### Protect the document in comments only mode

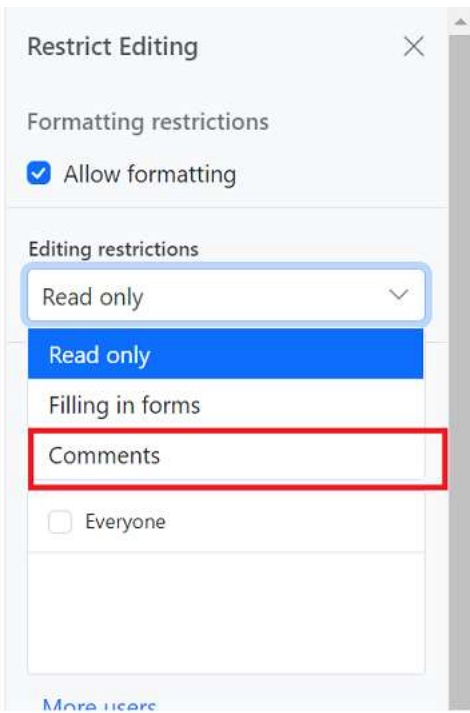

Document Editor provides support for protecting the document with **CommentsOnly** protection. In this protection, user allowed to add or edit comments alone in the document.

Document editor provides an option to protect and unprotect document using [enforceProtection](#) and [stopProtection](#) API.

The following example code illustrates how to enforce and stop protection in Document editor container.

```
`ts
<template>
<div id="app">
<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' height="590px" id='container'
:enableToolbar='true'></ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';
import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent,Toolbar} from
'@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
data() {
return { serviceUrl:'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/'};
},
provide: {
//Inject require modules.
DocumentEditorContainer: [Toolbar]
},
mounted(){
//enforce protection
this.$refs.container.ej2Instances.documentEditor.editor.enforceProtection('123','CommentsOnly');
//stop the document protection
this.$refs.container.ej2Instances.documentEditor.editor.stopProtection('123');
}
}
</script>
`
```

Comment only protection can be enabled in UI by using [Restrict Editing pane](#)

Note: In enforce Protection method, first parameter denotes password and second parameter denotes protection type. Possible values of protection type are `NoProtection` | `ReadOnly` | `FormFieldsOnly` | `CommentsOnly`. In stop protection method, parameter denotes the password.

### Track changes in Vue Document editor component

Track Changes allows you to keep a record of changes or edits made to a document. You can then choose to accept or reject the modifications. It is a useful tool for managing changes made by several reviewers to the same document. If track changes option is enabled, all editing operations are preserved as revisions in Document Editor.

#### Enable track changes in Document Editor

The following example demonstrates how to enable track changes.

```
`ts
```

```
<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' height="590px" id='container'
:enableTrackChanges='true'></ejs-documenteditorcontainer>
```

```
,
```

#### Get all tracked revisions

The following example demonstrate how to get all tracked revision from current document.

```
`ts
```

```
<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' height="590px" id='container'
:enableTrackChanges='true'></ejs-documenteditorcontainer>
```

```
/
```

- Get revisions from the current document

```
*/
```

```
let revisions : RevisionCollection = this.$refs.container.documentEditor.revisions;
```

```
,
```

### Accept or Reject all changes programmatically

The following example demonstrates how to accept/reject all changes.

```
`ts
```

```
<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' height="590px" id='container'
:enableTrackChanges='true'></ejs-documenteditorcontainer>
```

```
/
```

- Get revisions from the current document

```
*/
```

```
let revisions : RevisionCollection = this.$refs.container.documentEditor.revisions;
```

```
/
```

- Accept all tracked changes

```
*/
```

```
revisions.acceptAll();
```

```
/
```

- Reject all tracked changes

```
*/
```

```
revisions.rejectAll();
```

```
,
```

### Accept or reject a specific revision

The following example demonstrates how to accept/reject specific revision in the Document Editor.

```
`ts
```

```
/
```

- Get revisions from the current document

```
*/
```

```
let revisions : RevisionCollection = this.$refs.container.documentEditor.revisions;
```

```
/
```

- Accept specific changes

```
*/
```

```
revisions.get(0).accept();
```

```
/
```

- Reject specific changes

```
*/
```

```
revisions.get(1).reject();
```

```
,
```

### Navigate between the tracked changes

The following example demonstrates how to navigate tracked revision programmatically.

```
`ts
```

```
<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' height="590px" id='container'
:enableTrackChanges='true'></ejs-documenteditorcontainer>
```

```
/
```

- Navigate to next tracked change from the current selection.

```
*/
```

```
this.$refs.container.documentEditor.selection.navigateNextRevision();
```

```
/
```

- Navigate to previous tracked change from the current selection.

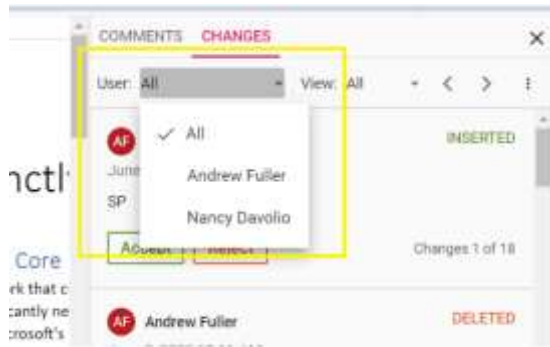

```
*/
```

```
this.$refs.container.documentEditor.selection.navigatePreviousRevision();
```

```
,
```

### Filtering changes based on user

In DocumentEditor, we have built-in review panel in which we have provided support for filtering changes based on the user.

### Protect the document in track changes only mode

Document Editor provides support for protecting the document with **RevisionsOnly** protection. In this protection, all the users are allowed to view the document and do their corrections, but they cannot accept or reject any tracked changes in the document. Later, the author can view their corrections and accept or reject the changes.

Document editor provides an option to protect and unprotect document using [enforceProtection](#) and [stopProtection](#) API.

The following example code illustrates how to enforce and stop protection in Document editor container.

```
`ts
<template>
<div id="app">

<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' height="590px" id='container'
:enableToolbar='true'></ejs-documenteditorcontainer>

</div>
</template>
<script>
import Vue from 'vue';

import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent, Toolbar } from
'@syncfusion/ej2-vue-documenteditor';

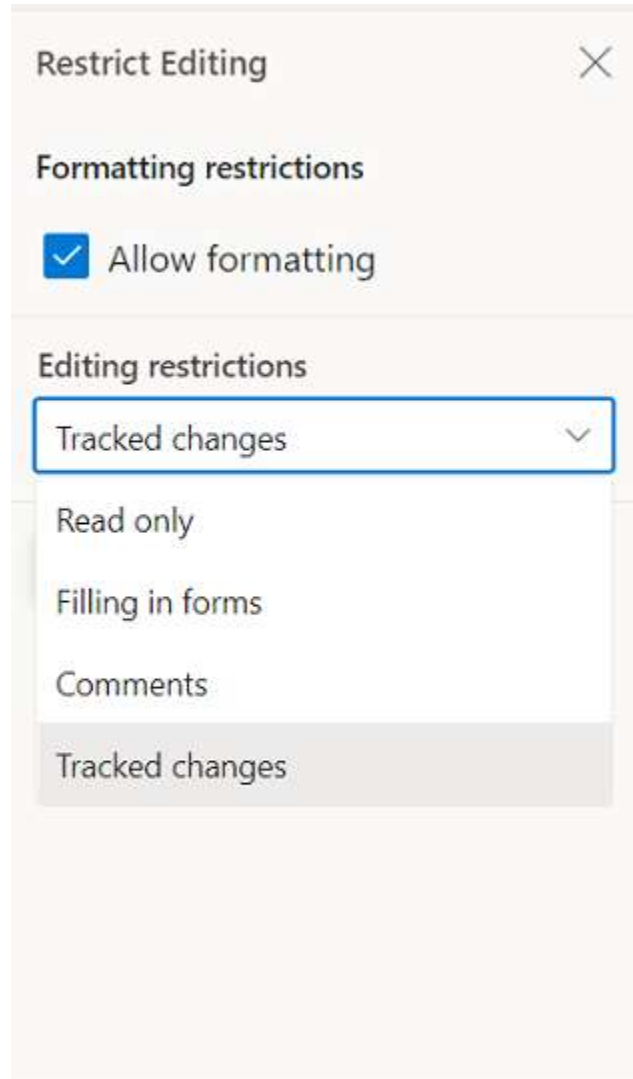

Vue.use(DocumentEditorContainerPlugin);

export default {
  data() {
    return { serviceUrl: 'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/' };
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar]
  },
  mounted(){
    //enforce protection
    this.$refs.container.ej2Instances.documentEditor.editor.enforceProtection('123','RevisionsOnly');
    //stop the document protection
    this.$refs.container.ej2Instances.documentEditor.editor.stopProtection('123');
  }
}
```

```
</script>
```

```
,
```

Tracked changes only protection can be enabled in UI by using [Restrict Editing pane](#)

Note: In enforce Protection method, first parameter denotes password and second parameter denotes protection type. Possible values of protection type are NoProtection | ReadOnly | FormFieldsOnly | CommentsOnly | RevisionsOnly. In stop protection method, parameter denotes the password.

#### Event

You can restrict the accept and reject changes based on the author name. The following example demonstrates how to restrict an author from accept/reject changes.

```
`ts
```

```
<template>
```

```
<div>
```

```
<div>
```

```

<div>
<DocumentEditorContainerComponent
ref="container"
style="display: block;"
:height="'590px'"
@beforeAcceptRejectChanges="beforeAcceptRejectChanges"
:enableToolbar="true"
/>
</div>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent, Toolbar } from
 '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
  components: {
    DocumentEditorContainerComponent
  },
  methods: {
    beforeAcceptRejectChanges(args) {
      // Check the author of the revision
      if (args.author !== 'Hary') {
        // Cancel the accept/reject action
        args.cancel = true;
      }
    }
  }
};
</script>

```

## Fields in Vue Document editor component

Document Editor has preservation support for all types of fields in an existing word document without any data loss.

### Adding Fields

You can add a field to the document by using [insertField](#) method in [Editor](#) module.

The following example code illustrates how to insert merge field programmatically by providing the field code and field result.

```
`ts
let fieldCode: string = 'MERGEFIELD First Name \* MERGEFORMAT ';
let fieldResult: string = '«First Name»';
this.$refs.documenteditor.ej2Instances.editor.insertField(fieldCode, fieldResult);
`
```

Note: Document editor does not validate/process the field code/field result. it simply inserts the field with specified field information.

### Update fields

Document Editor provides support for updating bookmark cross reference field. The following example code illustrates how to update bookmark cross reference field.

```
`ts
//Update all the bookmark cross reference field in the document.
this.$refs.documenteditor.ej2Instances.updateFields();
`
```

Bookmark cross reference fields can be updated through UI by using update fields option in **Toolbar**.

The following type of fields are automatically updated in Document Editor.

- Numpages
- Section
- Page

### Get field info

You can get field code and field result of the current selected field by using [getFieldInfo](#) method in the [Selection](#) module.

```
`ts
//Gets the field information of the selected field.
let fieldInfo: FieldInfo = this.$refs.documenteditor.ej2Instances.selection.getFieldInfo();
`
```

Note: For nested fields, this method returns combined field code and result.

#### Set field info

You can modify the field code and field result of the current selected field by using [setFieldInfo](#) method in the [Editor](#) module.

```
`ts
//Gets the field information for the selected field.
let fieldInfo: FieldInfo = this.$refs.documenteditor.ej2Instances.selection.getFieldInfo();
//Modify field code
fieldInfo.code = 'MERGEFIELD First Name \* MERGEFORMAT ';
//Modify field result
fieldInfo.result = '«First Name»';
//Modify field code and result of the current selected field.
this.$refs.documenteditor.ej2Instances.editor.setFieldInfo(fieldInfo);`
```

Note: For nested field, entire field gets replaced completely with the specified field information.

#### Form fields in Vue Document editor component

Document Editor Container component provide support for inserting Text, CheckBox, DropDown form fields through in-built toolbar.

#### Insert form field

Form fields can be inserted using [insertFormField](#) method in editor module.

```
`ts
//Insert Text form field`
```

```
this.$refs.documenteditor.ej2Instances.editor.insertFormField('Text');  
//Insert Checkbox form field  
this.$refs.documenteditor.ej2Instances.editor.insertFormField('CheckBox');  
//Insert Drop down form field  
this.$refs.documenteditor.ej2Instances.editor.insertFormField('Dropdown');  
`
```

#### Get form field names

All the form fields names form current document can be retrieved using [getFormFieldNames\(\)](#).

```
`ts  
this.$refs.documenteditor.ej2Instances.getFormFieldNames();  
`
```

#### Get form field properties

Form field properties can be retrieved using [getFormFieldInfo\(\)](#).

```
`ts  
//Text form field  
var textfieldInfo = this.$refs.documenteditor.ej2Instances.getFormFieldInfo('Text1');  
//Checkbox form field  
var checkboxfieldInfo = this.$refs.documenteditor.ej2Instances.getFormFieldInfo('Check1');  
//Dropdown form field  
var dropdownfieldInfo = this.$refs.documenteditor.ej2Instances.getFormFieldInfo('Drop1');  
`
```

#### Set form field properties

Form field properties can be modified using [setFormFieldInfo\(\)](#).

```
`ts  
// Set text form field properties  
var textfieldInfo = this.$refs.documenteditor.ej2Instances.getFormFieldInfo('Text1');  
textfieldInfo.defaultValue = "Hello";  
textfieldInfo.format = "Uppercase";  
textfieldInfo.type = "Text";  
textfieldInfo.name = "Text2";  
this.$refs.documenteditor.ej2Instances.setFormFieldInfo('Text1',textfieldInfo);  
// Set checkbox form field properties  
var checkboxfieldInfo = this.$refs.documenteditor.ej2Instances.getFormFieldInfo('Check1');  
checkboxfieldInfo.defaultValue = true;  
`
```

```
checkboxfieldInfo.name = "Check2";
this.$refs.documenteditor.ej2Instances.setFormFieldInfo('Check1',checkboxfieldInfo);
// Set checkbox form field properties
var dropdownfieldInfo = this.$refs.documenteditor.ej2Instances.getFormFieldInfo('Drop1');
dropdownfieldInfo.dropDownItems = ['One','Two', 'Three'];
dropdownfieldInfo.name = "Drop2";
this.$refs.documenteditor.ej2Instances.setFormFieldInfo('Drop1',dropdownfieldInfo);
`ts
```

Note:If a form field already exists in the document with the new name specified, the old form field name property will be cleared and it will not be accessible. Ensure the new name is unique.

#### Export form field data

Data of the all the Form fields in the document can be exported using [exportFormData](#).

```
`ts
var formFieldDate = this.$refs.documenteditor.ej2Instances.exportFormData();
`
```

#### Import form field data

Form fields can be prefilled with data using [importFormData](#).

```
`ts
var textformField = {fieldName: 'Text1', value: 'Hello World'};
var checkformField = {fieldName: 'Check1', value: true};
var dropdownformField = {fieldName: 'Drop1', value: 1};
//Import form field data
this.$refs.documenteditor.ej2Instances.importFormData([textformField,checkformField,dropdownformField]);
`
```

#### Reset form fields

Reset all the form fields in current document to default value using [resetFormFields](#).

```
`ts
this.$refs.documenteditor.ej2Instances.resetFormFields();
`
```

#### Protect the document in form filling mode

Document Editor provides support for protecting the document with **FormFieldsOnly** protection. In this protection, user can only fill form fields in the document.

Document editor provides an option to protect and unprotect document using [enforceProtection](#) and [stopProtection](#) API.

