You can use [serialize](#) API to get the whole document content as SFDT string from Vue Document Editor component.

The following example code illustrates how to get the whole document content as SFDT.

```

<template>
<div id="app">
<ejs-documenteditorcontainer
  ref="container"
  :serviceUrl="serviceUrl"
  height="590px"
  id="container"
  :enableToolbar="true"
  v-on:created="onCreated.bind(this)"
</ejs-documenteditorcontainer>

```

```
</div>
</template>
<script>
import Vue from 'vue';
import {
  DocumentEditorContainerPlugin,
  DocumentEditorContainerComponent,
  Toolbar,
} from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
  data() {
    return {
      serviceUrl:
        'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
    };
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar],
  },
  methods: {
    onCreated: function () {
      // To insert text in cursor position
      this.$refs.container.ej2Instances.documentEditor.editor.insertText('Document editor');
      // To get the content as SFDT
      let selectedContent: string = this.$refs.container.ej2Instances.documentEditor.serialize();
    }
  }
};
</script>
,
```

*Get the header content as text*

You can use [goToHeader](#) API to navigate the selection to the header and then use [text](#) API to get the content as plain text.

The following example code illustrates how to get the header content as plain text.

```
,
<template>
<div id="app">
<ejs-documenteditorcontainer
ref="container"
:serviceUrl="serviceUrl"
height="590px"
id="container"
:enableToolbar="true"
v-on:created="onCreated.bind(this)"
</ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';
import {
DocumentEditorContainerPlugin,
DocumentEditorContainerComponent,
Toolbar,
} from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
data() {
return {
serviceUrl:
'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
};
},
provide: {
//Inject require modules.
```

```

DocumentEditorContainer: [Toolbar],
},
methods: {
  onCreated: function () {
    // To navigate the selection to header
    this.$refs.container.ej2Instances.documentEditor.selection.goToHeader();
    // To insert text in cursor position
    this.$refs.container.ej2Instances.documentEditor.editor.insertText('Document editor');
    // To select all the content in document
    this.$refs.container.ej2Instances.documentEditor.selection.selectAll();
    // To get the selected content as text
    let selectedContent = this.$refs.container.ej2Instances.documentEditor.selection.text;
  }
}
};
</script>
`

```

Similarly, you can use [goToFooter](#) API to navigate the selection to the footer and then use [text](#) API to get the content as plain text.

#### Get current word in Vue Document editor component

You can get the current word or paragraph content from the Vue Document Editor component as plain text and SFDT (rich text).

##### Select and get the word in current cursor position

You can use [selectCurrentWord](#) API in selection module to select the current word at cursor position and use [text](#) API to get the selected content as plain text from Vue Document Editor component.

The following example code illustrates how to select and get the current word as plain text.

```

<template>
<div id="app">
<ejs-documenteditorcontainer
ref="container"
:serviceUrl="serviceUrl"
height="590px"
id="container"
:enableToolbar="true"

```

```

v-on:created="onCreated.bind(this)"
</ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';
import {
  DocumentEditorContainerPlugin,
  DocumentEditorContainerComponent,
  Toolbar,
} from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
  data() {
    return {
      serviceUrl:
        'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
    };
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar],
  },
  methods: {
    onCreated: function () {
      // To insert text in cursor position
      this.$refs.container.ej2Instances.documentEditor.editor.insertText(
        'Document editor'
      );
      // Move selection to previous character
      this.$refs.container.ej2Instances.documentEditor.selection.moveToPreviousCharacter();
      // To select the current word in document
      this.$refs.container.ej2Instances.documentEditor.selection.selectCurrentWord();
    }
  }
}

```

```
// To get the selected content as text
var selectedContent =
this.$refs.container.ej2Instances.documentEditor.selection.text;
}
}
};
</script>
`
```

To get the bookmark content as SFDT (rich text), please check this [link](#)

*Select and get the paragraph in current cursor position*

You can use [selectParagraph](#) API in selection module to select the current paragraph at cursor position and use [text](#) API or [sfdt](#) API to get the selected content as plain text or SFDT from Vue Document Editor component.

The following example code illustrates how to select and get the current paragraph as SFDT.

```
<template>
<div id="app">
<ejs-documenteditorcontainer
ref="container"
:serviceUrl="serviceUrl"
height="590px"
id="container"
:enableToolbar="true"
v-on:created="onCreated.bind(this)"
</ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';
import {
DocumentEditorContainerPlugin,
DocumentEditorContainerComponent,
Toolbar,
} from '@syncfusion/ej2-vue-documenteditor';
```

```

Vue.use(DocumentEditorContainerPlugin);
export default {
  data() {
    return {
      serviceUrl:
        'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
    };
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar],
  },
  methods: {
    onCreated: function () {
      // To insert text in cursor position
      this.$refs.container.ej2Instances.documentEditor.editor.insertText('Document editor');
      // To select the current paragraph in document
      this.$refs.container.ej2Instances.documentEditor.selection.selectParagraph();
      // To get the selected content as SFDT
      let selectedContent = this.$refs.container.ej2Instances.documentEditor.selection.sfDT;
    }
  }
};
</script>

```

### Insert page number and navigate to page in Vue Document editor component

You can insert page number and navigate to specific page in Vue Document Editor component by following ways.

#### Insert page number

You can use [insertPageNumber](#) API in editor module to insert the page number in current cursor position. By default, Page number will insert in Arabic number style. You can change it, by providing the number style in parameter.

Note: Currently, Documenteditor have options to insert page number at current cursor position.

The following example code illustrates how to insert page number in header.

,

```
<template>
<div id="app">
<ejs-documenteditorcontainer
ref="container"
:serviceUrl="serviceUrl"
height="590px"
id="container"
:enableToolbar="true"
v-on:created="onCreated.bind(this)"
</ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';
import {
  DocumentEditorContainerPlugin,
  DocumentEditorContainerComponent,
  Toolbar,
} from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
  data() {
    return {
      serviceUrl:
        'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
    };
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar],
  },
  methods: {
    onCreated: function () {
```

```
// To insert text in cursor position
this.$refs.container.ej2Instances.documentEditor.editor.insertText('Document editor');

// To move the selection to header
this.$refs.container.ej2Instances.documentEditor.selection.goToHeader();

// Insert page number in the current cursor position
this.$refs.container.ej2Instances.documentEditor.editor.insertPageNumber();
}
}
};
</script>
,
```

Also, you use [insertField](#) API in Editor module to insert the Page number in current position

,

```
//Current page number
this.$refs.container.ej2Instances.documentEditor.editor.insertField('PAGE * MERGEFORMAT', '1');
,
```

#### *Get page count*

You can use [pageCount](#) API to gets the total number of pages in Document.

The following example code illustrates how to get the number of pages in Document.

,

```
<template>
<div id="app">
<ejs-documenteditorcontainer
ref="container"
:serviceUrl="serviceUrl"
height="590px"
id="container"
:enableToolbar="true"
v-on:created="onCreated.bind(this)"
</ejs-documenteditorcontainer>
</div>
</template>
<script>
```

```
import Vue from 'vue';
import {
  DocumentEditorContainerPlugin,
  DocumentEditorContainerComponent,
  Toolbar,
} from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
  data() {
    return {
      serviceUrl:
        'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
    };
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar],
  },
  methods: {
    onCreated: function () {
      // To insert text in cursor position
      this.$refs.container.ej2Instances.documentEditor.editor.insertText('Document editor');
      // To get the total number of pages
      let pageCount = this.$refs.container.ej2Instances.documentEditor.pageCount;
    }
  }
};
</script>
```

#### *Navigate to specific page*

You can use [goToPage](#) API in Selection module to move selection to the start of the specified page number.

The following example code illustrates how to move selection to specific page.

```
<template>
<div id="app">
<ejs-documenteditorcontainer
ref="container"
:serviceUrl="serviceUrl"
height="590px"
id="container"
:enableToolbar="true"
v-on:created="onCreated.bind(this)"
</ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';
import {
  DocumentEditorContainerPlugin,
  DocumentEditorContainerComponent,
  Toolbar,
} from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
  data() {
    return {
      serviceUrl:
        'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
    };
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar],
  },
  methods: {
    onCreated: function () {
```

```
// To move selection to page number 2
this.$refs.container.ej2Instances.documentEditor.selection.goToPage(2);
}
}
};
</script>
`
```

Move selection to specific position in Vue Document editor component

Using [select](#) API in selection module, You can set cursor position to anywhere in the document.

*Selects content based on start and end hierarchical index*

Hierarchical index will be in below format.

**sectionIndex;blockIndex;offset**

The following code snippet illustrate how to select using hierarchical index.

```
// Selection will occur between provided start and end offset
this.$refs.container.ej2Instances..documentEditor.editor.insertText("Welcome");
// The below code will select the letters "We" from inserted text "Welcome"
this.$refs.container.ej2Instances..documentEditor.selection.select("0;0;0", "0;0;2");
`
```

The following table illustrates about Hierarchical index in detail.

Element	Hierarchical Format	Explanation
---------	---------------------	-------------

----- ----- ----		
------------------	--	--

Move selection to Paragraph	sectionIndex;blockIndex;offset	 <b>Ex:</b> 0;0;0	It moves the cursor to the start of paragraph.
-----------------------------	--------------------------------	----------------------	------------------------------------------------

Move selection to Table	sectionIndex;tableIndex;rowIndex;cellIndex;blockIndex;offset	 <b>Ex:</b> 0;0;0;1;0	It moves the cursor to the second paragraph which is inside first row and cell of table.
-------------------------	--------------------------------------------------------------	--------------------------	------------------------------------------------------------------------------------------

Move selection to header	pageIndex;H;sectionIndex;blockIndex;offset	 <b>Ex:</b> 1;H;0;0;0	It moves cursor to the header in second page.
--------------------------	--------------------------------------------	--------------------------	-----------------------------------------------

Move selection to Footer	pageIndex;F;sectionIndex;blockIndex;offset	 <b>Ex:</b> 1;F;0;0;0	It moves cursor to the footer in second page.
--------------------------	--------------------------------------------	--------------------------	-----------------------------------------------

*Get the selection start and end hierarchical index*

Using [startOffset](#), you can get start hierarchical index which denotes the start index of current selection.

Similarly, using [endOffset](#), you can get end hierarchical index which denotes the end index of current selection.

The following code snippet illustrate how to get the selection start and end offset on selection changes in document.

```
,  
  
<template>  
<div id="app">  
<ejs-documenteditorcontainer  
  ref="container"  
  :serviceUrl="serviceUrl"  
  height="590px"  
  id="container"  
  :enableToolbar="true"  
  v-on:selectionChange="selectionChanged.bind(this)"  
</ejs-documenteditorcontainer>  
</div>  
</template>  
<script>  
import Vue from 'vue';  
import {  
  DocumentEditorContainerPlugin,  
  DocumentEditorContainerComponent,  
  Toolbar,  
} from '@syncfusion/ej2-vue-documenteditor';  
Vue.use(DocumentEditorContainerPlugin);  
export default {  
  data() {  
    return {  
      serviceUrl:  
        'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',  
    };  
  },  
  provide: {  
    //Inject require modules.  
    DocumentEditorContainer: [Toolbar],  
  },  
  methods: {
```

```

selectionChanged: function () {
//Get the start index of current selection
let startOffset =
this.$refs.container.ej2Instances.documentEditor.selection.startOffset;
//Get the end index of current selection
let endOffset = this.$refs.container.ej2Instances.documentEditor.selection.endOffset;
}
}
};
</script>
`

```

Document editor have [selectionChange](#) event which is triggered whenever the selection changes in Document.

*Selects the content based on left and top position*

Here, you can specify the [selection settings](#) to select the content based on left and top position.

x denotes the left position and y denotes the top position and extend denotes whether to extend or update selection.

Please check below code sample for reference.

```

this.$refs.container.ej2Instances.documentEditor.selection.select({ x: 188.4814208984375 , y:
662.00005, extend: true });
`

```

[Disable header and footer edit in document editor in Vue Document editor component](#)

*Disable header and footer edit in DocumentEditorContainer instance*

You can use [restrictEditing](#) property to disable header and footer editing based on selection context type.

RestrictEditing allows you to restrict the document modification and makes the Document read only mode. So, by using this property, and if selection inside header or footer, you can set this property as true.

The following example code illustrates how to header and footer edit in `DocumentEditorContainer` instance.

```

<template>
<div id="app">
<ejs-documenteditorcontainer
ref="container"

```

```

:serviceUrl="serviceUrl"
height="590px"
id="container"
:enableToolbar="true"
v-on:selectionChange="selectionChanged.bind(this)"
</ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';
import {
  DocumentEditorContainerPlugin,
  DocumentEditorContainerComponent,
  Toolbar,
} from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
  data() {
    return {
      serviceUrl:
        'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
    };
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar],
  },
  methods: {
    selectionChanged: function () {
      // Check whether selection is in header
      if (this.$refs.container.ej2Instances.documentEditor.selection.contextType.indexOf('Header') > -1 ||
        // Check whether selection is in Footer
        this.$refs.container.ej2Instances.documentEditor.selection.contextType.indexOf('Footer') > -1 ) {

```

```
// Change the document to read only mode
this.$refs.container.ej2Instances.restrictEditing = true;
} else {
// Change the document to editable mode
this.$refs.container.ej2Instances.restrictEditing = false;
}
}
};
</script>
```

Otherwise, you can disable clicking inside Header or Footer by using [closeHeaderFooter](#) API in selection module.

The following example code illustrates how to close header and footer when selection is inside header or footer in `DocumentEditorContainer` instance.

```
<template>
<div id="app">
<ejs-documenteditorcontainer
ref="container"
:serviceUrl="serviceUrl"
height="590px"
id="container"
:enableToolbar="true"
v-on:selectionChange="selectionChanged.bind(this)"
</ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';
import {
DocumentEditorContainerPlugin,
DocumentEditorContainerComponent,
Toolbar,
```

```

} from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
  data() {
    return {
      serviceUrl:
        'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
    };
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar],
  },
  methods: {
    selectionChanged: function () {
      // Check whether selection is in header
      if (this.$refs.container.ej2Instances.documentEditor.selection.contextType.indexOf('Header') > -1 ||
        // Check whether selection is in Footer
        this.$refs.container.ej2Instances.documentEditor.selection.contextType.indexOf('Footer') > -1 ) {
        // Close header Footer
        this.$refs.container.ej2Instances.documentEditor.selection.closeHeaderFooter();
      }
    }
  }
};
</script>

```

#### *Disable header and footer edit in DocumentEditor instance*

Like restrictEditing, you can use [isReadOnly](#) property in Document editor to disable header and footer edit.

The following example code illustrates how to header and footer edit in **DocumentEditor** instance.

```

<template>
<div id="app">

```

```

<ejs-documenteditor :serviceUrl='serviceUrl' ref='documentEditor' :isReadOnly='false'
:enablePrint='true' :enableSfdtExport='true' :enableSelection='true' :enableContextMenu='true'
:enableSearch='true' :enableOptionsPane='true' :enableWordExport='true' :enableTextExport='true'
:enableEditor='true' :enableImageResizer='true' :enableEditorHistory='true'
:enableHyperlinkDialog='true' :enableTableDialog='true' :enableBookmarkDialog='true'
:enableTableOfContentsDialog='true' :enablePageSetupDialog='true' :enableStyleDialog='true'
:enableListDialog='true' :enableParagraphDialog='true' :enableFontDialog='true'
:enableTablePropertiesDialog='true' :enableBordersAndShadingDialog='true'
:enableTableOptionsDialog='true' height="370px" v-on:selectionChange="selectionChanged.bind(this)">
</ejs-documenteditor>

</div>

</template>

<script>

import Vue from 'vue';

import { DocumentEditorPlugin, DocumentEditorComponent, Print, SfdtExport, WordExport, TextExport,
Selection, Search, Editor, ImageResizer, EditorHistory, ContextMenu, OptionsPane, HyperlinkDialog,
TableDialog, BookmarkDialog, TableOfContentsDialog, PageSetupDialog, StyleDialog, ListDialog,
ParagraphDialog, BulletsAndNumberingDialog, FontDialog, TablePropertiesDialog,
BordersAndShadingDialog, TableOptionsDialog, CellOptionsDialog, StylesDialog } from '@syncfusion/ej2-
vue-documenteditor';

Vue.use(DocumentEditorPlugin);

export default {

data () {

return {

serviceUrl:'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/'

},

provide: {

//Inject require modules.

DocumentEditor: [Print, SfdtExport, WordExport, TextExport, Selection, Search, Editor, ImageResizer,
EditorHistory, ContextMenu, OptionsPane, HyperlinkDialog, TableDialog, BookmarkDialog,
TableOfContentsDialog, PageSetupDialog, StyleDialog, ListDialog, ParagraphDialog,
BulletsAndNumberingDialog, FontDialog, TablePropertiesDialog, BordersAndShadingDialog,
TableOptionsDialog, CellOptionsDialog, StylesDialog]

},

methods: {

selectionChanged: function () {

// Check whether selection is in header

if (this.$refs.documentEditor.ej2Instances.selection.contextType.indexOf('Header') > -1 ||

// Check whether selection is in Footer

```

```
this.$refs.documentEditor.ej2Instances.selection.contextType.indexOf('Footer') > -1) {
// Change the document to read only mode
this.$refs.documentEditor.ej2Instances.isReadOnly = true;
} else {
// Change the document to editable mode
this.$refs.documentEditor.ej2Instances.isReadOnly = false;
}
}
}
}
</script>
`
```

### Insert text in current position in Vue Document editor component

You can insert the text, paragraph and rich-text content in Vue Document Editor component.

#### *Insert text in current cursor position*

You can use [insertText](#) API in editor module to insert the text in current cursor position.

The following example code illustrates how to add the text in current selection.

```
`
// It will insert the provided text in current selection
this.$refs.container.ej2Instances.documentEditor.editor.insertText('Syncfusion');
`

<template>
<div id="app">
<div>
<button v-on:click='insertText'>Insert Text</button>
</div>
<ejs-documenteditorcontainer ref='container' height="590px" id='container'
:enableToolbar='true'></ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue'
import { DocumentEditorContainerPlugin, Toolbar } from '@syncfusion/ej2-vue-documenteditor';
```

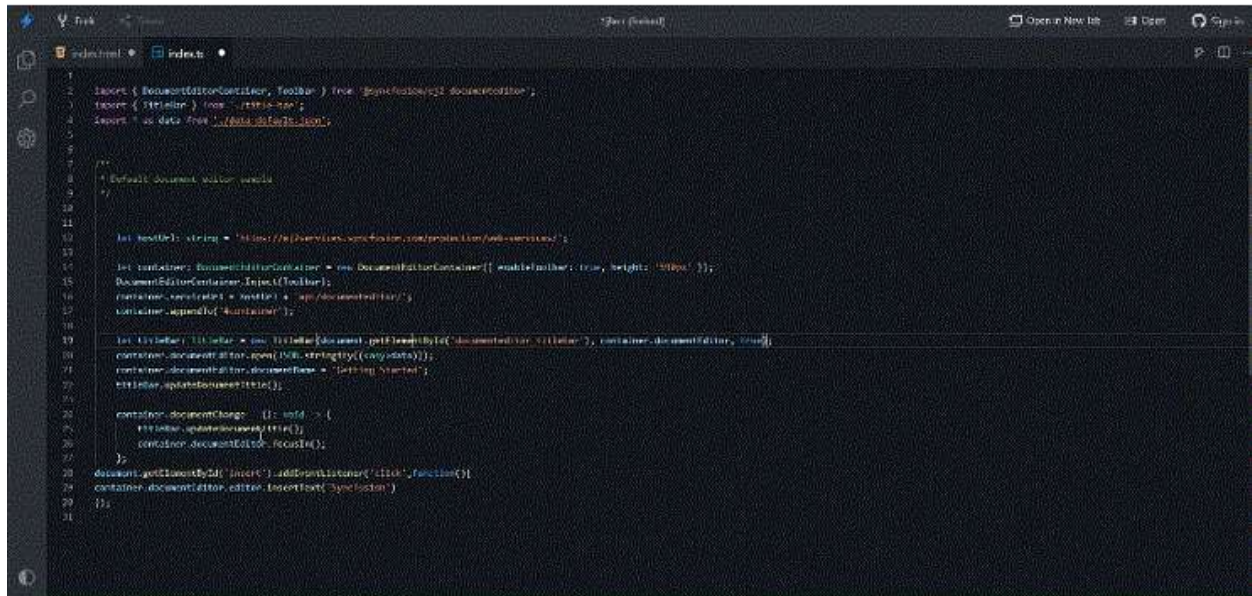

```

Vue.use(DocumentEditorContainerPlugin);
export default {
  data: function() {
    return {
    };
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar],
  },
  methods: {
    insertText: function() {
      //It will insert the provided text in current selection
      this.$refs.container.ej2Instances.documentEditor.editor.insertText('Syncfusion');
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>
`

```

Please check below gif which illustrates how to insert text in current cursor position on button click:

### Insert paragraph in current cursor position

To insert new paragraph at current selection, you can use [insertText](#) API with parameter as `\r\n` or `\n`.

The following example code illustrates how to add the new paragraph in current selection.

```

// It will add the new paragraph in current selection
this.$refs.container.ej2Instances.documentEditor.editor.insertText('\n');

```

### Insert the rich-text content

To insert the HTML content, you have to convert the HTML content to SFDT Format using [web service](#). Then use [paste](#) API to insert the sfdt at current cursor position.

Note: Html string should be wellformatted html. [DocIO](#) support only wellformatted XHTML.

The following example illustrates how to insert the HTML content at current cursor position.

- Send the HTML content to server side for SFDT conversion. Refer to the following example to send the HTML content to server side and inserting it in current cursor position.

```

<template>
<div id="app">
<ejs-documenteditorcontainer
ref="container"

```

```

:serviceUrl="serviceUrl"
height="590px"
id="container"
:enableToolbar="true"
v-on:created="onCreated.bind(this)"
</ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';
import {
  DocumentEditorContainerPlugin,
  DocumentEditorContainerComponent,
  Toolbar,
} from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
  data() {
    return {
      serviceUrl:
        'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
    };
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar]
  },
  methods: {
    onCreated: function () {
      let proxy = this;
      let htmltags =
        "<?xml version='1.0' encoding='utf - 8'?><!DOCTYPE html PUBLIC '-//W3C//DTD XHTML 1.0 Strict//EN'http://www.w3.org/TR/xhtml1/DTD/xhtml1-strict.dtd><html xmlns='http://www.w3.org/1999/xhtml' xml:lang='en' lang='en'><body><h1>The img element</h1><img

```

```
src='https://www.w3schools.com/images/lamp.jpg' alt='Lamp Image' width='500'
height='600'/></body></html>";
let http = new XMLHttpRequest();
http.open('POST', 'http://localhost:5000/api/documenteditor/LoadString');
http.setRequestHeader('Content-Type', 'application/json;charset=UTF-8');
http.responseType = 'json';
http.onreadystatechange = function () {
if (http.readyState === 4) {
if (http.status === 200 || http.status === 304) {
// Insert the sfdt content in cursor position using paste API
proxy.container.documentEditor.editor.paste(http.response);
} else {
alert('failed;');
}
}
};
let htmlContent = { content: htmltags };
http.send(JSON.stringify(htmlContent));
}
}
};
</script>
`
```

- Please refer the following code example for server-side web implementation for HTML conversion using DocumentEditor.

```
`c#
//API controller for the conversion.
[HttpPost]
public string LoadString([FromBody]InputParameter data)
{
// You can also load HTML file/string from server side.
Syncfusion.EJ2.DocumentEditor.WordDocument document =
Syncfusion.EJ2.DocumentEditor.WordDocument.LoadString(data.content, FormatType.Html); // Convert
the HTML to SFDt format.
```

```

string json = Newtonsoft.Json.JsonConvert.SerializeObject(document);
document.Dispose();
return json;
}

public class InputParameter
{
    public string content {get; set; }
}

```

Note: The above example illustrates inserting HTML content. Similarly, you can insert any rich-text content by converting any of the supported file formats (DOCX, DOC, WordML, HTML, RTF) to SFDT.

#### [Change the cursor color in document editor in Vue Document editor component](#)

Document Editor default cursor color is black. The user can change the color by overriding the css property using class name. The Document editor cursor css have a class named `e-de-blink-cursor`.

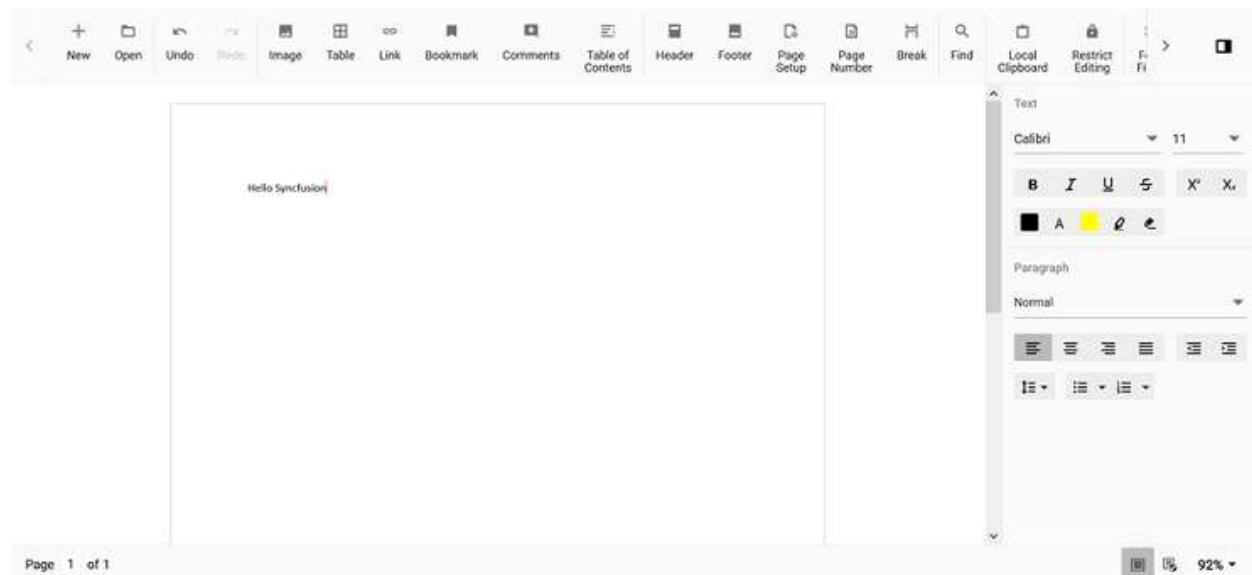

Please refer the below code snippet to change the cursor color to red.

```

.e-de-blink-cursor {
    border-left: 1px solid red!important;
}

```

Output will be like below:

### Hide tool bar and properties pane in Vue Document editor component

**Document editor container** provides the main document view area along with the built-in toolbar and properties pane.

**Document editor** provides just the main document view area. Here, the user can compose, view, and edit the Word documents. You may prefer to use this component when you want to design your own UI options for your application.

#### *Hide the properties pane*

By default, Document editor container has built-in properties pane which contains options for formatting text, table, image and header and footer. You can use [showPropertiesPane](#) API in [DocumentEditorContainer](#) to hide the properties pane.

The following example code illustrates how to hide the properties pane.

```
<template>
<div id="app">
<ejs-documenteditorcontainer
ref="container"
:serviceUrl="serviceUrl"
height="590px"
id="container"
:enableToolbar="true"
:showPropertiesPane='false'
</ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';
import {
DocumentEditorContainerPlugin,
DocumentEditorContainerComponent,
Toolbar,
} from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
data() {
return {
```

```

serviceUrl:
'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
};
},
provide: {
//Inject require modules.
DocumentEditorContainer: [Toolbar],
}
};
</script>
`

```

Note: Positioning and customizing the properties pane in Document editor container is not possible. Instead, you can hide the exiting properties pane and create your own pane using public API's.

#### *Hide the toolbar*

You can use [enableToolbar](#) API in [DocumentEditorContainer](#) to hide the existing toolbar.

The following example code illustrates how to hide the existing toolbar.

```

`
<template>
<div id="app">
<ejs-documenteditorcontainer
ref="container"
:serviceUrl="serviceUrl"
height="590px"
id="container"
:enableToolbar="false"></ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';
import {
DocumentEditorContainerPlugin,
DocumentEditorContainerComponent,
Toolbar,
} from '@syncfusion/ej2-vue-documenteditor';

```

```

Vue.use(DocumentEditorContainerPlugin);
export default {
  data() {
    return {
      serviceUrl:
        'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
    };
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar],
  }
};
</script>
`

```

*See Also*

- [How to customize the toolbar](#)

Insert text or image in table programmatically in Vue Document editor component

Using Document editor API's, you can insert [text](#) or [image](#) in [table](#) programmatically based on your requirement.

Use [selection](#) API's to navigate between rows and cells.

The following example illustrates how to create 2\*2 table and then add text and image programmatically.

```

<template>
<div id="app">
<ejs-documenteditorcontainer
  ref="container"
  :serviceUrl="serviceUrl"
  height="590px"
  id="container"
  :enableToolbar="true"
  v-on:created="onCreated.bind(this)"

```

```

</ejs-documenteditorcontainer>
</div>
</template>
<script>
import Vue from 'vue';
import {
  DocumentEditorContainerPlugin,
  DocumentEditorContainerComponent,
  Toolbar,
} from '@syncfusion/ej2-vue-documenteditor';
Vue.use(DocumentEditorContainerPlugin);
export default {
  data() {
    return {
      serviceUrl:
        'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',
    };
  },
  provide: {
    //Inject require modules.
    DocumentEditorContainer: [Toolbar],
  },
  methods: {
    onCreated: function () {
      // To insert the table in cursor position
      this.$refs.container.ej2Instances.documentEditor.editor.insertTable(2, 2);
      // To insert the image at table first cell
      this.$refs.container.ej2Instances.documentEditor.editor.insertImage(
        'data:image/png;base64,iVBORw0KGgoAAAANSUhEUgAAAAUAAAACAYAAACNbybIAAAAHIEQVQI12P4
        //8/w38GIAXDIBKE0DHxgljNBAAO9TXL0Y4OHwAAAABJRU5ErkJggg=='
      );
      // To move the cursor to next cell
      this.moveCursorToNextCell();
    }
  }
};

```

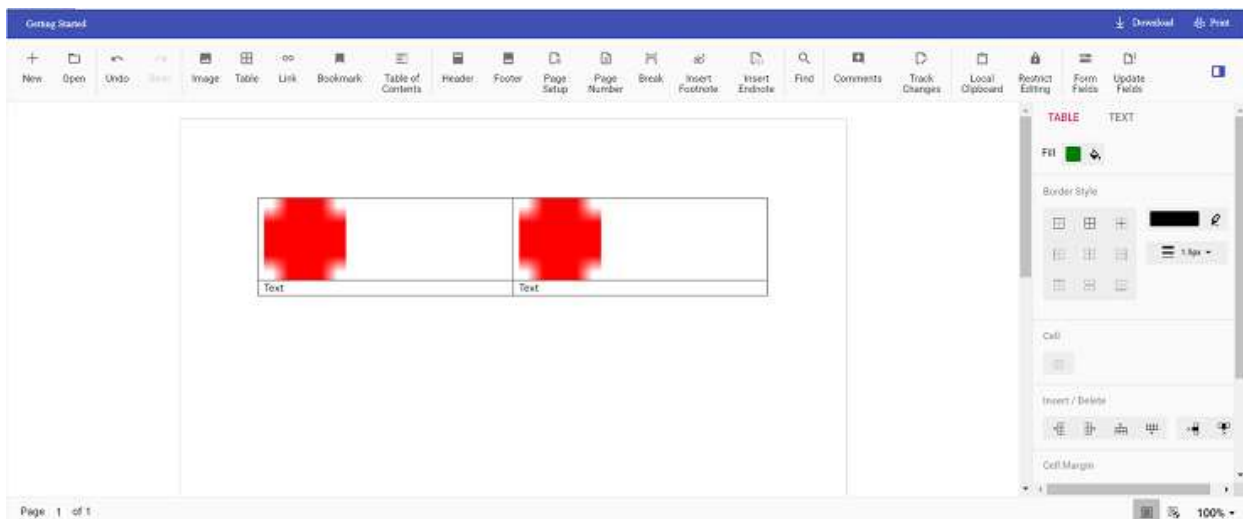

```
// To insert the image at table second cell
this.$refs.container.ej2Instances.documentEditor.editor.insertImage(
'data:image/png;base64,iVBORw0KGgoAAAANSUgAAAAUAAAAFCAYAAACNbybIAAAAHIEQVQI12P4
//8/w38GIAXDIBKE0DHxgljNBAAO9TXL0Y4OHwAAAABJRu5ErkJggg=='
);
// To move the cursor to next row
this.moveCursorToNextRow();
// To insert text in cursor position
this.$refs.container.ej2Instances.documentEditor.editor.insertText('Text');
// To move the cursor to next cell
this.moveCursorToNextCell();
// To insert text in cursor position
this.$refs.container.ej2Instances.documentEditor.editor.insertText('Text');
},
moveCursorToNextCell:function() {
// To get current selection start offset
var startOffset = this.$refs.container.ej2Instances.documentEditor.selection.startOffset;
// Increasing cell index to consider next cell
var cellIndex = parseInt(startOffset.substring(6, 7)) + 1;
// Changing start offset
startOffset =
startOffset.substring(0, 6) +
cellIndex.toString() +
startOffset.substring(7, startOffset.length);
// Navigating selection using select method
this.$refs.container.ej2Instances.documentEditor.selection.select(startOffset, startOffset);
},
moveCursorToNextRow:function() {
// To get current selection start offset
var startOffset = this.$refs.container.ej2Instances.documentEditor.selection.startOffset;
// Increasing row index to consider next row
var rowIndex = parseInt(startOffset.substring(4, 5)) + 1;
var cellIndex =
```

```

parseInt(startOffset.substring(6, 7)) != 0
? parseInt(startOffset.substring(6, 7)) - 1
: 0;
// Changing start offset
startOffset =
startOffset.substring(0, 4) +
rowIndex.toString() +
startOffset.substring(5, 6) +
cellIndex +
startOffset.substring(7, startOffset.length);
// Navigating selection using select method
this.$refs.container.ej2Instances.documentEditor.selection.select(startOffset, startOffset);
}
}
};
</script>
`

```

The output will be like below.