The following example code illustrates how to enforce and stop protection in Document editor container.

```
`ts
<template>
<div id="app">
<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' height="590px" id='container'
:enableToolbar='true'></ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';
import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent, Toolbar } from
'@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
data() {
return { serviceUrl: 'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/' };
},
provide: {
//Inject require modules.
DocumentEditorContainer: [Toolbar]
},
mounted(){
//enforce protection
this.$refs.container.ej2Instances.documentEditor.editor.enforceProtection('123', 'FormFieldsOnly');
//stop the document protection
this.$refs.container.ej2Instances.documentEditor.editor.stopProtection('123');
}
}
</script>
`
```

Note: In enforce Protection method, first parameter denotes password and second parameter denotes protection type. Possible values of protection type are **NoProtection | ReadOnly | FormFieldsOnly**. In stop protection method, parameter denotes the password.

## Clipboard in Vue Document editor component

Document Editor takes advantage of system clipboard and allows you to copy or move a portion of the document into it in HTML format, so that it can be pasted in any application that supports clipboard.

### Copy

Copy a portion of document to system clipboard using built-in context menu of Document Editor. You can also do it programmatically using the following sample code.

```
`javascript
this.$refs.documenteditor.ej2Instances.selection.copy();
`
```

### Cut

Cut a portion of document to system clipboard using built-in context menu of Document Editor. You can also do it programmatically using the following sample code.

```
`javascript
this.$refs.documenteditor.ej2Instances.editor.cut();
`
```

### Paste

Due to limitations, you can paste contents from system clipboard as plain text in Document Editor only using the 'CTRL + V' keyboard shortcut.

### Local paste

Document Editor expose API to enable local paste within the control. On enabling this, the following is performed:

- Selected contents will be stored to an internal clipboard in addition to system clipboard.
- Clipboard paste will be overridden, and internally stored data that has formatted text will be pasted.

Refer to the following sample code.

```
`
<ejs-documenteditor ref="documenteditor" :enableLocalPaste='true' :enableEditor='true'
:isReadOnly=false style="width: 100%;height: 100%;"></ejs-documenteditor>
`
```

By default, **enableLocalPaste** is false.

When local paste is enabled for a Document Editor instance, you can paste contents programmatically if the internal clipboard has stored data during last copy operation. Refer to the following sample code.

```
`javascript
this.$refs.documenteditor.ej2Instances.editor.pasteLocal();
`
```

### EnableLocalPaste behaviour

**| EnableLocalPaste | Paste behavior details |**

|-----|-----|

|True| Allows to paste content that is copied from the same Document Editor component alone and prevents pasting content from system clipboard. Hence the content copied from outside Document Editor component can't be pasted.<br>Browser limitation of pasting from system clipboard using API and context menu options, will be resolved. So, you can copy and paste content within the Document Editor component using API and context menu options too. |

|False| Allows to paste content from system clipboard. Hence the content copied from both the Document Editor component and outside can be pasted.<br>Browser limitation of pasting from system clipboard using API and context menu options, will remain as a limitation. |

Note:

- Keyboard shortcut for pasting will work properly in both cases.
- Copying content from Document Editor component and pasting outside will work properly in both cases.

### Paste with formatting

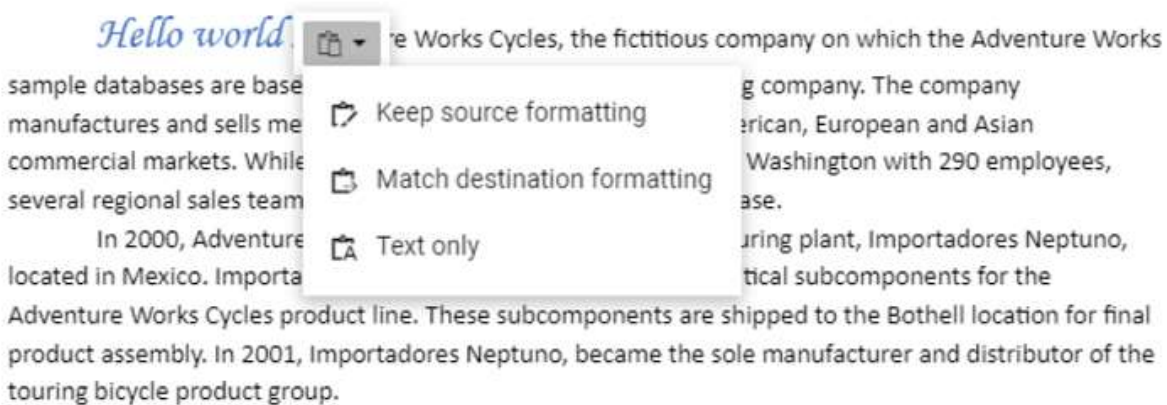

Document Editor provides support to paste the system clipboard data with formatting. To enable clipboard paste with formatting options, set the `enableLocalPaste` property in Document Editor to false and use this .NET Standard library [Syncfusion.EJ2.WordEditor.AspNet.Core](#) by the web API service implementation. This library helps you to paste the system clipboard data with formatting.

You can paste your system clipboard data in the following ways:

- **Keep Source Formatting** This option retains the character styles and direct formatting applied to the copied text. Direct formatting includes characteristics such as font size, italics, or other formatting that is not included in the paragraph style.
- **Match Destination Formatting** This option discards most of the formatting applied directly to the copied text, but it retains the formatting applied for emphasis, such as bold and italic when it is applied to only a portion of the selection. The text takes on the style characteristics of the paragraph where it is pasted. The text also takes on any direct formatting or character style properties of text that immediately precedes the cursor when the text is pasted.
- **Text Only** This option discards all formatting and non-text elements such as pictures or tables. The text takes on the style characteristics of the paragraph where it is pasted and takes on any direct formatting or character style properties of text that immediately precedes the cursor when the text is pasted. Graphical elements are discarded and tables are converted to a series of paragraphs.

This paste option appears as follows.

## History in Vue Document editor component

Document Editor tracks the history of all editing actions done in the document, which allows undo and redo functionality.

### Enable or disable history

Inject the `EditorHistory` module in your application to provide history preservation functionality for `DocumentEditor`. Refer to the following code example.

```
,
<template>
<div id="app">
<ejs-documenteditor ref="documenteditor" :enableEditor='true' :isReadOnly='false'
:enableEditorHistory='true' style="width: 100%;height: 100%;"></ejs-documenteditor>
</div>
</template>
<script>
import Vue from 'vue'

import { DocumentEditorPlugin, Editor, Selection, EditorHistory } from '@syncfusion/ej2-vue-
documenteditor';

Vue.use(DocumentEditorPlugin);

export default {
data: function() {
```

```

return {
};
},
provide: {
  DocumentEditor : [Editor, Selection, EditorHistory]
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
`

```

You can enable or disable history preservation for a Document Editor instance any time using the `enableEditorHistory` property. Refer to the following sample code.

```

`javascript
this.$refs.documenteditor.enableEditorHistory = false;
`

```

### Undo and redo

You can perform undo and redo by `CTRL+Z` and `CTRL+Y` keyboard shortcuts. Document Editor exposes API to do it programmatically.

To undo the last editing operation in Document Editor, refer to the following sample code.

```

`javascript
this.$refs.documenteditor.ej2Instances.editorHistory.undo();
`

```

To redo the last undone action, refer to the following code example.

```

`javascript
this.$refs.documenteditor.ej2Instances.editorHistory.redo();
`

```

### Stack size

History of editing actions will be maintained in stack, so that the last item will be reverted first. By default, Document Editor limits the size of undo and redo stacks to 500 each respectively. However, you can customize this limit. Refer to the following sample code.

```

`javascript
this.$refs.documenteditor.ej2Instances.editorHistory.undoLimit = 400;
this.$refs.documenteditor.ej2Instances.editorHistory.redoLimit = 400;
`

```

### Find and replace in Vue Document editor component

The Document Editor component searches a portion of text in the document through a built-in interface called **OptionsPane** or rich APIs. When used in combination with selection performs various operations on the search results like replacing it with some other text, highlighting it, making it bolder, and more.

#### Options pane

This provides the options to search for a portion of text in the document. After search operation is completed, the search results will be displayed in a list and options to navigate between them. The current occurrence of matched text or all occurrences with another text can be replaced by switching to **Replace** tab. This pane is opened using the keyboard shortcut **CTRL+F**. You can also open it programmatically using the following sample code.

```
<template>
<div id="app" height="350px">
<div>
<button v-on:click='showOptionsPane' >Save</button>
</div>
<ejs-documenteditor ref="documenteditor" :enableEditor='true' :enableSearch='true'
:enableOptionsPane='true' :isReadOnly='false' height="370px" style="width: 100%;"></ejs-
documenteditor>
</div>
</template>
<script>
import Vue from 'vue'

import { DocumentEditorPlugin, Selection, Editor, Search, OptionsPane } from '@syncfusion/ej2-vue-
documenteditor';

Vue.use(DocumentEditorPlugin);

export default {
data: function() {
return {
};
},
provide: {
```

```
//Inject require modules.
DocumentEditor : [ Selection, Editor, Search, OptionsPane]
}
methods: {
  showOptionsPane: function() {
    //Open options pane.
    this.$refs.documenteditor.showOptionsPane();
  },
  mounted() {
    let sfdt: string = `{
      "sections": [
        {
          "blocks": [
            {
              "inlines": [
                {
                  "characterFormat": {
                    "bold": true,
                    "italic": true
                  },
                  "text": "Adventure Works Cycles, the fictitious company on which the AdventureWorks sample
databases are based, is a large, multinational manufacturing company. The company manufactures and
sells metal and composite bicycles to North American, European and Asian commercial markets. While
its base operation is located in Bothell, Washington with 290 employees, several regional sales teams
are located throughout their market base."
                }
              ]
            }
          ]
        }
      ]
    }`;
    this.$refs.documenteditor.open(sfdt);
```

```

}
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
`

```

You can close the options pane by pressing **Esc** key.

### Search

The [Search](#) module of Document Editor exposes the following APIs:

API Name	Type	Description
<a href="#">findAll()</a>	Method	Searches for specified text in the whole document and highlights it with yellow.
<a href="#">searchResults</a>	Property	This is an instance of <a href="#">SearchResults</a> .
<a href="#">find()</a>	Method	Find immediate occurrence of specified text from cursor position in the document and highlights it with yellow.

#### *Find the immediate occurrence in the document*

Using [find\(\)](#) method, you can find the immediate occurrence of specified text from current cursor position in the document.

The following example code illustrates how to use find in Document editor.

```

`ts
this.$refs.documenteditor.ej2instances.search.find('Some text', 'None');
`

```

Note: Second parameter is optional parameter and it denotes find Options. Possible values of find options are **'None' | 'WholeWord' | 'CaseSensitive' | 'CaseSensitiveWholeWord'**.

#### *Find all the occurrences in the document*

Using [findAll\(\)](#) method, you can find all the occurrences of specified text in the whole document and highlight it with yellow.

The following example code illustrates how to find All the text in the document.

```

`ts
this.$refs.documenteditor.ej2instances.search.findAll('Some text', 'None');
`

```

Note: Second parameter is optional parameter and it denotes find Options. Possible values of find options are **'None' | 'WholeWord' | 'CaseSensitive' | 'CaseSensitiveWholeWord'**.

## Search results

The [SearchResults](#) class provides information about the search results after a search operation is completed that can be identified using the [searchResultsChange](#) event. This will expose the following APIs:

API Name	Type	Description
<a href="#">length</a>	Property	Returns the total number of results found on the search.
<a href="#">index</a>	Property	Returns the index of selected search result. You can change the value for this property to move the selection.
<a href="#">replaceAll()</a>	Method	Replaces all the occurrences with specified text.
<a href="#">clear()</a>	Method	Clears the search result.

## Replace all the occurrences

Using [replaceAll](#), you can replace all the occurrences with specified text.

The following example code illustrates how to use replace All in Document editor.

```
`ts
```

```
this.$refs.documentEditor.ej2Instances.search.findAll ('Some text');
```

```
// Replace all the searched text with word 'Mike'
```

```
this.$refs.documentEditor.ej2Instances.search.searchResults.replaceAll("Mike");
```

```
`
```

## Replace

Using [insertText](#), you can replace the current searched text with specified text and it replace single occurrence.

Note: This [insertText](#) API accepts following control characters

- \* New line characters ("[\r](#)", "[\r\n](#)", "[\n](#)") - Inserts a new paragraph and appends the remaining text to the new paragraph.

- \* Line break character ("[\v](#)") - Moves the remaining text to start in new line.

- \* Tab character ("[\t](#)") - Allocates a tab space and continue the next character.

The following example code illustrates how to find a text in the document and replace each occurrence of the text one by one programmatically.

```
`ts
```

```
this.$refs.container.ej2instances.documentEditor.search.findAll('works');
```

```
let searchLength: number = container.documentEditor.search.searchResults.length;
```

```
for (let i = 0; i < searchLength; i++) {
```

```
// It will move selection to specific searched index,move to each occurrence one by one
```

```
this.$refs.container.ej2instances.documentEditor.search.searchResults.index = i;
```

```
// Replace it with some text
```

```
this.$refs.container.ej2instances.documentEditor.editor.insertText('Hello');
}
this.$refs.container.ej2Instances.documentEditor.search.searchResults.clear();
`
```

### SearchResultsChange event

[DocumentEditor](#) exposes the [searchResultsChange](#) event that will be triggered whenever search results are changed. Consider the following scenarios:

- A search operation is completed with some results.
- The results are replaced with some other text, since it will be cleared automatically.
- The results are cleared explicitly.

Refer to the following code example.

```
`ts
documenteditor.searchResultsChange = function() {
};
`
```

### Customize find and replace

Using the exposed APIs, you can customize the find and replace functionality in your application. Refer to the following sample code.

#### **APP.VUE**

```
<template>
  <div id="app" height="350px">
    <div>
      <table>
        <tr>
          <td>
            <label>Text to find:</label>
          </td>
          <td>
            <input type="text" id="find_text" />
          </td>
        </tr>
        <tr>
          <td>
            <label>Text to replace:</label>
          </td>
          <td>
            <input type="text" id="replace_text" />
          </td>
        </tr>
        <tr>
          <td colspan="2">
            <button id="replace_all" v-
on:click='onReplaceButtonClick' style="float:right;margin-top: 10px;"
class="e-control e-btn">Replace All</button>
          </td>
        </tr>
      </table>
    </div>
  </div>
</template>
```

```

        </tr>
      </table>
    </div>
    <ejs-documenteditor ref="documenteditor" :enableEditor='true'
:enableSearch='true' :enableOptionsPane='true' :isReadOnly='false'
height="370px" style="width: 100%;"></ejs-documenteditor>
  </div>
</template>
<script>
  import Vue from 'vue'
  import { DocumentEditorPlugin, Selection, Editor, Search,
OptionsPane } from '@syncfusion/ej2-vue-documenteditor';
  Vue.use(DocumentEditorPlugin);
  export default {
    data: function() {
      return {
      };
    },
    provide: {
      //Inject require modules.
      DocumentEditor : [ Selection, Editor, Search, OptionsPane]
    },
    methods: {
      onReplaceButtonClick: function() {
        let textToFind: string =
(document.getElementById('find_text') as HTMLInputElement).value;
        let textToReplace: string =
(document.getElementById('replace_text') as HTMLInputElement).value;
        if (textToFind !== '') {
          // Find all the occurrences of given text

this.$refs.documenteditor.ej2Instances.search.findAll(textToFind);
          if
(this.$refs.documenteditor.ej2Instances.searchModule.searchResults.length >
0) {
            // Replace all the occurrences of given text

this.$refs.documenteditor.ej2Instances.search.searchResults.replaceAll(textT
oReplace);
          }
        }
      },
      mounted() {
        let sfdt: string = `{
          "sections": [
            {
              "blocks": [
                {
                  "inlines": [
                    {
                      "characterFormat": {
                        "bold": true,
                        "italic": true
                      },
                      "text": "Adventure Works Cycles,
the fictitious company on which the AdventureWorks sample databases are

```

based, is a large, multinational manufacturing company. The company manufactures and sells metal and composite bicycles to North American, European and Asian commercial markets. While its base operation is located in Bothell, Washington with 290 employees, several regional sales teams are located throughout their market base."

```

    }
  ]
}

} `;
//Open the default document in Document Editor
this.$refs.documenteditor.open(sfdt);
}
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/document-editor/replace-all-cs1" %}
```

## Keyboard shortcut in Vue Document editor component

## Text formatting

The following table lists the default keyboard shortcuts in Document Editor for formatting text:

Key combination	Description
----- -----	
Ctrl + B	Toggles the bold property of selected text.
Ctrl + I	Toggles the italic property of selected text.
Ctrl + U	Toggles the underline property of selected text.
Ctrl + +	Toggles the subscript formatting of selected text.
Ctrl + Shift + +	Toggles the superscript formatting of selected contents.
Ctrl + }	Increases the actual font size of selected text by one point.
Ctrl + {	Decreases the actual font size of selected text by one point.

## Paragraph formatting

The following table lists the default keyboard shortcuts for formatting the paragraph:

Key combination	Description
Ctrl + E	Selected paragraphs are center aligned.
Ctrl + J	Selected paragraphs are justified.
Ctrl + L	Selected paragraphs are left aligned.

|Ctrl + R | Selected paragraphs are right aligned. |

|Ctrl + 1 | Single line spacing is applied for selected paragraphs. |

|Ctrl + 5 | 1.5 line spacing is applied for selected paragraphs. |

|Ctrl + 2 | Double spacing is applied for selected paragraphs. |

|Ctrl + 0 | No spacing is applied before the selected paragraphs. |

|Ctrl + M | Increases the left indent of selected paragraphs by a factor of 36 points. |

|Ctrl + Shift + M | Decreases the left indent of selected paragraphs by a factor of 36 points. |

|Ctrl + \* | Show/Hide the hidden characters like spaces, tab, paragraph marks, and breaks. |

#### Clipboard

Key Combination	Description
----- -----	
Ctrl + C	Copies selected contents to the clipboard.
Ctrl + V	Pastes plain text content from the clipboard.
Ctrl + X	Moves selected content to the clipboard.

#### Keyboard shortcut to navigate around the document

Key Combination	Description
----- -----	
Left arrow	Moves the cursor position one character to the left.
Right arrow	Moves the cursor position one character to the right.
Down arrow	Moves the cursor position down one line.
Up arrow	Moves the cursor position up one line.
Ctrl + Left arrow	Moves the cursor position one word to the left.
Ctrl + Right arrow	Moves the cursor position one word to the right.
Ctrl + Up arrow	Moves the cursor position one paragraph up.
Ctrl + Down arrow	Moves the cursor position one paragraph down.
Tab (in table)	Moves the cursor position one cell to the right.
Shift + Tab (in table)	Moves the cursor position one cell to the left.
Home	Moves the cursor position to the start of a line.
End	Moves the cursor position to the end of a line.
Page up	Moves the cursor position one screen up.
Page down	Moves the cursor position one screen down.
Ctrl + Home	Moves the cursor position to the start of a document.
Ctrl + End	Moves the cursor position to the end of a document.

### Keyboard shortcut to extend selection

Key Combination	Description
-----------------	-------------

-----	-----
-------	-------

Shift + Left arrow	Extends selection one character to the left.
--------------------	----------------------------------------------

Shift + Right arrow	Extends selection one character to the right.
---------------------	-----------------------------------------------

Shift + Down arrow	Extends selection one line downward.
--------------------	--------------------------------------

Shift + Up arrow	Extends selection one line upward.
------------------	------------------------------------

Shift + Home	Extends selection to the start of a line.
--------------	-------------------------------------------

Shift + End	Extends Selection to the end of a line.
-------------	-----------------------------------------

Ctrl + A	Extends selection to the entire document.
----------	-------------------------------------------

Ctrl + Shift + Left arrow	Extends selection one word to the left.
---------------------------	-----------------------------------------

Ctrl + Shift + Right arrow	Extends selection one word to the right.
----------------------------	------------------------------------------

Ctrl + Shift + Down arrow	Extends selection to the end of a paragraph.
---------------------------	----------------------------------------------

Ctrl + Shift + Up arrow	Extends selection to the start of a paragraph.
-------------------------	------------------------------------------------

Ctrl + Shift + Home	Extends selection to the start of a document.
---------------------	-----------------------------------------------

Ctrl + Shift + End	Extends selection to the end of a document.
--------------------	---------------------------------------------

### Find and Replace

Key Combination	Description
-----------------	-------------

-----	-----
-------	-------

Ctrl + F	Opens options pane.
----------	---------------------

Ctrl + H	Opens replace tab in options pane.
----------	------------------------------------

### Create, Save and Print document

Key Combination	Description
-----------------	-------------

-----	-----
-------	-------

Ctrl + N	Opens empty document.
----------	-----------------------

Ctrl + S	Saves the document in SFDt format.
----------	------------------------------------

Ctrl + P	Prints the document.
----------	----------------------

### Edit Operation

Key Combination	Description
-----------------	-------------

-----	-----
-------	-------

Backspace	Deletes one character to the left.
-----------	------------------------------------

Delete	Deletes one character to the right.
--------	-------------------------------------

Ctrl + Z	Undo last performed action.
----------	-----------------------------

Ctrl + Y	Redo last undo action.
----------	------------------------

### Insert special characters

Key Combination	Description
----- -----	
Ctrl + Enter	Inserts page break.
Shift + Enter	Inserts line break.

### Dialog

Key Combination	Description
----- -----	
Ctrl + F	Opens options pane.
Ctrl + D	Opens font dialog.
Ctrl + K	Opens hyperlink dialog.

## Scrolling zooming in Vue Document editor component

The Document Editor renders the document as page by page. You can scroll through the pages by mouse wheel or touch interactions. You can also scroll through the page by using 'scrollToPage()' method of Document Editor instance. Refer to the following code example.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-documenteditor ref="documenteditor" height="370px"
style="width: 100%;"></ejs-documenteditor>
  </div>
</template>
<script>
  import Vue from 'vue'
  import { DocumentEditorPlugin } from '@syncfusion/ej2-vue-
documenteditor';
  Vue.use(DocumentEditorPlugin);
  export default {
    data: function() {
      return {
    },
    mounted: function() {
      let defaultDocument: object = {
        "sections": [
          {
            "blocks": [
              {
                "paragraphFormat": {
                  "styleName": "Normal"
                },
            },
            "inlines": [
```

```

        {
            "text": "First page"
        }
    ],
    },
    "headersFooters": {},
},
{
    "blocks": [
        {
            "paragraphFormat": {
                "styleName": "Normal"
            },
            "inlines": [
                {
                    "text": "Second page"
                }
            ]
        }
    ],
    "headersFooters": {},
},
],
"characterFormat": {},
"paragraphFormat": {},
"background": {
    "color": "#FFFFFF"
},
"styles": [
    {
        "type": "Paragraph",
        "name": "Normal",
        "next": "Normal"
    },
    {
        "type": "Character",
        "name": "Default Paragraph Font"
    }
]
}
this.$refs.documenteditor.open(JSON.stringify(defaultDocument));
//Scroll to specified page.
this.$refs.documenteditor.scrollToPage(2);
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/document-editor/scrolling-zooming-cs1" %}

Calling this method brings the specified page into view but doesn't move selection. Hence this method will work by default. That is, it works even if selection is not enabled.

In case, if you wish to move the selection to any page in Document Editor and bring it into view, you can use 'goToPage()' method of selection instance. Refer to the following code example.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-documenteditor ref="documenteditor" :enableSelection='true'
    :isReadOnly=false height="370px" style="width: 100%;"></ejs-documenteditor>
  </div>
</template>
<script>
  import Vue from 'vue'
  import { DocumentEditorPlugin, Selection } from '@syncfusion/ej2-vue-
documenteditor';
  Vue.use(DocumentEditorPlugin);
  export default {
    data: function() {
      return {
      };
    },
    provide: {
      DocumentEditor : [Selection]
    },
    mounted: function() {

            "name": "Default Paragraph Font"
        }
    ]
}
this.$refs.documenteditor.open(JSON.stringify(defaultDocument));
//Navigate to specified page.
this.$refs.documenteditor.ej2Instances.selection.goToPage(3);
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>

```

```
{% previewsample "page.domainurl/code-snippet/document-editor/scrolling-zooming-cs2" %}
```

### Zooming

You can scale the contents in Document Editor ranging from 10% to 500% of the actual size. You can achieve this using mouse or touch interactions. You can also use 'zoomFactor' property of Document Editor instance. The value can be specified in a range from 0.1 to 5. Refer to the following code example.

```

<template>
<div id="app">

```

```
<ejs-documenteditor ref="documenteditor" style="width: 100%;height: 100%;"></ejs-documenteditor>
</div>
</template>
<script>
import Vue from 'vue'
import { DocumentEditorPlugin } from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorPlugin);
export default {
  data: function() {
    return {
    };
  },
  mounted: function() {
    //Set zoom factor.
    this.$refs.documenteditor.zoomFactor = 3;
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
`
```

### Page Fit Type

Apart from specifying the zoom factor as value, the Document Editor provides option to specify page fit options such as fit to full page or fit to page width. You can set this option using 'fitPage' method of Document Editor instance. Refer to the following code example.

```
`
<template>
<div id="app">
<ejs-documenteditor ref="documenteditor" height="370px" style="width: 100%;"></ejs-
documenteditor>
</div>
</template>
<script>
```

```

import Vue from 'vue'
import { DocumentEditorPlugin } from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorPlugin);
export default {
  data: function() {
    return {
    };
  },
  mounted: function() {
    //Set zoom factor to fit page width.
    this.$refs.documenteditor.fitPage('FitPageWidth');
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
`

```

### Zoom option using UI

The following code example shows how to provide zoom options in Document Editor.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-documenteditor ref="documenteditor" v-
bind:selectionChange='onSelectionChange' v-bind:viewChange='onViewChange' v-
bind:documentChange='onDocumentChange' :enableSelection='true'
:isReadOnly=false height="370px" style="width: 100%;></ejs-documenteditor>
    <div id="documenteditor_statusbar">
      <label style="margin-top: 6px;margin-right: 2px">Page
</label>
      <div class="single-line e-de-pagenumbers-text" v-
on:keydown='pageKeydownEvent' v-on:click='pagerClickEvent'
id="editablePageNumber" style="font-size:12px;font-weight: 700;display:
inline-flex;height: 17px;padding: 0px 4px;" contenteditable="false">
        <label id="documenteditor_page_no" style="text-
transform:capitalize;white-space:pre;overflow:hidden;user-
select:none;cursor:text;height:17px;max-width:150px">{{currentPage}}</label>
      </div>
      <label id="documenteditor_pagecount_separator"
style="margin-left:2px;letter-spacing: 1.05px">of</label>
      <label id="documenteditor_pagecount" style="margin-
left:6px;letter-spacing: 1.05px">{{pageCount}}</label>
    </div>
  </div>

```

```

        <ejs-dropdownbutton ref="de_zoom" :items="zoomItems"
class="e-de-statusbar-zoom" :content="zoomContent" v-bind:select="onZoom"
title="Zoom level. Click or tap to open the Zoom options."></ejs-
dropdownbutton>
    </div>
</div>
</template>
<script>

## Print in Vue Document editor component

To print the document, use the [print](#) method from Document Editor instance.

Refer to the following example for showing a document and print it.

### APP.VUE

```

<template>
  <div id="app">
    <div>
      <button v-on:click='print' >Print</button>
    </div>
    <ejs-documenteditor ref="documenteditor" :enablePrint='true'
height="370px" style="width: 100%;"></ejs-documenteditor>
  </div>
</template>
<script>
  import Vue from 'vue'
  import { DocumentEditorPlugin, Print } from '@syncfusion/ej2-vue-
documenteditor';
  Vue.use(DocumentEditorPlugin);
  export default {
    data: function() {
      return {
      };
    },
    provide: {
      DocumentEditor : [Print]
    },
    methods: {
      print: function() {
        //Print the content of the Document Editor.
        this.$refs.documenteditor.print();
      }
    },
    mounted: function() {
      let sfdt: string = `{
        "sections": [
          {
            "blocks": [
              {
                "inlines": [
                  {
                    "characterFormat": {
                      "bold": true,
                      "italic": true
                    },
                    "text": "Hello World"

```

```

    }
    ],
    },
    ],
    "headersFooters": {
    }
  }
]
} `;
//Open default document in Document Editor.
this.$refs.documenteditor.open(sfdt);
}
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/document-editor/print-cs1" %}

Refer to the following example for creating a document and print it.

#### APP.VUE

```

<template>
  <div id="app">
    <div>
      <button v-on:click='print' >Print</button>
    </div>
    <ejs-documenteditor ref="documenteditor" :isReadOnly='false'
:enablePrint='true' :enableEditor='true' :enableSelection='true'
:enableEditorHistory='true' height="370px" style="width: 100%;"></ejs-
documenteditor>
  </div>
</template>
<script>
  import Vue from 'vue'
  import { DocumentEditorPlugin, Print, Editor, Selection, EditorHistory }
from '@syncfusion/ej2-vue-documenteditor';
  Vue.use(DocumentEditorPlugin);
  export default {
    data: function() {
      return {
      };
    },
    provide: {
      //Inject require modules.
      DocumentEditor : [Print, Editor, Selection, EditorHistory]
    },
    methods: {
      print: function() {
        //Print the content of the Document Editor.
        this.$refs.documenteditor.print();
      }
    }
  }
}

```

```
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/document-editor/print-cs2" %}
```

### Improve print quality

Document editor provides an option to improve the print quality using [printDevicePixelRatio](#) in Document editor settings. Document editor using canvas approach to render content. Then, canvas are converted to image and it process for print. Using printDevicePixelRatio API, you can increase the image quality based on your requirement.

The following example code illustrates how to improve the print quality in Document editor container.

```
<template>
<div id="app">
  <ejs-documenteditorcontainer ref='documenteditor' :serviceUrl='serviceUrl'
:documentEditorSettings='settings' height="590px" id='container' :enableToolbar='true'></ejs-
documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';

import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent,Toolbar} from
'@syncfusion/ej2-vue-documenteditor';

Vue.use(DocumentEditorContainerPlugin);

export default {
  data() {
    return { serviceUrl:'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
settings:{ printDevicePixelRatio: 2 } };
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar]
  }
}
</script>
```

,

Note: By default, printDevicePixelRatio value is 1.

#### Print using window object

You can print the document in Document Editor by passing the window instance. This is useful to implement print in third party frameworks such as electron, where the window instance will not be available. Refer to the following example.

```
this.$refs.documenteditor.print(window);
```

#### Page setup

Some of the print options cannot be configured using JavaScript. Refer to the following links to learn more about the browser page setup:

- [Chrome](#)
- [Firefox](#)

However, you can customize margins, paper, and layout options by modifying the section format properties using page setup dialog

,

```
<template>
<div id="app">
<ejs-documenteditor ref="documenteditor" :isReadOnly='false' :enablePrint='true' :enableEditor='true'
:enableSelection='true' :enableEditorHistory='true' :enablePageSetupDialog='true' height="370px"
style="width: 100%;"></ejs-documenteditor>
</div>
</template>
<script>
import Vue from 'vue'

import { DocumentEditorPlugin, Print, Editor, Selection, EditorHistory, PageSetupDialog } from
'@syncfusion/ej2-vue-documenteditor';

Vue.use(DocumentEditorPlugin);

export default {
data: function() {
return {
};
},
provide: {
DocumentEditor : [Print, Editor, Selection, EditorHistory, PageSetupDialog]
},

```

```

mounted: function() {
this.$refs.documenteditor.showPageSetupDialog();
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
`

```

By customizing margins, papers, and layouts, the layout of the document will be changed in Document Editor. To modify these options during print operation, serialize the document as SFDT using the [serialize](#) method in Document Editor instance and open the SFDT data in another instance of Document Editor in separate window.

The following example shows how to customize layout options only for printing.