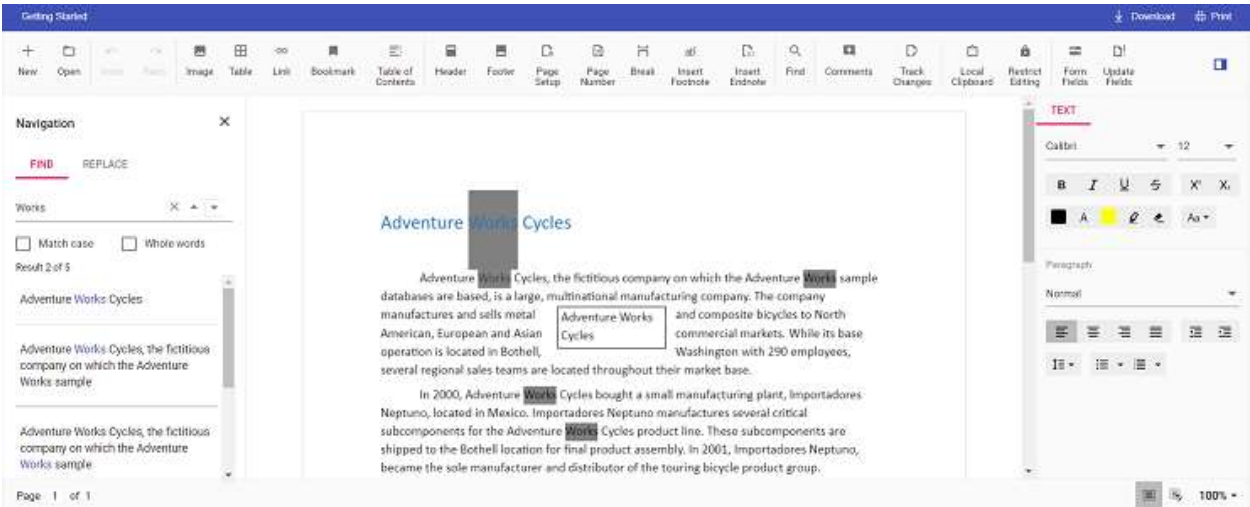

Change the default search highlight color in Vue Document editor component. Document editor provides an options to change the default search highlight color using [searchHighlightColor](#) in Document editor settings. The highlight color which is given in [documentEditorSettings](#) will be highlighted on the searched text. By default, search highlight color is yellow.

Similarly, you can use [documentEditorSettings](#) property for DocumentEditor also.

The following example code illustrates how to change the default search highlight color.

```
,  
<template>  
<div id="app">  
  <ejs-documenteditorcontainer ref='documenteditor' :serviceUrl='serviceUrl'  
    :documentEditorSettings='settings' height="590px" id='container' :enableToolbar='true'></ejs-  
    documenteditorcontainer>  
</div>  
</template>  
<script>  
import Vue from 'vue';  
  
import { DocumentEditorContainerPlugin, DocumentEditorContainerComponent, Toolbar } from  
'@syncfusion/ej2-vue-documenteditor';  
  
Vue.use(DocumentEditorContainerPlugin);  
  
export default {  
  data() {  
    return { serviceUrl: 'https://ej2services.syncfusion.com/production/web-services/api/documenteditor/',  
      // Add required color to change the default search highlight color  
      settings: { searchHighlightColor: 'Grey' } };  
  },  
  provide: {  
    //Inject require modules.  
    DocumentEditorContainer: [Toolbar]  
  }  
}  
</script>  
,
```

Output will be like below:

How to optimize the SFDT file

Starting from version v21.1.x, the SFDT file generated in Word Processor component is optimized by default to reduce the file size. All static keys are minified, and the final JSON string is compressed. This helps reduce the SFDT file size relative to a DOCX file and provides the following benefits,

- File transfer between client and server through the internet gets faster.
- The new optimized SFDT files require less storage space than the old SFDT files.

Hence, the optimized SFDT file can't be directly manipulated as JSON string.

This feature comes with a public API to switch between the old and new optimized SFDT format, allowing backward compatibility.

As a backward compatibility to create older format SFDT files, refer the following code changes,

Client/Server	Old Code	New Code from v21.1.x
Client-side		
Server-side C#	<code>WordDocument sfdtDocument = WordDocument.Load(stream, formatType);string sfdt = Newtonsoft.Json.JsonConvert.SerializeObject(sfdtDocument);</code>	<code>WordDocument sfdtDocument = WordDocument.Load(stream, formatType);sfdtDocument.OptimizeSfdt = false;string sfdt = Newtonsoft.Json.JsonConvert.SerializeObject(sfdtDocument);</code>
Server-side Java	<code>String sfdtDocument = WordProcessorHelper.load(stream, formatType);</code>	<code>String sfdtDocument = WordProcessorHelper.load(stream, formatType, false);</code>

To convert from older format SFDT from a new optimized SFDT file, refer the following code example,

Client/Server	Code example
---------------	--------------

Client-side	
Server-side C#	<pre>using(Syncfusion.DocIO.DLS.WordDocument docIODocument = WordDocument.Save(optimizedSfdt)) {sfdtDocument = WordDocument.Load(docIODocument);sfdtDocument.OptimizeSfdt = false;string oldSfdt = JsonSerializer.Serialize(sfdtDocument);}</pre>
Server-side Java	<pre>WordDocument docIODocument = WordProcessorHelper.save(optimizedSfdt);String oldSfdt = WordProcessorHelper.load(docIODocument, false);</pre>

### How to disable auto focus in Syncfusion Vue Document Editor component

Document Editor gets focused automatically when the page loads. If you want the Document editor not to be focused automatically it can be customized.

The following example illustrates to disable the auto focus in DocumentEditorContainer.

`typescript

```
<ejs-documenteditorcontainer ref="doceditcontainer" :enableAutoFocus='false' height='600px'></ejs-
documenteditorcontainer>
```

`

Note: Default value of [enableAutoFocus](#) property is `true`.

The following example illustrates to disable the auto focus in DocumentEditor.

`typescript

```
<ejs-documenteditor ref="doceditcontainer" :enableAutoFocus='false' height='600px'></ejs-
documenteditor>
```

`

Note: Default value of [enableAutoFocus](#) property is `true`.

### How to disable drag and drop in document editor in vue Document editor component

Document Editor provides support to drag and drop contents within the component and it can be customized(enable and disable) using [allowDragAndDrop](#) property in Document editor settings.

The following example illustrates to customize the drag and drop option.

`typescript

```
<template>
```

```
<ejs-documenteditorcontainer ref="doceditcontainer" :serviceUrl="hostUrl" :enableToolbar='true'
height='600px' :documentEditorSettings="settings"></ejs-documenteditorcontainer>
```

```
</template>
```

```
<script>
```

```
export default Vue.extend({
```

```
data: function() {
```

```
return {
```

```

hostUrl : 'https://services.syncfusion.com/vue/production/api/documenteditor/',
settings : { allowDragAndDrop: false };
}
}
})
</script>
`

```

Note: Default value of [allowDragAndDrop](#) property is `true`.

The following example illustrates to disable the drag and drop option in DocumentEditor.

```

`typescript
<template>
<ejs-documenteditor ref="docedit" height='600px' :documentEditorSettings="settings"></ejs-
documenteditor>
</template>
<script>
export default Vue.extend({
data: function() {
return {
hostUrl : 'https://services.syncfusion.com/vue/production/api/documenteditor/',
settings : { allowDragAndDrop: false };
}
}
})
</script>
`

```

Note: Default value of [allowDragAndDrop](#) property is `true`.

### Enable ruler

#### *How to enable ruler in Document Editor component*

Using ruler we can refer to setting specific margins, tab stops, or indentations within a document to ensure consistent formatting in Document Editor.

The following example illustrates how to enable ruler in Document Editor

### **APP.VUE**

```

<template>
  <div id="app">

```

```

    <button id='container_ruler_button' v-on:click="onClick">Show/Hide
    Ruler</button>
    <ejs-documenteditor id="container" height="370px" style="width: 100%"
    ref="container" :serviceUrl='serviceUrl' :isReadOnly='false'
    :enablePrint='true' :enableSfdtExport='true' :enableSelection='true'
    :enableContextMenu='true' :enableSearch='true' :enableOptionsPane='true'
    :enableWordExport='true' :enableTextExport='true' :enableEditor='true'
    :enableImageResizer='true' :enableEditorHistory='true'
    :enableHyperlinkDialog='true' :enableTableDialog='true'
    :enableBookmarkDialog='true' :enableTableOfContentsDialog='true'
    :enablePageSetupDialog='true' :enableStyleDialog='true'
    :enableListDialog='true' :enableParagraphDialog='true'
    :enableFontDialog='true' :enableTablePropertiesDialog='true'
    :enableBordersAndShadingDialog='true'
    :enableTableOptionsDialog='true'></ejs-documenteditor>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DocumentEditorPlugin, DocumentEditorComponent, Print,
  SfdtExport, WordExport, TextExport, Selection, Search, Editor, ImageResizer,
  EditorHistory, ContextMenu, OptionsPane, HyperlinkDialog, TableDialog,
  BookmarkDialog, TableOfContentsDialog, PageSetupDialog, StyleDialog,
  ListDialog, ParagraphDialog, BulletsAndNumberingDialog, FontDialog,
  TablePropertiesDialog, BordersAndShadingDialog, TableOptionsDialog,
  CellOptionsDialog, StylesDialog } from '@syncfusion/ej2-vue-documenteditor';
  Vue.use(DocumentEditorPlugin);
  export default {
    data() {
      return {
        serviceUrl: 'https://ej2services.syncfusion.com/production/web-
        services/api/documenteditor/',
        height: '370px',
        isReadOnly: false,
        documentEditorSettings: {showRuler: true}
      }
    },
    provide: {
      //Inject require modules.
      DocumentEditor: [Print, SfdtExport, WordExport, TextExport,
      Selection, Search, Editor, ImageResizer, EditorHistory, ContextMenu,
      OptionsPane, HyperlinkDialog, TableDialog, BookmarkDialog,
      TableOfContentsDialog, PageSetupDialog, StyleDialog, ListDialog,
      ParagraphDialog, BulletsAndNumberingDialog, FontDialog,
      TablePropertiesDialog, BordersAndShadingDialog, TableOptionsDialog,
      CellOptionsDialog, StylesDialog]
    },
    methods: {
      onClick: function() {
        this.$refs.container.ej2Instances.documentEditorSettings.showRuler =
        !this.$refs.container.ej2Instances.documentEditorSettings.showRuler
      }
    },
    mounted: function() {
      this.$refs.container.ej2Instances.documentEditorSettings.showRuler = true;
    }
  }

```

```

    }
  }
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
  @import "../node_modules/@syncfusion/ej2-vue-documenteditor/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/document-editor/ruler-cs1" %}

[How to enable ruler in Document Editor Container component](#)

Using ruler we can refer to setting specific margins, tab stops, or indentations within a document to ensure consistent formatting in Document Editor Container.

The following example illustrates how to enable ruler in Document Editor Container.

#### APP.VUE

```

<template>
  <div id="app">
    <button id='container_ruler_button' v-on:click="onClick">Show/Hide
    Ruler</button>
    <ejs-documenteditorcontainer ref="container" :serviceUrl='serviceUrl'
    :height='height' :enableToolbar='true'> </ejs-documenteditorcontainer>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { DocumentEditorContainerPlugin,
  DocumentEditorContainerComponent, Toolbar } from '@syncfusion/ej2-vue-
  documenteditor';
  Vue.use(DocumentEditorContainerPlugin);
  export default {
    data() {
      return {
        serviceUrl: 'https://ej2services.syncfusion.com/production/web-
        services/api/documenteditor/',
        height: '590px',
        documentEditorSettings: { showRuler: true }
      }
    },
    provide: {
      DocumentEditorContainer: [Toolbar]
    },
    methods: {
      onClick: function() {

```

```

        this.$refs.container.ej2Instances.documentEditorSettings.showRuler
    = !this.$refs.container.ej2Instances.documentEditorSettings.showRuler
    },
    },
  },
</script>

  @import "../node_modules/@syncfusion/ej2-vue-
documenteditor/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/document-editor/ruler-cs2" %}

## DropDownButton

### Getting Started with the Vue Dropdown Button Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLI](#) and integrating the Syncfusion Vue Dropdown Button component using the [Composition API](#) / [Options API](#).

#### Prerequisites

[System requirements for Syncfusion Vue UI components](#)

#### Dependencies

The list of dependencies required to use the DropDownButton component in your application is given as follows:

```

`js
|-- @syncfusion/ej2-vue-splitbuttons
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-splitbuttons
|-- @syncfusion/ej2-vue-base
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-buttons
`

```

#### Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

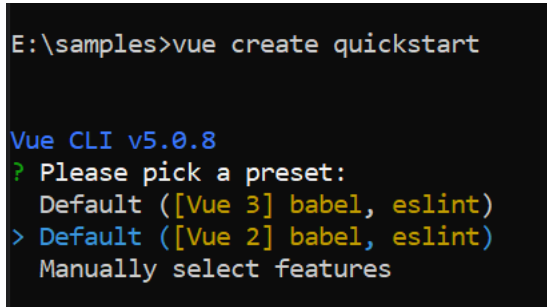

```

`bash

```

```
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
`
or
`bash
yarn global add @vue/cli
vue create quickstart
cd quickstart
yarn run serve
`
```

When creating a new project, choose the option `Default ([Vue 2] babel, eslint)` from the menu.

```
E:\samples>vue create quickstart

Vue CLI v5.0.8
? Please pick a preset:
  Default ([Vue 3] babel, eslint)
> Default ([Vue 2] babel, eslint)
  Manually select features
```

Once the `quickstart` project is set up with default settings, proceed to add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.npmjs.com). To use Vue components, install the required npm package.

This article uses the [Vue Dropdown Button component](#) as an example. Install the `@syncfusion/ej2-vue-splitbuttons` package by running the following command:

```
`bash
npm install @syncfusion/ej2-vue-splitbuttons --save
`
or
`bash
yarn add @syncfusion/ej2-vue-splitbuttons
`
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the **Material** theme is applied using CSS styles, which are available in installed packages. The necessary **Material** CSS styles for the Dropdown Button component and its dependents were imported into the `<style>` section of **src/App.vue** file.

#### ~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
</style>
```

### Add Syncfusion Vue component

Follow the below steps to add the Vue Dropdown Button component using **Composition API** or **Options API**:

1\ First, import and register the Dropdown Button component in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { DropDownButtonComponent as EjsDropdownbutton } from
"@syncfusion/ej2-vue-splitbuttons";
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { DropDownButtonComponent } from "@syncfusion/ej2-vue-splitbuttons";
export default {
  components: {
    'ejs-dropdownbutton': DropDownButtonComponent
  }
}
</script>
```

2\ In the **template** section, define the Dropdown Button component with the [content](#) property.

#### ~/SRC/APP.VUE

```
<template>
<ejs-dropdownbutton :items='items'>Clipboard</ejs-dropdownbutton>
</template>
```

3\ Declare the value for the **items** property in the **script** section.

**COMPOSITION API (~SRC/APP.VUE)**

```
<script setup>
const items = [
  {
    text: 'Cut'
  },
  {
    text: 'Copy'
  },
  {
    text: 'Paste'
  }
];
</script>
```

**OPTIONS API (~SRC/APP.VUE)**

```
<script>
data () {
  return {
    items:[
      {
        text: 'Cut'
      },
      {
        text: 'Copy'
      },
      {
        text: 'Paste'
      }
    ]
  };
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

**COMPOSITION API (~SRC/APP.VUE)**

```
<template>
<ejs-dropdownbutton :items='items'>Clipboard</ejs-dropdownbutton>
</template>
<script setup>
import { DropDownButtonComponent as EjsDropDownbutton } from
"@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
const items = [
  {
    text: 'Cut'
  },
  {
    text: 'Copy'
  },
  {
    text: 'Paste'
  }
];
```

```
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
</style>
```

### OPTIONS API (~SRC/APP.VUE)

```
<template>
<ejs-dropdownbutton :items='items'>Clipboard</ejs-dropdownbutton>
</template>
<script>
import { DropDownButtonComponent } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
  components: {
    'ejs-dropdownbutton': DropDownButtonComponent
  },
  data () {
    return {
      items:[
        {
          text: 'Cut'
        },
        {
          text: 'Copy'
        },
        {
          text: 'Paste'
        }
      ]
    };
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
</style>
```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run serve
```

```
`
```

or

```
`bash
```

```
yarn run serve
```

```
,
```

```
{% previewsample "page.domainurl/code-snippet/drop-down-button/default-cs2" %}
```

## Getting Started with the Vue DropDownButton Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue DropDownButton component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

### Prerequisites

#### [System requirements for Syncfusion Vue UI components](#)

#### Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm create vite@latest
```

```
,
```

or

```
`bash
```

```
yarn create vite
```

```
,
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as **my-project** for this article.

```
`bash
```

```
? Project name: » my-project
```

```
,
```

2. Select **Vue** as the framework. It will create a Vue 3 project.

```
`bash
```

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

,

3. Choose **JavaScript** as the framework variant to build this Vite project using JavaScript and Vue.

```
`bash
```

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

,

4. Upon completing the aforementioned steps to create the **my-project**, run the following command to install its dependencies:

```
`bash
```

```
cd my-project
```

```
npm install
```

,

or

```
`bash
```

```
cd my-project
```

```
yarn install
```

,

Now that **my-project** is ready to run with default settings, let's add Syncfusion components to the project.

### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue DropDownButton component](#) as an example. To use the Vue DropDownButton component in the project, the `@syncfusion/ej2-vue-splitbuttons` package needs to be installed using the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-splitbuttons --save
```

```
,
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-splitbuttons
```

```
,
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, `Material` theme is applied using CSS styles, which are available in installed packages. The necessary `Material` CSS styles for the DropDownButton component and its dependents were imported into the `<style>` section of `src/App.vue` file.

#### ~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

### Add Syncfusion Vue component

Follow the below steps to add the Vue DropDownButton component using `Composition API` or `Options API`:

1.First, import and register the DropDownButton component and its child directives in the `script` section of the `src/App.vue` file. If you are using the `Composition API`, you should add the `setup` attribute to the `script` tag to indicate that Vue will be using the `Composition API`.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { DropDownButtonComponent as EjsDropDownButton } from
"@syncfusion/ej2-vue-splitbuttons";
</script>
```

**OPTIONS API (~SRC/APP.VUE)**

```
<script>
import { DropDownButtonComponent } from "@syncfusion/ej2-vue-splitbuttons";
//Component registration
export default {
  name: "App",
  components: {
    "ejs-dropdownbutton": DropDownButtonComponent
  }
}
</script>
```

2. In the **template** section, define the DropDownButton component with the [items](#) property and content property.

**~/SRC/APP.VUE**

```
<template>
<ejs-dropdownbutton :items='items' content="Paste"></ejs-dropdownbutton>
</template>
```

3. Declare the values for the **items** property in the **script** section.

**COMPOSITION API (~SRC/APP.VUE)**

```
<script setup>
const items=[
{
  text: 'Cut'
},
{
  text: 'Copy'
},
{
  text: 'Paste'
}]
</script>
```

**OPTIONS API (~SRC/APP.VUE)**

```
<script>
data() {
  return {
    items:[
      {
        text: 'Cut'
      },
      {
        text: 'Copy'
      },
      {
        text: 'Paste'
      }
    ]
  }
}
```

```
};  
}  
</script>
```

3. Here is the summarized code for the above steps in the **src/App.vue** file:

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<template>  
<ejs-dropdownbutton :items='items' content="Paste"></ejs-dropdownbutton>  
</template>  
<script setup>  
import { DropDownButtonComponent as EjsDropDownButton } from  
"@syncfusion/ej2-vue-splitbuttons";  
const items=[  
  {  
    text: 'Cut'  
  },  
  {  
    text: 'Copy'  
  },  
  {  
    text: 'Paste'  
  }  
]  
</script>  
<style>  
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';  
</style>
```

#### **OPTIONS API (~SRC/APP.VUE)**

```
<template>  
<ejs-dropdownbutton :items='items'>Clipboard</ejs-dropdownbutton>  
</template>  
<script>  
import { DropDownButtonComponent } from "@syncfusion/ej2-vue-splitbuttons";  
export default {  
  name: "App",  
  components: {  
    "ejs-dropdownbutton": DropDownButtonComponent  
  },  
  data () {  
    return {  
      items:[  
        {  
          text: 'Cut'  
        },  
        {  
          text: 'Copy'  
        },  
        {  
          text: 'Paste'  
        }  
      ]  
    }  
  }  
}
```

```
};  
}  
}  
</script>  
<style>  
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';  
</style>
```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
,
```

or

```
`bash
```

```
yarn run dev
```

```
,
```

The output will appear as follows:

**Sample:** [vue-3-drop down button-getting-started](#).

For migrating from Vue 2 to Vue 3, refer to the [migration](#) documentation.

## Icons in Vue Drop down button component

### DropDownButton icons

DropDownButton can have an icon to provide the visual representation of the action. To place the icon on a DropdownButton, set the [iconCss](#) property to `e-icons` with the required icon CSS. By default, the

icon is positioned to the left side of the DropdownButton. You can customize the icon's position using the [iconPosition](#) property.

In the following example, the DropdownButton with default iconPosition and iconPosition as **Top** is showcased:

#### APP.VUE

```
<template>
<div>
<ejs-dropdownbutton :items='items' iconCss= 'ddb-icons e-
message'>Message</ejs-dropdownbutton>
<ejs-dropdownbutton :items='items' iconCss= 'ddb-icons e-message'
iconPosition= 'Top'>Message</ejs-dropdownbutton>
</div>
</template>
<script>
import Vue from 'vue';
import { DropDownButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(DropDownButtonPlugin);
export default {
  data () {
    return {
      items:[
        {
          text: 'Edit'
        },
        {
          text: 'Delete'
        },
        {
          text: 'Mark as Read'
        },
        {
          text: 'Like Message'
        }
      ]
    };
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css';
@font-face {
  font-family: 'e-db-icons';

    content: '\e703';
  }
}
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-button/default-cs13" %}

#### Icon only DropDownButton

Icon only DropDownButton can be achieved by using [iconCss](#) property and to hide drop down arrow [e-caret-hide](#) class is added using [cssClass](#) property.

#### APP.VUE

```

<template>
  <ejs-dropdownbutton :items='items' iconCss= 'e-icons e-menu' cssClass= 'e-
  caret-hide'></ejs-dropdownbutton>
</template>
<script>
import Vue from 'vue';
import { DropDownButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);

```

```

Vue.use(DropDownButtonPlugin);
export default {
  data () {
    return {
      items:[
        {
          text: 'New tab'
        },
        {
          text: 'New window'
        },
        {
          text: 'New incognito window'
        },
        {
          separator: true
        },
        {
          text: 'Print'
        },
        {
          text: 'Cast'
        },
        {
          text: 'Find'
        }
      ]
    };
  }
}
</script>
<style>
  @import
'https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css';
  .e-menu::before {
    content: '\e984';
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-button/default-cs14" %}

The Essential JS 2 provides a set of icons that can be loaded by applying **e-icons** class name to the element. You can also use third party icons on the DropDownButton using the [iconCss](#) property.

#### *DropDownButton with sprite image*

Sprite images can be loaded in DropDownButton instead of font icons using **[iconCss]**(  
<https://ej2.syncfusion.com/vue/documentation/api/drop-down-button/#iconcss>) property.

In this following example, **e-image** class is added with background url of the sprite image along with X and Y positions. The **width** and **height** of the element set as **32px**.

#### **APP.VUE**

```

<template>
<ejs-dropdownbutton :items='items' cssClass= 'e-caret-hide' iconCss= 'e-
image'></ejs-dropdownbutton>
</template>
<script>
import Vue from 'vue';
import { DropDownButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(DropDownButtonPlugin);
export default {
  data () {
    return {
      items:[
        {
          text: 'Display Settings'
        },
        {
          text: 'System Settings'
        },
        {
          text: 'Additional Settings'
        }
      ]
    };
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css';
.e-btn-icon.e-image {
  background: url(../spritesheet.png) -384px -48px;
  width: 32px;
  height: 32px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-button/default-cs15" %}

### Vertical button

Vertical button in DropDownButton can be achieved by adding `e-vertical` class using [cssClass](#) property.

The following example illustrates how to provide vertical support in DropDownButton component.

### APP.VUE

```

<template>
<ejs-dropdownbutton :items='items' iconCss= 'ddb-icons e-message' cssClass=
'e-vertical' iconPosition= 'Top'>Message</ejs-dropdownbutton>
</template>
<script>
import Vue from 'vue';
import { DropDownButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';

```

```

enableRipple(true);
Vue.use(DropDownButtonPlugin);
export default {
  data () {
    return {
      items:[
        {
          text: 'Edit'
        },
        {
          text: 'Delete'
        },
        {
          text: 'Mark as Read'
        },
        {
          text: 'Like Message'
        }
      ]
    };
  }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css';
  @font-face {
    font-family: 'e-db-icons';
    src:
      url(data:application/x-font-ttf;charset=utf-

## Popup items in Vue Drop down button component

### Icons

The popup action item have an icon or image to provide visual representation of the action. To place the icon on a popup item, set the [iconCss](#) property to `e-icons` with the required icon CSS. By default, the icon is positioned to the left side of the popup action item.

In the following sample, the icons for edit, delete, mark as read and like message menu items are added using the `iconCss` property.

### APP.VUE

```

<template>
<ejs-dropdownbutton :items='items' iconCss= 'ddb-icons e-
message'>Message</ejs-dropdownbutton>
</template>
<script>
import Vue from 'vue';
import { DropDownButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(DropDownButtonPlugin);
export default {
  data () {
    return {
      items:[
        {
          text: 'Edit',
          iconCss: 'ddb-icons e-edit'

```

```

    },
    {
        text: 'Delete',
        iconCss: 'ddb-icons e-delete'
    },
    {
        text: 'Mark As Read',
        iconCss: 'ddb-icons e-read'
    },
    {
        text: 'Like Message',
        iconCss: 'ddb-icons e-like'
    }
];
}
</script>

### Navigations

Actions in DropDownButton can be used to navigate to the other web page when action item is clicked. This can be achieved by providing link to the action item using `url` property.

In the following sample, navigation URL for Flipkart, Amazon, and Snapdeal action items are added using the `url` property:

### APP.VUE

```

<template>
<ejs-dropdownbutton :items='items' iconCss= 'e-cart-icon e-shopping'
:beforeItemRender='onBeforeItemRender'>Shop By</ejs-dropdownbutton>
</template>
<script>
import Vue from 'vue';
import { DropDownButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(DropDownButtonPlugin);

```

```
export default {
  data () {
    return {
      items:[
        {
          text: 'Flipkart',
          iconCss: 'e-cart-icon e-link',
          url: 'https://www.google.co.in/search?q=flipkart'
        },
        {
          text: 'Amazon',
          iconCss: 'e-cart-icon e-link',
          url: 'https://www.google.co.in/search?q=amazon'
        },
        {
          text: 'Snapdeal',
          iconCss: 'e-cart-icon e-link',
          url: 'https://www.google.co.in/search?q=snapdeal'
        }
      ]
    };
  },
  methods: {
    onBeforeItemRender: function(args) {
      args.element.getElementsByTagName('a')[0].setAttribute('target',
'_blank');
    }
  }
}

## Template

### Item templating

Popup items can be customized using the [beforeItemRender](#) event. The item render event triggers while rendering each popup action item. The event argument will be used to identify the action item and customize based on the requirement.

The following popup template is customized using `beforeItemRender` event by appending `span` and `div` element on each `li` rendering:

## APP.VUE

```

<template>
<ejs-dropdownbutton :items='items' iconCss= 'e-ddb-icons e-paste' cssClass=
'e-vertical' iconPosition= 'Top'
:beforeItemRender='onBeforeItemRender'>Paste</ejs-dropdownbutton>
</template>
<script>
import Vue from 'vue';
import { DropDownButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(DropDownButtonPlugin);
export default {
  data () {
    return {
      items:[

```

```

        {
            text: 'Edit'
        },
        {
            text: 'Cut'
        }
    ];
},
methods: {
    onBeforeItemRender: function(args) {
        if (args.item.text === 'Edit') {
            args.element.innerHTML = '<span></span><div><b>Paste
Text</b><div>Provides option to paste only the<br>selected
text.</div></div>';
            args.element.style.height = '80px';
            var span = args.element.children[0];
            span.setAttribute('class', 'e-cm-icons e-pastetext e-align');
            var div = args.element.children[1];
            div.setAttribute('class', 'e-div-align');
        } else {
            args.element.innerHTML = '<span></span><div><b>Paste
Special</b><div>Provides options to paste formulas,<br> values, comments,
validations etc...</div></div>';
            args.element.style.height = '80px';
            var span = args.element.children[0];
            span.setAttribute('class', 'e-cm-icons e-pastespecial e-
align');
            var div = args.element.children[1];
            div.setAttribute('class', 'e-div-align');
        }
    }

</style>

```

```
{% previewsample "page.domainurl/code-snippet/drop-down-button/default-cs19" %}
```

### Popup templating

The whole popup can be customized as per the requirement and it can be customized by handling it in [target](#) property.

In the following sample, the whole popup item is customized as table template by giving `div` as target and it can be achieved using `target` property.

### APP.VUE

```
<template>
  <div>
    <div id="target" style='border: 1px solid grey;'>
      <table>
        <caption style='height: 18px; background-color: #e0e0e0;'><b>Insert
Table</b></caption>
        <tr class='e-row'><td class='e-cell'></td><td class='e-
cell'></td><td class='e-cell'></td><td class='e-cell'></td><td class='e-
cell'></td><td class='e-cell'></td></tr>
        <tr class='e-row'><td class='e-cell'></td><td class='e-
cell'></td><td class='e-cell'></td><td class='e-cell'></td><td class='e-
cell'></td><td class='e-cell'></td></tr>
        <tr class='e-row'><td class='e-cell'></td><td class='e-
cell'></td><td class='e-cell'></td><td class='e-cell'></td><td class='e-
cell'></td><td class='e-cell'></td></tr>
        <tr class='e-row'><td class='e-cell'></td><td class='e-
cell'></td><td class='e-cell'></td><td class='e-cell'></td><td class='e-
cell'></td><td class='e-cell'></td></tr>
        <tr class='e-row'><td class='e-cell'></td><td class='e-
cell'></td><td class='e-cell'></td><td class='e-cell'></td><td class='e-
cell'></td><td class='e-cell'></td></tr>
        <tr class='e-row'><td class='e-cell'></td><td class='e-
cell'></td><td class='e-cell'></td><td class='e-cell'></td><td class='e-
cell'></td><td class='e-cell'></td></tr>
      </table>
    </div>
    <ejs-dropdownbutton target= '#target' iconCss= 'e-icons e-table'
cssClass= 'e-vertical' iconPosition= 'Top'>Table</ejs-dropdownbutton>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(DropDownButtonPlugin);
export default {}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css';
```

```

.e-cell {
  border: 1px solid grey;
  padding: 8px;
}
.e-table::before {
  content: '\e705';
}
.e-row {
  padding-left: 3px;
  padding-right: 3px;
}

```

{% previewsample "page.domainurl/code-snippet/drop-down-button/default-cs20" %}

### Separator

The Separators are the horizontal lines that are used to separate the popup items. You cannot select the separators. You can enable separators to group the popup items using the `separator` property.

In the following sample, cut, copy, and paste popup items are grouped using the separator property:

### APP.VUE

```

<template>
<ejs-dropdownbutton :items='items'>Clipboard</ejs-dropdownbutton>
</template>
<script>
import Vue from 'vue';
import { DropDownButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(DropDownButtonPlugin);
export default {
  data () {
    return {
      items:[
        {
          text: 'Cut',
          iconCss: 'e-db-icons e-cut'
        },
        {
          text: 'Copy',
          iconCss: 'e-icons e-copy'
        },
        {
          text: 'Paste',
          iconCss: 'e-db-icons e-paste'
        },
        {
          separator: true
        },
        {
          text: 'Font',
          iconCss: 'e-db-icons e-font'
        },
        {

### Accessibility in Vue Drop down button component

The Drop down button component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Drop down button component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

```
.post .post-content img {  
display: inline-block;  
margin: 0.5em 0;  
}
```

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

#### WAI-ARIA attributes

The Drop down button component followed the [WAI-ARIA] patterns to meet the accessibility. The following ARIA attributes are used in the Drop down button component:

| Attributes | Purpose |

| --- | --- |

| **role** | Indicates the Drop down button component as **button**, Drop down button popup as **menu**, and the dropdown popup action items as **menuitem**. |

| **aria-haspopup** | Indicates the availability of the popup element. |

| **aria-expanded** | Indicates whether the popup can be expanded or collapsed, as well as indicates whether its current state is expanded or collapsed. |

| **aria-owns** | Identifies an elements in order to define a visual, functional, or contextual parent/child relationship between DOM elements where the DOM hierarchy cannot be used to represent the relationship. |

| **aria-disabled** | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |

### Keyboard interaction

The Dropdown button component followed the [keyboard interaction] guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Drop down button component.

| **Press** | **To do this** |

| --- | --- |

| **Esc** | **Closes the popup.** |

| **Enter** | **Opens the popup, or activates the highlighted item and closes the popup.** |

| **Space** | **Opens the popup.** |

| **Up** | **Navigates up or to the previous action item.** |

| **Alt + Up Arrow** | **Closes the popup.** |

| **Alt + Down Arrow** | **Opens the popup.** |

### Ensuring accessibility

The Drop down component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Drop down button component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Drop down button component with accessibility tools.

{% previewsample "page.domainurl/code-snippet/drop-down-button/default-cs1" %}

### Style and appearance in Vue Drop down button component

To modify the DropDownButton appearance, you need to override the default CSS of DropDownButton component. Please find the list of CSS classes and its corresponding section in DropDownButton. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

CSS Class | Purpose of Class

| .e-dropdown-btn | To customize the dropdown button

| .e-dropdown-btn: hover | To customize the dropdown button on hover

| .e-dropdown-btn.e-active | To customize the dropdown button on active

| .e-dropdown-popup | To customize the dropdown button pop up

| .e-dropdown-popup ul .e-item: hover | To customize the dropdown button pop up items on hover

| .e-dropdown-popup ul .e-item: active | To customize the dropdown button pop up items on active

### How To

#### Change caret icon in Vue Drop down button component

Dropdown arrow can be customized on popup open and close. It can be handled in [beforeOpen](#)

and [beforeClose](#) event.

In the following example, the up arrow is updated on popup close and down arrow is updated on popup open using `beforeOpen` and `beforeClose` event by adding and removing `e-caret-up` class.

#### APP.VUE

```
<template>
<ejs-dropdownbutton id="ddBtn" :items='items' :beforeOpen='onBeforeOpen'
:beforeClose='onBeforeClose'>Clipboard</ejs-dropdownbutton>
</template>
<script>
import Vue from 'vue';
import { DropDownButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(DropDownButtonPlugin);
export default {
  data () {
    return {
      items:[
        {
          text: 'Cut'
        },
        {
          text: 'Copy'
        },
        {
          text: 'Paste'
        }
      ]
    };
  },
  methods: {
    // Removing 'e-caret-up' class.
    onBeforeClose: (args) => {
      document.getElementById('ddBtn').ej2_instances[0].cssClass = '';
    },
    // Adding 'e-caret-up' class.
    onBeforeOpen: (args) => {
      document.getElementById('ddBtn').ej2_instances[0].cssClass = 'e-
caret-up';
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css';
.e-caret {
  transform: rotate(0deg);
  transition: transform 200ms ease-in-out;
}
.e-caret-up .e-caret {
  transform: rotate(180deg);
}
```

```
}
</style>
```

{% previewsample "page.domainurl/code-snippet/drop-down-button/default-cs3" %}

Create dropdownbutton with rounded corner in Vue Drop down button component

DropDownButton with rounded corner can be achieved by adding `border-radius` CSS property to button element.

In the following example, `e-round-corner` class is defined with `5px border-radius` property and added that class to button element using `cssClass` property.

#### APP.VUE

```
<template>
<ejs-dropdownbutton :items='items' cssClass='e-round-corner'>Clipboard</ejs-
dropdownbutton>
</template>
<script>
import Vue from 'vue';
import { DropDownButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(DropDownButtonPlugin);
export default {
  data () {
    return {
      items:[
        {
          text: 'Cut'
        },
        {
          text: 'Copy'
        },
        {
          text: 'Paste'
        }
      ]
    };
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css';
.e-round-corner {
  border-radius: 5px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/drop-down-button/default-cs4" %}

Create right to left dropdownbutton in Vue Drop down button component

DropDownButton component has RTL support. This can be achieved by setting [enableRtl](#) as true.