#### APP.VUE

```

<template>
  <div id="app">
    <div>
      <button v-on:click='print' >Print</button>
    </div>
    <ejs-documenteditor ref="documenteditor" :isReadOnly='false'
:enablePrint='true' :enableEditor='true' :enableSelection='true'
:enableEditorHistory='true' :enableSfdtExport='true' height="370px"
style="width: 100%;"></ejs-documenteditor>
    <ejs-documenteditor ref="pagesetup_documenteditor"
:isReadOnly='false' :enablePrint='true' :enableEditor='true'
:enableSelection='true' :enableEditorHistory='true' :enableSfdtExport='true'
height="370px" style="width: 100%;"></ejs-documenteditor>
  </div>
</template>
<script>
import Vue from 'vue'
import { DocumentEditorPlugin, Print, Editor, Selection, EditorHistory,
SfdtExport } from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorPlugin);
export default {
  data: function() {
    return {
    };
  },
  provide: {
    DocumentEditor : [Print, Editor, Selection, EditorHistory,
SfdtExport]
  },
  methods: {
    print: function() {
      let sfdtData = this.$refs.documenteditor.serialize();

```

```

        this.$refs.pagesetup_documenteditor.open(sfddata);
        //Set A5 paper size

this.$refs.pagesetup_documenteditor.ej2Instances.selection.sectionFormat.pag
eWidth = 419.55;

this.$refs.pagesetup_documenteditor.ej2Instances.selection.sectionFormat.pag
eHeight = 595.30;
        this.$refs.pagesetup_documenteditor.print();
    }
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/document-editor/print-cs3" %}

### Dialog in Vue Document editor component

Document Editor provides dialog support to major operations such as insert or edit hyperlink, formatting text, paragraph, style, list and table properties.

#### Font Dialog

Font dialog allows you to modify all text properties for selected contents at once such as bold, italic, underline, font size, font color, strikethrough, subscript and superscript.

Refer to the following example.

#### APP.VUE

```

<template>
  <div id="app">
    <div>
      <button v-on:click='showFontDialog' >Open dialog</button>
    </div>
    <ejs-documenteditor ref="documenteditor" :enableSelection='true'
:isReadOnly='false' :enableEditor='true' :enableFontDialog='true'
:enableSfdtExport='true' height="370px" style="width: 100%;"></ejs-
documenteditor>
  </div>
</template>
<script>
  import Vue from 'vue'
  import { DocumentEditorPlugin, Selection, Editor, FontDialog,
SfdtExport } from '@syncfusion/ej2-vue-documenteditor';
  Vue.use(DocumentEditorPlugin);
  export default {
    data: function() {
      return {
      };
    },
    provide: {
      //Inject require modules.
      DocumentEditor : [Selection, Editor, FontDialog, SfdtExport]
    }
  }

```

```

    }
    methods: {
      showFontDialog: function() {
        //Open the font dialog.
        this.$refs.documenteditor.showDialog('Font');
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/document-editor/dialog-cs1" %}

### Paragraph dialog

This dialog allows modifying the paragraph formatting for selection at once such as text alignment, indentation, and spacing.

To open this dialog, refer to the following example.

### APP.VUE

```

<template>
  <div id="app">
    <div>
      <button v-on:click='showParagraphDialog' >Open dialog</button>
    </div>
    <ejs-documenteditor ref="documenteditor" :enableSelection='true'
:isReadOnly='false' :enableEditor='true' :enableParagraphDialog='true'
:enableSfdtExport='true' height="370px" style="width: 100%;"></ejs-
documenteditor>
    </div>
  </template>
<script>
  import Vue from 'vue'
  import { DocumentEditorPlugin, Selection, Editor, ParagraphDialog,
SfdtExport } from '@syncfusion/ej2-vue-documenteditor';
  Vue.use(DocumentEditorPlugin);
  export default {
    data: function() {
      return {
      };
    },
    provide: {
      //Inject require modules.
      DocumentEditor : [Selection, Editor, ParagraphDialog,
SfdtExport]
    },
    methods: {
      showParagraphDialog: function() {
        //Open the paragraph dialog.
        this.$refs.documenteditor.showDialog('Paragraph');
      }
    }
  }

```

```

    }
  </script>
  <style>
    @import ".../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
  </style>

```

{% previewsample "page.domainurl/code-snippet/document-editor/dialog-cs2" %}

### Table dialog

This dialog allows creating and inserting a table at cursor position by specifying the required number of rows and columns.

To open this dialog, refer to the following example.

### APP.VUE

```

<template>
  <div id="app" style="height:400px">
    <div>
      <button v-on:click='showTableDialog' >Open dialog</button>
    </div>
    <ejs-documenteditor ref="documenteditor" :enableSelection='true'
:isReadOnly='false' :enableEditor='true' :enableTableDialog='true'
:enableSfdtExport='true' style="width: 100%;" height="370px" ></ejs-
documenteditor>
  </div>
</template>
<script>
  import Vue from 'vue'
  import { DocumentEditorPlugin, Selection, Editor, TableDialog,
SfdtExport } from '@syncfusion/ej2-vue-documenteditor';
  Vue.use(DocumentEditorPlugin);
  export default {
    data: function() {
      return {
      };
    },
    provide: {
      //Inject require modules
      DocumentEditor : [Selection, Editor, TableDialog, SfdtExport]
    },
    methods: {
      showTableDialog: function() {
        //Open the table dialog.
        this.$refs.documenteditor.showDialog('Table');
      }
    }
  }
</script>
<style>
  @import ".../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/document-editor/dialog-cs3" %}

## Bookmark dialog

This dialog allows you to perform the following operations:

- View all bookmarks.
- Navigate to a bookmark.
- Create a bookmark at current selection.
- Delete an existing bookmark.

To open this dialog, refer to the following example.

### APP.VUE

```
<template>
  <div id="app" style="height:400px">
    <div>
      <button v-on:click='showBookmarkDialog' >Open
dialog</button>
    </div>
    <ejs-documenteditor ref="documenteditor" :enableSelection='true'
:isReadOnly='false' :enableEditor='true' :enableBookmarkDialog='true'
:enableSfdtExport='true' height="370px" style="width: 100%;"></ejs-
documenteditor>
  </div>
</template>
<script>
  import Vue from 'vue'
  import { DocumentEditorPlugin, Selection, Editor, BookmarkDialog,
SfdtExport } from '@syncfusion/ej2-vue-documenteditor';
  Vue.use(DocumentEditorPlugin);
  export default {
    data: function() {
      return {
      };
    },
    provide: {
      //Inject require modules
      DocumentEditor : [Selection, Editor, BookmarkDialog,
SfdtExport]
    },
    methods: {
      showBookmarkDialog: function() {
        //Open the bookmark dialog.
        this.$refs.documenteditor.showDialog('Bookmark');
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/document-editor/dialog-cs4" %}

### Hyperlink dialog

This dialog allows editing or inserting a hyperlink at cursor position.

To open this dialog, refer to the following example.

#### APP.VUE

```
<template>
  <div id="app" style="height:400px">
    <div>
      <button v-on:click='showHyperlinkDialog' >Open
dialog</button>
    </div>
    <ejs-documenteditor ref="documenteditor" :enableSelection='true'
:isReadOnly='false' :enableEditor='true' :enableHyperlinkDialog='true'
:enableSfdtExport='true' height="370px" style="width: 100%;"></ejs-
documenteditor>
  </div>
</template>
<script>
import Vue from 'vue'
import { DocumentEditorPlugin, Selection, Editor, HyperlinkDialog,
SfdtExport } from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorPlugin);
export default {
  data: function() {
    return {
    };
  },
  provide: {
    //Inject require modules
    DocumentEditor : [Selection, Editor, HyperlinkDialog,
SfdtExport]
  },
  methods: {
    showHyperlinkDialog: function() {
      //Opens hyperlink dialog.
      this.$refs.documenteditor.showDialog('Hyperlink');
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/document-editor/dialog-cs5" %}

### Table of contents dialog

This dialog allows creating and inserting table of contents at cursor position. If the table of contents already exists at cursor position, you can customize its properties.

To open this dialog, refer to the following example.

,

```

<template>
<div id="app" style="height:400px">
<div>
<button v-on:click='showTableOfContentsDialog' >Open dialog</button>
</div>
<ejs-documenteditor ref="documenteditor" :enableSelection='true' :isReadOnly='false'
:enableEditor='true' :enableTableOfContentsDialog='true' :enableSfdtExport='true' height="370px"
style="width: 100%;"></ejs-documenteditor>
</div>
</template>
<script>
import Vue from 'vue'

import { DocumentEditorPlugin, Selection, Editor, TableOfContentsDialog, SfdtExport } from
'@syncfusion/ej2-vue-documenteditor';

Vue.use(DocumentEditorPlugin);

export default {
data: function() {
return {
};
},
provide: {
//Inject require modules
DocumentEditor : [Selection, Editor, TableOfContentsDialog, SfdtExport]
}
methods: {
showTableOfContentsDialog: function() {
//Open the table of contents dialog.
this.$refs.documenteditor.showDialog('TableOfContents');
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";

```

```
</style>
```

```
,
```

### Styles Dialog

This dialog allows managing the styles in a document. It will display all the styles in the document with options to modify the properties of the existing style or create new style with the help of 'Style dialog'. Refer to the following example.

```
,
```

```
<template>
```

```
<div id="app" style="height:400px">
```

```
<div>
```

```
<button v-on:click='showStylesDialog' >Open dialog</button>
```

```
</div>
```

```
<ejs-documenteditor ref="documenteditor" :enableSelection='true' :isReadOnly='false'
:enableEditor='true' :enableStylesDialog='true' :enableSfdtExport='true' :enableStyleDialog='true'
height="370px" style="width: 100%;"></ejs-documenteditor>
```

```
</div>
```

```
</template>
```

```
<script>
```

```
import Vue from 'vue'
```

```
import { DocumentEditorPlugin, Selection, Editor, StylesDialog, StyleDialog, SfdtExport } from
'@syncfusion/ej2-vue-documenteditor';
```

```
Vue.use(DocumentEditorPlugin);
```

```
export default {
```

```
data: function() {
```

```
return {
```

```
};
```

```
},
```

```
provide: {
```

```
//Inject require modules
```

```
DocumentEditor : [Selection, Editor, StylesDialog, StyleDialog, SfdtExport]
```

```
}
```

```
methods: {
```

```
showStylesDialog: function() {
```

```
//Open the styles dialog.
```

```
this.$refs.documenteditor.showDialog('Styles');
```

```

}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
`

```

### Style dialog

You can directly use this dialog for modifying any existing style or add new style by providing the style name.

To open this dialog, refer to the following example.

```

`
<template>
<div id="app" style="height:400px">
<div>
<button v-on:click='showStyleDialog' >Open dialog</button>
</div>
<ejs-documenteditor ref="documenteditor" :enableSelection='true' :isReadOnly='false'
:enableEditor='true' :enableSfdtExport='true' :enableStyleDialog='true' height="370px" style="width:
100%;"></ejs-documenteditor>
</div>
</template>
<script>
import Vue from 'vue'

import { DocumentEditorPlugin, Selection, Editor, StyleDialog, SfdtExport } from '@syncfusion/ej2-vue-
documenteditor';

Vue.use(DocumentEditorPlugin);

export default {
data: function() {
return {
};
},
provide: {
//Inject require modules

```

```

DocumentEditor : [Selection, Editor, StyleDialog, SfdtExport]
}
methods: {
  showStylesDialog: function() {
    //Open styles dialog.
    this.$refs.documenteditor.showDialog('Style');
  }
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
`

```

### List dialog

This dialog allows creating a new list or modifying existing lists in the document.

To open this dialog, refer to the following example.

```

<template>
<div id="app" style="height:400px">
<div>
<button v-on:click='showListDialog' >Open dialog</button>
</div>
<ejs-documenteditor ref="documenteditor" :enableSelection='true' :isReadOnly='false'
:enableEditor='true' :enableSfdtExport='true' :enableListDialog='true' height="370px" style="width:
100%;"></ejs-documenteditor>
</div>
</template>
<script>
import Vue from 'vue'

import { DocumentEditorPlugin, Selection, Editor, ListDialog, SfdtExport } from '@syncfusion/ej2-vue-
documenteditor';

Vue.use(DocumentEditorPlugin);

export default {
`

```

```

data: function() {
  return {
  };
},
provide: {
  //Inject require modules
  DocumentEditor : [Selection, Editor, ListDialog, SfdtExport]
}
methods: {
  showListDialog: function() {
    //Open list dialog.
    this.$refs.documenteditor.showDialog('List');
  }
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
`

```

### Borders and shading dialog

This dialog allows customizing the border style, border width, and background color of the table or selected cells.

To open this dialog, refer to the following example.

```

`
<template>
<div id="app" style="height:400px">
<div>
<button v-on:click='showBordersAndShadingDialog' >Open dialog</button>
</div>
<ejs-documenteditor ref="documenteditor" :enableSelection='true' :isReadOnly='false'
:enableEditor='true' :enableSfdtExport='true' :enableBordersAndShadingDialog='true' height="370px"
style="width: 100%;"></ejs-documenteditor>
</div>
`

```

```

</template>
<script>
import Vue from 'vue'

import { DocumentEditorPlugin, Selection, Editor, BordersAndShadingDialog, SfdtExport } from
 '@syncfusion/ej2-vue-documenteditor';

Vue.use(DocumentEditorPlugin);

export default {
  data: function() {
    return {
    };
  },
  provide: {
    //Inject require modules
    DocumentEditor : [Selection, Editor, BordersAndShadingDialog, SfdtExport]
  }
  methods: {
    showBordersAndShadingDialog: function() {
      //Open borders and shading dialog.
      this.$refs.documenteditor.showDialog('BordersAndShading');
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>

```

### Table options dialog

This dialog allows customizing the default cell margins and spacing between each cells of the selected table.

To open this dialog, refer to the following example.

```

<template>
<div id="app" style="height:400px">

```

```
<div>
<button v-on:click='showTableOptionsDialog' >Open dialog</button>
</div>

<ejs-documenteditor ref="documenteditor" :enableSelection='true' :isReadOnly='false'
:enableEditor='true' :enableSfdtExport='true' :enableTableOptionsDialog='true' height="370px"
style="width: 100%;"></ejs-documenteditor>
</div>
</template>
<script>
import Vue from 'vue'

import { DocumentEditorPlugin, Selection, Editor, TableOptionsDialog, SfdtExport } from
'@syncfusion/ej2-vue-documenteditor';

Vue.use(DocumentEditorPlugin);

export default {
data: function() {
return {
};
},
provide: {
//Inject require modules
DocumentEditor : [Selection, Editor, TableOptionsDialog, SfdtExport]
}
methods: {
showTableOptionsDialog: function() {
//Open table options dialog.
this.$refs.documenteditor.showDialog('TableOptions');
}
},
mounted() {
this.$refs.documenteditor.ej2Instances.editor.insertTable(2,2);
}
}
</script>
<style>
```

```
@import "../../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
```

### Table properties dialog

This dialog allows customizing the table, row, and cell properties of the selected table.

To open this dialog, refer to the following example.

```
<template>
<div id="app" style="height:400px">
<div>
<button v-on:click='showTablePropertiesDialog' >Open dialog</button>
</div>
<ejs-documenteditor ref="documenteditor" :enableSelection='true' :isReadOnly='false'
:enableEditor='true' :enableSfdtExport='true' :enableTablePropertiesDialog='true' height="370px"
style="width: 100%;"></ejs-documenteditor>
</div>
</template>
<script>
import Vue from 'vue'

import { DocumentEditorPlugin, Selection, Editor, TablePropertiesDialog, SfdtExport } from
'@syncfusion/ej2-vue-documenteditor';

Vue.use(DocumentEditorPlugin);

export default {
data: function() {
return {
};
},
provide: {
//Inject require modules
DocumentEditor : [Selection, Editor, TablePropertiesDialog, SfdtExport]
}
methods: {
showTablePropertiesDialog: function() {
//Open table properties dialog.
```

```

this.$refs.documenteditor.showDialog('TableProperties');
}
},
mounted() {
this.$refs.documenteditor.ej2Instances.editor.insertTable(2,2);
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
`

```

### Page setup dialog

This dialog allows customizing margins, size, and layout options for pages of the section.

To open this dialog, refer to the following example.

#### APP.VUE

```

<template>
  <div id="app" style="height:400px">
    <div>
      <button v-on:click='showPageSetupDialog' >Open
dialog</button>
    </div>
    <ejs-documenteditor ref="documenteditor" :enableSelection='true'
:isReadOnly='false' :enableEditor='true' :enableSfdtExport='true'
:enablePageSetupDialog='true' height="370px" style="width: 100%;"></ejs-
documenteditor>
    </div>
  </div>
</template>
<script>
  import Vue from 'vue'
  import { DocumentEditorPlugin, Selection, Editor, PageSetupDialog,
SfdtExport } from '@syncfusion/ej2-vue-documenteditor';
  Vue.use(DocumentEditorPlugin);
  export default {
    data: function() {
      return {
      };
    },
    provide: {
      //Inject require modules.
      DocumentEditor : [Selection, Editor, PageSetupDialog,
SfdtExport]
    },
    methods: {
      showPageSetupDialog: function() {
        //Open page setup dialog.

```

```

        this.$refs.documenteditor.showDialog('PageSetup');
    }
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/document-editor/dialog-cs6" %}

### Chart in Vue Document editor component

Document Editor provides chart preservation support. Using Document Editor, you can see the chart reports from your Word document.

The following example shows chart preservation in Document Editor.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-documenteditor ref="documenteditor" id="container_1"
height="600px" ></ejs-documenteditor>
  </div>
</template>
<script>
  import Vue from 'vue'
  import { DocumentEditorPlugin } from '@syncfusion/ej2-vue-
documenteditor';
  Vue.use(DocumentEditorPlugin);
  export default {
    data: function() {
      return {
      };
    },
  },

```

```

    mounted: function() {

### Supported Chart Types

The following chart types are supported in Document Editor

- Scatter\_Markers
- Bubble
- Area
- Area\_Stacked
- AreaStacked100
- Bar\_Clustered
- Bar\_Stacked
- BarStacked100
- Column\_Clustered
- Column\_Stacked
- ColumnStacked100
- Pie
- Doughnut
- Line
- Line\_Markers
- LineMarkersStacked
- LineMarkersStacked\_100
- Line\_Stacked
- LineStacked100

### Restrict editing in Vue Document editor component

Document Editor provides support to restrict editing. When the protected document includes range permission, then unique user or user group only authorized to edit separate text area.

#### Set current user

You can use the `currentUser` property to authorize the current document user by name, email, or user group name.

The following code shows how to set currentUser

```
`javascript
this.$refs.doceditcontainer.ej2Instances.documentEditor.currentUser = 'engineer@mycompany.com';
`
```

#### Highlighting the text area

You can highlight the editable region of the current user using the `userColor` property.

The following code shows how to set userColor.

```
`javascript
this.$refs.doceditcontainer.ej2Instances.documentEditor..userColor = '#fff000';
`
```

You can toggle the highlight the editable region value using the "highlightEditableRanges" property.

The following code shows how to toggle the highlight editable region value.

```
`javascript
```

```
this.$refs.doceditcontainer.ej2Instances.documentEditor.documentEditorSettings.highlightEditableRanges = true;
```

```
`
```

## Restrict Editing Pane

Restrict Editing Pane provides the following options to manage the document:

- To apply formatting restrictions to the current document, select the allow formatting check box.
- To apply editing restrictions to the current document, select the read only check box.
- To add users to the current document, select more users option and add user from the popup dialog.
- To include range permission to the current document, select parts of the document and choose users who are allowed to freely edit them from the listed check box.
- To apply the chosen editing restrictions, click the **YES, START ENFORCING PROTECTION** button. A dialog box displays asking for a password to protect.
- To stop protection, select **STOP PROTECTION** button. A dialog box displays asking for a password to stop protection.

The following code shows Restrict Editing Pane. To unprotect the document, use password '123'.

### Spell check in Vue Document editor component

Document editor supports performing spell checking for any input text. You can perform spell checking for the text in Document Editor and it will provide suggestions for the mis-spelled words through dialog and in context menu. Document editor's spell checker is compatible with [hunspell dictionary files](#).

```
<template>
<div id="app">
<ejs-documenteditor ref="documenteditor" id="container_1" height="370px" style="width: 100%;"
:enableSpellCheck='true'></ejs-documenteditor>
</div>
</template>
<script>
import Vue from 'vue'
import { DocumentEditorPlugin } from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorPlugin);
export default {
data: function() {
return {
};
},
mounted: function() {
//Set language id to map dictionary.
this.$refs.documenteditor.ej2Instances.spellChecker.languageID = 1033;
this.$refs.documenteditor.ej2Instances.spellChecker.removeUnderline = false;
this.$refs.documenteditor.ej2Instances.spellChecker.allowSpellCheckAndSuggestion = true;
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
`
```

## Features

- Supports context menu suggestions.
- Provides built-in options to Ignore, Ignore All, Change, Change All for error words in spell checker dialog.

## Enable SpellCheck

To enable spell check in Document Editor, set [enableSpellCheck](#) property as `true` and then configure [SpellCheckSettings](#).

### Disable SpellCheck

To disable spell check in Document Editor, set [enableSpellCheck](#) property as `false` or remove [enableSpellCheck](#) property initialization code. The default value of this property is `false`.

### Spell check settings

#### *Remove Underline*

By default, mis-spelled words are marked with squiggly line. You can also disable this behavior by enabling the [removeUnderline](#) API and now, the squiggly lines will never be rendered for mis-spelled words.

```
`ts
```

```
this.$refs.documenteditor.ej2Instances.spellChecker.removeUnderline = false;
```

```
,
```

#### *AllowSpellCheckAndSuggestion*

By default, on performing spell check in Document Editor, both spelling and suggestions of the mis-spelled words will be retrieved, and this mis-spelled words can be corrected through context menu suggestions. You can modify this behavior using the [allowSpellCheckAndSuggestion](#) API, which will perform only spell check.

```
`ts
```

```
this.$refs.documenteditor.ej2Instances.spellChecker.allowSpellCheckAndSuggestion = false;
```

```
,
```

#### *LanguageID*

Document Editor provides multi-language spell check support. You can add as many languages (dictionaries) in the server-side and to use that language for spell checking in Document Editor, it must be matched with [languageID](#) you pass in the Document Editor.

```
`ts
```

```
this.$refs.documenteditor.ej2Instances.spellChecker.languageID = 1033 //LCID of "en-us";
```

```
,
```

#### *EnableOptimizedSpellCheck*

Document editor provides option to spellcheck page by page when loading the documents. The default value of this property is `false`, so when opening the document spellcheck web API will be called for each word in the document. To optimize the frequency of spellcheck web API calls, you can enable this property.

The following code example illustrates how to enable optimized spell checking.

```
`ts
```

```
this.container.documentEditor.spellChecker.enableOptimizedSpellCheck = true;
```

```
,
```

#### *Spell check dictionary cache*

Starting from `v20.1.0.xx`, we have optimized the performance and memory usage of spell checker by adding a static method to initialize the dictionaries with specified cache count.

By default, the spell checker holds only one language dictionary in memory. If you want to hold multiple dictionaries in memory, you need to set the cache limit by using `InitializeDictionaries` method as in the below example.

```
`c#
List<DictionaryData> spellDictCollection = new List<DictionaryData>();
string personalDictPath = string.Empty;
int cacheCount = 2;
// Initialize dictionaries
SpellChecker.InitializeDictionaries(spellDictCollection, personalDictPath, cacheCount);
`
```

If dictionaries are initialized using `InitializeDictionaries` method, then we should use default constructor of the `SpellChecker` to check spelling and get suggestion as in the below example code, it will prevent reinitialization of already loaded dictionaries.

```
`c#
public string SpellCheck([FromBody] SpellCheckJsonData spellChecker)
{
    try
    {
        SpellChecker spellCheck = new SpellChecker();
        spellCheck.GetSuggestions(spellChecker.LanguageID, spellChecker.TexttoCheck,
            spellChecker.CheckSpelling, spellChecker.CheckSuggestion, spellChecker.AddWord);
        return Newtonsoft.Json.JsonConvert.SerializeObject(spellCheck);
    }
    catch
    {
        return "{\"SpellCollection\":[],\"HasSpellingError\":false,\"Suggestions\":null}";
    }
}
`
```

Previously on every `SpellChecker.GetSuggestion()` method call, the `.aff` and dictionary data will be parsed to generate suggestion for miss spelled word. But, starting from v20.1.0.xx, the `.aff` and dictionary data will be parsed only for the first time alone while calling `SpellChecker.GetSuggestion()` method.

### Add new root word and possible words to dictionary

If you find any root word is missing in the dictionary file, then you can add that new root word and the rule to form the possible words to dictionary file using `AddNewWord` API in the server-side Spell check library.

Note:

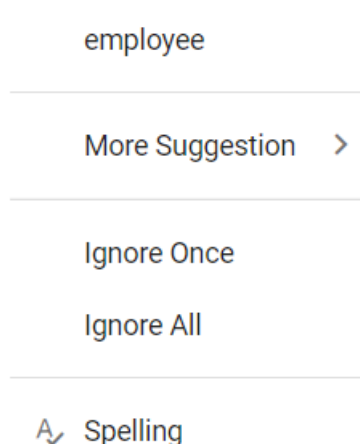

1. The rules are framed automatically using the root word, the possible words and affix file.
2. If you pass null for the parameters `affPath` and `possibleWords`, then it will add a single root word to dictionary.
3. This API is included starting from `v20.2.0.xx`.

The following code example demonstrates how to add a new root word to the dictionary along with the rule to form the possible words.

```
`c#
SpellChecker spellChecker = new SpellChecker();
// Adds the specified new root word to the dictionary along with the rule to form the possible words.
spellChecker.AddNewWord("en.dic","en.aff", "construct", new string[] { "constructs", "reconstruct",
"constructed", "constructive" });
`
```

### Context menu

Right click on error word to open the context menu with spell check options. Please see below screenshot for your reference.

### Suggestions

Context menu shows the suggestions for mis-spelled words. By clicking on the required word from suggestion, the error word gets replaced automatically.

### Add To Dictionary

Using this option, you can add the current word to the dictionary. So that the spell checker does not consider that word as error in future.

### [Ignore Once and Ignore All](#)

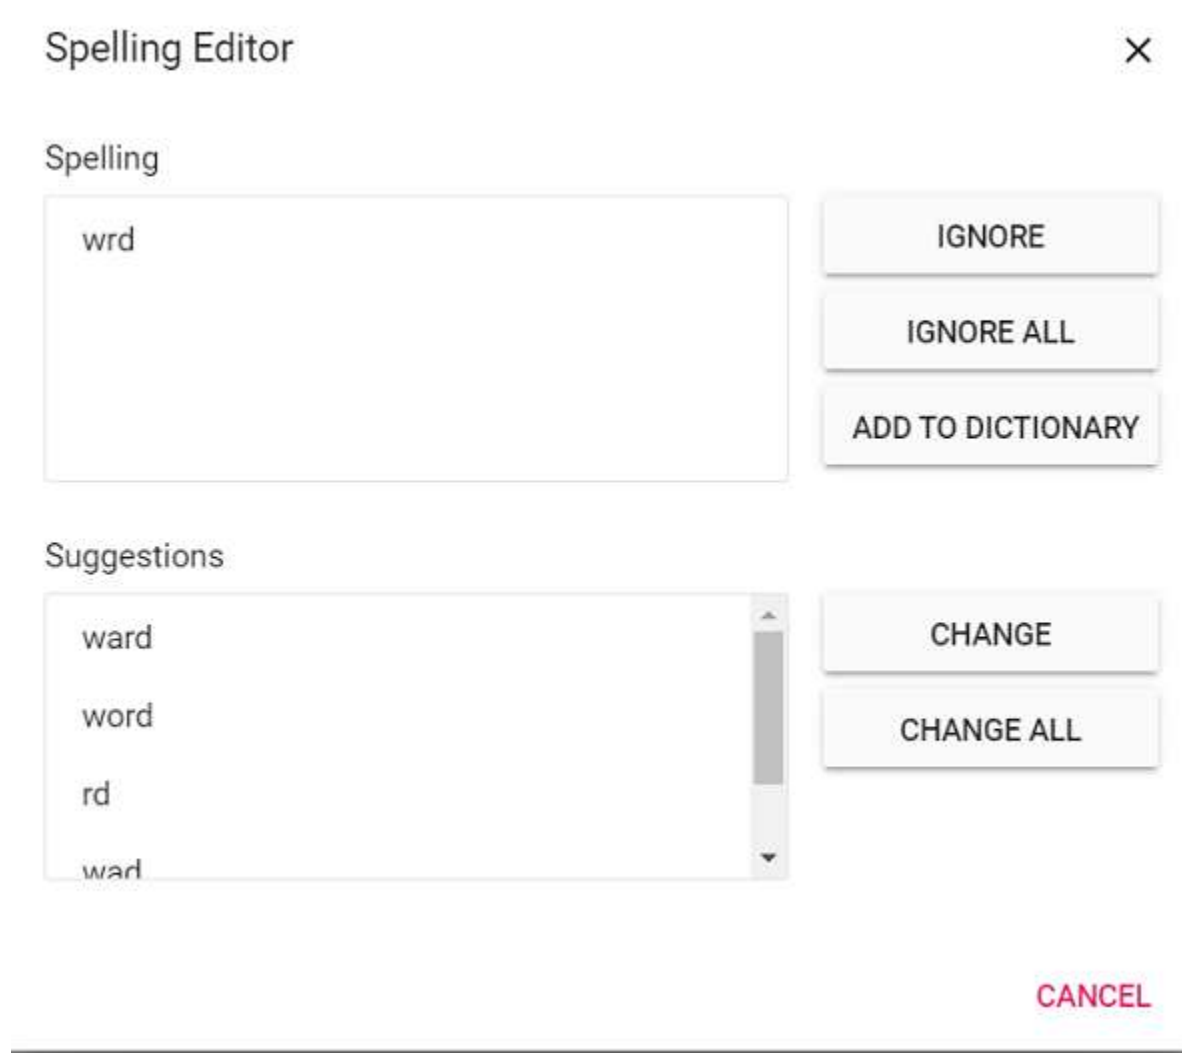

If you do not wish to add the word to dictionary and do not want to show error, use Ignore Once or Ignore All options.

Ignore: ignore only the current occurrence of a word from error.

Ignore All: ignore all occurrence of a word from error in the entire document.

### [Spelling](#)

Using this option, you can open spell check dialog. Please see below screenshot for your reference.

- Refer to the [Spell checker](#) link for configuring spell checker in server-side.

### [Global local in Vue Document editor component](#)

#### Localization

The Localization library allows you to localize default text content of the Document Editor. The document editor component has static text on some features (like find & replace, context-menu,

dialogs) that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the locale value and translation object. Please refer the sample link [RTL](#)

Note: Please refer the [Locale](#).

## Notes in Vue Document editor component

DocumentEditorContainer component provides support for inserting footnotes and endnotes through the in-built toolbar. Refer to the following screenshot.

The Footnotes and endnotes are both ways of adding extra bits of information to your writing outside of the main text. You can use footnotes and endnotes to add side comments to your work or to place other publications like books, articles, or websites.

### Insert footnotes

Document Editor exposes an API to insert footnotes at cursor position programmatically or can be inserted to the end of selected text.