The following example illustrates how to enable right-to-left support in DropDownButton component.

#### APP.VUE

```
<template>
<ejs-dropdownbutton :items='items' iconCss='ddb-icons e-message'
enableRtl='true'>Message</ejs-dropdownbutton>
</template>
<script>
import Vue from 'vue';
import { DropDownButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(DropDownButtonPlugin);
export default {
  data () {
    return {
      items:[
        {
          text: 'Edit'
        },
        {
          text: 'Delete'
        },
        {
          text: 'Mark as Read'
        },
        {
          text: 'Like Message'
        }
      ]
    };
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@font-face {
  font-family: 'e-db-icons';

## Customize icon and width in Vue Drop down button component

Width of the DropDownButton can be customized by setting required width to the dropdown element.

The following UI can be achieved by setting `iconPosition` as `Top`, width as `85px` and size of the font icon as `40px` by adding `e-custom` class.

## APP.VUE

```
<template>
<ejs-dropdownbutton :items='items' iconCss='e-icons e-search' cssClass='e-
custom' iconPosition='Top'          content='Find & Select'></ejs-
dropdownbutton>
</template>
<script>
import Vue from 'vue';
import { DropDownButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(DropDownButtonPlugin);
export default {
```

```

    data () {
      return {
        items:[
          {
            text: 'Find'
          },
          {
            text: 'Replace'
          },
          {
            text: 'Go To'
          },
          {
            text: 'Go To Special'
          }
        ]
      };
    }
  }
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
  .e-search::before {
    content: '\e993';
  }
  .e-dropdown-btn.e-custom {
    width: 85px;
  }
  .e-dropdown-btn.e-custom .e-search::before {
    font-size: 40px;
  }
</style>

```

### Disable a dropdownbutton in Vue Drop down button component

DropDownButton component can be enabled/disabled by giving [disabled](#) property. It can be disabled by setting disabled property as **true**.

#### APP.VUE

```

<template>
  <ejs-dropdownbutton :items='items' iconCss='ddb-icons e-message'
    disabled='true'>Message</ejs-dropdownbutton>
</template>
<script>
import Vue from 'vue';
import { DropDownButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(DropDownButtonPlugin);
export default {
  data () {

```

```
return {
  items:[
    {
      text: 'Edit'
    },
    {
      text: 'Delete'
    },
    {
      text: 'Mark as Read'
    },
    {
      text: 'Like Message'
    }
  ]
};
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@font-face {
  font-family: 'e-db-icons';

Group popup items with listview component in Vue Drop down button component

Header in popup items is possible in DropDownButton by templating entire popup with ListView. Create ListView with id `#listview` and provide it as a [target](#) for DropDownButton.

Install Syncfusion `List` packages using below command.

```
`bash
```

```
npm install @syncfusion/ej2-vue-list --save
```

```
,
```

In the following example, ListView element is given as `target` to DropDownButton and header can be achieved by [groupBy](#) property.

#### APP.VUE

```

<template>
<div>
    <ejs-dropdownbutton target= '#listview' iconCss= 'e-icons e-down'
    cssClass= 'e-caret-hide'></ejs-dropdownbutton>
    <ejs-listview id='listview' :dataSource='dataSource' :fields='fields'
    showCheckBox= 'true'
    ></ejs-listview>
</div>
</template>
<script>
import Vue from 'vue';
import { DropDownButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { ListViewPlugin } from '@syncfusion/ej2-vue-lists';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(DropDownButtonPlugin);
Vue.use(ListViewPlugin);
export default {
    data () {
        return {
            dataSource :[
                { class: 'data', text: 'Print', id: 'data1', category:
'Customize Quick Access Toolbar' },

```

```

        { class: 'data', text: 'Save As', id: 'data2', category:
'Customize Quick Access Toolbar' },
        { class: 'data', text: 'Update Folder', id: 'data3',
category: 'Customize Quick Access Toolbar' },
        { class: 'data', text: 'Reply', id: 'data4', category:
'Customize Quick Access Toolbar' }
    ],
    fields: { text: 'text', groupBy: 'category' }
}
}
}
</script>
<style>
    @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
    .e-down::before {
        content: '\e969';
    }
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-button/default-cs8" %}

### Hide dropdown arrow in Vue Drop down button component

You can hide the dropdown arrow from the DropDownButton by adding class `e-caret-hide` to DropDownButton element using [cssClass](#) property.

### APP.VUE

```

<template>
<ejs-dropdownbutton :items='items' cssClass= 'e-caret-hide'>Clipboard</ejs-
dropdownbutton>
</template>
<script>
import Vue from 'vue';
import { DropDownButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(DropDownButtonPlugin);
export default {
    data () {
        return {
            items:[
                {
                    text: 'Cut'
                },
                {
                    text: 'Copy'
                },
                {
                    text: 'Paste'
                }
            ]
        };
    }
};

```

```

    }
  }
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-button/default-cs9" %}

Open a dialog on popup item click in Vue Drop down button component

This section explains about how to open a dialog on DropdownButton popup item click. This can be achieved by handling dialog open in [select](#) event of the DropdownButton.

Install Syncfusion **List** packages using below command.

```
`bash
```

```
npm install @syncfusion/ej2-vue-list --save
```

In the following example, Dialog will open while selecting **Other Folder...** item.

#### APP.VUE

```

<template>
<div>
  <ejs-dropdownbutton :items='items' iconCss='ddb-icons e-
  folder' cssClass='e-vertical'
    iconPosition='Top' :select='onSelect'>Move</ejs-dropdownbutton>
  <ejs-dialog id="dialog" content="Move Items To 'Web Team'" header='Move
  Items' :buttons='buttons' width='250px' height='150px' :visible='false'
  :position='position'></ejs-dialog>
</div>
</template>
<script>
import Vue from 'vue';
import { DropDownButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { DialogPlugin } from "@syncfusion/ej2-vue-popups";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(DropDownButtonPlugin);
Vue.use(DialogPlugin);
export default {
  data () {
    return {
      items:[
        {
          text: 'Archive'
        },
        {
          text: 'Inbox'
        },
      ],
    }
  },

```

```

        {
            text: 'HR Portal'
        },
        {
            separator: true
        },
        {
            text: 'Other Folder...'
        },
        {
            text: 'Copy to Folder'
        }
    ]],
    buttons: [{
        buttonModel: {
            isPrimary: true,
            content: 'OK',
            cssClass: 'e-flat',
        },
        click: function () {
            this.hide();
        }
    }],
    position: {X: 100, Y: 100}
};

},
methods: {
    onSelect: function(args) {

## Position popup open in Vue Drop down button component

Popup open position can be changed according to the requirement. Popup open position can be changed in `open` event by setting `top` and `left` for the popup element.

In the following example, the `top` position of the popup element is changed in `open` event.

## APP.VUE

```
<template>
<ejs-dropdownbutton id="ddBtn" :items='items' cssClass= 'e-caret-up'
:open='onOpen'>Clipboard</ejs-dropdownbutton>
</template>
<script>
import Vue from 'vue';
import { DropDownButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { OpenCloseMenuEventArgs } from '@syncfusion/ej2-splitbuttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(DropDownButtonPlugin);
export default {
  data () {
    return {
      items:[
```

```

        {
            text: 'Cut'
        },
        {
            text: 'Copy'
        },
        {
            text: 'Paste'
        }
    ]
};
},
methods: {
    onOpen: function(args: OpenCloseMenuEventArgs) {
        args.element.parentElement.style.top =
document.getElementById('ddBtn').ej2_instances[0].element.getBoundingClientRect().top - args.element.parentElement.offsetHeight + 'px';
    }
}
}
</script>
<style>
    @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
    .e-dropdown-btn{
        margin: 25% 5px 25px 30%;
    }
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-button/default-cs11" %}

Underline a character in the item text in Vue Drop down button component

Underline a particular character in a text can be handled in [beforeItemRender](#) event by adding `<u>` tag in between the text and given as innerHTML in `li` rendering.

In the following example, **C** is underlined in the text **Copy**.

#### APP.VUE

```

<template>
<ejs-dropdownbutton :items='items'
:beforeItemRender='onBeforeItemRender'>Clipboard</ejs-dropdownbutton>
</template>
<script>
import Vue from 'vue';
import { DropDownButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(DropDownButtonPlugin);
export default {
    data () {
        return {
            items:[
                {

```

```

        text: 'Cut'
      },
      {
        text: 'Copy'
      },
      {
        text: 'Paste'
      }
    ]],
  },
  methods: {
    onBeforeItemRender: function(args) {
      if (args.item.text === 'Copy') {
        //To underline a particular text.
        args.element.innerHTML = '<u>C</u>opy';
      }
    }
  }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-button/default-cs12" %}

## DropDownList

### Getting Started with the Vue Drop down list Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLI](#) and integrating the Syncfusion Vue Drop down list component using the [Composition API](#) / [Options API](#)[Link to the Video](#).

To get start quickly with DropDownList Component using Vue CLI, you can check on this video:

#### Prerequisites

[System requirements for Syncfusion Vue UI components](#)

#### Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```

`bash
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
`

```

or

```
`bash
```

```
yarn global add @vue/cli
```

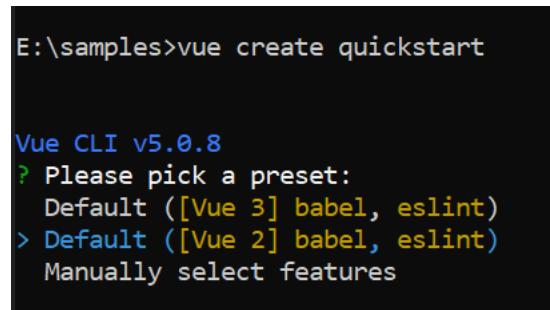

```
vue create quickstart
```

```
cd quickstart
```

```
yarn run serve
```

```
`
```

When creating a new project, choose the option **Default ([Vue 2] babel, eslint)** from the menu.

```
E:\samples>vue create quickstart

Vue CLI v5.0.8
? Please pick a preset:
  Default ([Vue 3] babel, eslint)
> Default ([Vue 2] babel, eslint)
  Manually select features
```

Once the **quickstart** project is set up with default settings, proceed to add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.npmjs.com). To use Vue components, install the required npm package.

This article uses the [Vue Drop down list component](#) as an example. Install the **@syncfusion/ej2-vue-dropdowns** package by running the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-dropdowns --save
```

```
`
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-dropdowns
```

```
`
```

#### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the **Material** theme is applied using CSS styles, which are available in installed packages. The necessary **Material** CSS styles for the Drop down list component and its dependents were imported into the `<style>` section of **src/App.vue** file.

### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

#### Add Syncfusion Vue component

Follow the below steps to add the Vue Drop down list component using **Composition API** or **Options API**:

1\ First, import and register the Drop down list component in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### **COMPOSITION API (~/SRC/APP.VUE)**

```
<script setup>
import { DropDownListComponent as EjsDropdownlist } from "@syncfusion/ej2-vue-dropdowns";
</script>
```

#### **COMPOSITION API (~/SRC/APP.VUE)**

```
<script>
import { DropDownListComponent } from "@syncfusion/ej2-vue-dropdowns";
export default {
  components: {
    'ejs-dropdownlist': DropDownListComponent
  }
}
</script>
```

2\ In the **template** section, define the Drop down list component with the **dataSource** and **[placeholder]** (<https://ej2.syncfusion.com/vue/documentation/api/drop-down-list/#placeholder>) property.

### ~/SRC/APP.VUE

```
<template>
<div id="app">
<div id='container' style="margin:50px auto 0; width:250px;">
<br>
<ejs-dropdownlist id='dropdownlist' :dataSource='sportsData'
placeholder='Select a game'></ejs-dropdownlist>
</div>
</div>
</template>
```

#### Binding data source

After initialization, populate the DropDownList with data using the **dataSource** property. Here, an array of string values is passed to the DropDownList component.

**COMPOSITION API (~SRC/APP.VUE)**

```
<template>
<div id="app">
<div id='container' style="margin:50px auto 0; width:250px;">
<br>
<ejs-dropdownlist id='dropdownlist' :dataSource='sportsData'
placeholder='Select a game'></ejs-dropdownlist>
</div>
</div>
</template>
<script setup>
import { DropDownListComponent as EjsDropdownlist } from "@syncfusion/ej2-vue-dropdowns";
const sportsData = ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'];
</script>
```

**OPTIONS API (~SRC/APP.VUE)**

```
<template>
<div id="app">
<div id='container' style="margin:50px auto 0; width:250px;">
<br>
<ejs-dropdownlist id='dropdownlist' :dataSource='sportsData'
placeholder='Select a game'></ejs-dropdownlist>
</div>
</div>
</template>
<script>
import { DropDownListComponent } from "@syncfusion/ej2-vue-dropdowns";
export default {
  components: {
    'ejs-dropdownlist': DropDownListComponent
  },
  data () {
    return {
      sportsData: ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis']
    }
  }
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

**COMPOSITION API (~SRC/APP.VUE)**

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' :dataSource='sportsData'
placeholder='Select a game'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script setup>
```

```
import { DropDownListComponent as EjsDropdownlist } from "@syncfusion/ej2-vue-dropdowns";
const sportsData = ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'];
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

### OPTIONS API (~SRC/APP.VUE)

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' :dataSource='sportsData'
placeholder='Select a game'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script>
import { DropDownListComponent } from "@syncfusion/ej2-vue-dropdowns";
export default {
  components: {
    'ejs-dropdownlist': DropDownListComponent
  },
  data () {
    return {
      sportsData: ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis']
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run serve
```

```
,
```

```
or
```

```
`bash
```

```
yarn run serve
```

```
,
```

```
{% previewsample "page.domainurl/code-snippet/drop-down-list/getting-started/getting-started-cs1"
%}
```

### Configure the Popup List

By default, the width of the popup list automatically adjusts according to the DropDownList input element's width, and the height of the popup list has '300px'.

The height and width of the popup list can also be customized using the [popupHeight](<https://ej2.syncfusion.com/vue/documentation/api/drop-down-list/#popupheight>) and [popupWidth] properties respectively

### COMPOSITION API (~SRC/APP.VUE)

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' popupHeight="200px"
popupWidth="250px" :dataSource='sportsData' placeholder='Select a
game'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script setup>
import { DropDownListComponent as EjsDropDownlist } from "@syncfusion/ej2-
vue-dropdowns";
const sportsData = ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'];
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

### OPTIONS API (~SRC/APP.VUE)

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' popupHeight="200px"
popupWidth="250px" :dataSource='sportsData' placeholder='Select a
game'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script>
import { DropDownListComponent } from "@syncfusion/ej2-vue-dropdowns";
export default {
  components: {
    'ejs-dropdownlist': DropDownListComponent
  },
  data () {
    return {
      sportsData: ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'];
    }
  }
}
```

```
}  
}  
</script>  
<style>  
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";  
</style>
```

{% previewsample "page.domainurl/code-snippet/drop-down-list/getting-started/popup-cs1" %}

You can refer to our [Vue Dropdown List](#) feature tour page for its groundbreaking feature representations. You can also explore our [Vue Dropdown list example](#) that shows how to render the Dropdown List in Vue.

- [How to bind the data](#)

## Getting Started with the Vue DropDownList Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue DropDownList component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

[System requirements for Syncfusion Vue UI components](#)

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm create vite@latest
```

```
`
```

or

```
`bash
```

```
yarn create vite
```

```
`
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as `my-project` for this article.

```
`bash
```

```
? Project name: » my-project
```

```
,
```

2. Select `Vue` as the framework. It will create a Vue 3 project.

```
`bash
```

```
? Select a framework: » - Use arrow-keys. Return to submit.
```

```
Vanilla
```

```
Vue
```

```
React
```

```
Preact
```

```
Lit
```

```
Svelte
```

```
Others
```

```
,
```

3. Choose `JavaScript` as the framework variant to build this Vite project using JavaScript and Vue.

```
`bash
```

```
? Select a variant: » - Use arrow-keys. Return to submit.
```

```
JavaScript
```

```
TypeScript
```

```
Customize with create-vue ↗
```

```
Nuxt ↗
```

```
,
```

4. Upon completing the aforementioned steps to create the `my-project`, run the following command to install its dependencies:

```
`bash
```

```
cd my-project
```

```
npm install
```

```
,
```

```
or
```

```
`bash
```

```
cd my-project
```

yarn install

,

Now that `my-project` is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.syncfusion.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue DropDownList component](#) as an example. To use the Vue DropDownList component in the project, the `@syncfusion/ej2-vue-dropdowns` package needs to be installed using the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-dropdowns --save
```

,

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-dropdowns
```

,

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, `Material` theme is applied using CSS styles, which are available in installed packages. The necessary `Material` CSS styles for the DropDownList component and its dependents were imported into the `<style>` section of `src/App.vue` file.

#### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

### Add Syncfusion Vue component

Follow the below steps to add the Vue DropDownList component using `Composition API` or `Options API`:

1.First, import and register the DropDownList component in the `script` section of the `src/App.vue` file. If you are using the `Composition API`, you should add the `setup` attribute to the `script` tag to indicate that Vue will be using the `Composition API`.

**COMPOSITION API (~SRC/APP.VUE)**

```
<script setup>
import { DropDownListComponent as EjsDropdownlist } from "@syncfusion/ej2-vue-dropdowns";
</script>
```

**OPTIONS API (~SRC/APP.VUE)**

```
<script>
import { DropDownListComponent } from "@syncfusion/ej2-vue-dropdowns";
//Component registration
export default {
  name: "App",
  components: {
    'ejs-dropdownlist' : DropDownListComponent,
  }
}
</script>
```

2. In the **template** section, define the DropDownList component with the [dataSource](#) property and column definitions.

**~/SRC/APP.VUE**

```
<template>
<div class="control_wrapper">
<ejs-dropdownlist id='dropdownlist' :dataSource='sportsData'></ejs-
dropdownlist>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

**COMPOSITION API (~SRC/APP.VUE)**

```
<template>
<div class="control_wrapper">
<ejs-dropdownlist id='dropdownlist' :dataSource='data[0].sportsData'></ejs-
dropdownlist>
</div>
</template>
<script setup>
import { DropDownListComponent as EjsDropdownlist } from "@syncfusion/ej2-vue-dropdowns";
const data = [{ sportsData : ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'] }]
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

**OPTIONS API (~SRC/APP.VUE)**

```
<template>
<div class="control_wrapper">
<ejs-dropdownlist id='dropdownlist' :dataSource='sportsData'></ejs-
dropdownlist>
</div>
</template>
<script>
import { DropDownListComponent } from "@syncfusion/ej2-vue-dropdowns";
//Component registration
export default {
name: 'App',
components: {
"ejs-dropdownlist": DropDownListComponent
},
data () {
return {
sportsData: ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis']
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
,
```

```
or
```

```
`bash
```

```
yarn run dev
```

```
,
```

### Configure the Popup List

By default, the width of the popup list automatically adjusts according to the DropDownList input element's width, and the height of the popup list has '300px'.

The height and width of the popup list can also be customized using the [popupHeight](<https://ej2.syncfusion.com/vue/documentation/api/drop-down-list/#popupheight>) and [popupWidth] properties respectively

### COMPOSITION API (~SRC/APP.VUE)

```
<template>
<div id="app">
<div id='container' style="margin:50px auto 0; width:250px;">
<br>
```

```

<ejs-dropdownlist id='dropdownlist' popupHeight="200px" popupWidth="250px"
:dataSource='data[0].sportsData' placeholder='Select a game'></ejs-
dropdownlist>
</div>
</div>
</template>
<script setup>
import { DropDownListComponent as EjsDropDownlist } from "@syncfusion/ej2-
vue-dropdowns";
const data = [{ sportsData : ['Badminton', 'Cricket', 'Football', 'Golf',
'Tennis'] }]
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>

```

### OPTIONS API (~SRC/APP.VUE)

```

<template>
<div id="app">
<div id='container' style="margin:50px auto 0; width:250px;">
<br>
<ejs-dropdownlist id='dropdownlist' popupHeight="200px" popupWidth="250px"
:dataSource='sportsData' placeholder='Select a game'></ejs-dropdownlist>
</div>
</div>
</template>
<script>
import { DropDownListComponent } from "@syncfusion/ej2-vue-dropdowns";
//Component registration
export default {
name: 'App',
components: {
"ejs-dropdownlist": DropDownListComponent
},
data () {
return {
sportsData: ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'],
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>

```

The output will appear as follows:

See Also

- [How to bind the data](#)

### Data binding in Vue Drop down list component

The DropDownList loads the data either from local data sources or remote data services using the [dataSource](#) property. It supports the data type of array or **DataManager**.

The DropDownList also supports different kinds of data services such as OData, OData V4, and Web API, and data formats such as XML, JSON, and JSONP with the help of **DataManager** adaptors.

| Fields | Type | Description |

|-----|-----|-----|

| text | **string** | Specifies the display text of each list item. |

| value | **number or string** | Specifies the hidden data value mapped to each list item that should contain a unique value. |

| groupBy | **string** | Specifies the category under which the list item has to be grouped. |

| iconCss | **string** | Specifies the icon class of each list item. |

When binding complex data to the DropDownList, fields should be mapped correctly. Otherwise, the selected item remains undefined.

### Binding local data

Local data can be represented in two ways as described below.

#### 1. Array of simple data

The DropDownList has support to load array of primitive data such as strings and numbers. Here, both value and text field act the same.

### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' :dataSource='sportsData'
placeholder='Select a game'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
```

```

import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
export default {
  data () {
    return {
      sportsData: ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'];
    }
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-list/data-binding/simple-cs1" %}

## 2. Array of JSON data

The DropDownList can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, **Id** column and **Game** column from complex data have been mapped to the **value** field and **text** field, respectively.

### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' placeholder='Select a game'
      :dataSource='sportsData' :fields='fields'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
export default {
  data () {
    return {
      sportsData: [
        { Id: 'game1', Game: 'Badminton' },
        { Id: 'game2', Game: 'Football' },
        { Id: 'game3', Game: 'Tennis' }
      ],
      fields: { text: 'Game', value: 'Id' },
    }
  }
}
</script>

```

```
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import ".../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import ".../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/drop-down-list/data-binding/json-cs1" %}
```

### 3. Array of Complex data

The DropDownList can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, **Code.Id** column and **Country.Name** column from complex data have been mapped to the **value** field and **text** field, respectively.

#### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' placeholder='Select a country'
      :dataSource='countriesData' :fields='fields'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
export default {
  data () {
    return {
      countriesData : [
        { Country: { Name: 'Australia' }, Code: { Id: 'AU' } },
        { Country: { Name: 'Bermuda' }, Code: { Id: 'BM' } },
        { Country: { Name: 'Canada' }, Code: { Id: 'CA' } },
        { Country: { Name: 'Cameroon' }, Code: { Id: 'CM' } },
        { Country: { Name: 'Denmark' }, Code: { Id: 'DK' } },
        { Country: { Name: 'France' }, Code: { Id: 'FR' } }
      ],
      fields: { text: 'Country.Name', value: 'Code.Id' }
    }
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import ".../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import ".../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
```

```
</style>
```

```
{% previewsample "page.domainurl/code-snippet/drop-down-list/data-binding/complex-cs1" %}
```

### Binding remote data

The DropDownList supports retrieval of data from remote data services with the help of **DataManager** component. The [Query](#) property is used to fetch data from the database and bind it to the DropDownList.

The following sample displays the first 6 contacts from “Customers” table of the **Northwind** Data Service.

### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' placeholder='Select a customer'
sortOrder='Ascending' :dataSource='dataSource' :query='query'
:fields='fields'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
import { DataManager, Query, ODataV4Adaptor } from "@syncfusion/ej2-data";
export default {
  data () {
    return {
      query : new Query().from('Customers').select(['ContactName',
'CustomerID']).take(6),
      dataSource : new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      }),
      fields: { text: 'ContactName', value: 'CustomerID' }
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/drop-down-list/data-binding/remote-cs1" %}
```

## Templates in Vue Drop down list component

The DropDownList has been provided with several options to customize each list item, group title, selected value, header, and footer elements. It uses the Essential JS 2 **Template engine** to compile and render the elements properly.

## Item template

The content of each list item within the DropDownList can be customized with the help of [itemTemplate](#) property.

In the following sample, each list item is split into two columns to display relevant data's.

**APP.VUE**

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' placeholder='Select an employee'
sortOrder='Ascending' :itemTemplate='itemTemplate' :dataSource='dataSource'
:query='query' :fields='fields'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
import { DataManager, Query, ODataV4Adaptor } from "@syncfusion/ej2-data";
var itemVue = Vue.component("itemTemplate", {
  template: `<span><span class='name'>{{data.FirstName}}</span><span class
='city'>{{data.City}}</span></span>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data () {
    return {
      itemTemplate : function() {
        return {template: itemVue};
      },

```

```

        query : new Query().from('Employees').select(['FirstName', 'City',
'EmployeeID']).take(6),
        dataSource : new DataManager({
            url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
            adaptor: new ODataV4Adaptor,
            crossDomain: true
        }),
        fields: { text: 'FirstName', value: 'EmployeeID' }
    }
}
</script>
<style>
@import ".../node_modules/@syncfusion/ej2-base/styles/material.css";
@import ".../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import ".../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
.city {
    right: 15px;
    position: absolute;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-list/templates/item-template-cs1" %}

### Value template

The currently selected value that is displayed by default on the DropDownList input element can be customized using the [valueTemplate](#) property.

In the following sample, the selected value is displayed as a combined text of both **FirstName** and **City** in the DropDownList input, which is separated by a hyphen.

### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' placeholder='Select an employee'
sortOrder='Ascending' :itemTemplate='itemTemplate'
:valueTemplate='valueTemplate' :dataSource='dataSource' :query='query'
:fields='fields'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
import { DataManager, Query, ODataV4Adaptor } from "@syncfusion/ej2-data";
var itemVue = Vue.component("itemTemplate", {
  template: `<span><span class='name'>{{data.FirstName}}</span><span class
='city'>{{data.City}}</span></span>`,
  data() {
    return {
      data: {}
    }
  }
});

```

```

    };
  }
});
var valueVue = Vue.component("valueTemplate", {
  template: `<span>{{data.FirstName}} - {{data.City}}</span>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data () {
    return {
      itemTemplate : function() {
        return {template: itemVue};
      },
      valueTemplate: function() {
        return {template: valueVue};
      },
      query : new Query().from('Employees').select(['FirstName', 'City',
'EmployeeID']).take(6),
      dataSource : new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      }),
      fields: { text: 'FirstName', value: 'EmployeeID' }
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
.city {
  right: 15px;
  position: absolute;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-list/templates/value-template-cs1" %}

### Group template

The group header title under which appropriate sub-items are categorized can also be customized with the help of [groupTemplate](#) property. This template is common for both inline and floating group header template.

In the following sample, employees are grouped according to their city.

### APP.VUE

```

<template>
  <div id="app">

```

```

<div id='container' style="margin:5px auto; width:250px;">
  <br>
  <ejs-dropdownlist id='dropdownlist' placeholder='Select an employee'
sortOrder='Ascending' :groupTemplate="groupTemplate"
:dataSource='dataSource' :query='query' :fields='fields'></ejs-dropdownlist>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
import { DataManager, Query, ODataV4Adaptor, Predicate } from "@syncfusion/ej2-
data";
var groupVue = Vue.component("groupTemplate", {
  template: `<strong>{{data.City}}</strong>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data () {
    return {
      groupTemplate : function (e) {
        return {
          template: groupVue
        }
      },
      query : new Query().from('Employees').select(['FirstName', 'City',
'EmployeeID']).take(6).where(new Predicate('City', 'equal',
'London').or('City', 'equal', 'Seattle')),
      dataSource : new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      }),
      fields: { text: 'FirstName', value: 'EmployeeID', groupBy: 'City' }
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
.city {
  right: 15px;
  position: absolute;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-list/templates/group-template-cs1" %}

### Header template

The header element is shown statically at the top of the popup list items within the DropDownList, and any custom element can be placed as a header element using the [headerTemplate](#) property.

In the following sample, the list items and its headers are designed and displayed as two columns similar to multiple columns of the grid.

### APP.VUE

```
<template>
  <div id="app">
    <div class='combobox'>
      <br>
      <ejs-combobox id='combobox' sortOrder="Ascending"
:dataSource='employeeData' :itemTemplate='itemTemplate'
:headerTemplate='headerTemplate' :fields='fields' :query='query'
placeholder="Select an employee"></ejs-combobox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ComboBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ComboBoxPlugin);
import { Query, DataManager, Predicate, ODataV4Adaptor } from
'@syncfusion/ej2-data';
var headerVue = Vue.component("headerTemplate", {
  template: `<span class='head'><span class='name'>Name</span><span
class='city'>City</span></span>`,
  data() {
    return {
      data: {}
    };
  }
});
var itemVue = Vue.component("itemTemplate", {
  template: `<span class='item' ><span
class='name'>{{data.FirstName}}</span><span
class='city'>{{data.City}}</span></span>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data () {
    return {
      employeeData : new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      }),
      query : new Query().from('Employees').select(['FirstName', 'City',
'EmployeeID']).take(6),
      fields : { text: 'FirstName', value: 'EmployeeID' },
      headerTemplate : function(e) {
```

```

        return {
            template: headerVue
        };
    },
    itemTemplate : function(e) {
        return {
            template: itemVue
        };
    }
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
.head,
.item {
    display: table;
    width: 100%;
    margin: auto;
}
.head {
    height: 40px;
    font-size: 15px;
    font-weight: 600;
}
.name,
.city {
    display: table-cell;
    vertical-align: middle;
    width: 50%;
}
.head .name {
    text-indent: 16px;
}
.head .city {
    text-indent: 10px;
}
#app {
    color: #008cff;
    height: 40px;
    position: absolute;
    width: 90%;
    top: 10%;
}
.combobox {
    width: 30%;
    margin: 0 auto;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-list/templates/header-template-cs1" %}

### Footer template

The DropDownList has options to show a footer element at the bottom of the list items in the popup list. Here, you can place any custom element as a footer element using the [footerTemplate](#) property.

In the following sample, footer element displays the total number of list items present in the DropDownList.

### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' placeholder='Select a game'
:footerTemplate='footerTemplate' :dataSource='dataSource'></ejs-
dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
var itemVue = Vue.component("itemTemplate", {
  template: `<span class='foot'> Total list item: 5</span>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data () {
    var sportsData = ['Badminton', 'Cricket', 'Football', 'Golf',
'Tennis'];
    return {
      footerTemplate : function(e) {
        return {
          template: itemVue
        }
      },
      dataSource : sportsData,
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
.foot {
  text-indent: 1.2em;
  display: block;
  font-size: 15px;
  line-height: 40px;
  border-top: 1px solid #e0e0e0;
}
```

```
}
</style>
```

{% previewsample "page.domainurl/code-snippet/drop-down-list/templates/footer-template-cs1" %}

### No records template

The DropDownList is provided with support to custom design the popup list content when no data is found and no matches found on search with the help of [noRecordsTemplate](#) property.

In the following sample, popup list content displays the notification of no data available.

### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' placeholder='Select an item'
:noRecordsTemplate='noRecordsTemplate' :dataSource='dataSource'></ejs-
dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
var itemVue = Vue.component("noRecordsTemplate", {
  template: `<span class='norecord'> NO DATA AVAILABLE</span>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data () {
    var sportsData = [];
    return {
      noRecordsTemplate : function (e) {
        return {
          template: itemVue
        }
      },
      dataSource : sportsData
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/drop-down-list/templates/no-template-cs1" %}
```

### Action failure template

There is also an option to custom design the popup list content when the data fetch request fails at the remote server. This can be achieved using the [actionFailureTemplate](#) property.

In the following sample, when the data fetch request fails, the DropDownList displays the notification.

### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' placeholder='Select an customer'
sortOrder='Ascending' :actionFailureTemplate='failureTemplate'
:dataSource='dataSource' :query='query' :fields='fields'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
import { DataManager, Query, ODataV4Adaptor } from "@syncfusion/ej2-data";
var itemVue = Vue.component("failureTemplate", {
  template: `<span class='action-failure'> Data fetch get fails</span>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data () {
    return {
      failureTemplate : function(e) {
        return {
          template: itemVue
        }
      },
      query : new Query().from('Customers').select(['ContactName',
'CustomerID']).take(6),
      dataSource : new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      }),
      fields: { text: 'ContactName', value: 'CustomerID' }
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
```

```
@import "../../node_modules/@syncfusion/ej2-vue-  
dropdowns/styles/material.css";  
</style>
```

{% previewsample "page.domainurl/code-snippet/drop-down-list/templates/failure-template-cs1" %}

## Virtualization in DropDown List

Dropdown list virtualization is a technique used to efficiently render extensive lists of items while minimizing the impact on performance. This method is particularly advantageous when dealing with large datasets because it ensures that only a fixed number of DOM (Document Object Model) elements are created. When scrolling through the list, existing DOM elements are reused to display relevant data instead of generating new elements for each item. This recycling process is managed internally.

During virtual scrolling, the data retrieved from the data source depends on the popup height and the calculation of the list item height. Enabling the [enableVirtualization](#) option in a dropdown list activates this virtualization technique.

When fetching data from the data source, the [actionBegin](#) event is triggered before data retrieval begins. Then, the [actionComplete](#) event is triggered once the data is successfully fetched.

Furthermore, Incremental Search is supported with virtualization in the DropDownList component. When a key is typed, the focus is moved to the respective element, and the value is updated in the component in the open popup state. In the closed popup state, the respective value is updated in the component based on the typed key. The Incremental Search functionality is well-suited for scenarios involving remote data binding.

When the enableVirtualization property is enabled, the `skip` and `take` properties provided by the user within the Query class at the initial state or during the `actionBegin` or `actionComplete` events will not be considered, since it is internally managed and calculated based on certain dimensions with respect to the popup height.

## Binding local data

The DropDownList can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property. When using virtual scrolling, the list updates based on the scroll offset value, triggering a request to fetch more data from the server. As the data is being fetched, the `actionBegin` event occurs before the data retrieval starts. Once the data retrieval is successful, the `actionComplete` event is triggered, indicating that the data fetch process is complete.

In the following example, `id` column and `text` column from complex data have been mapped to the `value` field and `text` field, respectively.

## APP.VUE

```
<template>  
<div id="app">
```

```

    <div id="wrapper1">
      <ejs-dropdownlist id='dropdownlist' :dataSource='itemData'
placeholder='e.g Item 1' :fields='fields' :enableVirtualization='true'
:allowFiltering='false' popupHeight="200px"></ejs-dropdownlist>
    </div>
</div>
</template>
<script>
import { DropDownListComponent, VirtualScroll } from "@syncfusion/ej2-vue-
dropdowns";
let records = [];
function dataSource() {
  for (let i = 1; i <= 150; i++) {
    let item = {
      id: 'id' + i,
      text: "Item " + i,
    };
    records.push(item);
  }
}
dataSource();
//Component registration
export default {
  name: 'App',
  components: {
    "ejs-dropdownlist": DropDownListComponent
  },
  data () {
    return {
      itemData: records,
      fields: { value: 'id', text: 'text' },
      allowFiltering: true,
    }
  },
  provide: {
    dropdownlist: [VirtualScroll]
  }
}
</script>
<style>

dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-
notifications/styles/material.css";
#wrapper1{
  min-width: 250px;
  float: left;
  margin-left: 350px;
}
#wrapper2{
  min-width: 250px;
  float: right;
  margin-right: 100px;
}
</style>

```

```
{% previewsample "page.domainurl/code-snippet/drop-down-list/virtual-scroll" %}
```

### Binding remote data

The DropDownList supports retrieval of data from remote data services with the help of **DataManager** component. When using remote data, it initially fetches all the data from the server, triggering the **actionBegin** and **actionComplete** events, and then stores the data locally. During virtual scrolling, additional data is retrieved from the locally stored data, triggering the **actionBegin** and **actionComplete** events at that time as well.

The following sample displays the OrderId from the **Orders** Data Service.

### APP.VUE

```
<template>
<div id="app">
  <div id="wrapper1">
    <ejs-dropdownlist id='dropdownlist' :dataSource='itemData'
placeholder='e.g Item 1' :fields='fields' :enableVirtualization='true'
:allowFiltering='true' popupHeight="200px"></ejs-dropdownlist>
  </div>
</div>
</template>
<script>
import { DropDownListComponent, VirtualScroll } from "@syncfusion/ej2-vue-
dropdowns";
import { Query, DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
var remoteData = new DataManager({
  url: 'https://services.syncfusion.com/js/production/api/orders',
  adaptor: new WebApiAdaptor,
  crossDomain: true
});
//Component registration
export default {
  name: 'App',
  components: {
    "ejs-dropdownlist": DropDownListComponent
  },
  data () {
    return {
      itemData: remoteData,
      fields: { text: 'OrderID', value: 'OrderID' },
      allowFiltering: true,
    }
  },
  provide: {
    dropdownlist: [VirtualScroll]
  }
}
</script>
<style>

dropdowns/styles/material.css";
```

```
@import "../../../node_modules/@syncfusion/ej2-notifications/styles/material.css";
#wrapper1{
  min-width: 250px;
  float: left;
  margin-left: 350px;
}
#wrapper2{
  min-width: 250px;
  float: right;
  margin-right: 100px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/drop-down-list/virtual-scroll-remote" %}

### Grouping

The DropDownList component supports grouping with Virtualization. It allows you to organize elements into groups based on different categories. Each item in the list can be classified using the [groupBy](#) field in the data table. After grouping, virtualization works similarly to local data binding, providing a seamless user experience. When the data source is bound to remote data, an initial request is made to retrieve all data for the purpose of grouping. Subsequently, the grouped data works in the same way as local data binding on virtualization.

The following sample shows the example for Grouping with Virtualization.

### APP.VUE

```
<template>
<div id="app">
  <div id="wrapper1">
    <ejs-dropdownlist id='dropdownlist' :dataSource='itemData'
placeholder='e.g Item 1' :fields='fields' :enableVirtualization='true'
:allowFiltering='true' popupHeight="200px"></ejs-dropdownlist>
  </div>
</div>
</template>
<script>
import { DropDownListComponent, VirtualScroll } from "@syncfusion/ej2-vue-dropdowns";
let records = [];
function dataSource() {
  for (var i = 1; i <= 150; i++) {
    var item = {};
    item.id = 'id' + i;
    item.text = "Item ".concat(i);
    var randomGroup = Math.floor(Math.random() * 4) + 1;
    switch (randomGroup) {
      case 1:
        item.group = 'Group A';
        break;
      case 2:
        item.group = 'Group B';
        break;
      case 3:
        item.group = 'Group C';
    }
  }
}
```

```

        break;
      case 4:
        item.group = 'Group D';
        break;
      default:
        break;
    }
    records.push(item);
  }
}
dataSource();
//Component registration
export default {
  name: 'App',
  components: {
    "ejs-dropdownlist": DropDownListComponent
  },
  data () {
    return {
      itemData: records,
      fields: { groupBy: 'group', value: 'id', text: 'text' },
      allowFiltering: true,
    }
  },
  provide: {
    dropdownlist: [VirtualScroll]
  }
}
</script>
<style>

  margin-right: 100px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-list/virtual-scroll-group" %}

### Filtering with Virtualization

The DropDownList component supports Filtering with Virtualization. The DropDownList includes a built-in feature that enables data filtering when the [allowFiltering](#) option is enabled. In the context of Virtual Scrolling, the filtering process operates in response to the typed characters. Specifically, the DropDownList sends a request to the server, utilizing the full data source, to achieve filtering. Before

initiating the request, an action event is triggered. Upon successful retrieval of data from the server, an action complete event is triggered. The initial data is loaded when the popup is opened. Whether the filter list has a selection or not, the popup closes.

The following sample shows the example for Filtering with Virtualization.

#### APP.VUE

```
<template>
<div id="app">
  <div id="wrapper1">
    <ejs-dropdownlist id='dropdownlist' :dataSource='itemData'
placeholder='e.g Item 1' :fields='fields' :enableVirtualization='true'
:allowFiltering='true' popupHeight="200px"></ejs-dropdownlist>
  </div>
</div>
</template>
<script>
import { DropDownListComponent, VirtualScroll } from "@syncfusion/ej2-vue-
dropdowns";
let records = [];
function dataSource() {
  for (let i = 1; i <= 150; i++) {
    let item = {
      id: 'id' + i,
      text: "Item " + i,
    };
    records.push(item);
  }
}
dataSource();
//Component registration
export default {
  name: 'App',
  components: {
    "ejs-dropdownlist": DropDownListComponent
  },
  data () {
    return {
      itemData: records,
      fields: { value: 'id', text: 'text' },
      allowFiltering: true,
    }
  },
  provide: {
    dropdownlist: [VirtualScroll]
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";

### Grouping in Vue Drop down list component

The DropDownList supports wrapping nested elements into a group based on different categories. The category of each list item can be mapped through the [groupByLink to the Video](#) field in the data table. The group header is displayed both as inline and fixed headers. The fixed group header content is updated dynamically on scrolling the popup list with its category value.

How to group and filter the DropDownList Items, you can check on this video:

In the following sample, vegetables are grouped according on its category using `groupBy` field.

#### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:20px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' popupHeight='200px'
placeholder='Select a vegetable' :fields='fields'
:dataSource='dataSource'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
export default {
  data () {
    var vegetableData = [
      { Vegetable: 'Cabbage', Category: 'Leafy and Salad', Id: 'item1' },
      { Vegetable: 'Spinach', Category: 'Leafy and Salad', Id: 'item2' },
      { Vegetable: 'Wheat grass', Category: 'Leafy and Salad', Id: 'item3' },
    ],
    { Vegetable: 'Yarrow', Category: 'Leafy and Salad', Id: 'item4' },
    { Vegetable: 'Pumpkins', Category: 'Leafy and Salad', Id: 'item5' },
    { Vegetable: 'Chickpea', Category: 'Beans', Id: 'item6' },
    { Vegetable: 'Green bean', Category: 'Beans', Id: 'item7' },
    { Vegetable: 'Horse gram', Category: 'Beans', Id: 'item8' },
    { Vegetable: 'Garlic', Category: 'Bulb and Stem', Id: 'item9' },
    { Vegetable: 'Nopal', Category: 'Bulb and Stem', Id: 'item10' },
    { Vegetable: 'Onion', Category: 'Bulb and Stem', Id: 'item11' }
  ],
  return {

```

```

        dataSource : vegetableData,
        fields : { groupBy: 'Category', text: 'Vegetable', value: 'Id' }
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-list/grouping-cs1" %}

### Customization

The grouping header is also provided with customization option. This allows custom designing using the `groupTemplate` property for both inline and fixed headers.

See Also

- [Group Template support to DropDownList.](#)
- [How to disable the fixed group header](#)

### Filtering in Vue Drop down list component

The DropDownList has built-in support to filter data items when `allowFiltering` is enabled. The filter operation starts as soon as you start typing characters in the search box.

To display filtered items in the popup, filter the required data and return it to the DropDownList via `updateData` method by using the [filteringLink to the Video](#) event.

How to group and filter the DropDownList Items, you can check on this video:

The following sample illustrates how to query the data source and pass the data to the DropDownList through the `updateData` method in `filtering` event.

### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:20px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' placeholder='Select a country'
      :allowFiltering='allowFiltering' :filtering='filtering'
      :dataSource='dataSource' :fields='fields'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
import { DataManager, Query, ODataV4Adaptor, Predicate } from "@syncfusion/ej2-
data";
export default {

```

```

data () {
  var searchData = [
    { Index: "s1", Country: "Alaska" }, { Index: "s2", Country:
"California" },
    { Index: "s3", Country: "Florida" }, { Index: "s4", Country:
"Georgia" }
  ];
  return {
    dataSource : searchData,
    fields : { text: "Country", value: "Index" },
    allowFiltering: true,
  },
  methods: {
    filtering: function(e) {
      var searchData = [
        { Index: "s1", Country: "Alaska" }, { Index: "s2", Country:
"California" },
        { Index: "s3", Country: "Florida" }, { Index: "s4", Country:
"Georgia" }
      ];
      var query = new Query();
      //frame the query based on search string with filter type.
      query = (e.text != "") ? query.where("Country", "startswith",
e.text, true) : query;
      //pass the filter data source, filter query to updateData
      method.
      e.updateData(searchData, query);
    }
  }
}
</script>
<style>
@import "../../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-list/filtering/default-cs1" %}

### Limit the minimum filter character

When filtering the list items, you can set the limit for character count to raise remote request and fetch filtered data on the DropDownList. This can be done by manual validation within the filter event handler.

In the following example, the remote request does not fetch the search data until the search key contains three characters

### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:20px auto 0; width:250px;">
      <br>
    </div>
  </div>
</template>

```

```

        <ejs-dropdownlist id='dropdownlist' placeholder='Select a name'
        sortOrder="Ascending" :query='query' :allowFiltering='allowFiltering'
        :filtering='filtering' :dataSource='dataSource' :fields='fields'></ejs-
        dropdownlist>
    </div>
</div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
import { DataManager, Query, ODataV4Adaptor, Predicate } from "@syncfusion/ej2-
data";
export default {
    data () {
        return {
            dataSource : new DataManager({
                url:
                'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
                adaptor: new ODataV4Adaptor,
                crossDomain: true
            }),
            query : new Query().select(['ContactName', 'CustomerID']).take(7),
            fields : { text: 'ContactName', value: 'CustomerID' },
            allowFiltering: true,
        }
    },
    methods: {
        filtering: function(e) {
            var searchData = new DataManager({
                url:
                'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
                adaptor: new ODataV4Adaptor,
                crossDomain: true
            });
            if(e.text == '') e.updateData(searchData);
            else{
                // restrict the remote request until search key contains 3
                characters.
                if (e.text.length < 3) { return; }
                var query = new Query().select(['ContactName',
                'CustomerID']);
                query = (e.text !== '') ? query.where('ContactName',
                'startswith', e.text, true) : query;
                e.updateData(searchData, query);
            }
        }
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-list/filtering/min-filter-char-cs1" %}

### Change the filter type

While filtering, you can change the filter type to `contains`, `startsWith`, or `endsWith` for string type within the filter event handler

In the following examples, data filtering is done with `endsWith` type.

### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:20px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' placeholder='Select a name'
popupHeight='250px' sortOrder="Ascending" :query='query'
:allowFiltering='allowFiltering' :filtering='filtering'
:dataSource='dataSource' :fields='fields'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
import { DataManager, Query, ODataV4Adaptor, Predicate } from "@syncfusion/ej2-
data";
export default {
  data () {
    return {
      dataSource : new DataManager({
        url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      }),
      query : new Query().select(['ContactName', 'CustomerID']).take(7),
      fields : { text: 'ContactName', value: 'CustomerID' },
      allowFiltering: true,
    }
  },
  methods: {
    filtering: function(e) {
      var searchData = new DataManager({
        url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      });
      // load overall data when search key empty.
      if(e.text == '') e.updateData(searchData);
      else{
        let query: Query = new Query().select(['ContactName',
'CustomerID']);
        // change the type of filtering
```

```

        query = (e.text !== '') ? query.where('ContactName',
        'endswith', e.text, true) : query;
        e.updateData(searchData, query);
    }
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-list/filtering/filter-type-cs1" %}

### Case sensitive filtering

Data items can be filtered either with or without case sensitivity using the DataManager. This can be done by passing the fourth optional parameter of the `where` clause.

The following example shows how to perform case-sensitive filter

### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:20px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' placeholder='Select a name'
      popupHeight='250px' sortOrder="Ascending" :query='query'
      :allowFiltering='allowFiltering' :filtering='filtering'
      :dataSource='dataSource' :fields='fields'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
import { DataManager, Query, ODataV4Adaptor, Predicate } from "@syncfusion/ej2-
data";
export default {
  data () {
    return {
      dataSource : new DataManager({
        url:
        'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      }),
      query : new Query().select(['ContactName', 'CustomerID']).take(7),
      fields : { text: 'ContactName', value: 'CustomerID' },
      allowFiltering: true,
    }
  },
},

```

```

methods: {
  filtering: function(e) {
    var searchData = new DataManager({
      url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
      adaptor: new ODataV4Adaptor,
      crossDomain: true
    });
    // load overall data when search key empty.
    if(e.text == '') e.updateData(searchData);
    else{
      let query: Query = new Query().select(['ContactName',
'CustomerID']);
      //enable the case sensitive filtering by passing false to
4th parameter.
      query = (e.text !== '') ? query.where('ContactName',
'startswith', e.text, false) : query;
      e.updateData(searchData, query);
    }
  }
}
}
</script>

```

{% previewsample "page.domainurl/code-snippet/drop-down-list/filtering/case-sensitive-filter-cs1" %}

### Diacritics Filtering

The DropDownList supports diacritics filtering which will ignore the [diacritics](#) and makes it easier to filter the results in international characters lists when the [ignoreAccent](#) is enabled.

In the following sample, data with diacritics are bound as dataSource for DropDownList.

### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:20px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' placeholder='Select a value'
filterBarPlaceholder='e.g: aero' :ignoreAccent='ignoreAccent'
:allowFiltering='allowFiltering' :dataSource='dataSource'></ejs-
dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);

```

```

import { DataManager, Query, ODataV4Adaptor, Predicate } from "@syncfusion/ej2-data";
export default {
  data () {
    return {
      dataSource : [
        'Aeróbics',
        'Aeróbics en Agua',
        'Aerografía',
        'Aeromodelaje',
        'Águilas',
        'Ajedrez',
        'Ala Delta',
        'Álbumes de Música',
        'Alusivos',
        'Análisis de Escritura a Mano'
      ],
      allowFiltering : true,
      ignoreAccent : true
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";

## Localization in Vue Drop down list component

The Localization library allows you to localize static text content of the [noRecordsTemplate](#) and [actionFailureTemplate](#) properties according to the culture currently assigned to the DropDownList.

| Locale key | en-US (default) |

|-----|-----|

| noRecordsTemplate | No records found |

| actionFailureTemplate | The request failed |

## Loading translations

To load translation object to your application, use load function of the **L10n** class.

In the following sample, French culture is set to the DropDownList and no data is loaded. Hence, the `noRecordsTemplate` property displays its text in French culture initially, and if the sample is run offline, the `actionFailureTemplate` property displays its text appropriately.

#### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:20px auto 0; width:250px;">

## Style in Vue Drop down list component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

### Customizing the appearance of wrapper element

Use the following CSS to customize the appearance of wrapper element.

```
、  
  
.e-ddl.e-input-group.e-control-wrapper .e-input {  
font-size: 20px;  
font-family: emoji;  
color: #ab3243;  
background: #32a5ab;  
}  
、
```

### Customizing the dropdown icon's color

Use the following CSS to customize the dropdown icon's color.

```
、  
  
.e-ddl.e-input-group .e-input-group-icon,.e-ddl.e-input-group.e-control-wrapper .e-input-group-  
icon:hover {  
color: #bb233d;  
font-size: 13px;  
}  
、
```

### Customizing the focus color

Use the following CSS to customize the focusing color of input element.

```
、  
  
.e-ddl.e-input-group.e-control-wrapper.e-input-focus::before, .e-ddl.e-input-group.e-control-wrapper.e-  
input-focus::after {  
background: #c000ff;  
}  
、
```

### Customizing the outline theme's focus color

Use the following CSS to customize the focusing color of outline theme.

```

、

.e-outline.e-input-group.e-input-focus:hover:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled):not(.e-float-icon-left),.e-outline.e-input-group.e-input-focus.e-control-wrapper:hover:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled):not(.e-float-icon-left),.e-outline.e-input-group.e-input-focus:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled),.e-outline.e-input-group.e-control-wrapper.e-input-focus:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled) {
border-color: #b1bd15;
box-shadow: inset 1px 1px #b1bd15, inset -1px 0 #b1bd15, inset 0 -1px #b1bd15;
}
、

```

#### Customizing the disabled component's text color

Use the following CSS to customize the text color when the component is disabled.

```

、

.e-input-group.e-control-wrapper .e-input[disabled] {
-webkit-text-fill-color: #0d9133;
}
、

```

#### Customizing the float label element's focusing color

Use the following CSS to customize the focusing color of float label element.

```

、

.e-float-input.e-input-group:not(.e-float-icon-left) .e-float-line::before,.e-float-input.e-control-wrapper.e-input-group:not(.e-float-icon-left) .e-float-line::before,.e-float-input.e-input-group:not(.e-float-icon-left) .e-float-line::after,.e-float-input.e-control-wrapper.e-input-group:not(.e-float-icon-left) .e-float-line::after {
background-color: #2319b8;
}

.e-ddl.e-lib.e-input-group.e-control-wrapper.e-float-input.e-input-focus .e-float-text.e-label-top {
color: #2319b8;
}
、

```

#### Customizing the color of the placeholder text

Use the following CSS to customize the text color of placeholder.

```

、

.e-ddl.e-input-group input.e-input::placeholder {
color: red;
}

```

### Customizing the background color of focus, hover, and active item's

Use the following CSS to customize the background color of focus, hover and active item's.

```
.e-dropdownbase .e-list-item.e-item-focus, .e-dropdownbase .e-list-item.e-active, .e-dropdownbase .e-list-item.e-active.e-hover, .e-dropdownbase .e-list-item.e-hover {
background-color: #1f9c99;
color: #2319b8;
}
```

### Customizing the appearance of pop-up element

Use the following CSS to customize the appearance of popup element.

```
.e-dropdownbase .e-list-item, .e-dropdownbase .e-list-item.e-item-focus {
background-color: #29c2b8;
color: #207cd9;
font-family: emoji;
min-height: 29px;
}
```

### Adding mandatory asterisk to placeholder and float label

You can add a mandatory asterisk(\*) to placeholder and float label using `<b>.e-input-group.e-control-wrapper.e-float-input .e-float-text::after</b>` class.

### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' :dataSource='sportsData'
placeholder='Select a game' :floatLabelType= "auto"></ejs-dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
export default {
  data () {
    return {
      sportsData: ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'];
    }
  }
}
```

```

    }
  }
</script>
<style>
@import ".../node_modules/@syncfusion/ej2-base/styles/material.css";
@import ".../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import ".../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
.e-input-group.e-control-wrapper.e-float-input .e-float-text::after {
  content: '*';
  color: red;
}
</style>

```

```
{% previewsample "page.domainurl/code-snippet/drop-down-list/getting-started/getting-started-cs2"
%}
```

### Accessibility in Vue Drop down list component

The DropDownList component has been designed, keeping in mind the WAI-ARIA specifications, and applies the WAI-ARIA roles, states, and properties along with keyboard support. This component is characterized by complete keyboard interaction support and ARIA accessibility support that makes it easy for people who use assistive technologies (AT) or those who completely rely on keyboard navigation.

The DropDownList component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the DropDownList component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) |  |

| [Section 508 Support](#) |  |

| [Screen Reader Support](#) |  |

| [Right-To-Left Support](#) |  |

| [Color Contrast](#) |  |

| [Mobile Device Support](#) |  |

| [Keyboard Navigation Support](#) |  |

| [Accessibility Checker Validation](#) |  |

| [Axe-core Accessibility Validation](#) |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The DropDownList component uses the **Listbox** role, and each list item has an **option** role. The following **ARIA attributes** denote the DropDownList state.

#### | Properties | Functionalities |

| --- | --- |

| aria-haspopup | Indicates whether the DropDownList input element has a popup list or not. |

| aria-expanded | Indicates whether the popup list has expanded or not. |

| aria-selected | Indicates the selected option. |

| aria-readonly | Indicates the readonly state of the DropDownList element. |

| aria-disabled | Indicates whether the DropDownList component is in a disabled state or not. |

| aria-activedescendent | This attribute holds the ID of the active list item to focus its descendant child element. |

| aria-owns | This attribute contains the ID of the popup list to indicate popup as a child element. |

### Keyboard interaction

You can use the following key shortcuts to access the DropDownList without interruptions.

#### | Keyboard shortcuts | Actions |

| --- | --- |

| Arrow Down | Selects the first item in the DropDownList when no item selected. Otherwise, selects the item next to the currently selected item. |

| Arrow Up | Selects the item previous to the currently selected one. |

| Page Down | Scrolls down to the next page and selects the first item when popup list opens. |

| Page Up | Scrolls up to the previous page and selects the first item when popup list opens. |

| Enter | Selects the focused item, and when it is in an open state the popup list closes. Otherwise, toggles the popup list. |

| Tab | Focuses on the next TabIndex element on the page when the popup is closed. Otherwise, closes the popup list and remains the focus of the component. |

| Shift + tab | Focuses on the previous TabIndex element on the page when the popup is closed. Otherwise, closes the popup list and remains the focus of the component. |

| Alt + Down | Opens the popup list. |

| Alt + Up | Closes the popup list. |

| Esc(Escape) | Closes the popup list when it is in an open state and the currently selected item remains the same. |

| Home | Selects the first item. |

| End | Selects the last item. |

In the below sample, focus the DropDownList component using alt+t keys.

#### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' ref="DropdownInstance"
placeholder='Select a game' popupHeight='200px' :fields='fields'
:dataSource='dataSource'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
export default {
  mounted () {
    let dropdownObj = this.$refs.DropdownInstance;
    document.onkeyup = function (e) {
      if (e.altKey && e.keyCode === 84) {
        // press alt+t to focus the control.
        dropdownObj.$el.focus();
      }
    },
    data () {
      return {
        dataSource: [
          { Id: 'Game1', Game: 'Badminton' },
          { Id: 'Game2', Game: 'Basketball' },
          { Id: 'Game3', Game: 'Cricket' },
          { Id: 'Game4', Game: 'Football' },
        ],
      }
    }
  }
}
```

```

        { Id: 'Game5', Game: 'Golf' },
        { Id: 'Game6', Game: 'Hockey' },
        { Id: 'Game7', Game: 'Rugby' },
        { Id: 'Game8', Game: 'Snooker' },
        { Id: 'Game9', Game: 'Tennis' }
    ],
    fields: { text: 'Game', value: 'Id' }
}
}

### Ensuring accessibility

The DropDownList component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the DropDownList component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the DropDownList component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/drop-down-list.html" %}

### Two way binding in Vue Drop down list component

Two-way binding can be achieved by using the `v-model` directive in Vue. In the following sample, when you change the value in one DropDownList component, v-model will automatically update the value in the other DropDownList.

The following example demonstrates how to set the **two-way-binding** in the DropDownList.

#### APP.VUE

```

<template>
<div id="app">
  <div id="wrapper1">
    <ejs-dropdownlist id='first':dataSource='sportsData'
:fields='fields' :placeholder="waterMark" v-model="value" ></ejs-

## How To

### Add item in Vue Drop down list component

You can add item in between based on item [indexLink to the Video](#). If you add new item without item index, item will be added as last item in list.

To add and remove items dynamically in Vue DropDownList component, you can check on this video:

The following example demonstrate how to add item in between in DropDownList.

### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:0 auto; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' ref='dropdown' :index='index'
      :dataSource='sportsData' :fields='fields' placeholder='Select a game'></ejs-
      dropdownlist>
    </div>
    <div style='padding: 50px 0'>
      <button id='first' class="e-control e-btn" v-on:click="onFirst"> add
      item (Hockey) in first</button>
    </div>
    <div style='padding-left: 50px 0'>
      <button id='between' class="e-control e-btn" v-on:click="onMiddle">
      add item (Golf) in between</button>
    </div>
    <div style='padding: 50px 0'>
      <button id='last' class="e-control e-btn" v-on:click="onLast"> add
      item (Cricket) in last</button>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
export default {
  data () {
    return {
      sportsData: [
        { Id: 'game1', Game: 'Badminton' },
        { Id: 'game2', Game: 'Football' },
        { Id: 'game3', Game: 'Tennis' }
      ],
      fields : { text: 'Game', value: 'Id' },
      index : 2
    }
  },
  methods: {
    onFirst: function (event) {
      this.$refs.dropdown.addItem({Id: 'game0', Game: 'Hockey'}, 0);
    },
    onMiddle: function (event) {
      this.$refs.dropdown.addItem({Id: 'game4', Game: 'Golf'}, 2);
    },
    onLast: function (event) {
      this.$refs.dropdown.addItem({Id: 'game5', Game: 'Cricket'});
    }
  }
}
</script>

### Cascading in Vue Drop down list component

The cascading DropDownList is a series of DropDownList, where the value of one DropDownList depends upon another's value. This can be configured by using the [change](#) event of the parent DropDownList. Within that change event handler, data has to be loaded to the child DropDownList based on the selected value of the parent DropDownList.

The following example, shows the cascade behavior of country, state, and city DropDownList. Here, the `dataBind` method is used to reflect the property changes immediately to the DropDownList.

#### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='countries' ref='countries' :query='Query1'
      :dataSource='countryData' :index='countryindex' :fields='countryfields'
      :change='onCountryChange' placeholder='Select a country'></ejs-dropdownlist>
      <div class="padding-top">
        <ejs-dropdownlist id='states' ref='states' :query='Query2'
        :dataSource='stateData' :index='stateindex' :fields='statefields'
        :enabled='stateenabled' :change='onStateChange' placeholder='Select a
        state'></ejs-dropdownlist>
      </div>
      <div class="padding-top">
        <ejs-dropdownlist id='cities' ref='cities' :query='Query3'
        :dataSource='cityData' :index='cityindex' :enabled='cityenabled'
        :fields='cityfields' placeholder='Select a city'></ejs-dropdownlist>
      </div>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
import { Query } from '@syncfusion/ej2-data';
export default {
  data () {
    return {
      countryData: [
        { CountryName: 'United States', CountryId: '1' },
        { CountryName: 'Australia', CountryId: '2' }
      ],
      stateData: [
        { StateName: 'New York', CountryId: '1', StateId: '101' },
        { StateName: 'Virginia ', CountryId: '1', StateId: '102' },
        { StateName: 'Tasmania ', CountryId: '2', StateId: '105' }
      ],
      cityData : [
        { CityName: 'Albany', StateId: '101', CityId: 201 },
        { CityName: 'Beacon ', StateId: '101', CityId: 202 },
        { CityName: 'Emporia', StateId: '102', CityId: 206 },
      ]
    }
  }
}
```

```

        { CityName: 'Hampton ', StateId: '102', CityId: 205 },
        { CityName: 'Hobart', StateId: '105', CityId: 213 },
        { CityName: 'Launceston ', StateId: '105', CityId: 214 }
    ],

### Clear item in Vue Drop down list component

You can clear the selected item in the below two different ways.

By clicking on the **clear icon** which is shown in DropDownList element, you can clear the selected item in DropDownList through **interaction**. By using [showClearButton](#) property, you can enable the clear icon in DropDownList element.

Through **programmatic** you can set **null** value to anyone of the index, text or value property to clear the selected item in DropDownList.

The following example demonstrate about how to clear the selected item in DropDownList.

### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:0 auto; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' ref='dropdownObj'
: value='dropDownValue' :dataSource='sportsData' :showClearButton='true'
placeholder='Select a game'></ejs-dropdownlist>
    </div>
    <div style='padding: 50px'>
      <button id='button' class="e-control e-btn" v-on:click="onClick"> Set
null to value property</button>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
export default {
  data () {
    return {
      dropDownValue: null,
      sportsData: ["American Football", "Badminton", "Basketball",
"Cricket", "Football", "Golf", "Hockey", "Rugby", "Snooker", "Tennis"]
    }
  },
  methods: {
    onClick: function (event) {
      this.$refs.dropdownObj.ej2Instances.value = null;
      this.$refs.dropdownObj.dataBind();
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-list/how-to/value-cs1" %}

### Close popup in Vue Drop down list component

By using the `hidePopup` method in `DropDownList`, you can close the popup on scroll when triggered the windows scroll event.

The following example demonstrate about how to close the popup on scroll.

#### APP.VUE

```

<template>
  <div id="app">
    <div style = 'padding: 50px'>
      <h4> You can close the opened popup by scroll the page.</h4>
    </div>
  </div>

```

```

<div id='container' style="margin:0 auto; width:250px;">
  <br>
  <ejs-dropdownlist id='dropdownlist' popupHeight="220px"
:dataSource='sportsData' placeholder='Select a game'></ejs-dropdownlist>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
export default {
  data () {
    return {
      sportsData: ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis']
    }
  }
}
document.onscroll = () => {
  var dropObj = document.getElementById("dropdownlist"); //to get
  dropdown list object
  dropObj.ej2_instances[0].hidePopup(); // hide the popup using
  hidePopup method
};
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
body {
  height: 500px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-list/how-to/scroll-cs1" %}

### Group header in Vue Drop down list component

The following example demonstrate about how to disable the Fixed group header in DropDownList through CSS by using visibility attribute.

#### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:20px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' popupHeight='200px'
placeholder='Select a vegetable' :fields='fields'
:dataSource='dataSource'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";

```

```

Vue.use(DropDownListPlugin);
export default {
  data () {
    var vegetableData = [
      { Vegetable: 'Cabbage', Category: 'Leafy and Salad', Id: 'item1' },
      { Vegetable: 'Spinach', Category: 'Leafy and Salad', Id: 'item2' },
      { Vegetable: 'Wheat grass', Category: 'Leafy and Salad', Id: 'item3' },
    ],
    { Vegetable: 'Yarrow', Category: 'Leafy and Salad', Id: 'item4' },
    { Vegetable: 'Pumpkins', Category: 'Leafy and Salad', Id: 'item5' },
    { Vegetable: 'Chickpea', Category: 'Beans', Id: 'item6' },
    { Vegetable: 'Green bean', Category: 'Beans', Id: 'item7' },
    { Vegetable: 'Horse gram', Category: 'Beans', Id: 'item8' },
    { Vegetable: 'Garlic', Category: 'Bulb and Stem', Id: 'item9' },
    { Vegetable: 'Nopal', Category: 'Bulb and Stem', Id: 'item10' },
    { Vegetable: 'Onion', Category: 'Bulb and Stem', Id: 'item11' }
  ];
  return {
    dataSource : vegetableData,
    fields : { groupBy: 'Category', text: 'Vegetable', value: 'Id' }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
.e-ddl.e-dropdownbase.e-fixed-head {
  visibility: hidden;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-list/how-to/header-cs1" %}

### Highlight filtering in Vue Drop down list component

By using the **highlightSearch** method, you can highlight the matched character in DropDownList filtering.

The following example demonstrates about how to highlight the matched character in filtering.

#### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:20px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' placeholder='Select a customer'
      popupHeight='250px' sortOrder="Ascending" :query='query'
      :allowFiltering='allowFiltering' :filtering='filtering'
      :dataSource='dataSource' :fields='fields'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script>

```

```

import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
import { DataManager, Query, ODataV4Adaptor, Predicate } from "@syncfusion/ej2-data";
import { DropDownList, FilteringEventArgs, highlightSearch } from '@syncfusion/ej2-dropdowns';
export default {
  data () {
    return {
      dataSource : new DataManager({
        url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      }),
      query : new Query().select(['ContactName', 'CustomerID']).take(7),
      fields : { text: 'ContactName', value: 'CustomerID' },
      allowFiltering: true,
    }
  },
  methods: {
    filtering: function(e) {
      var searchData = new DataManager({
        url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      });
      var text = e.text;
      var query = new Query().select(['ContactName', 'CustomerID']);
      //frame the query based on search string with filter type.
      query = (e.text !== '') ? query.where('ContactName',
'startswith', e.text, true) : query;
      //pass the filter data source, filter query to updateData
      method.
      e.updateData(searchData, query);
      setTimeout(() => {
        var popupElement =
document.getElementById('dropdownlist_popup');
        // get the list from popup element
        var lists = popupElement.querySelector('ul');
        // pass the element, text, ignore case and filter type as
argument to highlightSearch method.
        highlightSearch(lists, text, true, 'StartsWith');
      }, 300);
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>

```

```
{% previewsample "page.domainurl/code-snippet/drop-down-list/how-to/highlight-cs1" %}
```

### Icons support in Vue Drop down list component

You can render **icons** to the list items by mapping the [iconCss](#) field. This `iconCss` field create a span in the list item with mapped class name to allow styling as per your need.

In the following sample, icon classes are mapped with `iconCss` field.

#### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' :dataSource='sortFormatData'
:fields='fields' placeholder='Select a format'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
export default {
  data () {
    return {
      sortFormatData: [

### Incremental search in Vue Drop down list component

DropDownList supports incremental search, by default. You can search the list item by focusing the DropDownList and typing the characters in it. The closely matched items are selected sequentially.

If the same key is searched once again, the next matched item is selected.

### Modify data in Vue Drop down list component

When binding the remote data source, by using the [actionComplete](#) event, you can modify the result data before passing it to DropDownList.

The following sample demonstrate how to modify the result data.

#### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' placeholder='Select a customer'
      :actionComplete='actionComplete' :dataSource='dataSource' :query='query'
      :fields='fields'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
import { DataManager, Query, ODataV4Adaptor } from "@syncfusion/ej2-data";
export default {
  data () {
    return {
      query : new Query().from('Customers').select(['ContactName',
      'CustomerID']).take(6),
      dataSource : new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      }),
      fields: { text: 'ContactName', value: 'CustomerID' }
    }
  },
  methods: {
    actionComplete: function (e) {
      // initially result contains 6 items
      console.log("Before modified the result: " + e.result.length);
    }
  }
}

```

```

        // remove first 2 items from result.
        e.result.splice(0, 2);
        // now displays the result count is 4.
        console.log("After modified the result: " + e.result.length);
    }
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-list/how-to/modify-cs1" %}

### Multiple cascading in Vue Drop down list component

The following example demonstrate about how to preselect the list items in multiple cascading DropDownList.

#### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='countries' :dataSource='countryData'
      :index='countryindex' :fields='countryfields' :change='onCountryChange'
      placeholder='Select a country'></ejs-dropdownlist>
      <div class="padding-top">
        <ejs-dropdownlist id='states' :dataSource='stateData'
        :index='stateindex' :fields='statefields' :stateenabled='stateenabled'
        :change='onStateChange' placeholder='Select a state'></ejs-dropdownlist>
      </div>
      <div class="padding-top">
        <ejs-dropdownlist id='cities' :dataSource='cityData'
        :index='cityindex' :enabled='cityenabled' :fields='cityfields'
        placeholder='Select a city'></ejs-dropdownlist>
      </div>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
import { Query } from '@syncfusion/ej2-data';
export default {
  data () {
    return {
      countryData: [
        { CountryName: 'United States', CountryId: '1' },
        { CountryName: 'Australia', CountryId: '2' }
      ],
      stateData: [

```

```

        { StateName: 'New York', CountryId: '1', StateId: '101' },
        { StateName: 'Virginia ', CountryId: '1', StateId: '102' },
        { StateName: 'Tasmania ', CountryId: '2', StateId: '105' }
    ],
    cityData : [
        { CityName: 'Albany', StateId: '101', CityId: 201 },
        { CityName: 'Beacon ', StateId: '101', CityId: 202 },
        { CityName: 'Emporia', StateId: '102', CityId: 206 },
        { CityName: 'Hampton ', StateId: '102', CityId: 205 },
        { CityName: 'Hobart', StateId: '105', CityId: 213 },
        { CityName: 'Launceston ', StateId: '105', CityId: 214 }
    ]
    countryfields : { value: 'CountryId', text: 'CountryName' }
    statefields : { value: 'StateId', text: 'StateName' },
    cityfields : { text: 'CityName', value: 'CityId' },
    countryindex : 1,
    stateindex : 0,
    cityindex : 0,
    cityenabled : false,
    stateenabled : false,
    }
},
methods: {
    onCountryChange: function(e) {
        var countryObj =
document.getElementById('countries').ej2_instances[0];
        var stateObj =
document.getElementById('states').ej2_instances[0];
        var cityObj =
document.getElementById('cities').ej2_instances[0];
        //Query the data source based on country DropDownList selected
        value
        stateObj.query = new Query().where('CountryId', 'equal',
countryObj.value);
        // enable the state DropDownList
        stateObj.enabled = true;
        //clear the existing selection.
        stateObj.text = null;
        // bind the property changes to state DropDownList
        stateObj.dataBind();
        //clear the existing selection in city DropDownList
        cityObj.text = null;
        //disabe the city DropDownList
        cityObj.enabled = false;
        //bind the property cahnges to City DropDownList
        cityObj.dataBind();
    },
    onStateChange: function(e) {
        var stateObj =
document.getElementById('states').ej2_instances[0];
        var cityObj =
document.getElementById('cities').ej2_instances[0];
        // Query the data source based on state DropDownList selected
        value
        cityObj.query = new Query().where('StateId', 'equal',
stateObj.value);
        // enable the city DropDownList

```

```

        cityObj.enabled = true;
        //clear the existing selection
        cityObj.text = null;
        // bind the property change to city DropDownList
        cityObj.dataBind();
    }
}
}
</script>

### Remote data bind in Vue Drop down list component

Before component rendering, you can get the total items count by using [actionComplete](#) &#160;event with its result arguments.

After rendering this component, you can get the total items count by using [getItems](#) method.

The following example demonstrate how to get the total items count.

### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' ref='dropdown'
placeholder='Select a customer' :actionComplete='actionComplete'
:dataSource='dataSource' :query='query' :fields='fields'></ejs-dropdownlist>
    </div>
    <div style='padding: 50px 0'>
      <button id='first' class="e-control e-btn" v-on:click="getItems"> Get
items</button>
    </div>
    <p id='event'> </p>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
import { DataManager, Query, ODataV4Adaptor } from "@syncfusion/ej2-data";
export default {
  data () {
    return {
      query : new Query().from('Customers').select(['ContactName',
'CustomerID']).take(6),
      dataSource : new DataManager({

```

```

        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
    )),
    fields: { text: 'ContactName', value: 'CustomerID' }
}
},
methods: {
    actionComplete: function (e) {
        // initially result contains 6 items
        console.log("Before modified the result: " + e.result.length);
        // remove first 2 items from result.
        e.result.splice(0, 2);
        // now displays the result count is 4.
        console.log("After modified the result: " + e.result.length);
    },
    getItem: function(e) {
        // get items count using getItem method
        console.log("Total items count: " +
this.$refs.dropdown.getItem().length);
        var element = document.createElement('p');
        element.innerText = "Total items count: " +
this.$refs.dropdown.getItem().length;
        document.getElementById('event').append(element);
    }
}
}
</script>

```

{% previewsample "page.domainurl/code-snippet/drop-down-list/how-to/getItems-cs1" %}

### Remove item in Vue Drop down list component

The following example demonstrate about how to remove an item from DropDownList.

#### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:0 auto; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' ref="dropdownObj"
:dataSource='sportsData' :fields='fields' placeholder='Select a game'></ejs-
dropdownlist>
    </div>
    <div style='padding: 50px 0'>
      <button id='first' class="e-control e-btn" v-on:click="remove"> Remove
0th item</button>
    </div>
  </div>
</template>

```

```

<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
export default {
  data () {
    return {
      sportsData: [
        { Id: 'game1', Game: 'Badminton' },
        { Id: 'game2', Game: 'Football' },
        { Id: 'game3', Game: 'Tennis' }
      ],
      fields : { text: 'Game', value: 'Id' }
    }
  },
  methods: {
    remove: function (event) {
      if(this.$refs.dropdownObj.getItems().length > 1) {
        this.$refs.dropdownObj.getItems()[0].remove();
        this.$refs.dropdownObj.dataSource.splice(0, 1);
      } else {
        this.sportsData = [];
      }
    }
  }
}
</script>

[Search on filtering in Vue Drop down list component](#)

The following example demonstrates about how to set limit the search result on filtering.

#### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:20px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' placeholder='Select a customer'
        popupHeight='250px' sortOrder="Ascending" :query='query'
        :allowFiltering='allowFiltering' :filtering='filtering'
        :dataSource='dataSource' :fields='fields'></ejs-dropdownlist>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);

```

```

import { DataManager, Query, ODataV4Adaptor, Predicate } from "@syncfusion/ej2-data";
export default {
  data () {
    return {
      dataSource : new DataManager({
        url:
        'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      }),
      query : new Query().select(['ContactName', 'CustomerID']).take(7),
      fields : { text: 'ContactName', value: 'CustomerID' },
      allowFiltering: true,
    }
  },
  methods: {
    filtering: function(e) {
      var searchData = new DataManager({

### Tooltip in Vue Drop down list component

You can achieve this behavior by using **ej2-tooltip** component. When the mouse hover on the DropDownList option that tooltip display some details related to hovered list item.

### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownlist id='Countries' ref='ddlObj'
      :created='onDropdownCreate' :dataSource='countryData' :fields='fields'
      :close='onClose' placeholder='Select a country'>

```

```

        </ejs-dropdownlist>
    </div>
</div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
import { TooltipPlugin } from "@syncfusion/ej2-vue-popups";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(TooltipPlugin);
Vue.use(ButtonPlugin);
Vue.use(DropDownListPlugin);
import { Tooltip } from "@syncfusion/ej2-vue-popups";
export default { data () {
    return {
        countryData: [
            { id: '1', text: 'Australia', content: 'National sports is Cricket' },
            { id: '2', text: 'Bhutan', content: 'National sports is Archery' },
            { id: '3', text: 'China', content: 'National sports is Table Tennis' },
            { id: '4', text: 'Cuba', content: 'National sports is Baseball' },
            { id: '5', text: 'India', content: 'National sports is Hockey' },
            { id: '6', text: 'Spain', content: 'National sports is Football' },
            { id: '7', text: 'United States', content: 'National sports is Baseball' }
        ],
        fields : { text: 'text', value: 'id' },
        tooltip: Tooltip
    },
    methods: {
        onClose: function(e) {
            this.tooltip.close();
        },
        onBeforeRender : function(args) {
            var result = this.$refs.ddlObj.dataSource;
            var i;
            for (i = 0; i < result.length; i++) {
                if (result[i].text === args.target.textContent) {
                    this.tooltip.content = result[i].content;
                    this.tooltip.dataBind();
                    break;
                }
            }
        },
        onDropdownCreate: function(args) {
            this.tooltip = new Tooltip({
                // default content of tooltip
                content: 'Loading...',
                // set target element to tooltip
                target: '.e-list-item',
                // set position of tooltip
                position: 'top center',
                // bind beforeRender event
                beforeRender: this.onBeforeRender
            });
        }
    }
}

```

```

        this.tooltip.appendTo('body');
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";

### Value change in Vue Drop down list component

You can check about whether value change happened by manual or programmatic by using [change](#) event argument that argument name is `isInteracted`.

The following example demonstrate, how to check whether value change happened by manual or programmatic.

#### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:0 auto; width:250px;">
      <br>
      <ejs-dropdownlist id='dropdownlist' ref='dropdown'
      :dataSource='sportsData' :fields='fields' :change='onChange'
      placeholder='Select a game'></ejs-dropdownlist>
    </div>
    <div style='margin: 50px'>
      <button id='button' class="e-control e-btn" v-on:click="onClick"> Set
      value dynamically</button>
    </div>
    <p style='margin: 5px' id='event'> </p>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownListPlugin);
export default {
  data () {
    return {
      sportsData: [
        { Id: 'game1', Game: 'Badminton' },
        { Id: 'game2', Game: 'Football' },
        { Id: 'game3', Game: 'Tennis' }
      ],
      fields : { text: 'Game', value: 'Id' }
    }
  },
  methods: {
    onClick: function (event) {

```

```
        this.$refs.dropdown.ej2Instances.value = 'game3';
    },
    onChange : function(args) {
        let element = document.createElement('p');
        if (args.isInteracted) {
            element.innerText = 'Changes happened by Interaction';
        } else {
            element.innerText = 'Changes happened by programmatic';
        }
        document.getElementById('event').append(element);
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";

Value support in Vue Drop down list component

yes, value for each list items should be unique.

## Dropdown Tree

### Getting Started with the Vue Drop down tree Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLI](#) and integrating the Syncfusion Vue Drop down tree component using the [Composition API](#) / [Options API](#).

Prerequisites

[System requirements for Syncfusion Vue UI components](#)

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```
`bash
```

```
npm install -g @vue/cli
```

```
vue create quickstart
```

```
cd quickstart
```

```
npm run serve
```

```
,
```

or

```
`bash
```

```
yarn global add @vue/cli
```

```
vue create quickstart
```

```
cd quickstart
```

```
yarn run serve
```

```
,
```

When creating a new project, choose the option **Default ([Vue 2] babel, eslint)** from the menu.

```
E:\samples>vue create quickstart

Vue CLI v5.0.8
? Please pick a preset:
  Default ([Vue 3] babel, eslint)
> Default ([Vue 2] babel, eslint)
  Manually select features
```

Once the **quickstart** project is set up with default settings, proceed to add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.npmjs.com). To use Vue components, install the required npm package.

This article uses the [Vue Drop down tree component](#) as an example. Install the **@syncfusion/ej2-vue-dropdowns** package by running the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-dropdowns --save
```

```
,
```

```
or
```

```
`bash
```

```
yarn add @syncfusion/ej2-vue-dropdowns
```

```
,
```

#### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the **Material** theme is applied using CSS styles, which are available in installed packages. The necessary **Material** CSS styles for the Drop down tree component and its dependents were imported into the `<style>` section of **src/App.vue** file.

#### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
```

```
</style>
```

### Add Syncfusion Vue component

Follow the below steps to add the Vue Drop down tree component using **Composition API** or **Options API**:

1\ First, import and register the Drop down tree component in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<script setup>
import { DropDownTreeComponent as EjsDropdowntree } from "@syncfusion/ej2-vue-dropdowns";
</script>
```

#### **OPTIONS API (~SRC/APP.VUE)**

```
<script>
import { DropDownTreeComponent } from "@syncfusion/ej2-vue-dropdowns";
export default {
  components: {
    'ejs-dropdowntree': DropDownTreeComponent
  }
}
</script>
```

2\ In the **template** section, define the Drop down tree component with the **fields** property.

#### **~/SRC/APP.VUE**

```
<template>
<div id="app">
<div id='container' style="margin:50px auto 0; width:250px;">
<br>
<ejs-dropdowntree id='dropdowntree' :fields='fields'></ejs-dropdowntree>
</div>
</div>
</template>
```

### Binding data source

The Dropdown Tree component can load the data either from local data sources or remote data services. This can be done using the **dataSource** property that is a member of the **fields** property. The **dataSource** property supports array of JavaScript objects and DataManager. Here, an array of JSON values is passed to the Dropdown Tree component.

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<template>
<div id="app">
<div id='container' style="margin:50px auto 0; width:250px;">
<br>
```

```

<ejs-dropdowntree id='dropdowntree' :fields='fields'></ejs-dropdowntree>
</div>
</div>
</template>
<script setup>
import { DropDownTreeComponent as EjsDropdowntree } from "@syncfusion/ej2-vue-dropdowns";
var data = [
{
  nodeId: '01', nodeText: 'Music',
  nodeChild: [
    { nodeId: '01-01', nodeText: 'Gouttes.mp3' }
  ]
},
{
  nodeId: '02', nodeText: 'Videos', expanded: true,
  nodeChild: [
    { nodeId: '02-01', nodeText: 'Naturals.mp4' },
    { nodeId: '02-02', nodeText: 'Wild.mpeg' },
  ]
},
{
  nodeId: '03', nodeText: 'Documents',
  nodeChild: [
    { nodeId: '03-01', nodeText: 'Environment Pollution.docx' },
    { nodeId: '03-02', nodeText: 'Global Water, Sanitation, & Hygiene.docx' },
    { nodeId: '03-03', nodeText: 'Global Warming.ppt' },
    { nodeId: '03-04', nodeText: 'Social Network.pdf' },
    { nodeId: '03-05', nodeText: 'Youth Empowerment.pdf' },
  ]
}
];
const fields = { dataSource: data, value: 'nodeId', text: 'nodeText', child: 'nodeChild' };
</script>

```

### OPTIONS API (~SRC/APP.VUE)

```

<template>
<div id="app">
<div id='container' style="margin:50px auto 0; width:250px;">
<br>
<ejs-dropdowntree id='dropdowntree' :fields='fields'></ejs-dropdowntree>
</div>
</div>
</template>
<script>
import { DropDownTreeComponent } from "@syncfusion/ej2-vue-dropdowns";
var data = [
{
  nodeId: '01', nodeText: 'Music',
  nodeChild: [
    { nodeId: '01-01', nodeText: 'Gouttes.mp3' }
  ]
},
{
  nodeId: '02', nodeText: 'Videos', expanded: true,

```

```

nodeChild: [
  { nodeId: '02-01', nodeText: 'Naturals.mp4' },
  { nodeId: '02-02', nodeText: 'Wild.mpeg' },
],
},
{
  nodeId: '03', nodeText: 'Documents',
  nodeChild: [
    { nodeId: '03-01', nodeText: 'Environment Pollution.docx' },
    { nodeId: '03-02', nodeText: 'Global Water, Sanitation, & Hygiene.docx' },
    { nodeId: '03-03', nodeText: 'Global Warming.ppt' },
    { nodeId: '03-04', nodeText: 'Social Network.pdf' },
    { nodeId: '03-05', nodeText: 'Youth Empowerment.pdf' },
  ]
}
];
export default {
  components: {
    'ejs-dropdowntree': DropDownTreeComponent
  },
  data () {
    return {
      fields: { dataSource: data, value: 'nodeId', text: 'nodeText', child:
        'nodeChild' }
    }
  }
}
</script>

```

Here is the summarized code for the above steps in the **src/App.vue** file:

#### **COMPOSITION API (~SRC/APP.VUE)**

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdowntree id='dropdowntree' :fields='fields'></ejs-
dropdowntree>
    </div>
  </div>
</template>
<script setup>
import { DropDownTreeComponent as EjsDropdowntree } from "@syncfusion/ej2-
vue-dropdowns";
var data = [
  {
    nodeId: '01', nodeText: 'Music',
    nodeChild: [
      { nodeId: '01-01', nodeText: 'Gouttes.mp3' }
    ]
  },
  {
    nodeId: '02', nodeText: 'Videos', expanded: true,
    nodeChild: [
      { nodeId: '02-01', nodeText: 'Naturals.mp4' },
      { nodeId: '02-02', nodeText: 'Wild.mpeg' },

```

```

    ]
  },
  {
    nodeId: '03', nodeText: 'Documents',
    nodeChild: [
      { nodeId: '03-01', nodeText: 'Environment Pollution.docx' },
      { nodeId: '03-02', nodeText: 'Global Water, Sanitation, &
Hygiene.docx' },
      { nodeId: '03-03', nodeText: 'Global Warming.ppt' },
      { nodeId: '03-04', nodeText: 'Social Network.pdf' },
      { nodeId: '03-05', nodeText: 'Youth Empowerment.pdf' },
    ]
  }
];
const fields = { dataSource: data, value: 'nodeId', text: 'nodeText', child:
'nodeChild' };
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>

```

### OPTIONS API (~SRC/APP.VUE)

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdowntree id='dropdowntree' :fields='fields'></ejs-
dropdowntree>
    </div>
  </div>
</template>
<script>
import { DropDownTreeComponent } from "@syncfusion/ej2-vue-dropdowns";
var data = [
  {
    nodeId: '01', nodeText: 'Music',
    nodeChild: [
      { nodeId: '01-01', nodeText: 'Gouttes.mp3' }
    ]
  },
  {
    nodeId: '02', nodeText: 'Videos', expanded: true,
    nodeChild: [
      { nodeId: '02-01', nodeText: 'Naturals.mp4' },
      { nodeId: '02-02', nodeText: 'Wild.mpeg' },
    ]
  },
  {
    nodeId: '03', nodeText: 'Documents',
    nodeChild: [
      { nodeId: '03-01', nodeText: 'Environment Pollution.docx' },

```

```

        { nodeId: '03-02', nodeText: 'Global Water, Sanitation, &
Hygiene.docx' },
        { nodeId: '03-03', nodeText: 'Global Warming.ppt' },
        { nodeId: '03-04', nodeText: 'Social Network.pdf' },
        { nodeId: '03-05', nodeText: 'Youth Empowerment.pdf' },
      ]
    }
  });
  export default {
    components: {
      'ejs-dropdowntree': DropDownTreeComponent
    },
    data () {
      return {
        fields: { dataSource: data, value: 'nodeId', text: 'nodeText', child:
'nodeChild' }
      }
    }
  }
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>

```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run serve
```

```
,
```

or

```
`bash
```

```
yarn run serve
```

```
,
```

```
{% previewsample "page.domainurl/code-snippet/drop-down-tree/getting-started/getting-started-cs1"
%}
```

### Getting Started with the Vue Dropdown Tree Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue Dropdown Tree component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

#### Prerequisites

##### [System requirements for Syncfusion Vue UI components](#)

#### Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm create vite@latest
```

```
`
```

or

```
`bash
```

```
yarn create vite
```

```
`
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as **my-project** for this article.

```
`bash
```

```
? Project name: » my-project
```

```
`
```

2. Select **Vue** as the framework. It will create a Vue 3 project.

```
`bash
```

```
? Select a framework: » - Use arrow-keys. Return to submit.
```

```
Vanilla
```

```
Vue
```

```
React
```

```
Preact
```

```
Lit
```

```
Svelte
```

```
Others
```

```
`
```

3. Choose **JavaScript** as the framework variant to build this Vite project using JavaScript and Vue.

```
`bash
```

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

,

4. Upon completing the aforementioned steps to create the `my-project`, run the following command to install its dependencies:

```
`bash
```

```
cd my-project
```

```
npm install
```

,

or

```
`bash
```

```
cd my-project
```

```
yarn install
```

,

Now that `my-project` is ready to run with default settings, let's add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue Dropdown Tree component](#) as an example. To use the Vue Dropdown Tree component in the project, the `@syncfusion/ej2-vue-navigations` package needs to be installed using the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-dropdowns --save
```

,

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-dropdowns
```

,

#### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, **Material** theme is applied using CSS styles, which are available in installed packages. The necessary **Material** CSS styles for the Dropdown Tree component and its dependents were imported into the `<style>` section of **src/App.vue** file.

#### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

#### Add Syncfusion Vue component

Follow the below steps to add the Vue Dropdown Tree component using **Composition API** or **Options API**:

1.First, import and register the Dropdown Tree component in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the Composition API.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { DropDownTreeComponent as EjsDropdowntree } from "@syncfusion/ej2-vue-dropdowns";
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { DropDownTreeComponent } from "@syncfusion/ej2-vue-dropdowns";
//Component registration
export default {
  name: "App",
  components: {
    "ejs-dropdowntree": DropDownTreeComponent
  }
}
</script>
```

2.Add the component definition in template section.

#### ~/SRC/APP.VUE

```
<template>
<ejs-dropdowntree id='dropdowntree' :fields='fields'></ejs-dropdowntree>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

#### COMPOSITION API (~/SRC/APP.VUE)

```
<template>
```

```

<ejs-dropdowntree id='dropdowntree' :fields='fields'></ejs-dropdowntree>
</template>
<script setup>
import { DropDownTreeComponent as EjsDropdowntree } from "@syncfusion/ej2-vue-dropdowns";
const data = [
  {
    nodeId: '01', nodeText: 'Music',
    nodeChild: [
      { nodeId: '01-01', nodeText: 'Gouttes.mp3' }
    ]
  },
  {
    nodeId: '02', nodeText: 'Videos', expanded: true,
    nodeChild: [
      { nodeId: '02-01', nodeText: 'Naturals.mp4' },
      { nodeId: '02-02', nodeText: 'Wild.mpeg' },
    ]
  },
  {
    nodeId: '03', nodeText: 'Documents',
    nodeChild: [
      { nodeId: '03-01', nodeText: 'Environment Pollution.docx' },
      { nodeId: '03-02', nodeText: 'Global Water, Sanitation, & Hygiene.docx' },
      { nodeId: '03-03', nodeText: 'Global Warming.ppt' },
      { nodeId: '03-04', nodeText: 'Social Network.pdf' },
      { nodeId: '03-05', nodeText: 'Youth Empowerment.pdf' },
    ]
  }
];
const fields = { dataSource: data, value: 'nodeId', text: 'nodeText', child: 'nodeChild' };
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>

```

### OPTIONS API (~SRC/APP.VUE)

```

<template>
<ejs-dropdowntree id='dropdowntree' :fields='fields'></ejs-dropdowntree>
</template>
<script>
import { DropDownTreeComponent } from "@syncfusion/ej2-vue-dropdowns";
const data = [
  {
    nodeId: '01', nodeText: 'Music',
    nodeChild: [
      { nodeId: '01-01', nodeText: 'Gouttes.mp3' }
    ]
  },
  {
    nodeId: '02', nodeText: 'Videos', expanded: true,
    nodeChild: [

```

```
{ nodeId: '02-01', nodeText: 'Naturals.mp4' },
{ nodeId: '02-02', nodeText: 'Wild.mpeg' },
],
},
{
  nodeId: '03', nodeText: 'Documents',
  nodeChild: [
    { nodeId: '03-01', nodeText: 'Environment Pollution.docx' },
    { nodeId: '03-02', nodeText: 'Global Water, Sanitation, & Hygiene.docx' },
    { nodeId: '03-03', nodeText: 'Global Warming.ppt' },
    { nodeId: '03-04', nodeText: 'Social Network.pdf' },
    { nodeId: '03-05', nodeText: 'Youth Empowerment.pdf' },
  ]
}
];
//Component registration
export default {
  name: "App",
  components: {
    "ejs-dropdowntree": DropDownTreeComponent
  },
  data() {
    return {
      fields: { dataSource: data, value: 'nodeId', text: 'nodeText', child:
        'nodeChild' }
    };
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
`
```

or

```
`bash
```

```
yarn run dev
```

```
`
```

The output will appear as follows:

For migrating from Vue 2 to Vue 3, refer to the [migration](#) documentation.

### Data binding in Vue Drop down tree component

The Dropdown Tree component provides an option to load the data either from local data sources or from remote data services. This can be done through `dataSource` property that is a member of the `fields` property. The `dataSource` property supports array of JavaScript objects and `DataManager`. It also supports different kinds of data services such as OData, OData V4, Web API, URL, and JSON with the help of `DataManager` adaptors.

Dropdown Tree has `load on demand` (Lazy load) option. It reduces the bandwidth size when consuming the huge data. By default, the `loadOnDemand` is set to false. By enabling this property, it loads first level items initially, and when parent item is expanded, loads the child items based on the `parentValue/child` member.

#### Local data

To bind local data to the Dropdown Tree, you can assign a JavaScript object array to the `dataSource` property.

The Dropdown Tree component requires three fields (Value, text, and parentValue) to render local data source. When mapper fields are not specified, it takes the default values as the mapping fields. Local data source can also be provided as an instance of the `DataManager`. It supports two kinds of local data binding methods.

- Hierarchical data
- Self-referential data

#### Hierarchical data

Dropdown Tree can be populated with the hierarchical data source that contains nested array of JSON objects. You can directly map the hierarchical data and the field members with corresponding key values from the hierarchical data to the `fields` property.

In the following example, **code**, **name**, and **countries** columns from the hierarchical data have been mapped to **value**, **text**, and **child** fields, respectively.

#### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdowntree id='dropdowntree' :fields='fields'></ejs-
dropdowntree>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownTreePlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownTreePlugin);
var data = [
  {
    code: 'AF', name: 'Africa', countries: [
      { code: 'NGA', name: 'Nigeria' },
      { code: 'EGY', name: 'Egypt' },
      { code: 'ZAF', name: 'South Africa' }
    ]
  },
  {
    code: 'AS', name: 'Asia', expanded: true, countries: [
      { code: 'CHN', name: 'China' },
      { code: 'IND', name: 'India', selected: true },
      { code: 'JPN', name: 'Japan' }
    ]
  },
  {
    code: 'EU', name: 'Europe', countries: [
      { code: 'DNK', name: 'Denmark' },
      { code: 'FIN', name: 'Finland' },
      { code: 'AUT', name: 'Austria' }
    ]
  },
  {
    code: 'NA', name: 'North America', countries: [
      { code: 'USA', name: 'United States of America' },
      { code: 'CUB', name: 'Cuba' },
      { code: 'MEX', name: 'Mexico' }
    ]
  },
  {
    code: 'SA', name: 'South America', countries: [
      { code: 'BRA', name: 'Brazil' },
      { code: 'COL', name: 'Colombia' },
      { code: 'ARG', name: 'Argentina' }
    ]
  },
  {
    code: 'OC', name: 'Oceania', countries: [
      { code: 'AUS', name: 'Australia' },

```

```

        { code: 'NZL', name: 'New Zealand' },
        { code: 'WSM', name: 'Samoa' }
      ],
    },
    {
      code: 'AN', name: 'Antarctica', countries: [
        { code: 'BVT', name: 'Bouvet Island' },
        { code: 'ATF', name: 'French Southern Lands' }
      ]
    },
  ],
];
export default {
  data () {
    return {
      fields: { dataSource: data, value: 'code', text: 'name', child:
'countries' }
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-
navigations/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>

```

```
{% previewsample "page.domainurl/code-snippet/drop-down-tree/data-binding/hierarchial-data-cs1"
%}
```

### Self-referential data

Dropdown Tree can be populated from the self-referential data structure that contains array of JSON objects with `parentValue` mapping.

You can directly assign the self-referential data and map all the field members with corresponding key values from self-referential data to the `fields` property.

To render the root level items, specify the `parentValue` as null or no need to specify the `parentValue` in the `dataSource`.

In the following example, **id**, **pid**, **hasChild**, and **name** columns from self-referential data have been mapped to **value**, **parentValue**, **hasChildren**, and **text** fields, respectively.

### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdowntree id='dropdowntree' :fields='fields'></ejs-
dropdowntree>
    </div>
  </div>

```

```

</div>
</template>
<script>
import Vue from 'vue';
import { DropDownTreePlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownTreePlugin);
var data = [

### Remote data

Dropdown Tree can also be populated from a remote data service with the help of the **DataManager** component and **Query** property.

It supports different kinds of data services such as OData, OData V4, Web API, URL, and JSON with the help of **DataManager** adaptors.

You can assign service data as an instance of **DataManager** to the **dataSource**. To interact with remote data source, you must provide the endpoint **url**.

The **DataManager** that acts as an interface between the service endpoint and the Dropdown Tree requires the following information to interact with service endpoint properly.

- **DataManager->url**: Defines the service endpoint to fetch data.
- **DataManager->adaptor**: Defines the adaptor option. By default, **ODataAdaptor** is used for remote binding.

Adaptor is responsible for processing response and request from/to the service endpoint. The **@syncfusion/ej2-data** package provides some pre-defined adaptors designed to interact with service endpoints. They are,

- **UrlAdaptor**: Used to interact with remote services. This is the base adaptor for all remote based adaptors.
- **ODataAdaptor**: Used to interact with OData endpoints.
- **ODataV4Adaptor**: Used to interact with OData V4 endpoints.
- **WebApiAdaptor**: Used to interact with Web API created under OData standards.
- **WebMethodAdaptor**: Used to interact with web methods.

In the following example, **ODataV4Adaptor** is used to fetch data from the remote services. The **EmployeeID**, **FirstName**, and **EmployeeID** columns from the Employees table have been mapped to **value**, **text**, and **hasChildren** fields respectively for first level items.

The **OrderID**, **EmployeeID**, and **ShipName** columns from the orders table have been mapped to **value**, **parentValue**, and **text** fields respectively for second level items.

### Prevent Node selection

You can prevent the selection of individual tree node by using the [selectable](#) property. The tree node selection is not allowed while disable this property.

The [selectable](#) property is disabled and the selection is prevented for parent nodes in below sample.

## Templates in Vue Drop down tree component

The Dropdown Tree provides support to customize each list item, header, and footer elements. It uses the Essential JS 2 Template engine to compile and render the elements properly.

### Item template

The content of each list item within the Dropdown Tree can be customized with the help of [itemTemplate](#) property.

In the following sample, the Dropdown Tree list items are customized with employee information such as **name** and **job** using the **itemTemplate** property.

The template expression should be provided inside the `{% raw %}{{...}}{% endraw %}` interpolation syntax.

### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;"><br>
      <ejs-dropdowntree id='dropdowntree' :fields='fields'
placeholder='Select an employee':itemTemplate='itemTemplate' ></ejs-
dropdowntree>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownTreePlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownTreePlugin);
var data = [
  { "id": 1, "name": "Steven Buchanan", "job": "General Manager",
"hasChild": true, "expanded": true },
  { "id": 2, "pid": 1, "name": "Laura Callahan", "job": "Product Manager",
"hasChild": true },
  { "id": 3, "pid": 2, "name": "Andrew Fuller", "job": "Team Lead",
"hasChild": true },
  { "id": 4, "pid": 3, "name": "Anne Dodsworth", "job": "Developer" },
  { "id": 10, "pid": 3, "name": "Lilly", "job": "Developer", "status":
"online" },
  { "id": 5, "pid": 1, "name": "Nancy Davolio", "job": "Product Manager",
"hasChild": true },
  { "id": 6, "pid": 5, "name": "Michael Suyama", "job": "Team Lead",
"hasChild": true },
  { "id": 7, "pid": 6, "name": "Robert King", "job": "Developer" },
  { "id": 11, "pid": 6, "name": "Mary", "job": "Developer" },
  { "id": 9, "pid": 1, "name": "Janet Leverling", "job": "HR" }
];
var itemVue = Vue.component("itemTemplate", {
  template: `<span><span class="ename">{{data.name}} - </span><span
class="ejjob">{{data.job}}</span></span>`,
  data() {return {data: {}};
  }
});
export default {
  data () {
    return {
      itemTemplate : function() {
        return {template: itemVue};
      },
      fields: { dataSource: data, value: 'id', text: 'name',
parentValue:"pid", hasChildren: 'hasChild' },
    }
  }
}
</script>
```

```

    opacity: .60;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-tree/templates/item-template-cs1" %}

### Header template

The header element is shown statically at the top of the popup list items within the Dropdown Tree. A custom element can be placed as a header element using the [headerTemplate](#) property.

In the following sample, the header is customized with the custom element.

### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;"><br>
      <ejs-dropdowntree id='dropdowntree' :fields='fields'
placeholder='Select an employee':headerTemplate='headerTemplate' ></ejs-
dropdowntree>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownTreePlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownTreePlugin);
var data = [
  { "id": 1, "name": "Steven Buchanan", "job": "General Manager",
"hasChild": true, "expanded": true },
  { "id": 2, "pid": 1, "name": "Laura Callahan", "job": "Product Manager",
"hasChild": true },
  { "id": 3, "pid": 2, "name": "Andrew Fuller", "job": "Team Lead",
"hasChild": true },
  { "id": 4, "pid": 3, "name": "Anne Dodsworth", "job": "Developer" },
  { "id": 10, "pid": 3, "name": "Lilly", "job": "Developer", "status":
"online" },
  { "id": 5, "pid": 1, "name": "Nancy Davolio", "job": "Product Manager",
"hasChild": true },
  { "id": 6, "pid": 5, "name": "Michael Suyama", "job": "Team Lead",
"hasChild": true },
  { "id": 7, "pid": 6, "name": "Robert King", "job": "Developer " },
  { "id": 11, "pid": 6, "name": "Mary", "job": "Developer " },
  { "id": 9, "pid": 1, "name": "Janet Leverling", "job": "HR" }
];
var headerVue = Vue.component("headerTemplate", {
  template: `<span class='head'>Employee List</span>`,
  data() {

```

```

    return {
      data: {}
    };
  }
});
export default {
  data () {
    return {
      fields: { dataSource: data, value: 'id', text: 'name',
parentValue: "pid", hasChildren: 'hasChild' },
      headerTemplate : function(e) {
        return {
          template: headerVue
        };
      }
    }
  }
}
</script>
<style>

.head {
  height: 40px;
  font-size: 15px;
  font-weight: 600;
  border-bottom: 1px solid #e0e0e0;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-tree/templates/header-template-cs1" %}

### Footer template

The Dropdown Tree has options to show a footer element at the bottom of the list items in the popup list. Here, you can place any custom element as a footer element using the [footerTemplate](#) property.