,

```
<template>
<div id="app">
<div>
<button v-on:click='Insertfootnote' >Insert footnote</button>
</div>

<ejs-documenteditor id="container6" height="370px" style="width: 100%;" :serviceUrl='serviceUrl'
:isReadOnly='false' :enablePrint='true' :enableSfdtExport='true' :enableSelection='true'
:enableContextMenu='true' :enableSearch='true' :enableOptionsPane='true' :enableWordExport='true'
:enableTextExport='true' :enableEditor='true' :enableImageResizer='true' :enableEditorHistory='true'
:enableHyperlinkDialog='true' :enableTableDialog='true' :enableBookmarkDialog='true'
:enableTableOfContentsDialog='true' :enablePageSetupDialog='true' :enableStyleDialog='true'
:enableListDialog='true' :enableParagraphDialog='true' :enableFontDialog='true'
:enableTablePropertiesDialog='true' :enableBordersAndShadingDialog='true'
:enableTableOptionsDialog='true'></ejs-documenteditor>

</div>
</template>
<script>
import Vue from 'vue'

import { DocumentEditorPlugin, DocumentEditorComponent, Print, SfdtExport, WordExport, TextExport,
Selection, Search, Editor, ImageResizer, EditorHistory, ContextMenu, OptionsPane, HyperlinkDialog,
TableDialog, BookmarkDialog, TableOfContentsDialog, PageSetupDialog, StyleDialog, ListDialog,
ParagraphDialog, BulletsAndNumberingDialog, FontDialog, TablePropertiesDialog,
BordersAndShadingDialog, TableOptionsDialog, CellOptionsDialog, StylesDialog } from '@syncfusion/ej2-
vue-documenteditor';

Vue.use(DocumentEditorPlugin);
```

```

export default {

```

### Update or edit footnotes and endnotes

You can update or edit the footnotes and endnotes using the built-in context menu shown up by right-clicking it. The footnote endnote dialog box popup and you can customize the number format and start at. Refer to the following screenshot.

### How To

Override the keyboard shortcuts in Vue Document editor component

Document Editor triggers the [keyDown](#) event every time when any key is entered and provides an instance of [DocumentEditorKeyDownEventArgs](#). You can use the [isHandled](#) property to override the keyboard shortcut behavior.

#### Preventing default keyboard shortcut

The following code shows how to prevent the **CTRL + C** keyboard shortcut for copying selected content in Document Editor.

#### APP.VUE

```
<template>
  <div style="height:330px">
    <ejs-documenteditor ref="documenteditor" :height="height"
    style="width: 100%;display:block" :isReadOnly='false'
    :enableSelection='true' :enableSfdtExport='true' :enableEditor='true' v-
    bind:keyDown='onKeyDown'></ejs-documenteditor>
  </div>
</template>
<script>
  import Vue from 'vue'
```

```
import { DocumentEditorPlugin, Selection, Editor, SfdtExport } from
'@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorPlugin);
export default {
  data: function() {
    return {
      height: '370px'
    };
  },
  provide: {
    DocumentEditor : [SfdtExport, Selection, Editor]
  }
  methods: {
    onKeyDown: function(args) {
      let keyCode: number = args.event.which ||
args.event.keyCode;
      let isCtrlKey: boolean = (args.event.ctrlKey ||
args.event.metaKey) ? true : ((keyCode === 17) ? true : false);
      //67 is the character code for 'C'
      if (isCtrlKey && keyCode === 67) {
        //To prevent copy operation set isHandled to true
        args.isHandled = true;
      }
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/document-editor/export-cs6" %}

### Override or define the keyboard shortcut

Override or define a new keyboard shortcut behavior instead of preventing the keyboard shortcut.

For example, **Ctrl + S** keyboard shortcut saves the document in SFDT format by default, and there is no behavior for **Ctrl + Alt + S**. The following code demonstrates how to override the **Ctrl + S** shortcut to save a document in DOCX format and define **Ctrl + Alt + S** to save the document in SFDT format.

### APP.VUE

```
<template>
  <div>
    <ejs-documenteditor ref="documenteditor" :height="height"
style="width: 100%;display:block" :isReadOnly='false'
:enableSelection='true' :enableSfdtExport='true' :enableWordExport=true
:enableEditor='true' v-bind:keyDown='onKeyDown'></ejs-documenteditor>
  </div>
</template>
<script>
  import Vue from 'vue'
  import { DocumentEditorPlugin, Selection, Editor,
DocumentEditorKeyDownEventArgs, SfdtExport, WordExport } from

Customize context menu in Vue Document editor component

[How to customize context menu in Document Editor](#)

Document Editor allows you to add custom option in context menu. It can be achieved by using the [addCustomMenu\(\)](#) method and custom action is defined using the [customContextMenuSelect](#)

Add Custom Option

The following code shows how to add custom option in context menu.

,

<template>

<div id="app">

<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' v-on:created="onCreated"  
height="590px" id='container' :enableToolBar='true'></ejs-documenteditorcontainer>

```
</div>
</template>
<script>
import Vue from 'vue';
import {
  DocumentEditorContainerPlugin,
  DocumentEditorContainerComponent,
  Toolbar,
} from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
  data() {
    return {
      serviceUrl:
        'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
    };
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar],
  },
  methods: {
    onCreated: function () {
      // creating Custom Options
      let menuItems = [
        {
          text: 'Search In Google',
          id: 'searchingoogle',
          iconCss: 'e-icons e-de-ctnr-find',
        },
      ];
      // adding Custom Options
      this.$refs.container.ej2Instances.documentEditor.contextMenu.addCustomMenu(
```

```

menuItems,
false
);
// custom Options Select Event
this.$refs.container.ej2Instances.documentEditor.customContextMenuSelect =
(args) => {
// custom Options Functionality
let id =
this.$refs.container.ej2Instances.documentEditor.element.id;
switch (args.id) {
case id + 'searchingoogle':
// To get the selected content as plain text
let searchContent =
this.$refs.container.ej2Instances.documentEditor.selection
.text;
if (
!this.$refs.container.ej2Instances.documentEditor.selection
.isEmpty &&
/\S/.test(searchContent)
) {
window.open('http://google.com/search?q=' + searchContent);
}
break;
}
};
},
},
};
</script>
`

```

#### [Customize custom option in context menu](#)

Document Editor allows you to customize the added custom option and also to hide/show default context menu.

### Hide default context menu items

Using [addCustomMenu\(\)](#) method, you can hide the default context menu. By setting second parameter as true.

The following code shows how to hide default context menu and add custom option in context menu.

```
<template>
<div id="app">
<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' v-on:created="onCreated"
height="590px" id='container' :enableToolbar='true'></ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';
import {
DocumentEditorContainerPlugin,
DocumentEditorContainerComponent,
Toolbar,
} from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
data() {
return {
serviceUrl:
'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
};
},
provide: {
//Inject require modules.
DocumentEditorContainer: [Toolbar],
},
methods: {
onCreated: function () {
// creating Custom Options
let menuItems = [
```

```
{
text: 'Search In Google',
id: 'searchingoogle',
iconCss: 'e-icons e-de-ctnr-find',
},
];
// adding Custom Options
this.$refs.container.ej2Instances.documentEditor.contextMenu.addCustomMenu( menuItems,true);
}
}
};
</script>
`
```

Customize added context menu items

The following code shows how to hide/show added custom option in context menu using the [customContextMenuBeforeOpen](#).

```
`
<template>
<div id="app">
<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' v-on:created="onCreated"
height="590px" id='container' :enableToolbar='true'></ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';
import {
DocumentEditorContainerPlugin,
DocumentEditorContainerComponent,
Toolbar,
} from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
data() {
return {
```

```
serviceUrl:
'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
};
},
provide: {
//Inject require modules.
DocumentEditorContainer: [Toolbar],
},
methods: {
onCreated: function () {
// creating Custom Options
let menuItems = [
{
text: 'Search In Google',
id: 'searchingoogle',
iconCss: 'e-icons e-de-ctnr-find',
},
];
// adding Custom Options
this.$refs.container.ej2Instances.documentEditor.contextMenu.addCustomMenu( menuItems,false);
// custom Options Select Event
this.$refs.container.ej2Instances.documentEditor.customContextMenuSelect =
(args) => {
// custom Options Functionality
let id =
this.$refs.container.ej2Instances.documentEditor.element.id;
switch (args.id) {
case id + 'searchingoogle':
// To get the selected content as plain text
let searchContent =
this.$refs.container.ej2Instances.documentEditor.selection
.text;
if (
```

```

!this.$refs.container.ej2Instances.documentEditor.selection
.isEmpty &&
/\S/.test(searchContent)
){
window.open('http://google.com/search?q=' + searchContent);
}
break;
}
};
// custom options hide/show functionality
this.$refs.container.ej2Instances.documentEditor.customContextMenuBeforeOpen = (args) => {
let search = document.getElementById(args.ids[0]);
search.style.display = 'none';
let searchContent = this.$refs.container.ej2Instances.documentEditor.selection.text;
if (!this.$refs.container.ej2Instances.documentEditor.selection.isEmpty && /\S/.test(searchContent)) {
search.style.display = 'block';
}
};
},
},
};
</script>
`

```

The following is the output of custom context menu with customization.

### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl'
v-on:created="onCreated" height="590px" id='container'
:enableToolbar='true'></ejs-documenteditorcontainer>
  </div>
</template>
<script>
import Vue from 'vue';
import {
  DocumentEditorContainerPlugin,
  DocumentEditorContainerComponent,
  Toolbar,
} from '@syncfusion/ej2-vue-documenteditor';

```

```

Vue.use(DocumentEditorContainerPlugin);
export default {
  data() {
    return {
      serviceUrl:
        'https://ej2services.syncfusion.com/production/web-
services/api/documenteditor/',
    };
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar],
  },
  methods: {
    onCreate: function () {
      // creating Custom Options
      let menuItems = [
        {
          text: 'Search In Google',

## Customize tool bar in Vue Document editor component

### *How to customize existing toolbar in DocumentEditorContainer*

Document Editor Container allows you to customize(add, show, hide, enable, and disable) existing items in a toolbar.

- Add - New items can be defined by [CustomToolbarItemModel](#) and with existing items in [toolbarItems](#) property. Newly added item click action can be defined in [toolbarclick](#).
- Show, Hide - Existing items can be shown or hidden using the [toolbarItems](#) property. Pre-defined toolbar items are available with [ToolbarItem](#).
- Enable, Disable - Toolbar items can be enabled or disable using [enableItems](#)

,

<template>

<div id="app">

<ejs-documenteditorcontainer ref="container" :toolbarItems='items' v-  
bind:toolbarClick='onToolbarClick' :enableToolbar='true'> </ejs-documenteditorcontainer>

</div>

</template>

<script>

import Vue from 'vue';

import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent, Toolbar } from  
'@syncfusion/ej2-vue-documenteditor';

Vue.use(DocumentEditorContainerPlugin);

export default {

data(){

```

return {
  items: [
    {
      prefixIcon: "e-de-ctnr-lock",
      tooltipText: "Disable Image",
      text: "Disable Image",
      id: "Custom"
    },
    'Undo','Redo','Separator','Image','Table','Hyperlink','Bookmark','Comments','TableOfContents','Separator',
    'Header','Footer','PageSetup','PageNumber','Break',
    'Separator','Find','Separator','LocalClipboard','RestrictEditing']
  ],
  provide: {
    DocumentEditorContainer: [Toolbar]
  },
  methods: {
    onToolbarClick:function(args) {
      switch(args.item.id) {
        case 'Custom':
          //Disable image toolbar item.
          this.$refs.container.ej2Instances.toolbar.enableItems(4, false);
          break;
        }
      }
    }
  }
}
</script>

```

Note: Default value of `toolbarItems` is ['New', 'Open', 'Separator', 'Undo', 'Redo', 'Separator', 'Image', 'Table', 'Hyperlink', 'Bookmark', 'TableOfContents', 'Separator', 'Header', 'Footer', 'PageSetup', 'PageNumber', 'Break', 'InsertFootnote', 'InsertEndnote', 'Separator', 'Find', 'Separator', 'Comments', 'TrackChanges', 'Separator', 'LocalClipboard', 'RestrictEditing', 'Separator', 'FormFields', 'UpdateFields'].

Change document view in Vue Document editor component

*How to change the document view in DocumentEditor component*

Document Editor allows you to change the view to web layout and print using the [layoutType](#) property with the supported [LayoutType](#).

```
<ejs-documenteditor :layoutType='Continuous' id='container'></ejs-documenteditor>
```

Note: Default value of [layoutType](#) in Document Editor component is [Pages](#).

*How to change the document view in DocumentEditorContainer component*

Document Editor Container component allows you to change the view to web layout and print using the [layoutType](#) property with the supported [LayoutType](#).

```
<ejs-documenteditorcontainer :layoutType='Continuous' id='container'></ejs-documenteditorcontainer>
```

Note: Default value of [layoutType](#) in Document Editor Container component is [Pages](#).

Open default document in Vue Document editor component

In this article, we are going to see how to open a default document when Document Editor & Document Editor Container is initialized.

*Opening a default document in DocumentEditor*

By default, Document Editor will open blank document. You can use [open](#) API in Document Editor to open the sfdt content.

Document editor have [created](#) event which gets triggered once Document editor control created. So, if you want to open the document by default, you can use [open](#) and [created](#) API.

The following example illustrates how to open the default SFDT content once Document editor control gets created.

{% previewsample "page.domainurl/code-snippet/document-editor/getting-started-cs5" %}

Note: You can use the `restrictEditing` in Document Editor Container and `isReadOnly` in Document Editor based on your requirement to change component to read only mode.

Open document by address in Vue Document editor component

[How to open a document from URL in DocumentEditor](#)

In this article, we are going to see how to open a document from URL in DocumentEditor

please refer below example for client-side code

,

```

<template>
<div id="app">
<button id='import' v-on:click="onClick">Import</button>
<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' height="590px" id='container'
:enableToolbar='true'></ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';
import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent, Toolbar } from
'@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
data() {
return { serviceUrl:'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/'
};
},
provide: {

```

```
//Inject require modules.
DocumentEditorContainer: [Toolbar]
},
methods: {
onClick:function() {
let obj = this;
let http: XMLHttpRequest = new XMLHttpRequest();
//add your url in which you want to open document inside the ""
let content = { fileUrl: "" };
let baseUrl: string = "/api/documenteditor/ImportFileURL";
http.open("POST", baseUrl, true);
http.setRequestHeader("Content-Type", "application/json;charset=UTF-8");
http.onreadystatechange = () => {
if (http.readyState === 4) {
if (http.status === 200 || http.status === 304) {
//open the SFDt text in Document Editor
this.$refs.container.ej2Instances.documentEditor.open(http.responseText);
}
}
};
http.send(JSON.stringify(content));
}
}
};
</script>
`
```

please refer below example for server-side code

```
`c#
[AcceptVerbs("Post")]
public string ImportFileURL([FromBody]FileInfo param)
{
try {
using(WebClient client = new WebClient())
```

```
{
MemoryStream stream = new MemoryStream(client.DownloadData(param.fileUrl));
WordDocument document = WordDocument.Load(stream, FormatType.Docx);
string json = Newtonsoft.Json.JsonConvert.SerializeObject(document);
document.Dispose();
stream.Dispose();
return json;
}
}
catch (Exception) {
return "";
}
}

public class FileUrlInfo {
public string fileUrl { get; set; }
public string Content { get; set; }
}
、
```

### Deploy document editor component for mobile in Vue Document editor component

#### *Document editor component for Mobile*

At present, Document editor component is not responsive for mobile, and we haven't ensured the editing functionalities in mobile browsers. Whereas it works properly as a document viewer in mobile browsers.

Hence, it is recommended to switch the Document editor component as read-only in mobile browsers. Also, invoke [fitPage](#) method with [FitPageWidth](#) parameter in document change event, such as to display one full page by adjusting the zoom factor.