In the following sample, the footer element displays the total number of employees present in the Dropdown Tree.

### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;"><br>
      <ejs-dropdowntree id='dropdowntree' :fields='fields'
placeholder='Select an employee':footerTemplate='footerTemplate' ></ejs-
dropdowntree>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';

```

```

import { DropDownTreePlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownTreePlugin);
var data = [
  { "id": 1, "name": "Steven Buchanan", "job": "General Manager",
    "hasChild": true, "expanded": true },
  { "id": 2, "pid": 1, "name": "Laura Callahan", "job": "Product Manager",
    "hasChild": true },
  { "id": 3, "pid": 2, "name": "Andrew Fuller", "job": "Team Lead",
    "hasChild": true },
  { "id": 4, "pid": 3, "name": "Anne Dodsworth", "job": "Developer" },
  { "id": 10, "pid": 3, "name": "Lilly", "job": "Developer", "status":
    "online" },
  { "id": 5, "pid": 1, "name": "Nancy Davolio", "job": "Product Manager",
    "hasChild": true },
  { "id": 6, "pid": 5, "name": "Michael Suyama", "job": "Team Lead",
    "hasChild": true },
  { "id": 7, "pid": 6, "name": "Robert King", "job": "Developer" },
  { "id": 11, "pid": 6, "name": "Mary", "job": "Developer" },
  { "id": 9, "pid": 1, "name": "Janet Leverling", "job": "HR" }
];
var footerVue = Vue.component("footerTemplate", {
  template: `<span class='foot'> Total number of employees: 10</span>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data () {
    return {
      fields: { dataSource: data, value: 'id', text: 'name',
        parentValue: "pid", hasChildren: 'hasChild' },
      footerTemplate : function(e) {
        return {
          template: footerVue
        }
      }
    }
  }
}
</script>

</style>
```

{% previewsample "page.domainurl/code-snippet/drop-down-tree/templates/footer-template-cs1" %}

### No records template

The Dropdown Tree is supports to display custom design in the popup list content using the [noRecordsTemplate](#) property when no matches found on search.

In the following sample, popup list content displays the notification of no data available.

### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;"><br>
      <ejs-dropdowntree id='dropdowntree' :fields='fields'
placeholder='Select an employee':noRecordsTemplate='noRecordsTemplate'
></ejs-dropdowntree>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownTreePlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownTreePlugin);
var data = [ ];
var noRecordsVue = Vue.component("noRecordsTemplate", {
  template: `<span class='norecord'> NO DATA AVAILABLE</span>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data () {
    return {
      noRecordsTemplate : function (e) {
        return {
          template: noRecordsVue
        }
      },
      fields: { dataSource: data, value: 'id', text: 'name',
parentValue:"pid", hasChildren: 'hasChild' },
    }
  }
}
</script>
<style>

</style>
```

```
{% previewsample "page.domainurl/code-snippet/drop-down-tree/templates/noRecords-template-cs1"
%}
```

### Action failure template

The Dropdown Tree provides an option to custom design the popup list content using [actionFailureTemplate](#) property, when the data fetch request fails at the remote server.

In the following sample, when the data fetch request fails, the Dropdown Tree displays the notification.

#### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdownntree id='dropdownntree' :fields='fields'
placeholder='Select an
employee':actionFailureTemplate='actionFailureTemplate' ></ejs-dropdownntree>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownTreePlugin } from "@syncfusion/ej2-vue-dropdowns";
import { DataManager, Query, ODataV4Adaptor } from "@syncfusion/ej2-data";
Vue.use(DropDownTreePlugin);
var remoteData = new DataManager({
  url: 'https://services.odata.org/V4/Northwind/Northwind.svs',
  adaptor: new ODataV4Adaptor,
  crossDomain: true,
});
var failureVue = Vue.component("failureTemplate", {
  template: `<span class='action-failure'> Data fetch request fails</span>`,
  data() {
    return {
      data: {}
    };
  }
});
export default Vue.extend({
  data: function() {
    return {
      actionFailureTemplate : function(e) {
        return {
          template: failureVue
        }
      },
      fields: { dataSource: remoteData, value: 'id', text: 'name',
parentValue:"pid", hasChildren: 'hasChild' },
      height: '200px'
    };
  },
});
```

```
});

@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/drop-down-tree/templates/actionFailure-template-cs1" %}
```

### Custom template to show selected items in input

In Dropdown Tree, while selecting more than one items via checkbox or multi selection support, all the selected items will be displayed in the input. Instead of displaying all the selected item text, the custom template can be displayed by setting the the [mode](#) property as **Custom** and [customTemplate](#) property.

When the **mode** property is set as **Custom**, the Dropdown Tree displays the default template value (**\${value.length} item(s) selected**) like **1 item(s) selected** or **2 item(s) selected**. The default template can be customized by setting **customTemplate** property.

In the following sample, the Dropdown Tree is rendered with default value of the **customTemplate** property like **"1 item(s) selected or 2 item(s) selected"**.

### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;"><br>
      <ejs-dropdowntree id='dropdowntree' ref="ddtreeObj" :fields='fields'
:customTemplate='customTemplate' :showCheckBox='true'
:treeSettings='treeSettings' mode= 'Custom' :placeholder='waterMark'

### Checkbox in Vue Drop down tree component

The Dropdown Tree component allows you to check more than one item from the tree without affecting the UI's appearance by enabling the `showCheckBox` property. When this property is enabled, checkbox appears before each item text in the popup.

In the following example, the `showCheckBox` property is enabled.

#### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdowntree id='dropdowntree' :fields='fields'
:showCheckBox='true'></ejs-dropdowntree>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';

```

```

import { DropDownTreePlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownTreePlugin);
var data = [
  { id: 1, name: 'Discover Music', hasChild: true, expanded: true },
  { id: 2, pid: 1, name: 'Hot Singles' },
  { id: 3, pid: 1, name: 'Rising Artists' },
  { id: 4, pid: 1, name: 'Live Music' },
  { id: 6, pid: 1, name: 'Best of 2017 So Far' },
  { id: 7, name: 'Sales and Events', hasChild: true },
  { id: 8, pid: 7, name: '100 Albums - $5 Each' },
  { id: 9, pid: 7, name: 'Hip-Hop and R&B Sale' },
  { id: 10, pid: 7, name: 'CD Deals' },
  { id: 11, name: 'Categories', hasChild: true },
  { id: 12, pid: 11, name: 'Songs' },
  { id: 13, pid: 11, name: 'Bestselling Albums' },
  { id: 14, pid: 11, name: 'New Releases' },
  { id: 15, pid: 11, name: 'Bestselling Songs' },
  { id: 16, name: 'MP3 Albums', hasChild: true },
  { id: 17, pid: 16, name: 'Rock' },
  { id: 18, pid: 16, name: 'Gospel' },
  { id: 19, pid: 16, name: 'Latin Music' },
  { id: 20, pid: 16, name: 'Jazz' },
  { id: 21, name: 'More in Music', hasChild: true },
  { id: 22, pid: 21, name: 'Music Trade-In' },
  { id: 23, pid: 21, name: 'Redeem a Gift Card' },
  { id: 24, pid: 21, name: 'Band T-Shirts' },
];
export default {
  data () {
    return {
      fields: { dataSource: data, value: 'id', text: 'name',
parentValue:"pid", hasChildren: 'hasChild' }
    }
  }
}
</script>
<style>

dropdowns/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-tree/checkboxes-cs1" %}

### Auto Check

By default, the checkbox state of the parent and child items in the Dropdown Tree will not be dependent over each other. If you need dependent checked state, then enable the `autoCheck` property which is a member of `treeSettings` property.

- If one or more child items are not in the checked state, then the parent item will be in the intermediate state.
- If all the child items are checked, then the parent item will also be in the checked state.
- If a parent item is checked, then all the child items will also be changed to the checked state.

In the following example, the `autoCheck` property is enabled.

#### APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdowntree id='dropdowntree' :fields='fields'
:showCheckBox='true' :treeSettings='treeSettings'></ejs-dropdowntree>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownTreePlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownTreePlugin);
var data = [
  { id: 1, name: 'Discover Music', hasChild: true, expanded: true },
  { id: 2, pid: 1, name: 'Hot Singles' },
  { id: 3, pid: 1, name: 'Rising Artists' },
  { id: 4, pid: 1, name: 'Live Music' },
  { id: 6, pid: 1, name: 'Best of 2017 So Far' },
  { id: 7, name: 'Sales and Events', hasChild: true },
  { id: 8, pid: 7, name: '100 Albums - $5 Each' },
  { id: 9, pid: 7, name: 'Hip-Hop and R&B Sale' },
  { id: 10, pid: 7, name: 'CD Deals' },
  { id: 11, name: 'Categories', hasChild: true },
  { id: 12, pid: 11, name: 'Songs' },
  { id: 13, pid: 11, name: 'Bestselling Albums' },
  { id: 14, pid: 11, name: 'New Releases' },
  { id: 15, pid: 11, name: 'Bestselling Songs' },
  { id: 16, name: 'MP3 Albums', hasChild: true },
  { id: 17, pid: 16, name: 'Rock' },
  { id: 18, pid: 16, name: 'Gospel' },
  { id: 19, pid: 16, name: 'Latin Music' },
  { id: 20, pid: 16, name: 'Jazz' },
  { id: 21, name: 'More in Music', hasChild: true },
  { id: 22, pid: 21, name: 'Music Trade-In' },
  { id: 23, pid: 21, name: 'Redeem a Gift Card' },
  { id: 24, pid: 21, name: 'Band T-Shirts' },
];
export default {
  data () {
    return {
      fields: { dataSource: data, value: 'id', text: 'name',
parentValue:"pid", hasChildren: 'hasChild' },
      treeSettings: { autoCheck: true }
    }
  }
}
```

```

dropdowns/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-tree/auto-check-cs1" %}

### Select All

The Dropdown Tree component has in-built support to select all the tree items using Select All options in the header.

When the `showSelectAll` property is set to true, a checkbox will be displayed in the popup header that allows you to select or deselect all the tree items in the popup.

By default, `Select All` and `unSelect All` text values will be showcased along with the checkbox in the popup header to indicate the action to be performed on checking or unchecking the checkbox. You can customize these name attributes by using `selectAllText` and `unSelectAllText` properties respectively.

### APP.VUE

```

<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
      <br>
      <ejs-dropdowntree id='dropdowntree' :fields='fields'
      :showCheckBox='true' :showSelectAll='true' :selectAllText='selectText'
      :unSelectAllText='unSelectText'></ejs-dropdowntree>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DropDownTreePlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(DropDownTreePlugin);
var data = [
  { id: 1, name: 'Discover Music', hasChild: true, expanded: true },
  { id: 2, pid: 1, name: 'Hot Singles' },
  { id: 3, pid: 1, name: 'Rising Artists' },
  { id: 4, pid: 1, name: 'Live Music' },
  { id: 6, pid: 1, name: 'Best of 2017 So Far' },

dropdowns/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/drop-down-tree/select-all-cs1" %}

### Localization in Vue Drop down tree component

The [Localization](#) library allows you to localize default text content of the Dropdown Tree and it can be localized to any culture by defining the texts and messages of the Dropdown Tree in the corresponding culture. The default locale of the Dropdown Tree is en (English). The following table represents the default texts and messages of the Dropdown Tree in en culture.

KEY	Text/Message
----	----
noRecordsTemplate	No records found
actionFailureTemplate	Request failed
overflowCountTemplate	+\$ {count} more..
totalCountTemplate	\$ {count} selected

### Accessibility in Vue Dropdown Tree component

The Dropdown Tree component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Dropdown Tree component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The Dropdown Tree component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Dropdown Tree component:

| Attributes | Purpose |

| --- | --- |

- | `role=checkbox` | All list items are contained within the element. |
- | `aria-disabled` | Indicates element is perceivable but disabled. |
- | `aria-owns` | This attribute contains the ID of the popup list to indicate popup as a child element. |
- | `aria-haspopup` | Indicates whether the Dropdown Tree input element has a popup list or not. |
- | `aria-expanded` | Indicates the state of the popup list for Dropdown Tree and the parent node's expansion status for TreeView. |
- | `aria-activedescendent` | This attribute holds the ID of the active list item to focus its descendant child element. |
- | `aria-labelledby` | This attribute points to the element(s) labeling the element it's applied to. |
- | `aria-describedby` | This attribute points to the element(s) describing the one it's set on. |
- | `role=tree` | All tree nodes are contained within the element. |
- | `role=treeitem` | Specifies the role of each tree node in a selectable TreeView and its containment within the tree. |
- | `role=group` | Specifies the role of each parent node container in the TreeView. |
- | `role=checkbox` | Indicates checkbox control along with treeitem element. |
- | `aria-multiselectable` | Indicates whether the TreeView enables multiple selection or not. |
- | `aria-selected` | Indicates the selected node. |
- | `aria-level` | Indicates the level of node in TreeView. |
- | `aria-checked` | Indicates the current checked state of TreeView checkbox. |
- | `aria-label` | Indicates the contextual message for the TreeView checkbox and Dropdown Tree. |
- | `aria-activedescendant` | Identifies the currently active element when focusing on the TreeView. |

### Keyboard interaction

The Dropdown Tree component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Dropdown Tree component.

| Interaction Keys | Description |

|-----|-----|

| **Alt + Down** | Opens the popup. |

| **Alt + Up** | Closes the popup. |

| **Esc(Escape)** | Closes the popup when it is in an open state. |

| **Arrow Up** | Goes to the previous item in the popup. |

| **Arrow Down** | Goes to the next item in the popup. |

| **Arrow Right** | Expands the current item in the popup. |

| Arrow Left | Collapses the current item in the popup. |

| Home | Goes to the first item in the popup. |

| End | Goes to the last item in the popup. |

| Enter | Selects the focused item in the popup. |

| Space | Checks the current item in the popup. |

### Ensuring accessibility

The Dropdown Tree component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Dropdown Tree component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Dropdown Tree component with accessibility tools.

```
{% previewsample "https://ej2.syncfusion.com/accessibility/drop-down-tree.html" %}
```

## FileManager

### Getting Started with the Vue File manager Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLI](#) and integrating the Syncfusion Vue Filemanager component

#### Prerequisites

[System requirements for Syncfusion Vue UI components](#)

#### Dependencies

The following are the dependencies required to use the File Manager component in your application:

```
`js
|-- @syncfusion/ej2-vue-filemanager
|-- @syncfusion/ej2-vue-base
|-- @syncfusion/ej2-vue-grids
|-- @syncfusion/ej2-vue-navigations
|-- @syncfusion/ej2-vue-inputs
|-- @syncfusion/ej2-vue-lists
|-- @syncfusion/ej2-vue-popups
|-- @syncfusion/ej2-vue-buttons
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-grids
```

```
|-- @syncfusion/ej2-filemanager  
|-- @syncfusion/ej2-navigations  
|-- @syncfusion/ej2-inputs  
|-- @syncfusion/ej2-lists  
|-- @syncfusion/ej2-popups  
|-- @syncfusion/ej2-buttons  
`
```

### Setting up the Vue 2 project

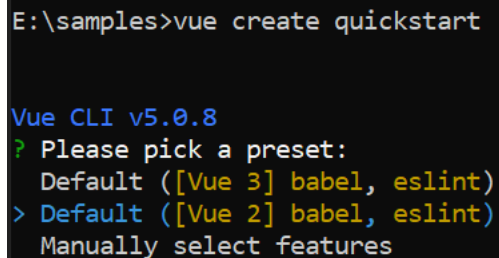

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```
`bash  
npm install -g @vue/cli  
vue create quickstart  
cd quickstart  
npm run serve  
`
```

or

```
`bash  
yarn global add @vue/cli  
vue create quickstart  
cd quickstart  
yarn run serve  
`
```

When creating a new project, choose the option **Default ([Vue 2] babel, eslint)** from the menu.

```
E:\samples>vue create quickstart  
  
Vue CLI v5.0.8  
? Please pick a preset:  
  Default ([Vue 3] babel, eslint)  
> Default ([Vue 2] babel, eslint)  
  Manually select features
```

Once the **quickstart** project is set up with default settings, proceed to add Syncfusion components to the project.

### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.npmjs.com). To use Vue components, install the required npm package.

This article uses the [Vue File manager component](#) as an example. Install the `@syncfusion/ej2-vue-filemanager` package by running the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-filemanager --save
```

```
,
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-filemanager
```

```
,
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the `Material` theme is applied using CSS styles, which are available in installed packages. The necessary `Material` CSS styles for the File manager component and its dependents were imported into the `<style>` section of `src/App.vue` file.

#### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-filemanager/styles/material.css";
</style>
```

Note: If you want to refer the combined component styles, please make use of our [CRG](#) (Custom Resource Generator) in your application.

### Add Syncfusion Vue component

Follow the below steps to add the Vue File manager component:

1\ First, import and register the File manager component in the `script` section of the `src/App.vue` file.

#### ~/SRC/APP.VUE

```
<script>
```

```
import { FileManagerComponent } from "@syncfusion/ej2-vue-filemanager";
export default {
  components: {
    'ejs-filemanager': FileManagerComponent
  }
}
</script>
```

2\ In the **template** section, define the File manager component with [ajaxSettings](#) property.

#### ~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-filemanager id="file-manager" :ajaxSettings="ajaxSettings">
</ejs-filemanager>
</div>
</template>
```

3\ Declare the value for the **ajaxSettings** property in the **script** section.

#### ~/SRC/APP.VUE

```
<script>
data () {
  return {
    ajaxSettings:
    {
      url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations"
    }
  }
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

#### ~/SRC/APP.VUE

```
<template>
  <div id="app">
    <ejs-filemanager id="file-manager" :ajaxSettings="ajaxSettings">
    </ejs-filemanager>
  </div>
</template>
<script>
import { FileManagerComponent } from "@syncfusion/ej2-vue-filemanager";
export default {
  components: {
    'ejs-filemanager': FileManagerComponent
  },
  data () {
    return {
      ajaxSettings:
      {

```

```

        url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations"
    }
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
filemanager/styles/material.css";
</style>

```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run serve
```

```
,
```

or

```
`bash
```

```
yarn run serve
```

```
,
```

```
{% previewsample "page.domainurl/code-snippet/file-manager/getting-started-cs1" %}
```

### File Download support

To perform the download operation, initialize the `downloadUrl` property in a [ajaxSettings](#) of File Manager component.

#### ~/SRC/APP.VUE

```

<script>
import { FileManagerComponent } from "@syncfusion/ej2-vue-filemanager";
export default {
  components: {
    'ejs-filemanager': FileManagerComponent
  },
  data () {
    return {
      ajaxSettings:
      {
        url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",

```

```
downloadUrl: "https://ej2-aspcore-  
service.azurewebsites.net/api/FileManager/Download"  
}  
}  
}  
}  
</script>
```

### File Upload support

To perform the upload operation, initialize the `uploadUrl` property in a [ajaxSettings](#) of File Manager Component.

#### ~/SRC/APP.VUE

```
<script>  
import { FileManagerComponent } from "@syncfusion/ej2-vue-filemanager";  
export default {  
  components: {  
    'ejs-filemanager': FileManagerComponent  
  },  
  data () {  
    return {  
      ajaxSettings: {  
        url: "https://ej2-aspcore-  
service.azurewebsites.net/api/FileManager/FileOperations",  
        uploadUrl: "https://ej2-aspcore-  
service.azurewebsites.net/api/FileManager/Upload"  
      }  
    }  
  }  
}  
</script>
```

### Image Preview support

To perform the image preview support in the File Manager component, need to initialize the `getImageUrl` property in a [ajaxSettings](#) of File Manager component.

#### APP.VUE

```
<template>  
  <div id="app">  
    <ejs-filemanager id="file-manager" :ajaxSettings="ajaxSettings">  
    </ejs-filemanager>  
  </div>  
</template>  
<script>  
import { FileManagerComponent } from "@syncfusion/ej2-vue-filemanager";  
export default {  
  components: {  
    'ejs-filemanager': FileManagerComponent  
  },  
  data () {  
    return {  
      ajaxSettings:  

```

```

        {
            url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",
            getImageUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/GetImage"
        }
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
filemanager/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/file-manager/getting-started-cs2" %}

### Injecting feature modules

Basically, the file manager component contains large-icons view for displaying the files and folders, a breadcrumbbar for navigation and context menu for performing operations. However, these basic functionalities can be extended by using the additional feature modules like detailsview, toolbar, navigation pane, and context menu to change the layout and to simplify the navigation and file operations within the file system. The above modules can be injected using `provide`.

The following example shows you the File Manager with all feature modules.

### APP.VUE

```

<template>
<div id="app">
    <div class="wrapper">
        <ejs-filemanager id="overview_filemanager" :ajaxSettings="ajaxSettings"
:vue="view">
            </ejs-filemanager>
        </div>
    </div>
</template>
<script>
import { FileManagerComponent, DetailsView, NavigationPane, Toolbar } from
"@syncfusion/ej2-vue-filemanager";
export default {
    components: {
        'ejs-filemanager': FileManagerComponent
    },
    data () {
        return {
            ajaxSettings:

```

```

        {
            url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",
            getImageUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/GetImage",
            uploadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Upload",
            downloadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Download"
        },
        // Initial view of File Manager is set to details view
        view: "Details"
    },
    //Injecting additional modules in FileManager
    provide: {
        filemanager: [DetailsView, NavigationPane, Toolbar]
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
filemanager/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/file-manager/overview-cs1" %}

**Note:** The appearance of the File Manager can be customized by using [cssClass](#) property. This adds a css class to the root of the File Manager which can be used to add new styles or override existing styles to the File Manager.

### Switching initial view of the File Manager

The initial view of the File Manager can be changed to details or largeicons view with the help of [view](#) property. By default, the File Manager will be rendered in large icons view. When the File Manager is initially rendered, [created](#) will be triggered. This event can be utilized for performing operations once the File Manager has been successfully created.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-filemanager id="file-manager" :view="view" :created="onCreate"
:ajaxSettings="ajaxSettings">
            </ejs-filemanager>
        </div>
    </template>
</script>

```

```

import { FileManagerComponent, DetailsView, NavigationPane, Toolbar } from
"@syncfusion/ej2-vue-filemanager";
export default {
  components: {
    'ejs-filemanager': FileManagerComponent
  },
  data () {
    return {
      ajaxSettings: {
        url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",
        getImageUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/GetImage",
        uploadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Upload",
        downloadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Download"
      },
      // Initial view of File Manager is set to details view
      view: "Details"
    };
  },
  provide: {
    filemanager: [DetailsView, NavigationPane, Toolbar]
  },
  methods: {
    // File Manager's created event function
    onCreate() {
      console.log("File Manager has been created successfully");
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
filemanager/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/file-manager/view-cs1" %}

### Maintaining component state on page reload

The File Manager supports maintaining the component state on page reload. This can be achieved by enabling [enablePersistence](#) property which maintains the following,

- Previous view of the File Manager - [View](#)

- Previous path of the File Manager - [Path](#)
- Previous selected items of the File Manager - [SelectedItems](#)

For every operation in File Manager, ajax request will be sent to the server which then processes the request and sends back the response. When the ajax request is success, [success](#) event will be triggered and [failure](#) event will be triggered if the request gets failed.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-filemanager id="file-manager"
      :enablePersistence="enablePersistence" :ajaxSettings="ajaxSettings"
      :success="onAjaxSuccess" :failure="onAjaxFailure">
      </ejs-filemanager>
    </div>
  </template>
<script>
import { FileManagerComponent, DetailsView, NavigationPane, Toolbar } from
"@syncfusion/ej2-vue-filemanager";
export default {
  components: {
    'ejs-filemanager': FileManagerComponent
  },
  data () {
    return {
      ajaxSettings:
        {
          url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",
          getImageUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/GetImage",
          uploadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Upload",
          downloadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Download"
        },
      enablePersistence: true
    };
  },
  provide: {
    filemanager: [DetailsView, NavigationPane, Toolbar]
  },
  methods: {
    // File Manager's file onSuccess function
    onAjaxSuccess() {
      console.log("Ajax request successful");
    },
    // File Manager's file onError function
    onAjaxFailure() {
      console.log("Ajax request has failed");
    }
  }
}
</script>
<style>
```

```
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-filemanager/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/file-manager/persistence-cs1" %}

**Note:** The files of the current folder opened in the File manager can be refreshed programatically by calling [refreshFiles](#) method.

Rendering component in right-to-left direction

It is possible to render the File Manager in right-to-left direction by setting the [enableRtl](#) API to true.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-filemanager id="file-manager" :enableRtl="enableRtl"
    :ajaxSettings="ajaxSettings">
      </ejs-filemanager>
    </div>
  </template>
<script>
import { FileManagerComponent, DetailsView, NavigationPane, Toolbar } from
"@syncfusion/ej2-vue-filemanager";
export default {
  components: {
    'ejs-filemanager': FileManagerComponent
  },
  data () {
    return {
      ajaxSettings: {
        url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",
        getImageUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/GetImage",
        uploadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Upload",
        downloadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Download"
      },
      enableRtl: true
    };
  },
  provide: {
    filemanager: [DetailsView, NavigationPane, Toolbar]
  }
}
```

```

}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
filemanager/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/file-manager/rtl-cs1" %}

### Specifying the current path of the File Manager

The current path of the File Manager can be specified initially or dynamically using the [path](#) property.

The following code snippet demonstrates specifying the current path in File Manager on rendering.

#### ~/SRC/APP.VUE

```

<template>
<div id="app">
<ejs-filemanager id="file-manager" :path="path"
:ajaxSettings="ajaxSettings">
</ejs-filemanager>
</div>
</template>
<script>
import { FileManagerComponent, DetailsView, NavigationPane, Toolbar } from
"@syncfusion/ej2-vue-filemanager";
export default {
components: {
'ejs-filemanager': FileManagerComponent
},
data () {
return {
ajaxSettings:
{
url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",
getImageUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/GetImage",
uploadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Upload",
downloadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Download"
},
// Initial view of File Manager is set to details view
view: "Details",
// Specify the required current path

```

```
path: '/Food'
};
},
provide: {
  filemanager: [DetailsView, NavigationPane, Toolbar]
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-filemanager/styles/material.css";
</style>
```

**Note:** You can refer to our [Vue File Manager](#) feature tour page for its groundbreaking feature representations. You can also explore our [Vue File Manager example](#) that shows you how to render the File Manager in Vue.

## Getting Started with the Vue File Manager Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue File Manager component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

### Prerequisites

#### [System requirements for Syncfusion Vue UI components](#)

#### Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm create vite@latest
```

```
`
```

or

```
`bash
```

```
yarn create vite
```

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as `my-project` for this article.

`bash

? Project name: » my-project

`

2. Select `Vue` as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3. Choose `JavaScript` as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4. Upon completing the aforementioned steps to create the `my-project`, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

```
`bash
cd my-project
yarn install
`
```

Now that `my-project` is ready to run with default settings, let's add Syncfusion components to the project.

### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue File Manager component](#) as an example. To use the Vue File Manager component in the project, the `@syncfusion/ej2-vue-navigations` package needs to be installed using the following command:

```
`bash
npm install @syncfusion/ej2-vue-navigations --save
`
```

or

```
`bash
yarn add @syncfusion/ej2-vue-navigations
`
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, `Material` theme is applied using CSS styles, which are available in installed packages. The necessary `Material` CSS styles for the File Manager component and its dependents were imported into the `<style>` section of `src/App.vue` file.

### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
filemanager/styles/material.css";
</style>
```

### Add Syncfusion Vue component

Follow the below steps to add the Vue File Manager component using **Composition API** or **Options API**:

1.First, import and register the File Manager component in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### **COMPOSITION API (~/SRC/APP.VUE)**

```
<script setup>
import { FileManagerComponent as EjsFilemanager, DetailsView,
  NavigationPane, Toolbar } from "@syncfusion/ej2-vue-filemanager";
</script>
```

#### **OPTIONS API (~/SRC/APP.VUE)**

```
<script>
import { FileManagerComponent, DetailsView, NavigationPane, Toolbar } from
"@syncfusion/ej2-vue-filemanager";
//Component registration
export default {
  name: "App",
  components: {
    "ejs-filemanager": FileManagerComponent
  }
}
</script>
```

Note: By default, LargeIcons view will be initialized in the File Manager. If Grid view is required then the DetailsView module needs to be injected using **provide**.

2.Add the component definition in template section.

#### **~/SRC/APP.VUE**

```
<template>
<ejs-filemanager id="file-manager" :ajaxSettings="ajaxSettings"></ejs-
filemanager>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

#### **COMPOSITION API (~/SRC/APP.VUE)**

```
<template>
<ejs-filemanager id="file-manager" :ajaxSettings="ajaxSettings"></ejs-
filemanager>
</template>
<script setup>
import { FileManagerComponent as EjsFilemanager, DetailsView,
  NavigationPane, Toolbar } from "@syncfusion/ej2-vue-filemanager";
import { provide } from "vue";
const filemanager = [DetailsView, NavigationPane, Toolbar];
provide('filemanager', filemanager);
```

```
const ajaxSettings = {
url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",
getImageUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/GetImage",
uploadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Upload",
downloadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Download"
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
filemanager/styles/material.css";
</style>
```

### OPTIONS API (~SRC/APP.VUE)

```
<template>
<ejs-filemanager id="file-manager" :ajaxSettings="ajaxSettings"></ejs-
filemanager>
</template>
<script>
import { FileManagerComponent, DetailsView, NavigationPane, Toolbar } from
"@syncfusion/ej2-vue-filemanager";
//Component registration
export default {
name: "App",
components: {
"ejs-filemanager": FileManagerComponent
},
data() {
return {
ajaxSettings:
{
url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",
getImageUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/GetImage",
uploadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Upload",
downloadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Download"
},
};
},
provide: {
```

```
filemanager: [DetailsView, NavigationPane, Toolbar]
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";

```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
`
```

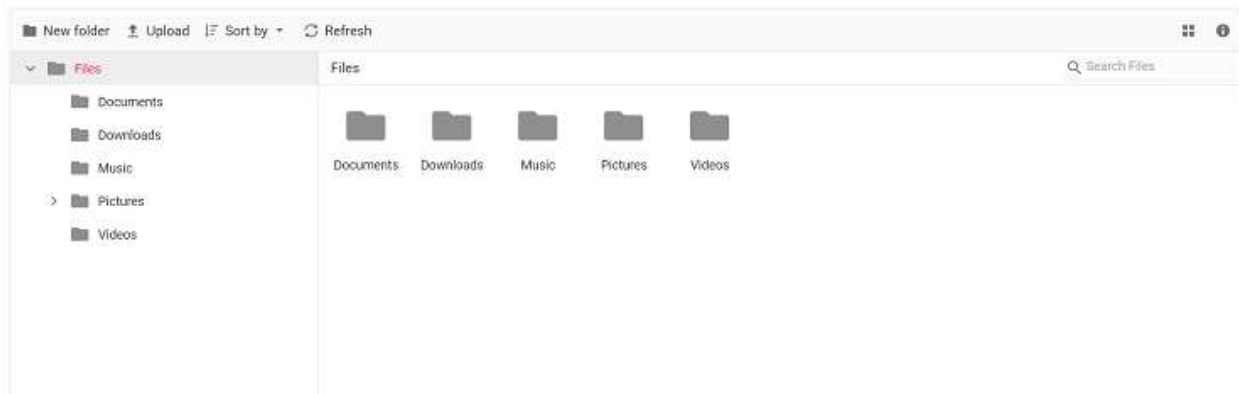

or

```
`bash
```

```
yarn run dev
```

```
`
```

The output will appear as follows:

For migrating from Vue 2 to Vue 3, refer to the [migration](#) documentation.

### User interface in Vue File manager component

The file manager UI is comprised of several sections like view, toolbar, breadcrumb, context menu, and so on. The UI of the file manager is enhanced with injectable modules like **Details View** for browsing files and folders in a grid, **Navigation Pane** for folder navigation, and **Toolbar** for file operations. The file manager with all feature modules have the following sections in its UI.

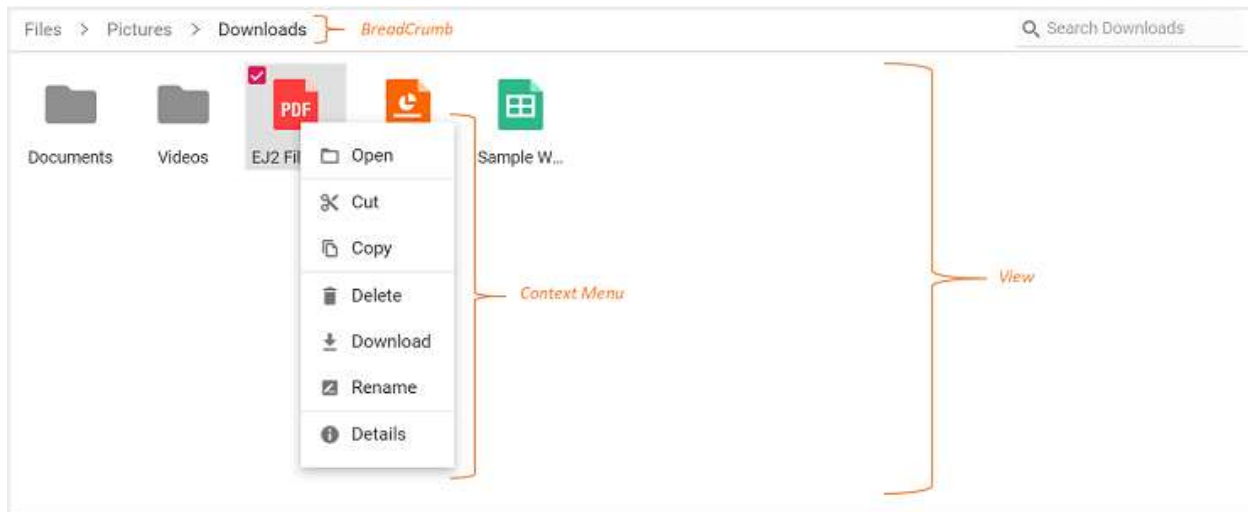

- [View](#) (Large Icons view for browsing files and folders),
- [Toolbar](#) (For direct access to file operations),
- [Navigation Pane](#) (For easy navigation between folders),
- [Breadcrumb](#) (For parent folder navigations),
- [Context Menu](#) (For accessing file operations).

The basic file manager is a light weight component with all the basic functions. The basic file manager have the following sections in its UI to browse files and folders and manage them with file operations.

- [View](#) (Large Icons view for browsing files and folders),
- [Breadcrumb](#) (For parent folder navigations),
- [Context Menu](#) (For accessing file operations).

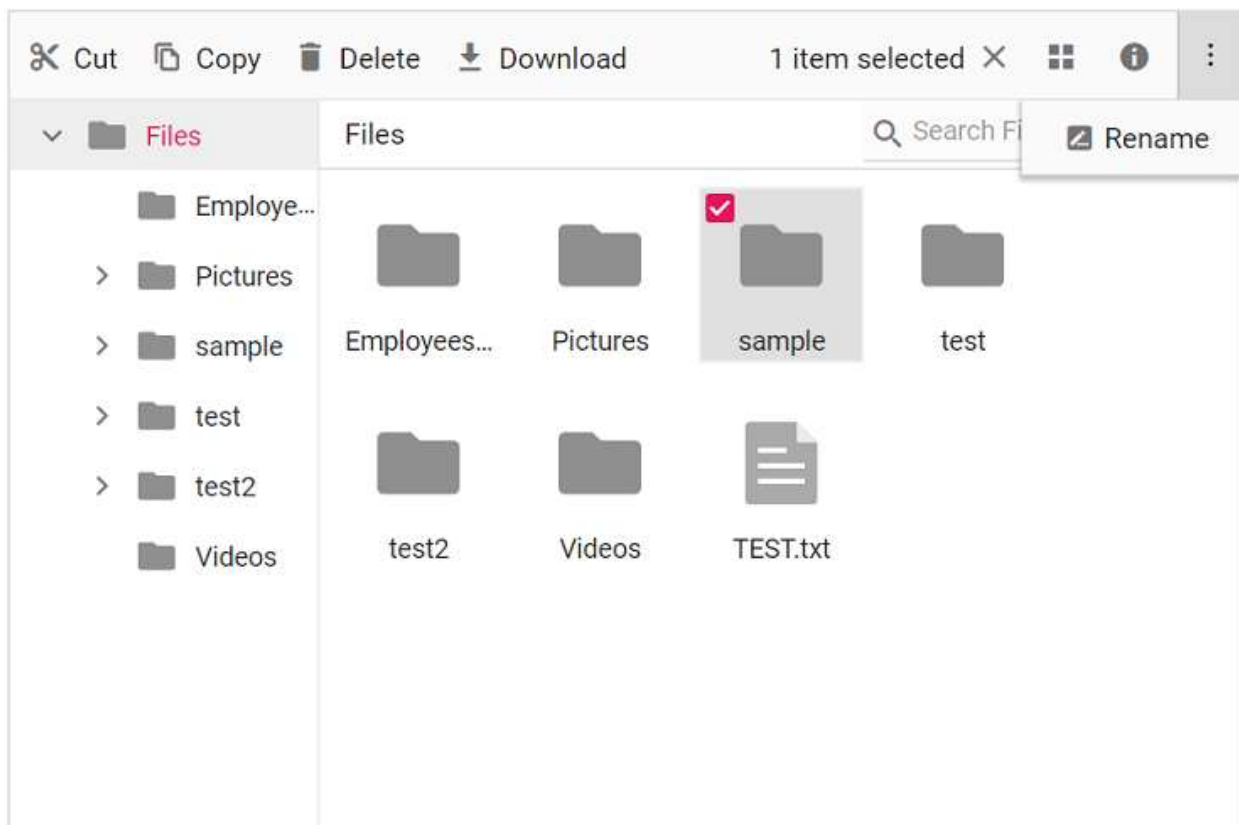

### Toolbar

The **Toolbar** provides easy access to the file operations using different buttons and it is presented at the top of the file manager.

If the toolbar items exceed the size of the toolbar, then the exceeding toolbar size will be moved to toolbar popup with a dropdown button at the end of toolbar.

*\*Refer [Toolbar](#) section in file operations to know more about the buttons present in toolbar\*.*

### Files and folders navigation

The file manager provides navigation between files and folders using the following two options.

- [Navigation Pane](#)
- [Breadcrumb](#)

### Navigation pane

The navigation pane is an injectable module so, it should be injected before rendering the file manager to use its functionality. It displays the folder hierarchy of the file system and provides easy navigation to the desired folder. Using [navigationPaneSettings](#) minimum and maximum width of the navigation pane can be changed. The navigation pane can be shown or hidden using the `visible` option in the [navigationPaneSettings](#).

### BreadCrumb

The file manager provides breadcrumb for navigating to the parent folders. The breadcrumb the in file manager is responsible for resizing.

Whenever the path length exceeds the breadcrumb length, a dropdown button will be added at the starting of the breadcrumb to hold the parent folders adjacent to root.

### View

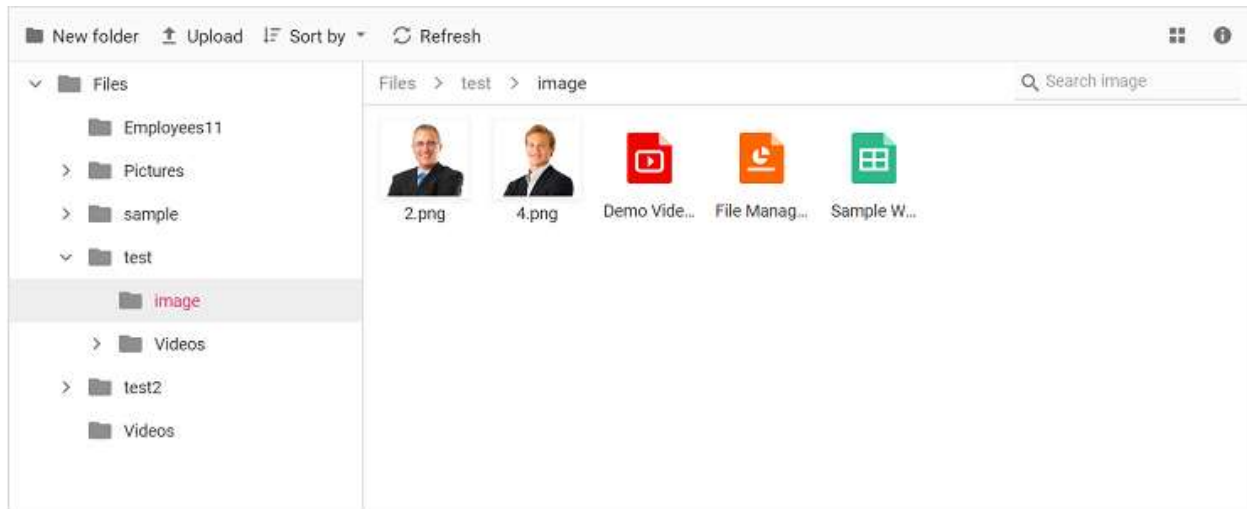

View is the section where the files and folders are displayed for the user to browse. The file manager has two types of views to display the files and folders.

- [Large Icons View](#)
- [Details View](#)

The **large icons view** is the default starting view in the file manager. The view can be changed by using the [toolbar](#) view button or by using the view menu in [context menu](#). The [view](#) API can also be used to change the initial view of the file manager.

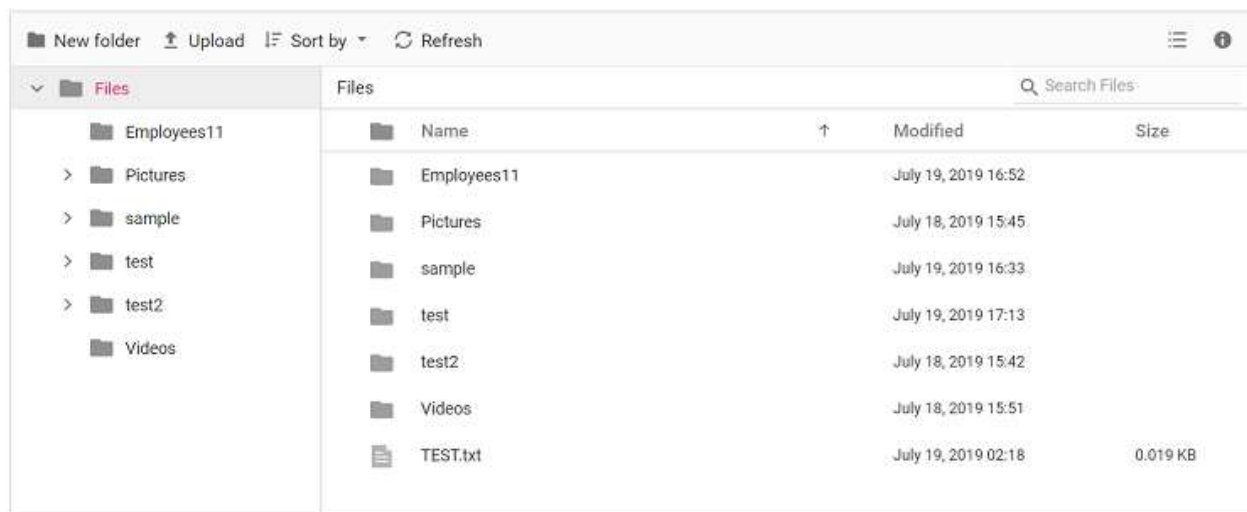

### Large icons view

In the large icons view, the thumbnail icons will be shown in a larger size, which displays the data in a form that best suits their content. For image and video type files, a **preview** will be displayed. Extension thumbnails will be displayed for other type files.

### Details view

Details view is an injectable module in the file manager so, it should be injected before rendering the file manager to avail its functionality. In the details view, the files are displayed in a sorted list order. This file list comprises of several columns of information about the files such as **Name**, **Date Modified**, **Type**, and **Size**. Each file has its own small icon representing the file type. Additional columns can be added using [detailsViewSettings](#) API. The details view allows you to perform sorting using column header.

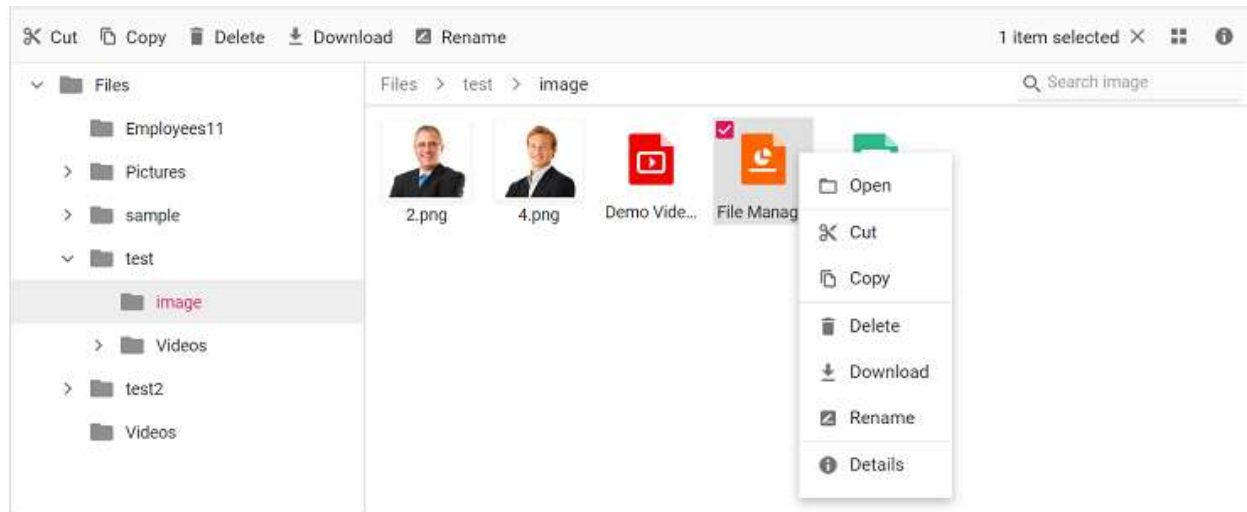

### Context menu

The context menu appears on user interaction such as right-click. The file manager is provided with context menu support to perform list of file operations with the files and folders. Context menu appears with varying menu items based on the targets such as file, folder (including navigation pane folders), and layout (empty area in view).

Context menu can be customized using the [contextMenuSettings](#), [menuOpen](#), and [menuClick](#) events.

*\*Refer [Context Menu](#) section in file operations to know more about the menu items present in context menu\*.*

### File operations in Vue File manager component

The file manager component is used to browse, manage, and organize the files and folders in a file system through a web application. All basic file operations like creating a new folder, uploading and downloading of files in the file system, and deleting and renaming of existing files and folders are available in the file manager component. Additionally, previewing of image files is also provided in the file manager component.

The following table represents the basic operations available in the file manager and their corresponding functions.

Operation Name	Function
----------------	----------

----	----
------	------

read	Read the details of files or folders available in the given path from the file system, to display the files for the user to browse the content.
------	-------------------------------------------------------------------------------------------------------------------------------------------------

create	Creates a new folder in the current path of the file system.
--------	--------------------------------------------------------------

delete	Removes the file or folder from the file server.
--------	--------------------------------------------------

rename	Rename the selected file or folder in the file system.
--------	--------------------------------------------------------

search	Searches for items matching the search string in the current and child directories.
--------	-------------------------------------------------------------------------------------

details	Gets the detail of the selected item(s) from the file server.
---------	---------------------------------------------------------------

copy	Copy the selected file or folder in the file system.
------	------------------------------------------------------

move	Cut the selected file or folder in the file server.
------	-----------------------------------------------------

upload	Upload files to the current path or directory in the file system.
--------	-------------------------------------------------------------------

download	Downloads the file from the server and the multiple files can be downloaded as ZIP files.
----------	-------------------------------------------------------------------------------------------

The *CreateFolder*, *Remove*, and *Rename* actions will be reflected in the file manager only after the successful response from the server.

### Folder Upload support

To perform the directory(folder) upload in File Manager, set [directoryUpload](#) as true within the uploadSettings property. The directory upload feature is supported for the following file service providers:

- Physical file service provider.
- Azure file service provider.
- NodeJS file service provider.
- Amazon file service provider.

In the following example, directory upload is enabled/disabled on DropDownButton selection.

#### APP.VUE

```
<template>
<div id="app">
  <div class="control-section folder-upload">
    <div class="sample-container">
      <ejs-filemanager id="filemanager" :ajaxSettings='ajaxSettings'
:created='onCreated' >
    </ejs-filemanager>
    </div>
  </div>
</div>
</template>
<script>
import Vue from "vue";
import { FileManagerPlugin, NavigationPane, Toolbar, DetailsView,
FileManagerComponent } from "@syncfusion/ej2-vue-filemanager";
import { DropDownButton, ItemModel } from "@syncfusion/ej2-splitbuttons";
Vue.use(FileManagerPlugin);
// File Manager directory upload feature sample
let hostUrl = 'https://ej2-aspcore-service.azurewebsites.net/';
export default {
  data () {
    return {
      ajaxSettings: {
        url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",
        getImageUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/GetImage",
        uploadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Upload",
        downloadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Download"
      }
    };
  },
  provide: {
    filemanager: [NavigationPane, DetailsView, Toolbar]
  },
  methods: {
    onCreated: function (args) {
```

```

        var customBtn =
document.getElementById("filemanager_tb_upload");
        customBtn.onclick = (e) => {
            e.stopPropagation();
        };
        //DropDownButton items definition
        var items = [{ text: "Folder" }, { text: "Files" }];
        var drpDownBtn = new DropDownButton({
            items: items,
            select: (args) => {
                var fileObj =
document.getElementById("filemanager").ej2_instances[0];
                if (args.item.text === "Folder") {
                    fileObj.uploadSettings.directoryUpload = true;
                } else {
                    fileObj.uploadSettings.directoryUpload = false;
                }
                setTimeout(function () {
                    var uploadBtn = document.querySelector(".e-file-
select-wrap button");
                    uploadBtn.click();
                }, 100);
            },
        }, "#filemanager_tb_upload"
    );
    },
    },
    });
</script>

</style>

```

{% previewsample "page.domainurl/code-snippet/file-manager/directory-upload-cs1" %}

#### Physical file service provider

To achieve the directory upload in the physical file service provider, use the below code snippet in **ActionResult Upload** method in the **Controllers/FileManagerController.cs** file.

```
`ts
```

```
[Route("Upload")]
```

```
public IActionResult Upload(string path, IList<IFormFile> uploadFiles, string action)
{
    FileManagerResponse uploadResponse;
    foreach (var file in uploadFiles)
    {
        var folders = (file.FileName).Split('/');
        // checking the folder upload
        if (folders.Length > 1)
        {
            for (var i = 0; i < folders.Length - 1; i++)
            {
                string newDirectoryPath = Path.Combine(this.basePath + path, folders[i]);
                if (!Directory.Exists(newDirectoryPath))
                {
                    this.operation.ToCamelCase(this.operation.Create(path, folders[i]));
                }
                path += folders[i] + "/";
            }
        }
    }
    uploadResponse = operation.Upload(path, uploadFiles, action, null);
    if (uploadResponse.Error != null)
    {
        Response.Clear();
        Response.ContentType = "application/json; charset=utf-8";
        Response.StatusCode = Convert.ToInt32(uploadResponse.Error.Code);
        Response.HttpContext.Features.Get<IHttpResponseFeature>().ReasonPhrase =
            uploadResponse.Error.Message;
    }
    return Content("");
}
```

Refer to the [GitHub](#) for more details

And also add the below code snippet in `FileManagerResponse Upload` method in `Models/PhysicalFileProvider.cs` file.

```
`ts
string[] folders = name.Split('/');
string fileName = folders[folders.Length - 1];
var fullName = Path.Combine((this.contentRootPath + path), fileName);
`
```

Refer to the [GitHub](#) for more details.

#### *Azure file service provider*

For Azure file service provider, no customizations are needed for directory upload with server side and this will work with the below default upload method code.

Refer to the [GitHub](#) for more details.

#### *NodeJS file service provider*

To perform the directory upload in the NodeJS file service provider, use the below code snippet in `app.post` method in the `filesystem-server.js` file.

```
`ts
var folders = (req.body.filename).split('/');
var filepath = req.body.path;
var uploadedFileName = folders[folders.length - 1];
// checking the folder upload
if (folders.length > 1)
{
  for (var i = 0; i < folders.length - 1; i++)
  {
    var newDirectoryPath = path.join(contentRootPath + filepath, folders[i]);
    if (!fs.existsSync(newDirectoryPath)) {
      fs.mkdirSync(newDirectoryPath);
      (async () => {
        await FileManagerDirectoryContent(req, res, newDirectoryPath).then(data => {
          response = { files: data };
          response = JSON.stringify(response);
        });
      })();
    }
    filepath += folders[i] + "/";
  }
}
```

```
}  
fs.rename('./' + uploadedFileName, path.join(contentRootPath, filepath + uploadedFileName), function  
(err) {  
  if (err) {  
    if (err.code !== 'EBUSY') {  
      errorValue.message = err.message;  
      errorValue.code = err.code;  
    }  
  }  
});  
}  
`
```

Refer to the [GitHub](#) for more details.

#### *Amazon file service provider*

To perform the directory upload in the Amazon file service provider, use the below code snippet in `IActionResult AmazonS3Upload` method in the `Controllers/AmazonS3ProviderController.cs` file.

```
`ts  
foreach (var file in uploadFiles)  
{  
  var folders = (file.FileName).Split('/');  
  // checking the folder upload  
  if (folders.Length > 1)  
  {  
    for (var i = 0; i < folders.Length - 1; i++)  
    {  
      if (!this.operation.checkFileExist(path, folders[i]))  
      {  
        this.operation.ToCamelCase(this.operation.Create(path, folders[i], dataObject));  
      }  
      path += folders[i] + "/";  
    }  
  }  
}
```

Refer to the [GitHub](#) for more details.

And also add the below code snippet in `AsyncUpload` method in `Models/AmazonS3FileProvider.cs` file.

```
`ts
string[] folders = file.FileName.Split('/');
string name = folders[folders.Length - 1];
`
```

Refer to the [GitHub](#) for more details.

### File operation request and response Parameters

The default parameters available in file operation request from the file manager and the corresponding response parameters required by the file manager are listed as follows.

#### Read

The following table represents the request parameters of *read* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	read	Name of the file operation.
path	String	-	Relative path from which the data has to be read.
showHiddenItems	Boolean	-	Defines show or hide the hidden items.
data	FileManagerDirectoryContent	-	Details about the current path (directory).

*\*Refer [File request and response contents](#) for the contents of data\*.*

*Example:*

```
`ts
{
  action: "read",
  path: "/",
  showHiddenItems: false,
  data: []
}
`
```

The following table represents the response parameters of *read* operations.

Parameter	Type	Default	Explanation
----	----	----	----
cwd	FileManagerDirectoryContent	-	Path (Current Working Directory) details.
files	FileManagerDirectoryContent[]	-	Details of files and folders present in given path or directory.

|error|ErrorDetails|-|Error Details|

*\*Refer [File request and response contents](#) for the contents of cwd, files, and error\*.*

*Example:*

```
`ts
{
  cwd:
  {
    name:"Download",
    size:0,
    dateModified:"2019-02-28T03:48:19.8319708+00:00",
    dateCreated:"2019-02-27T17:36:15.812193+00:00",
    hasChild:false,
    isFile:false,
    type:"",
    filterPath:"//Download//"
  },
  files:[
    {
      name:"Sample Work Sheet.xlsx",
      size:6172,
      dateModified:"2019-02-27T17:23:50.9651206+00:00",
      dateCreated:"2019-02-27T17:36:15.8151955+00:00",
      hasChild:false,
      isFile:true,
      type:".xlsx",
      filterPath:"//Download//"
    }
  ],
  error:null,
  details:null
}
```

### Create

The following table represents the request parameters of *create* operations.

Parameter	Type	Default	Explanation
action	String	create	Name of the file operation.
path	String	-	Relative path in which the folder has to be created.
name	String	-	Name of the folder to be created.
data	FileManagerDirectoryContent	-	Details about the current path (directory).

*\*Refer [File request and response contents](#) for the contents of data\**

*Example:*

```
`ts
{
  action: "create",
  data: [
    {
      dateCreated: "2019-02-27T17:36:15.6571949+00:00",
      dateModified: "2019-03-12T10:17:31.8505975+00:00",
      filterPath: "/",
      hasChild: true,
      isFile: false,
      name: files,
      nodeId: "fe_tree",
      size: 0,
      type: ""
    }
  ],
  name: "Hello",
  path: "/"
}
```

The following table represents the response parameters of *create* operations.

Parameter	Type	Default	Explanation
-----	-----	-----	-----

|files|FileManagerDirectoryContent[]|-|Details of the created folder|

|error|ErrorDetails|-|Error Details|

*\*Refer [File request and response contents](#) for the contents of files and error\*.*

*Example:*

```
`ts
{
  cwd: null,
  files: [
    {
      dateCreated: "2019-03-15T10:25:05.3596171+00:00",
      dateModified: "2019-03-15T10:25:05.3596171+00:00",
      filterPath: null,
      hasChild: false,
      isFile: false,
      name: "New",
      size: 0,
      type: ""
    }
  ],
  details: null,
  error: null
}
```

### [Rename](#)

The following table represents the request parameters of *rename* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	rename	Name of the file operation.
path	String	-	Relative path in which the item is located.
name	String	-	Current name of the item to be renamed.
newname	String	-	New name for the item.
data	FileManagerDirectoryContent	-	Details of the item to be renamed.

*\*Refer [File request and response contents](#) for the contents of data\*.*

*Example:*

```
`ts
{
  action: "rename",
  data: [
    {
      dateCreated: "2019-03-20T05:22:34.621Z",
      dateModified: "2019-03-20T08:45:56.000Z",
      filterPath: "/Pictures/Nature/",
      hasChild: false,
      iconClass: "e-fe-image",
      isFile: true,
      name: "seaviews.jpg",
      size: 95866,
      type: ".jpg"
    }
  ],
  newname: "seaview.jpg",
  name: "seaviews.jpg",
  path: "/Pictures/Nature/"
}
```

The following table represents the response parameters of *rename* operations.

Parameter	Type	Default	Explanation
files	FileManagerDirectoryContent[]	-	Details of the renamed item.
error	ErrorDetails	-	Error Details

*\*Refer [File request and response contents](#) for the contents of files and error\*.*

*Example:*

```
`ts
{
  cwd:null,
  files:[
```

```
{
  name:"seaview.jpg",
  size:95866,
  dateModified:"2019-03-20T08:45:56+00:00",
  dateCreated:"2019-03-20T05:22:34.6214847+00:00",
  hasChild:false,
  isFile:true,
  type:".jpg",
  filterPath:"//Pictures//Nature//seaview.jpg"
},
error:null,
details:null
},
,
```

#### Delete

The following table represents the request parameters of *delete* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	delete	Name of the file operation.
path	String	-	Relative path where the items to be deleted are located.
names	String[]	-	List of the items to be deleted.
data	FileManagerDirectoryContent	-	Details of the item to be deleted.

*\*Refer [File request and response contents](#) for the contents of data\*.*

*Example:*

```
`ts
{
  action: "delete",
  path: "/Hello/",
  names: ["New"],
  data: []
},
,
```

The following table represents the response parameters of *delete* operations.

Parameter	Type	Default	Explanation
----	----	----	----
files	FileManagerDirectoryContent[]	-	Details about the deleted item(s).
error	ErrorDetails	-	Error Details

*\*Refer [File request and response contents](#) for the contents of files and error\*.*

*Example:*

```
`ts
{
  cwd: null,
  details: null,
  error: null,
  files: [
    {
      dateCreated: "2019-03-15T10:13:30.346309+00:00",
      dateModified: "2019-03-15T10:13:30.346309+00:00",
      filterPath: "/Hello/folder",
      hasChild: true,
      isFile: false,
      name: "folder",
      size: 0,
      type: ""
    }
  ]
}
```

#### *Details*

The following table represents the request parameters of *details* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	details	Name of the file operation.
path	String	-	Relative path where the items are located.
names	String[]	-	List of the items to get details.

|data|FileManagerDirectoryContent|-|Details of the selected item.|

*\*Refer [File request and response contents](#) for the contents of data\*.*

*Example:*

```
`ts
{
  action: "details",
  path: "/FileContents/",
  names: ["All Files"],
  data: []
},
```

The following table represents the response parameters of *details* operations.

Parameter	Type	Default	Explanation
details	FileManagerDirectoryContent	-	Details of the requested item(s).
error	ErrorDetails	-	Error Details

*\*Refer [File request and response contents](#) for the contents of details and error\*.*

*Example:*

```
`ts
{
  cwd:null,
  files:null,
  error:null,
  details:
  {
    name:"All Files",
    location:"//Files//FileContents//All Files",
    isFile:false,
    size:"679.8 KB",
    created:"3/8/2019 10:18:37 AM",
    modified:"3/8/2019 10:18:39 AM",
    multipleFiles:false
  }
}
```

```
}  
,
```

### Search

The following table represents the request parameters of *search* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	search	Name of the file operation.
path	String	-	Relative path to the directory where the files should be searched.
showHiddenItems	Boolean	-	Defines show or hide the hidden items.
caseSensitive	Boolean	-	Defines search is case sensitive or not.
searchString	String	-	String to be searched in the directory.
data	FileManagerDirectoryContent	-	Details of the searched item.

*Example:*

```
`ts  
{  
  action: "search",  
  path: "/",  
  searchString: "nature",  
  showHiddenItems: false,  
  caseSensitive: false,  
  data: []  
}  
,
```

The following table represents the response parameters of *search* operations.

Parameter	Type	Default	Explanation
----	----	----	----
cwd	FileManagerDirectoryContent	-	Path (Current Working Directory) details.
files	FileManagerDirectoryContent[]	-	Files and folders in the searched directory that matches the search input.
error	ErrorDetails	-	Error Details

*\*Refer [File request and response contents](#) for the contents of cwd, files and error.\**

*Example:*

```
`ts  
{
```

```
cwd:
{
  name:files,
  size:0,
  dateModified:"2019-03-15T10:07:00.8658158+00:00",
  dateCreated:"2019-02-27T17:36:15.6571949+00:00",
  hasChild:true,
  isFile:false,
  type:"",
  filterPath:"/"
},
files:[
{
  name:"Nature",
  size:0,

},
,
```

### Copy

The following table represents the request parameters of *copy* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	copy	Name of the file operation.
path	String	-	Relative path to the directory where the files should be copied.

names	String[]	-	List of files to be copied.
targetPath	String	-	Relative path where the items to be pasted are located.
data	FileManagerDirectoryContent	-	Details of the copied item.
renameFiles	String[]	-	Details of the renamed item.

*Example:*

```
`ts
{
  action: "copy",
  path: "/",
  names: ["6.png"],
  renameFiles: ["6.png"],
  targetPath: "/Videos/"
}
```

The following table represents the response parameters of *copy* operations.

Parameter	Type	Default	Explanation
----	----	----	----
cwd	FileManagerDirectoryContent	-	Path (Current Working Directory) details.
files	FileManagerDirectoryContent[]	-	Details of copied files or folders
error	ErrorDetails	-	Error Details

*\*Refer [File request and response contents](#) for the contents of cwd, files and error.\**

*Example:*

```
`ts
{
  cwd:null,
  files:[
    {
      path:null,
      action:null,
      newName:null,
      names:null,
      name:"justin.mp4",
      size:0,
```

```
previousName:"album.mp4",
dateModified:"2019-06-21T06:58:32+00:00",
dateCreated:"2019-06-24T04:22:14.6245618+00:00",
hasChild:false,
isFile:true,
type:".mp4",
id:null,
filterPath:"/"
}
],
error:null,
details:null
}
、
```

### Move

The following table represents the request parameters of *move* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	move	Name of the file operation.
path	String	-	Relative path to the directory where the files should be copied.
names	String[]	-	List of files to be moved.
targetPath	String	-	Relative path where the items to be pasted are located.
data	FileManagerDirectoryContent	-	Details of the moved item.
renameFiles	String[]	-	Details of the renamed item.

### Example:

```
`ts
{
  action: "move",
  path: "/",
  names: ["6.png"],
  renameFiles: ["6.png"],
  targetPath: "/Videos/"
}
```

The following table represents the response parameters of *copy* operations.

Parameter	Type	Default	Explanation
----	----	----	----
cwd	FileManagerDirectoryContent	-	Path (Current Working Directory) details.
files	FileManagerDirectoryContent[]	-	Details of cut files or folders
error	ErrorDetails	-	Error Details

*\*Refer [File request and response contents](#) for the contents of cwd, files and error.\**

*Example:*

```
`ts
{
  cwd:null,
  files:[
    {
      path:null,
      action:null,
      newName:null,
      names:null,
      name:"justin biber.mp4",
      size:0,
      previousName:"justin biber.mp4",
      dateModified:"2019-06-21T06:58:32+00:00",
      dateCreated:"2019-06-24T04:26:49.2690476+00:00",
      hasChild:false,
      isFile:true,
      type:".mp4",
      id:null,
      filterPath:"//Videos//"
    }
  ],
  error:null,
  details:null
}
```

`

### Upload

The following table represents the request parameters of *Upload* operations.

Parameter	Type	Default	Explanation
action	String	Save	Name of the file operation.
path	String	-	Relative path to the location where the file has to be uploaded.
uploadFiles	<code>IList&lt;IFormFile&gt;</code>	-	File that are uploaded.

#### Example:

```
`ts
uploadFiles: (binary),
path: /,
action: Save,
data: {
  path:null,
  action:null,
  newName:null,
  names:null,
  name:"Downloads",
  size:0,
  previousName:null,
  dateModified:"2019-07-22T11:23:46.7153977 00:00",
  dateCreated:"2019-07-22T11:26:13.9047229 00:00",
  hasChild:false,
  isFile:false,
  type:"",
  id:null,
  filterPath:"/",
  targetPath:null,
  renameFiles:null,
  uploadFiles:null,
  caseSensitive:false,
  searchString:null,
```

```
showHiddenItems:false,
fmiconClass:null,
fmid:"fetree1",
fmpld:null,
fmselected:false,
fmicon:null,
data:null,
targetData:null,
permission:null
},
,
```

The upload response is an empty string.

#### [Download](#)

The following table represents the request parameters of *download* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	download	Name of the file operation
path	String	-	Relative path to location where the files to download are present.
names	String[]	-	Name list of the items to be downloaded.
data	FileManagerDirectoryContent	-	Details of the download item.

*Example:*

```
`ts
{
  action:"download",
  path:"/",
  names:["1.png"],
  data:[
    {
      path:null,
      action:null,
      newName:null,
      names:null,
      name:"1.png",
```

```
size:49792,
previousName:null,
dateModified:"2019-07-22T12:15:45.0972405+00:00",
dateCreated:"2019-07-22T12:15:45.0816042+00:00",
hasChild:false,
isFile:true,
type:".png",
id:null,
filterPath:"/",
targetPath:null,
renameFiles:null,
uploadFiles:null,
caseSensitive:false,
searchString:null,
showHiddenItems:false,
fmiconClass:"e-fe-image",
fmid:null,
fmpld:null,
fmselected:false,
fmicon:null,
data:null,
targetData:null,
permission:null,
fmcreated:"2019-07-22T12:15:45.081Z",
fmmodified:"2019-07-22T12:15:45.097Z",
fmimageUrl:"https://ej2-aspcore-service.azurewebsites.net/api/FileManager/GetImage?path=/1.png",
fmimageAttr:
{
  alt:"1.png"
},
fmhtmlAttr:
{
  class:"e-large-icon",
```

```
title:"1.png"
}
}
]
}
、
```

Downloads the requested items from the file server in response.

#### [GetImage](#)

The following table represents the request parameters of *GetImage* operations.

Parameter	Type	Default	Explanation
----	----	----	----
path	String	-	Relative path to the image file

Return the image as a file stream in response.

The request from the file manager can be customized using the [beforeSend](#) event. Additional information can be passed to the file manager in file operation response and can be used in customization.

#### [File request and response contents](#)

The following table represents the contents of *data*, *cwd*, and *files* in the file manager request and response.

Parameter	Type	Default	Explanation
----	----	----	----
name	String	-	File name
dateCreated	String	-	Date in which file was created (UTC Date string).
dateModified	String	-	Date in which file was last modified (UTC Date string).
filterPath	String	-	Relative path to the file or folder.
hasChild	Boolean	-	Defines this folder has any child folder or not.
isFile	Boolean	-	Say whether the item is file or folder.
size	Number	-	File size
type	String	-	File extension

The following table represents the contents of *error* in the file manager request and response.

Parameter	Type	Default	Explanation
----	----	----	----
code	String	-	Error code
message	String	-	Error message
fileExists	String[]	-	List of duplicate file names

The following table represents the contents of *details* in the file manager request and response.

Parameter	Type	Default	Explanation
----	----	----	----
name	String	-	File name
dateCreated	String	-	Date in which file was created (UTC Date string).
dateModified	String	-	Date in which file was last modified (UTC Date string).
filterPath	String	-	Relative path to the file or folder.
hasChild	Boolean	-	Defines this folder has any child folder or not.
isFile	Boolean	-	Say whether the item is file or folder.
size	Number	-	File size
type	String	-	File extension
multipleFiles	Boolean	-	Say whether the details are about single file or multiple files.