The following example code illustrates how to deploy Document Editor component for Mobile.

```
、
<template>
<div id="app">
<ejs-documenteditorcontainer ref="container" height="590px" :serviceUrl='serviceUrl'
:enableToolbar='true' :documentChange='onDocumentChange'> </ejs-documenteditorcontainer>
</div>
</template>
<script>
```

```
import Vue from 'vue';
import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent, Toolbar } from
 '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
  data(){
    return { serviceUrl:'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/' }
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar]
  },
  methods:{
    onDocumentChange: function (args) {
      //To detect the device
      let isMobileDevice = /Android|Windows Phone|webOS/i.test(navigator.userAgent);
      if (isMobileDevice) {
        this.$refs.container.ej2Instances.restrictEditing = true;
        setTimeout(() => {
          this.$refs.container.ej2Instances.documentEditor.fitPage("FitPageWidth");
        }, 50);
      }
      else {
        this.$refs.container.ej2Instances.restrictEditing = false;
      }
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
```

```

@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
`

```

You can download the complete working example from this [GitHub location](#)

Note: You can use the [restrictEditing](#) in DocumentEditorContainer and [isReadOnly](#) in DocumentEditor based on your requirement to change component to read only mode.

#### Disable optimized text measuring in Vue Document editor component

Starting from v19.3.0.x, the accuracy of text size measurements in Document editor is improved such as to match Microsoft Word pagination for most Word documents. This improvement is included as default behavior along with an optional API [enableOptimizedTextMeasuring](#) in Document editor settings.

If you want the Document editor component to retain the document pagination (display page-by-page) behavior like v19.2.0.x and older versions. Then you can disable this optimized text measuring improvement, by setting `false` to [enableOptimizedTextMeasuring](#) property of Vue Document Editor component.

#### Disable optimized text measuring in `DocumentEditorContainer` instance

The following example code illustrates how to disable optimized text measuring improvement in `DocumentEditorContainer` instance.

```

`
<template>
<div id="app">
<ejs-documenteditorcontainer ref='documenteditor' :serviceUrl='serviceUrl' height="590px"
id='container' :enableToolbar='true' :documentEditorSettings='settings'></ejs-
documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';
import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent, Toolbar } from
'@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
data() {

```

```

return { serviceUrl:'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
settings:{ enableOptimizedTextMeasuring : false} };
},
provide: {
//Inject require modules.
DocumentEditorContainer: [Toolbar]
}
}
</script>
`

```

#### *Disable optimized text measuring in `DocumentEditor` instance*

The following example code illustrates how to disable optimized text measuring improvement in **DocumentEditor** instance.

```

<template>
<div id="app">
<ejs-documenteditor :serviceUrl='serviceUrl' :isReadOnly='false' :enablePrint='true'
:enableSfdtExport='true' :enableSelection='true' :enableContextMenu='true' :enableSearch='true'
:enableOptionsPane='true' :enableWordExport='true' :enableTextExport='true' :enableEditor='true'
:enableImageResizer='true' :enableEditorHistory='true' :enableHyperlinkDialog='true'
:enableTableDialog='true' :enableBookmarkDialog='true' :enableTableOfContentsDialog='true'
:enablePageSetupDialog='true' :enableStyleDialog='true' :enableListDialog='true'
:enableParagraphDialog='true' :enableFontDialog='true' :enableTablePropertiesDialog='true'
:enableBordersAndShadingDialog='true' :enableTableOptionsDialog='true' height="370px"
:documentEditorSettings='settings'> </ejs-documenteditor>
</div>
</template>
<script>
import Vue from 'vue';

import { DocumentEditorPlugin, DocumentEditorComponent, Print, SfdtExport, WordExport, TextExport,
Selection, Search, Editor, ImageResizer, EditorHistory, ContextMenu, OptionsPane, HyperlinkDialog,
TableDialog, BookmarkDialog, TableOfContentsDialog, PageSetupDialog, StyleDialog, ListDialog,
ParagraphDialog, BulletsAndNumberingDialog, FontDialog, TablePropertiesDialog,
BordersAndShadingDialog, TableOptionsDialog, CellOptionsDialog, StylesDialog } from '@syncfusion/ej2-
vue-documenteditor';

Vue.use(DocumentEditorPlugin);

export default {
data () {

```

```

return { serviceUrl:'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
settings:{ enableOptimizedTextMeasuring : false} };
},
provide: {
//Inject require modules.
DocumentEditor: [Print, SfdtExport, WordExport, TextExport, Selection, Search, Editor, ImageResizer,
EditorHistory, ContextMenu, OptionsPane, HyperlinkDialog, TableDialog, BookmarkDialog,
TableOfContentsDialog, PageSetupDialog, StyleDialog, ListDialog, ParagraphDialog,
BulletsAndNumberingDialog, FontDialog, TablePropertiesDialog, BordersAndShadingDialog,
TableOptionsDialog, CellOptionsDialog, StylesDialog]
}
}
</script>
`

```

### Get the selected content in Vue Document editor component

You can get the selected content from the Vue Document Editor component as plain text and SFDT (rich text).

#### Get the selected content as plain text

You can use [text](#) API to get the selected content as plain text from Vue Document Editor component.

The following example code illustrates how to add search in google option in context menu for the selected text.

```

`
<template>
<div id="app">
<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' v-on:created="onCreated"
height="590px" id='container' :enableToolbar='true'></ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';

import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent,Toolbar} from
'@syncfusion/ej2-vue-documenteditor';

Vue.use(DocumentEditorContainerPlugin);

export default {
data() {
return {

```

```
serviceUrl:
'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
};
},
provide: {
//Inject require modules.
DocumentEditorContainer: [Toolbar],
},
methods: {
handleCustomMenuSelect: function (args) {
var documentEditor = this.$refs.container.ej2Instances.documentEditor;
// custom Options Functionality
let id = documentEditor.element.id;
switch (args.id) {
case id + 'searchingoogle':
var searchContent = documentEditor.selection.text;
if (!documentEditor.selection.isEmpty && /\S/.test(searchContent)) {
window.open('http://google.com/search?q=' + searchContent);
}
break;
}
},
onCreated: function () {
var obj = this.$refs.container.ej2Instances.documentEditor;
var menuItems = [
{
text: 'Search In Google',
id: 'searchingoogle',
iconCss: 'e-icons e-de-ctnr-find',
},
];
// adding Custom Options
obj.contextMenu.addCustomMenu(menuItems, false);
```

```
// custom Options Select Event
obj.customContextMenuSelect = (args) => {
  this.handleCustomMenuSelect(args);
};
},
}
};
</script>
`
```

You can add the following custom options using this API,

- Save or export the selected text as text file.
- Search the selected text in Google or other search engines.
- Show synonyms for the selected word in context menu and replace with selected synonym using the setter method of same API.

*Get the selected content as SFDT (rich text)*

You can use [sfdt](#) API to get the selected content as plain text from Vue Document Editor component.

The following example code illustrates how to get the content of a bookmark and export it as SFDT.

```
<template>
<div id="app">
  <ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' v-on:created="onCreated"
  height="590px" id='container' :enableToolbar='true'></ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';

import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent, Toolbar } from
'@syncfusion/ej2-vue-documenteditor';

Vue.use(DocumentEditorContainerPlugin);

export default {
  data() {
    return {
      serviceUrl:
        'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
    }
  }
}
```

```
};
},
provide: {
  //Inject require modules.
  DocumentEditorContainer: [Toolbar],
},
methods: {
  onCreated: function () {
    var obj = this.$refs.container.ej2Instances.documentEditor;
    // To insert text in cursor position
    obj.editor.insertText('Document editor');
    // To select all the content in document
    obj.selection.selectAll();
    // Insert bookmark to selected content
    obj.editor.insertBookmark('Bookmark1');
    //Select the bookmark
    obj.selection.selectBookmark('Bookmark1');
    // To get the selected content as sfdt
    let selectedContent = obj.selection.sfdt;
    // Insert the sfdt content in cursor position using paste API
    obj.editor.paste(selectedContent);
  }
}
};
</script>
```

You can add the following custom options using this API,

- Save or export the selected content as SFDT file.
- Get the content of a bookmark in Word document as SFDT by selecting a bookmark using [selectbookmark](#) API.
- Create template content that can be inserted to multiple documents in cursor position using [paste](#) API.

[Set default format in document editor in Vue Document editor component](#)

You can set the default character format, paragraph format and section format in Document editor.

*Set the default character format*

You can use [setDefaultCharacterFormat](#) method to set the default character format. For example, Document editor default font size is 11 and you can change it as any valid value.

The following example code illustrates how to change the default font size in Document editor.

```
<template>
<div id="app">
<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' v-on:created="onCreated"
height="590px" id='container' :enableToolbar='true'></ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';

import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent, Toolbar } from
'@syncfusion/ej2-vue-documenteditor';

Vue.use(DocumentEditorContainerPlugin);

export default {
  data() {
    return {
      serviceUrl:
        'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
    };
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar],
  },
  methods: {
    onCreated: function () {
      this.$refs.container.ej2Instances.documentEditor.setDefaultCharacterFormat({fontSize: 20});
    },
  },
};
</script>
```

Similarly, you can change the required [CharacterFormatProperties](#) default value.

The following example code illustrates how to change other character format default value in Document editor.

```
<template>
<div id="app">
<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' v-on:created="onCreated"
height="590px" id='container' :enableToolbar='true'></ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';

import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent, Toolbar } from
'@syncfusion/ej2-vue-documenteditor';

Vue.use(DocumentEditorContainerPlugin);

export default {
data() {
return {
serviceUrl:
'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
};
},
provide: {
//Inject require modules.
DocumentEditorContainer: [Toolbar],
},
methods: {
onCreated: function () {
var defaultCharacterFormat = {
bold: false,
italic: false,
baselineAlignment: 'Normal',
underline: 'None',
```

```

fontColor: '#000000',
fontFamily: 'Algerian',
fontSize: 12,
};
this.$refs.container.ej2Instances.documentEditor.setDefaultCharacterFormat(
defaultCharacterFormat
);
},
},
};
</script>
`

```

#### *Set the default paragraph format*

You can use [setDefaultParagraphFormat](#) API to set the default paragraph format. You can change the required [ParagraphFormatProperties](#) default value.

The following example code illustrates how to change the paragraph format(before spacing, line spacing etc.,) default value in Document editor.

```

<template>
<div id="app">
<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' v-on:created="onCreated"
height="590px" id='container' :enableToolbar='true'></ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';

import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent,Toolbar} from
'@syncfusion/ej2-vue-documenteditor';

Vue.use(DocumentEditorContainerPlugin);

export default {
data() {
return {
serviceUrl:
'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
};
}
}

```

```

},
provide: {
  //Inject require modules.
  DocumentEditorContainer: [Toolbar],
},
methods: {
  onCreated: function () {
    let defaultParagraphFormat = {
      beforeSpacing: 8,
      lineSpacing: 1.5,
      leftIndent: 24,
      textAlignment: "Center"
    };
    this.$refs.container.ej2Instances.documentEditor.setDefaultParagraphFormat(defaultParagraphFormat)
  };
},
};
</script>

```

#### *Set the default section format*

You can use [setDefaultSectionFormat](#) API to set the default section format. You can change the required [SectionFormatProperties](#) default value.

The following example code illustrates how to change the section format(header and footer distance, page width and height, etc.,) default value in Document editor.

```

<template>
<div id="app">
  <ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' v-on:created="onCreated"
  height="590px" id='container' :enableToolbar='true'></ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';

```

```

import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent, Toolbar } from
 '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
  data() {
    return {
      serviceUrl:
        'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
    };
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar],
  },
  methods: {
    onCreated: function () {
      let defaultSectionFormat = {
        pageWidth: 500,
        pageHeight: 800,
        headerDistance: 56,
        footerDistance: 48,
        leftMargin: 12,
        rightMargin: 12,
        topMargin: 0,
        bottomMargin: 0
      };
      this.$refs.container.ej2Instances.documentEditor.setDefaultSectionFormat(defaultSectionFormat);
    },
  },
};
</script>

```

Show [hide spinner](#) in Vue Document editor component

Using [spinner](#) component, you can show/hide spinner while opening document in DocumentEditor .

Example code snippet to show/hide spinner

```
// showSpinner() will make the spinner visible
showSpinner(document.getElementById('container'));

// hideSpinner() method used hide spinner
hideSpinner(document.getElementById('container'));
```

Refer to the following example.

### APP.VUE

```
<template>
  <div id="app">
    <button id='import' v-on:click="onClick">Load Document</button>
    <ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl'
    v-on:created="onCreated" height="590px" id='container'
    :enableToolbar='true'></ejs-documenteditorcontainer>
  </div>
</template>
<script>
  import Vue from 'vue';
  import {
    DocumentEditorContainerPlugin,
    DocumentEditorContainerComponent,
    Toolbar,
  } from '@syncfusion/ej2-vue-documenteditor';
  import { showSpinner, hideSpinner } from '@syncfusion/ej2-popups';
  Vue.use(DocumentEditorContainerPlugin);
  export default {
    data() {
      return {
        serviceUrl:
          'https://ej2services.syncfusion.com/production/web-
          services/api/documenteditor/',
      };
    },
    provide: {
      //Inject require modules.
      DocumentEditorContainer: [Toolbar],
    },
    methods: {
      onClick:function() {
        // load your default document here
        let data=
          '{"sections":[{"sectionFormat":{"pageWidth":612,"pageHeight":792,"leftMargin":72,"rightMargin":72,"topMargin":72,"bottomMargin":72,"differentFirstPage":false,"differentOddAndEvenPages":false,"headerDistance":36,"footerDistance":36,"bidi":false},"blocks":[{"paragraphFormat":{"afterSpacing":30,"styleName":"Heading1","listFormat":{}},"characterFormat":{}},"inlines":[{"characterFormat":{}},"text":"Adventure Works Cycles"]]}],"headersFooters":{"header":{"blocks":[{"paragraphFormat":{"listF

l": []}';

    // showSpinner() will make the spinner visible
    showSpinner(document.getElementById('container'));
    // Open the default document
    this.$refs.container.ej2Instances.documentEditor.open(data);
    setInterval(function() {
        // hideSpinner() method used hide spinner
        hideSpinner(document.getElementById('container'));
    }, 5000);
},
onCreated: function () {
    createSpinner({
        // Specify the target for the spinner to show
        target: document.getElementById('container')
    });
}
},
};
</script>
<style>
    @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-
navigations/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-
dropdowns/styles/material.css';
    @import "../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/document-editor/spinner-cs1" %}

Note: In above example, we have used setInterval to hide spinner, just for demo purpose.

### [Resize document editor in Vue Document editor component](#)

In this article, we are going to see how to change height and width of Documenteditor.

#### [Change height of Document Editor](#)

DocumentEditorContainer initially render with default height. You can change height of documenteditor using [height](#) property, the value which is in pixel.

The following example code illustrates how to change height of Document Editor.

,

```
<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' height="590px" id='container'
:enableToolbar='true'></ejs-documenteditorcontainer>
```

,

Similarly, you can use [height](#) property for DocumentEditor also.

#### *Change width of Document Editor*

DocumentEditorContainer initially render with default width. You can change width of documenteditor using [width](#) property, the value which is in percent.

The following example code illustrates how to change width of Document Editor.

,

```
<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' v-on:created="onCreated"
width="100%" id='container' :enableToolbar='true'></ejs-documenteditorcontainer>
```

,

Similarly, you can use [width](#) property for DocumentEditor also.

#### *Resize Document Editor*

Using [resize](#) method, you change height and width of Document editor.

The following example code illustrates how to fit Document Editor to browser window size.

,

```
<template>
<div id="app">

<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' v-on:created="onCreated"
height="590px" id='container' :enableToolbar='true'></ejs-documenteditorcontainer>

</div>
</template>
<script>
import Vue from 'vue';

import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent,Toolbar} from
'@syncfusion/ej2-vue-documenteditor';

Vue.use(DocumentEditorContainerPlugin);

export default {
data() {
return {
serviceUrl:
'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
```

```

};
},
provide: {
  //Inject require modules.
  DocumentEditorContainer: [Toolbar],
},
methods: {
  onWindowResize: function () {
    //Resizes the document editor component to fit full browser window automatically whenever the
    browser resized.
    this.updateDocumentEditorSize();
  },
  updateDocumentEditorSize: function () {
    //Resizes the document editor component to fit full browser window.
    var windowWidth = window.innerWidth;
    var windowHeight = window.innerHeight;
    this.$refs.container.ej2Instances.resize(windowWidth, windowHeight);
  },
  onCreated: function () {
    setInterval(() => {
      this.updateDocumentEditorSize();
    }, 100);
    //Adds event listener for browser window resize event.
    window.addEventListener('resize', this.onWindowResize.bind(this));
  },
},
};
</script>
`

```

### [Export document as pdf in Vue Document editor component](#)

In this article, we are going to see how to export the document as Pdf format. You can export the document as Pdf in following ways:

*Export the document as pdf in client-side*

Use [pdf export component](#) in application level to export the document as pdf using [exportasimage](#) API. Here, all pages will be converted to image and inserted as pdf pages(works like print as PDF). There is one limitation we can't search the text because we are exporting the pdf as image.

Note: You can install the pdf export packages from this [link](#).

The following example code illustrates how to export the document as pdf in client-side.

```
,
<template>
<div id="app">
<button id='export' v-on:click="onClick">Export</button>
<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' height="590px" id='container'
:enableToolbar='true'></ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';
import {
PdfBitmap,
PdfDocument,
PdfPageOrientation,
PdfPageSettings,
PdfSection,
SizeF
} from '@syncfusion/ej2-pdf-export';
import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent, Toolbar } from
'@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
data() {
return { serviceUrl:'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/'
};
},
provide: {
//Inject require modules.
DocumentEditorContainer: [Toolbar]
```

```
},
methods: {
  onClick:function() {
    let obj = this;
    let pdfdocument = new PdfDocument();
    let count = obj.$refs.container.ej2Instances.documentEditor.pageCount;
    obj.$refs.container.ej2Instances.documentEditor.documentEditorSettings.printDevicePixelRatio = 2;
    let loadedPage = 0;
    for (let i = 1; i <= count; i++) {
      setTimeout(() => {
        let format = 'image/jpeg';
        // Getting pages as image
        let image = obj.$refs.container.ej2Instances.documentEditor.exportAsImage(i, format);
        image.onload = function () {
          let imageHeight = parseInt(
            image.style.height.toString().replace('px', '')
          );
          let imageWidth = parseInt(
            image.style.width.toString().replace('px', '')
          );
          let section = pdfdocument.sections.add();
          let settings = new PdfPageSettings(0);
          if (imageWidth > imageHeight) {
            settings.orientation = PdfPageOrientation.Landscape;
          }
          settings.size = new SizeF(imageWidth, imageHeight);
          (section).setPageSettings(settings);
          let page = section.pages.add();
          let graphics = page.graphics;
          let imageStr = image.src.replace('data:image/jpeg;base64,', '');
          let pdfImage = new PdfBitmap(imageStr);
          graphics.drawImage(pdfImage, 0, 0, imageWidth, imageHeight);
          loadedPage++;
        }
      }, 100);
    }
  }
}
```

```

if (loadedPage == count) {
  // Exporting the document as pdf
  pdfdocument.save(
    (obj.$refs.container.ej2Instances.documentEditor.documentName === ''
    ? 'sample'
    : obj.$refs.container.ej2Instances.documentEditor.documentName) + '.pdf'
  );
}
};
}, 500);
}
}
}
};
</script>
`

```

#### Export document as pdf in server-side using Syncfusion DocIO

With the help of [Synfusion DocIO](#), you can export the document as Pdf in server-side. Here, you can search the text.

The following way illustrates how to convert the document as Pdf:

- Using [serialize](#) API, convert the document as Sfdt and send it to server-side.

The following example code illustrates how to convert the document to sfdt and pass it to server-side.

```

`
<template>
<div id="app">
<button id='export' v-on:click="onClick">Export</button>
<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' height="590px" id='container'
:enableToolbar='true'></ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';

import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent, Toolbar } from
'@syncfusion/ej2-vue-documenteditor';

```

```

Vue.use(DocumentEditorContainerPlugin);
export default {
  data() {
    return { serviceUrl:'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/'
  };
},
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar]
  },
  methods: {
    onClick:function() {
      let obj = this;
      let http = new XMLHttpRequest();
      // Replace your running web service Url here
      http.open('POST', 'http://localhost:62869/api/documenteditor/ExportPdf');
      http.setRequestHeader('Content-Type', 'application/json;charset=UTF-8');
      http.responseType = 'json';
      //Serialize document content as SFDT.
      let sfdt = { content: obj.$refs.container.ej2Instances.documentEditor.serialize() };
      //Send the sfdt content to server side.
      http.send(JSON.stringify(sfdt));
    }
  }
};
</script>

```

- Using Save API in server-side, you can convert the sfdt to stream.
- Finally, convert the stream to Pdf using [Syncfusion.DocIORenderer.Net.Core](#) library.

The following example code illustrates how to process the sfdt in server-side.

```

`c#
[AcceptVerbs("Post")]
[HttpPost]

```

```
[EnableCors("AllowAllOrigins")]
[Route("ExportPdf")]
public void ExportPdf([FromBody]SaveParameter data)
{
    // Converts the sfdt to stream
    Stream document = WordDocument.Save(data.content, FormatType.Docx);
    Syncfusion.DocIO.DLS.WordDocument doc = new Syncfusion.DocIO.DLS.WordDocument(document,
    Syncfusion.DocIO.FormatType.Docx);
    //Instantiation of DocIORenderer for Word to PDF conversion
    DocIORenderer render = new DocIORenderer();
    //Converts Word document into PDF document
    PdfDocument pdfDocument = render.ConvertToPDF(doc);
    // Saves the document to server machine file system, you can customize here to save into databases or
    file servers based on requirement.
    FileStream fileStream = new FileStream("sample.pdf", FileMode.OpenOrCreate, FileAccess.ReadWrite);
    //Saves the PDF file
    pdfDocument.Save(fileStream);
    pdfDocument.Close();
    fileStream.Close();
    document.Close();
}
```

Get the complete working sample in this [link](#).

Customize font family drop down in Vue Document editor component

Document editor provides an options to customize the font family drop down list values using [fontfamilies](#) in Document editor settings. Fonts which are added in fontFamilies of [documentEditorSettings](#) will be displayed on font drop down list of text properties pane and font dialog.

Similarly, you can use [documentEditorSettings](#) property for DocumentEditor also.

The following example code illustrates how to change the font families in Document editor container.

```
<template>
<div id="app">
<ejs-documenteditorcontainer ref='documenteditor' :serviceUrl='serviceUrl'
:documentEditorSettings='settings' height="590px" id='container' :enableToolbar='true'></ejs-
documenteditorcontainer>
```

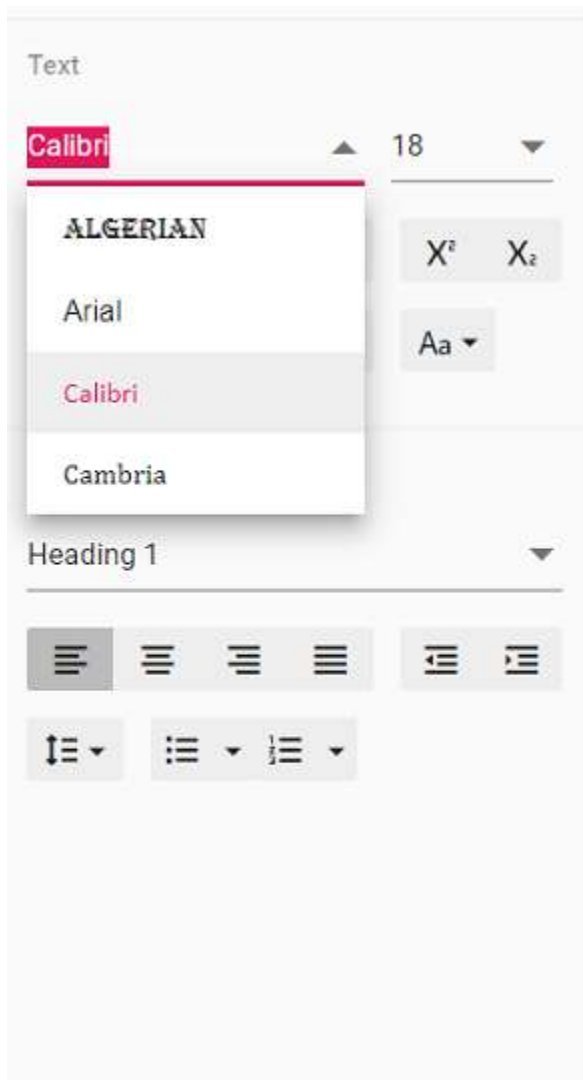

```
</div>
</template>
<script>
import Vue from 'vue';

import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent, Toolbar } from
 '@syncfusion/ej2-vue-documenteditor';

Vue.use(DocumentEditorContainerPlugin);

export default {
  data() {
    return { serviceUrl: 'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
      // Add required font families to list it in font drop down
      settings: { fontFamilies: ['Algerian', 'Arial', 'Calibri', 'Cambria'] } },
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar]
  }
}
</script>
`
```

Output will be like below:

#### [Auto save document in document editor in Vue Document editor component](#)

In this article, we are going to see how to autosave the document in AWS S3. You can automatically save the edited content in regular intervals of time. It helps reduce the risk of data loss by saving an open document automatically at customized intervals.

The following example illustrates how to auto save the document in AWS S3.

- In the client-side, using content change event, we can automatically save the edited content in regular intervals of time. Based on `contentChanged` boolean, the document send as Docx format to server-side using [saveAsBlob](#) method.

<template>

<div id="app">

```
<ejs-documenteditorcontainer ref='container' :serviceUrl='serviceUrl' v-on:created="onCreated" v-
on:contentChange="contentChangeEvent" height="590px" id='container' :enableToolbar='true'></ejs-
documenteditorcontainer>

</div>

</template>

<script>

import Vue from 'vue';

import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent, Toolbar } from
 '@syncfusion/ej2-vue-documenteditor';

Vue.use(DocumentEditorContainerPlugin);

export default {
  data() {
    return { serviceUrl:'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
      contentChanged:false};
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar]
  },
  methods: {
    contentChangeEvent: function () {
      this.contentChanged = true;
    },
    onCreated: function () {
      setInterval(() => {
        if (this.contentChanged) {
          //You can save the document as below
          this.$refs.container.ej2Instances.documentEditor
            .saveAsBlob('Docx')
            .then((blob) => {
              console.log('Saved sucessfully');
              let exportedDocument = blob;
              //Now, save the document where ever you want.
              let formData = new FormData();
```

```

formData.append('fileName', 'sample.docx');
formData.append('data', exportedDocument);
/ tslint:disable /
var req = new XMLHttpRequest();
// Replace your running Url here
req.open(
'POST',
'http://localhost:62869/api/documenteditor/SaveToS3',
true
);
req.onreadystatechange = () => {
if (req.readyState === 4) {
if (req.status === 200 || req.status === 304) {
console.log('Saved sucessfully');
}
}
};
req.send(formData);
});
this.contentChanged = false;
}
}, 1000);
},
},
};
</script>
`

```

- In server-side, configure the access key and secret key in `web.config` file and register profile in `startup.cs`.

In `web.config`, add key like below format:

```

`c#
<appSettings>

```

```
<add key="AWSProfileName" value="sync_development" />
<add key="AWSAccessKey" value="" />
<add key="AWSSecretKey" value="" />
</appSettings>
```

In `startup.cs`, register profile in below format:

```
`c#
Amazon.Util.ProfileManager.RegisterProfile("sync_development", "", "");
```

- In server-side, Receives the stream content from client-side and process it to save the document in aws s3. Add Web API in controller file like below to save the document in aws s3.

```
`c#
[AcceptVerbs("Post")]
[HttpPost]
[EnableCors("AllowAllOrigins")]
[Route("SaveToS3")]
public string SaveToS3()
{
    IFormFile file = HttpContext.Request.Form.Files[0];
    Stream stream = new MemoryStream();
    file.CopyTo(stream);
    UploadFileStreamToS3(stream, "documenteditor", "", "GettingStarted.docx");
    stream.Close();
    return "Sucess";
}

public bool UploadFileStreamToS3(System.IO.Stream localFilePath, string bucketName, string
subDirectoryInBucket, string fileNameInS3)
{
    AWSCredentials credentials = new StoredProfileAWSCredentials("sync_development");
    IAmazonS3 client = new AmazonS3Client(credentials, Amazon.RegionEndpoint.USEast1);
    TransferUtility utility = new TransferUtility(client);
    TransferUtilityUploadRequest request = new TransferUtilityUploadRequest();
    if (subDirectoryInBucket == "" || subDirectoryInBucket == null)
```

```

{
request.BucketName = bucketName; //no subdirectory just bucket name
}
else
{ // subdirectory and bucket name
request.BucketName = bucketName + @"/" + subDirectoryInBucket;
}
request.Key = fileNameInS3; //file name up in S3
request.InputStream = localFilePath;
utility.Upload(request); //commencing the transfer
return true; //indicate that the file was sent
}
`

```

Get the complete working sample in this [link](#).

Retrieve the bookmark content as text in Vue Document editor component

You can get the bookmark or whole document content from the Vue Document Editor component as plain text and SFDT (rich text).

*Get the bookmark content as plain text*

You can [selectBookmark](#) API to navigate to the bookmark and use [text](#) API to get the bookmark content as plain text from Vue Document Editor component.

The following example code illustrates how to get the bookmark content as plain text.

```

<template>
<div id="app">
<ejs-documenteditorcontainer
ref="container"
:serviceUrl="serviceUrl"
height="590px"
id="container"
:enableToolbar="true"
v-on:created="onCreated.bind(this)"
</ejs-documenteditorcontainer>
</div>
</template>

```

```

<script>
import Vue from 'vue';
import {
  DocumentEditorContainerPlugin,
  DocumentEditorContainerComponent,
  Toolbar,
} from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
  data() {
    return {
      serviceUrl:
        'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
    };
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar],
  },
  methods: {
    onCreated: function () {
      // To insert text in cursor position
      this.$refs.container.ej2Instances.documentEditor.editor.insertText('Document editor');
      // To select all the content in document
      this.$refs.container.ej2Instances.documentEditor.selection.selectAll();
      // Insert bookmark to selected content
      this.$refs.container.ej2Instances.documentEditor.editor.insertBookmark('Bookmark1');
      // Provide your bookmark name to navigate to specific bookmark
      this.$refs.container.ej2Instances.documentEditor.selection.selectBookmark('Bookmark1');
      // To get the selected content as text
      let selectedContent = this.$refs.container.ej2Instances.documentEditor.selection.text;
    }
  }
}

```

```
};
</script>
`
```

To get the bookmark content as SFDT (rich text), please check this [link](#)

*Get the whole document content as text*

You can use [text](#) API to get the whole document content as plain text from Vue Document Editor component.

The following example code illustrates how to get the whole document content as plain text.

```
`
<template>
<div id="app">
<ejs-documenteditorcontainer
ref="container"
:serviceUrl="serviceUrl"
height="590px"
id="container"
:enableToolbar="true"
v-on:created="onCreated.bind(this)"
</ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';
import {
DocumentEditorContainerPlugin,
DocumentEditorContainerComponent,
Toolbar,
} from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
data() {
return {
serviceUrl:
'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',

```

```

};
},
provide: {
  //Inject require modules.
  DocumentEditorContainer: [Toolbar],
},
methods: {
  onCreated: function () {
    // To insert text in cursor position
    this.$refs.container.ej2Instances.documentEditor.editor.insertText('Document editor');
    // To select all the content in document
    this.$refs.container.ej2Instances.documentEditor.selection.selectAll();
    // To get the content as text
    let selectedContent = this.$refs.container.ej2Instances.documentEditor.selection.text;
  }
}
};
</script>

```

#### *Get the whole document content as SFDT(rich text)*