### Action Buttons

The file manager has several menu buttons to access the file operations. The list of menu buttons available in the file manager is given in the following table.

Menu Button	Behaviour
----	----
SortBy	Opens the sub menu to choose the sorting order and sorting parameter.
View	Opens the sub menu to choose the View.
Open	Navigates to the selected folder. Opens the preview for image files.
Refresh	Initiates the read operation for the current directory and displays the updated directory content.
NewFolder	Opens the new folder dialog box to receive the name for the new folder.
Rename	Opens the rename dialog box to receive the new name for the selected item.
Delete	Opens the delete dialog box to confirm the removal of the selected items from the file system.
Upload	Opens the upload box to select the items to upload to the file system.
Download	Downloads the selected item(s).
Details	Get details about the selected items and display them in details dialog box.
SelectAll	Selects all the files and folders displayed in the view section.

The action menu buttons are present in the toolbar and context menu. The toolbar contains the buttons based on the selected items count, while the context menu will appear with a list based on the target.

### Toolbar

The toolbar can be divided into two sections as right and left. Whenever the toolbar buttons exceed the size, the buttons present in the left section of the toolbar will be moved to the toolbar popup.

The following table provides the toolbar buttons that appear based on the selection.

<!-- markdownlint-disable MD033 -->

Selected Items Count	Left section	Right section
0 (none of the item )	<i>SortBy</i> Refresh <i>NewFolder</i> Upload	<i>View</i> Details
1 (single item selected)	<i>Delete</i> Download* Rename	<i>Selected items count</i> View* Details
>1 (multiple selection)	<i>Delete</i> Download	<i>Selected items count</i> View* Details

### Context menu

The following table provides the default context menu item and the corresponding target areas.

<!-- markdownlint-disable MD033 -->

Menu Name	Menu Items	Target
Layout	<i>SortBy</i> View <i>Refresh</i> <i>NewFolder</i> Upload Details* Select all	<i>Empty space in the view section (details view and large icon view area). Empty folder content.</i>
Folders	<i>Open</i> Delete <i>Rename</i> Downloads* Details	* Folders in treeview, details view, and large icon view.
Files	<i>Open</i> Delete <i>Rename</i> Downloads* Details	* Files in details view and large icon view.

## Views in Vue File manager component

View is the section where the files and folders are displayed for the user to browse. The [view](#) API can also be used to change the initial view of the file manager.

The file manager has two types of [views](#) to display the files and folders.

- [Largelcons View](#)
- [Details View](#)

### Largelcons View

By Default, File Manager is rendered with largeicons view. The following example demonstrate this.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-filemanager id="file-manager" :ajaxSettings="ajaxSettings">
    </ejs-filemanager>
  </div>
</template>
<script>
import Vue from "vue";
import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from
"@syncfusion/ej2-vue-filemanager";
Vue.use(FileManagerPlugin);
```

```

export default {
  data () {
    return {
      ajaxSettings:
      {
        url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",
        getImageUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/GetImage",
        uploadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Upload",
        downloadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Download"
      },
    };
  },
  provide: {
    filemanager: [DetailsView, NavigationPane, Toolbar]
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";

@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
filemanager/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/file-manager/detailsview-cs2" %}

### Details View

Details view is an injectable module in the file manager so, it should be injected before rendering the file manager to avail its functionality. The default appearance of the file manager can be changed from largeicons to details view by using the [view](#) property. The following example demonstrate the file manager with details view.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-filemanager id="file-manager" :view="view"
:ajaxSettings="ajaxSettings">
      </ejs-filemanager>
    </div>
  </template>
<script>
import Vue from "vue";

```

```

import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from
"@syncfusion/ej2-vue-filemanager";
Vue.use(FileManagerPlugin);
export default {
  data () {
    return {
      ajaxSettings:
      {
        url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",
        getImageUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/GetImage",
        uploadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Upload",
        downloadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Download"
      },
      view : "Details"
    };
  },
  provide: {
    filemanager: [DetailsView, NavigationPane, Toolbar]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
filemanager/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/file-manager/detailsview-cs3" %}

### Customization in Vue File manager component

The file manager component allows customizing its functionalities like, context menu, searching, uploading, toolbar using APIs. Given below are some of the functionalities that can be customized in the File Manager,

- [Context menu customization](#)
- [Details view customization](#)
- [Navigation pane customization](#)
- [Show/Hide file extension](#)
- [Show/Hide hidden items](#)
- [Show/Hide thumbnail images in large icons view](#)
- [Toolbar customization](#)
- [Upload customization](#)

- [Tooltip customization](#)

### Context menu customization

The context menu settings like, items to be displayed on files, folders and layout click and visibility can be customized using [contextMenuSettings](#) property.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-filemanager id="file-manager"
      :contextMenuSettings="contextMenuSettings" :ajaxSettings="ajaxSettings">
      </ejs-filemanager>
    </div>
  </template>
<script>
import Vue from "vue";
import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from
"@syncfusion/ej2-vue-filemanager";
Vue.use(FileManagerPlugin);
export default {
  data () {
    return {
      ajaxSettings:
      {
        url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",
        getImageUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/GetImage",
        uploadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Upload",
        downloadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Download"
      },
      // Context Menu settings customization
      contextMenuSettings: { file: ['Open', '|', 'Details'], folder:
['Open', '|', 'Details'], layout: ['SortBy', 'View', 'Refresh', '|',
'Details', '|'], visible: true}
    };
  },
  provide: {
    filemanager: [DetailsView, NavigationPane, Toolbar]
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
```

```
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
filemanager/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/file-manager/contextmenu-cs1" %}

### Details view customization

The details view settings like, column width, header text, template for each field can be customized using [detailsViewSettings](#) property.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-filemanager id="file-manager" :view="view"
:detailsViewSettings="detailsViewSettings" :ajaxSettings="ajaxSettings">
      </ejs-filemanager>
    </div>
  </template>
<script>
import Vue from "vue";
import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from
"@syncfusion/ej2-vue-filemanager";
Vue.use(FileManagerPlugin);
export default {
  data () {
    return {
      ajaxSettings:
      {
        url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",
        getImageUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/GetImage",
        uploadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Upload",
        downloadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Download"
      },
      // Initial view of File Manager is set to details view
      view: "Details",
      // Details View settings customization
      detailsViewSettings: {
        columns: [
          {field: 'name', headerText: 'File Name', minWidth: 120,
width: 'auto', customAttributes: { class: 'e-fe-grid-name' },template:
'${name}'},
          {field: 'size', headerText: 'File Size',minWidth: 50,
width: '110', template: '${size}'},
          { field: '_fm_modified', headerText: 'Date
Modified',minWidth: 50, width: '190'}
        ]
      }
    };
  },
  provide: {
```

```

        filemanager: [DetailsView, NavigationPane, Toolbar]
    }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
filemanager/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/file-manager/detailsview-cs1" %}

### Navigation pane customization

The navigation pane settings like, minimum and maximum width and visibility can be customized using [navigationPaneSettings](#) property.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-filemanager id="file-manager"
      :navigationPaneSettings="navigationPaneSettings"
      :ajaxSettings="ajaxSettings">
      </ejs-filemanager>
    </div>
  </template>
<script>
import Vue from "vue";
import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from
"@syncfusion/ej2-vue-filemanager";
Vue.use(FileManagerPlugin);
export default {
  data () {
    return {
      ajaxSettings:
      {
        url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",
        getImageUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/GetImage",
        uploadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Upload",
        downloadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Download"
      },
      // Navigation Pane settings customization
    }
  }
}

```

```

        navigationPaneSettings: { maxWidth: '850px', minWidth: '140px',
visible: true}
    };
    },
    provide: {
        filemanager: [DetailsView, NavigationPane, Toolbar]
    }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
filemanager/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/file-manager/navigationpane-cs1" %}

### Show/Hide file extension

The file extensions are displayed in the File Manager by default. This can be hidden by disabling the [showFileExtension](#) property.

In File Manager [fileLoad](#) and [fileOpen](#) events are triggered before the file/folder is rendered and before the file/folder is opened respectively. These events can be utilized to perform operations before a file/folder is rendered or opened.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-filemanager id="file-manager"
:showFileExtension="showFileExtension" :ajaxSettings="ajaxSettings"
:fileLoad="onBeforeFileLoad" :fileOpen="onBeforeFileOpen">
      </ejs-filemanager>
    </div>
  </template>
<script>
import Vue from "vue";
import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from
"@syncfusion/ej2-vue-filemanager";
Vue.use(FileManagerPlugin);
export default {
  data () {
    return {
      ajaxSettings:
        {

```

```

        url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",
        getImageUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/GetImage",
        uploadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Upload",
        downloadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Download"
    },
    // Hides the file extension in File Manager
    showFileExtension: false
  };
},
provide: {
  filemanager: [DetailsView, NavigationPane, Toolbar]
},
methods: {
  // File Manager's file beforeFileLoad function

### Multiple selection in Vue File manager component

The file manager allows you to select multiple files by enabling the [allowMultiSelection](#) property (enabled by default). The multiple selection can be done by pressing the **Ctrl** key or **Shift** key and selecting the files. The check box can also be used to do multiple selection. **Ctrl + A** can be used to select all files in the current directory. The [fileSelect](#) event will be triggered when the items of file manager control is selected or unselected.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-filemanager id="file-manager" :fileSelect="onFileSelect"
    :allowMultiSelection="allowMultiSelection" :ajaxSettings="ajaxSettings">
    </ejs-filemanager>
  </div>
</template>
<script>
import Vue from "vue";
import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from
"@syncfusion/ej2-vue-filemanager";
Vue.use(FileManagerPlugin);
export default {
  data () {
    return {
      ajaxSettings:
      {
        url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",
        getImageUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/GetImage",
        uploadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Upload",

```

```

        downloadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Download"
    },
    // allowMultiSelection is true by default
    allowMultiSelection: true
  };
},
provide: {
  filemanager: [DetailsView, NavigationPane, Toolbar]
},
methods: {
  // File Manager's file select event function
  onFileSelect: function(args){
    console.log(args.fileDetails.name + " has been " + args.action +
"ed");
  }
}
});
</script>
<style>

filemanager/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/file-manager/multiselect-cs1" %}

Note: The File Manager has support to select files and folders initially or dynamically by specifying their names in [selectedItems](#) property.

### Drag and drop in Vue File manager component

The file manager allows files or folders to be moved from one folder to another by using the [allowDragAndDrop](#) property. It also supports uploading a file by dragging it from Windows Explorer to FileManager control. You can enable or disable this support by using the [allowDragAndDrop](#) property of file manager.

The event triggered in drag and drop support are

- [fileDragStart](#) - Triggers when the file/folder dragging is started.
- [fileDragging](#) - Triggers while dragging the file/folder.
- [fileDragStop](#) - Triggers when the file/folder is about to be dropped at the target.
- [fileDropped](#) - Triggers when the file/folder is dropped.

### APP.VUE

```
<template>
```

```

    <div id="app">
      <ejs-filemanager id="file-manager"
:allowDragAndDrop="allowDragAndDrop" :fileDragStart="onFileDragStart"

### File system provider in Vue File manager component

The file system provider allows the File Manager component to manage the files and folders in a physical or cloud-based file system. It provides the methods for performing various file actions like creating a new folder, copying and moving of files or folders, deleting uploading, and downloading the files or folders in the file system.

The following file providers are added in Syncfusion EJ2 File Manager component.

- [ASP.NET Core file system provider](#)
- [ASP.NET MVC 5 file system provider](#)
- [ASP.NET Core Azure cloud file system Provider](#)
- [ASP.NET MVC 5 Azure cloud file system Provider](#)
- [ASP.NET Core Amazon S3 cloud file provider](#)
- [ASP.NET MVC Amazon S3 cloud file provider](#)
- [File Transfer Protocol file system provider](#)
- [SQL database file system provider](#)
- [NodeJS file system provider](#)
- [Google Drive file system provider](#)
- [Firebase Realtime Database file system provider](#)
- [IBM Cloud Object Storage provider](#)

### ASP.NET Core file system provider

The ASP.NET Core file system provider allows the users to access and manage the physical file system. To get started, we need to clone the [ej2-aspcore-file-provider](#) using the following command.

```
`ts
```

```
git clone https://github.com/SyncfusionExamples/ej2-aspcore-file-provider ej2-aspcore-file-provider
cd ej2-aspcore-file-provider
```

After cloning, open the project in Visual Studio and restore the NuGet packages. Now, we need to set the root directory of the physical file system in the FileManager controller.

After setting the root directory of the file system, build and run the project. Now, the project will be hosted in `http://localhost:{port}` and mapping the ajaxSettings property of the FileManager component to the appropriate controller methods allows to manage the files in the physical file system.

```
<template>
<div id="app">
<ejs-filemanager id="file-manager" :ajaxSettings="ajaxSettings">
</ejs-filemanager>
</div>
</template>
<script>
import Vue from "vue";

import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from "@syncfusion/ej2-vue-filemanager";

Vue.use(FileManagerPlugin);

export default {
  data () {
    return {
      // Initializing File Manager ASP.NET Core service.
      ajaxSettings:
      { // Replace the hosted port number in the place of "{port}"
        url: "http://localhost:{port}/api/FileManager/FileOperations",
        getImageUrl: "http://localhost:{port}/api/FileManager/GetImage",
        uploadUrl: "http://localhost:{port}/api/FileManager/Upload",
        downloadUrl: "http://localhost:{port}/api/FileManager/Download"
      }
    };
  },
  provide: {
    filemanager: [DetailsView, NavigationPane, Toolbar]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
```

```

@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-filemanager/styles/material.css";
</style>
`

```

Note: To learn more about file actions that can be performed with ASP.NET Core file system provider, refer to this [link](#)

#### ASP.NET MVC 5 file system provider

The ASP.NET MVC5 file system provider allows the users to access and manage the physical file system. To get started, we need to clone the [ej2-aspmvc-file-provider](#) using the following command.

```

`ts
git clone https://github.com/SyncfusionExamples/ej2-aspmvc-file-provider ej2-aspmvc-file-provider
cd ej2-aspmvc-file-provider
`

```

After cloning, open the project in Visual Studio and restore the NuGet packages. Now, we need to set the root directory of the physical file system in the FileManager controller using the Root Folder method.

After setting the root directory of the file system, build and run the project. Now, the project will be hosted in `http://localhost:{port}` and mapping the ajaxSettings property of the FileManager component to the appropriate controller methods allows to manage the files in the physical file system.

```

<template>
<div id="app">
<ejs-filemanager id="file-manager" :ajaxSettings="ajaxSettings">
</ejs-filemanager>
</div>
</template>
<script>
import Vue from "vue";

import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from "@syncfusion/ej2-vue-filemanager";

```

```
Vue.use(FileManagerPlugin);
export default {
  data () {
    return {
      // Initializing File Manager ASP.NET MVC service.
      ajaxSettings:
      {
        // Replace the hosted port number in the place of "{port}"
        url: "http://localhost:{port}/FileManager/FileOperations",
        getImageUrl: "http://localhost:{port}/FileManager/GetImage",
        uploadUrl: "http://localhost:{port}/FileManager/Upload",
        downloadUrl: "http://localhost:{port}/FileManager/Download"
      }
    };
  },
  provide: {
    filemanager: [DetailsView, NavigationPane, Toolbar]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";

@import "../node_modules/@syncfusion/ej2-vue-filemanager/styles/material.css";
</style>
`
```

**Note:** To learn more about file actions that can be performed with ASP.NET MVC 5 file system provider, refer to this [link](#)

#### ASP.NET Core Azure cloud file system Provider

In ASP.NET Core, Azure file system provider allows the users to access and manage the blobs in the Azure blob storage. To get started, we need to clone the [azure-aspcore-file-provider](#) using the following command

```
`ts
git clone https://github.com/SyncfusionExamples/azure-aspcore-file-provider azure-aspcore-file-provider
`
```

After cloning, open the project in Visual Studio and restore the NuGet packages. Now, we need to register the Azure storage by passing details like name, password, and blob name to the Register Azure method in the FileManager controller.

```
`ts
void RegisterAzure(string accountName, string accountKey, string blobName)
`
```

Then, set the blob container and the root blob directory by passing the corresponding URLs as parameters in the setBlobContainer method as follows.

```
`ts
void setBlobContainer( Blob-contatiner-url, Root-blob-directory-url)
`
```

**Note:** Also, assign the same *blobPath URL* and *filePath URL* in [AzureFileOperations](#) and [AzureUpload](#) methods in the FileManager controller to determine the original path of the Azure blob.

After setting the blob container references, just build and run the project. Now, the project will be hosted in `http://localhost:{port}` and just mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods allows to manage the Azure blob storage.

```
<template>
<div id="app">
<ejs-filemanager id="file-manager" :ajaxSettings="ajaxSettings">
</ejs-filemanager>
</div>
</template>
<script>
import Vue from "vue";
import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from "@syncfusion/ej2-vue-filemanager";
```

```
Vue.use(FileManagerPlugin);
export default {
  data () {
    return {
      // Initializing File Manager Azure cloud file system service.
      ajaxSettings:
      {
        // Replace the hosted port number in the place of "{port}"
        url: "http://localhost:{port}/api/AzureProvider/AzureFileOperations",
        getImageUrl: "http://localhost:{port}/api/AzureProvider/AzureGetImage",
        uploadUrl: "http://localhost:{port}/api/AzureProvider/AzureUpload",
        downloadUrl: "http://localhost:{port}/api/AzureProvider/AzureDownload"
      }
    };
  },
  provide: {
    filemanager: [DetailsView, NavigationPane, Toolbar]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-filemanager/styles/material.css";
</style>
`
```

**Note:** To learn more about file actions that can be performed with ASP.NET Core Azure cloud file system Provider, refer to this [link](#)

#### ASP.NET MVC Azure cloud file system Provider

In ASP.NET MVC, Azure file system provider allows the users to access and manage the blobs in the Azure blob storage. To get started, we need to clone the [ej2-azure-aspmvc-file-provider](#) using the following command

```
`ts
git clone https://github.com/SyncfusionExamples/ej2-azure-aspmvc-file-provider ej2-azure-aspmvc-file-provider
`
```

After cloning, open the project in Visual Studio and restore the NuGet packages. Now, we need to register the Azure storage by passing details like name, password, and blob name to the Register Azure method in the FileManager controller.

```
`ts
void RegisterAzure(string accountName, string accountKey, string blobName)
`
```

Then, set the blob container and the root blob directory by passing the corresponding URLs as parameters in the setBlobContainer method as follows.

```
`ts
void setBlobContainer( Blob-container-url, Root-blob-directory-url)
`
```

**Note:** Also, assign the same *blobPath URL* and *filePath URL* in [AzureFileOperations](#) and [AzureUpload](#) methods in the FileManager controller to determine the original path of the Azure blob.

After setting the blob container references, just build and run the project. Now, the project will be hosted in `http://localhost:{port}` and just mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods allows to manage the Azure blob storage.

```
<template>
<div id="app">
<ejs-filemanager id="file-manager" :ajaxSettings="ajaxSettings">
</ejs-filemanager>
</div>
</template>
<script>
import Vue from "vue";
import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from "@syncfusion/ej2-vue-filemanager";
```

```
Vue.use(FileManagerPlugin);
export default {
  data () {
    return {
      // Initializing File Manager Azure cloud file system service.
      ajaxSettings:
      {
        // Replace the hosted port number in the place of "{port}"
        url: "http://localhost:{port}/AzureProvider/AzureFileOperations",
        getImageUrl: "http://localhost:{port}/AzureProvider/AzureGetImage",
        uploadUrl: "http://localhost:{port}/AzureProvider/AzureUpload",
        downloadUrl: "http://localhost:{port}/AzureProvider/AzureDownload"
      }
    };
  },
  provide: {
    filemanager: [DetailsView, NavigationPane, Toolbar]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-filemanager/styles/material.css";
</style>
`
```

**Note:** To learn more about file actions that can be performed with ASP.NET MVC Azure cloud file system Provider, refer to this [link](#)

#### ASP.NET Core Amazon S3 cloud file provider

In ASP.NET Core, Amazon **S3** (*Simple Storage Service*) cloud file provider allows the users to access and manage a server hosted file system as collection of objects stored in the Amazon S3 Bucket. To get started, clone the [amazon-s3-aspcore-file-provider](#) using the following command

```
`ts
git clone https://github.com/SyncfusionExamples/amazon-s3-aspcore-file-provider.git amazon-s3-
aspcore-file-provider.git
`
```

**Note:** To learn more about creating and configuring an Amazon S3 bucket, refer to this [link](#).

After cloning, open the project in Visual Studio and restore the NuGet packages. Now, register Amazon S3 client account details like *awsAccessKeyId*, *awsSecretKeyId* and *awsRegion* details in **RegisterAmazonS3** method in the FileManager controller to perform the file operations.

```
`ts
void RegisterAmazonS3(string bucketName, string awsAccessKeyId, string awsSecretAccessKey, string
bucketRegion)
`
```

After registering the Amazon client account details, build and run the project. Now, the project will be hosted in `http://localhost:{port}` and mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods allows to manage the Amazon **S3** (*Simple Storage Service*) bucket's objects storage.

```
<template>
<div id="app">
<ejs-filemanager id="file-manager" :ajaxSettings="ajaxSettings">
</ejs-filemanager>
</div>
</template>
<script>
import Vue from "vue";

import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from "@syncfusion/ej2-vue-
filemanager";

Vue.use(FileManagerPlugin);

export default {
data () {
return {
```

```
// Initializing File Manager Amazon S3 file system service.
ajaxSettings:
{
  // Replace the hosted port number in the place of "{port}"
  url: "http://localhost:{port}/api/AmazonS3Provider/AmazonS3FileOperations",
  getImageUrl: "http://localhost:{port}/api/AmazonS3Provider/AmazonS3GetImage",
  uploadUrl: "http://localhost:{port}/api/AmazonS3Provider/AmazonS3Upload",
  downloadUrl: "http://localhost:{port}/api/AmazonS3Provider/AmazonS3Download"
}
};
},
provide: {
  filemanager: [DetailsView, NavigationPane, Toolbar]
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-filemanager/styles/material.css";
</style>
`
```

**Note:** To learn more about the file actions that can be performed with Amazon S3 Cloud File provider, refer to this [link](#)

### ASP.NET MVC Amazon S3 cloud file provider

In ASP.NET MVC, Amazon **S3** (*Simple Storage Service*) cloud file provider allows the users to access and manage a server hosted files as collection of objects stored in the Amazon S3 Bucket. To get started, clone the [ej2-amazon-s3-aspmvc-file-provider](https://github.com/SyncfusionExamples/ej2-amazon-s3-aspmvc-file-provider) using the following command

```
`ts
git clone https://github.com/SyncfusionExamples/ej2-amazon-s3-aspmvc-file-provider.git ej2-amazon-
s3-aspmvc-file-provider.git
`
```

**Note:** To learn more about creating and configuring an Amazon S3 bucket, refer to this [link](#).

After cloning, open the project in Visual Studio and restore the NuGet packages. Now, register Amazon S3 client account details like *awsAccessKeyId*, *awsSecretKeyId* and *awsRegion* details in **RegisterAmazonS3** method in the FileManager controller to perform the file operations.

```
`ts
void RegisterAmazonS3(string bucketName, string awsAccessKeyId, string awsSecretAccessKey, string
bucketRegion)
`
```

After registering the Amazon client account details, just build and run the project. Now, the project will be hosted in `http://localhost:{port}` and just mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods allows to manage the Amazon **S3** (*Simple Storage Service*) bucket's objects storage.

```
<template>
<div id="app">
<ejs-filemanager id="file-manager" :ajaxSettings="ajaxSettings">
</ejs-filemanager>
</div>
</template>
<script>
import Vue from "vue";

import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from "@syncfusion/ej2-vue-
filemanager";

Vue.use(FileManagerPlugin);

export default {
  data () {
    return {
      // Initializing File Manager Amazon S3 file service.
```

```

ajaxSettings:
{
  // Replace the hosted port number in the place of "{port}"
  url: "http://localhost:{port}/FileManager/FileOperations",
  getImageUrl: "http://localhost:{port}/FileManager/GetImage",
  uploadUrl: "http://localhost:{port}/FileManager/Upload",
  downloadUrl: "http://localhost:{port}/FileManager/Download"
}
};
},
provide: {
  filemanager: [DetailsView, NavigationPane, Toolbar]
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-filemanager/styles/material.css";
</style>
`

```

**Note:** To learn more about the file actions that can be performed with ASP.NET MVC Amazon S3 Cloud File Provider, refer to this [link](#)

#### File Transfer Protocol file system provider

In ASP.NET Core, File Transfer Protocol file system provider allows the users to access to the hosted file system as collection of objects stored in the file storage using File Transfer Protocol. To get started, clone the [ftp-aspcore-file-provider](#) using the following command

```
`ts
```

```
git clone https://github.com/SyncfusionExamples/ftp-aspcore-file-provider.git ftp-aspcore-file-provider.git
```

```
,
```

After cloning, open the project in Visual Studio and restore the NuGet packages. Now, register File Transfer Protocol details like *hostName*, *userName* and *password* in **SetFTPConnection** method in the FileManager controller to perform the file operations.

```
`ts
```

```
void SetFTPConnection(string hostName, string userName, string password)
```

```
,
```

After registering the File Transfer Protocol details, just build and run the project. Now, the project will be hosted in `http://localhost:{port}` and mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods allows you to manage the FTP's objects storage.

```
,
```

```
<template>
```

```
<div id="app">
```

```
<ejs-filemanager id="file-manager" :ajaxSettings="ajaxSettings">
```

```
</ejs-filemanager>
```

```
</div>
```

```
</template>
```

```
<script>
```

```
import Vue from "vue";
```

```
import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from "@syncfusion/ej2-vue-filemanager";
```

```
Vue.use(FileManagerPlugin);
```

```
export default {
```

```
  data () {
```

```
    return {
```

```
    // Initializing File Manager file transfer protocol file system service.
```

```
    ajaxSettings:
```

```
    {
```

```
    // Replace the hosted port number in the place of "{port}"
```

```
    url: "http://localhost:{port}/api/FTPProvider/FTPFileOperations",
```

```
    getImageUrl: "http://localhost:{port}/api/FTPProvider/FTPGetImage",
```

```
    uploadUrl: "http://localhost:{port}/api/FTPProvider/FTPUUpload",
```

```

downloadUrl: "http://localhost:{port}/api/FTPProvider/FTPDownload"
}
};
},
provide: {
  filemanager: [DetailsView, NavigationPane, Toolbar]
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-filemanager/styles/material.css";
</style>
`

```

**Note:** To learn more about the file actions that can be performed with File Transfer Protocol file system provider, refer to this [link](#)

### SQL database file system provider

In ASP.NET Core, SQL database file system provider allows the users to manage the file system being maintained in a SQL database table. Unlike the other file system providers, the SQL database file system provider works on ID basis. Here, each file and folder have a unique ID based on which all the file operations will be performed. To get started, we need to clone the [sql-server-database-aspcore-file-provider](#) using the following command.

```

`ts
<add name="FileExplorerConnection" connectionString="Data
Source=(LocalDB)\v11.0;AttachDbFilename=|DataDirectory|\FileManager.mdf;Integrated
Security=True;Trusted_Connection=true" />
`

```

After cloning, open the project in Visual Studio and restore the NuGet packages. To establish the SQL server connection with the database file (for eg: FileManager.mdf), we need to specify the connection string in the web config file as follows.

```
`ts
<add name="FileExplorerConnection" connectionString="Data
Source=(LocalDB)\v11.0;AttachDbFilename=|DataDirectory|\FileManager.mdf;Integrated
Security=True;Trusted_Connection=true" />
`
```

Then, make an entry for the connection string in `appsettings.json` file as follows.

```
`ts
"ConnectionStrings": {
  "FileManagerConnection": "Data
Source=(LocalDB)\MSSQLLocalDB;AttachDbFilename=|DataDirectory|\\App_Data\\FileManager.mdf;In
tegrated Security=True;Connect Timeout=30"
}
`
```

Now, to configure the database connection, we need to set the connection name, table name and root folder ID value by passing these values to the SetSQLConnection method.

```
`ts
void SetSQLConnection(string name, string tableName, string tableID)
`
```

Refer to this [FileManager.mdf](#), to learn about the pre-defined file system SQL database for the EJ2 File Manager.

After configuring the connection, build and run the project. Now, the project will be hosted in `http://localhost:{port}` and mapping the `ajaxSettings` property of the FileManager component to the appropriate controller methods allows to manage the files in the SQL database table.

```
`
<template>
<div id="app">
<ejs-filemanager id="file-manager" :ajaxSettings="ajaxSettings">
</ejs-filemanager>
</div>
</template>
<script>
import Vue from "vue";
```

```
import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from "@syncfusion/ej2-vue-filemanager";

Vue.use(FileManagerPlugin);

export default {
  data () {
    return {
      // Initializing File Manager SQL database file system service.
      ajaxSettings:
      {
        // Replace the hosted port number in the place of "{port}"
        url: "http://localhost:{port}/api/SQLProvider/SQLFileOperations",
        getImageUrl: "http://localhost:{port}/api/SQLProvider/SQLGetImage",
        uploadUrl: "http://localhost:{port}/api/SQLProvider/SQLUpload",
        downloadUrl: "http://localhost:{port}/api/SQLProvider/SQLDownload"
      }
    };
  },
  provide: {
    filemanager: [DetailsView, NavigationPane, Toolbar]
  }
}

</script>

<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-filemanager/styles/material.css";
```

</style>

,

**Note:** To learn more about file actions that can be performed with SQL database file system provider, refer to this [link](#)

### Google Drive file system provider

In ASP.NET Core, Google Drive file system provider allows the users to manage the files and folders in a Google Drive account. The Google Drive file system provider works on id basis where each file and folder have a unique ID. To get started, we need to clone the [google-drive-aspcore-file-provider](#) using the following command.

`ts

```
git clone https://github.com/SyncfusionExamples/google-drive-aspcore-file-provider google-drive-aspcore-file-provider
```

```
cd google-drive-aspcore-file-provider
```

,

Google Drive file system provider use the [Google Drive APIs](#) to read the file in the file system and uses the [OAuth 2.0](#) protocol for authentication and authorization. To authenticate from the client end, have to obtain OAuth 2.0 client credentials from the [Google API Console](#). To learn more about generating the client credentials from the from Google API Console, refer to this [link](#).

After generating the client secret data, copy the JSON data to the following specified JSON files in the cloned location.

- EJ2GoogleDriveFileProvider > credentials > client\_secret.json
- GoogleOAuth2.0Base > credentials > client\_secret.json

After updating the credentials, build and run the project. Now, the project will be hosted in <http://localhost:{port}>, and it will ask to log on to the Gmail account created the client secret credentials. Then, provide permission to access the Google Drive files by clicking the allow access button in the page. Now, mapping the ajaxSettings property of the FileManager component to the appropriate controller methods will allows to manage the files from the Google Drive.

,

<template>

<div id="app">

<ejs-filemanager id="file-manager" :ajaxSettings="ajaxSettings">

</ejs-filemanager>

</div>

</template>

<script>

import Vue from "vue";

```
import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from "@syncfusion/ej2-vue-filemanager";

Vue.use(FileManagerPlugin);

export default {
  data () {
    return {
      // Initializing File Manager Google Drive file system service.
      ajaxSettings:
      {
        // Replace the hosted port number in the place of "{port}"
        url: "http://localhost:{port}/api/GoogleDriveProvider/GoogleDriveFileOperations",
        getImageUrl: "http://localhost:{port}/api/GoogleDriveProvider/GoogleDriveGetImage",
        uploadUrl: "http://localhost:{port}/api/GoogleDriveProvider/GoogleDriveUpload",
        downloadUrl: "http://localhost:{port}/api/GoogleDriveProvider/GoogleDriveDownload"
      }
    };
  },
  provide: {
    filemanager: [DetailsView, NavigationPane, Toolbar]
  }
}

</script>

<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-filemanager/styles/material.css";
```

</style>

**Note:** To learn more about file actions that can be performed with Google drive file system provider, refer to this [link](#)

### NodeJS file system provider

In ASP.NET Core, NodeJS file system provider allows the users to manage the files and folders in a physical file system. It provides methods for performing all basic file operations like creating a folder, copy, move, delete, and download files and folders in the file system. We can use of the NodeJS file system provider either by installing the [ej2-filemanager-node-filesystem](#) package or by cloning the [file system provider](#) from the GitHub.

#### Using ej2-filemanager-node-filesystem package

- Install the ej2-filemanager-node-filesystem package by running the below command.

```
`ts
```

```
npm install @syncfusion/ej2-filemanager-node-filesystem
```

- After installing the package, navigate to the ej2-filemanager-node-filesystem package folder within the node-modules
- Run the command **npm install** command.

#### Cloning the ej2-filemanager-node-filesystem from GitHub

- Clone the ej2-filemanager-node-filesystem using the following command.

```
`ts
```

```
git clone https://github.com/SyncfusionExamples/ej2-filemanager-node-filesystem.git node-filesystem-provider
```

- After cloning, open the root folder and run the command **npm install** command.

After installing the packages, set the root folder directory of the physical file system in the package JSON under scripts sections as follows.

```
`ts
```

```
"start": "node filesystem-server.js -d D:/Projects"
```

**Note:** By default, the root directory will be configured to set **C:/Users** as the root directory.

To set the port in which the project to be hosted and the root directory of the file system. Run the following command.

```
`ts
set PORT=3000 && node filesystem-server.js -d D:/Projects
`
```

**Note:** By default, the service will run 8090 port.

Now, mapping the ajaxSettings property of the FileManager component to the appropriate file operation methods in the filesystem-server.js file will allow to manage the physical file system with NodeJS file system provider.

```
<template>
<div id="app">
  <ejs-filemanager id="file-manager" :ajaxSettings="ajaxSettings">
</ejs-filemanager>
</div>
</template>
<script>
import Vue from "vue";

import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from "@syncfusion/ej2-vue-filemanager";

Vue.use(FileManagerPlugin);

export default {
  data () {
    return {
      // Initializing File Manager NodeJS file system service.
      ajaxSettings:
      {
        // Replace the hosted port number in the place of "{port}"
        url: "http://localhost:{port}/",
        getImageUrl: "http://localhost:{port}/GetImage",
        uploadUrl: "http://localhost:{port}/Upload",
        downloadUrl: "http://localhost:{port}/Download"
      }
    };
  },
  provide: {

</style>
`
```

**Note:** To learn more about file actions that can be performed with NodeJS file system provider, refer to this [link](#)

#### Firebase Realtime Database file system provider

The [Firebase Realtime Database](#) file system provider in **ASP.NET Core** provides the efficient way to store the File Manager file system in a cloud database as JSON representation.

#### *Generate Secret access key from service account*

Follow the given steps to generate the secret access key:

- To access the Firebase console, please click on this [link](#). Once you have accessed the console, you can create a new project by filling in the necessary fields and clicking on the relevant buttons.

- Within the Firebase console, navigate to the **Build** tab. Under this tab, select the option for **Realtime Database**. From there, you can create a new database by clicking on the **Create Database** button.

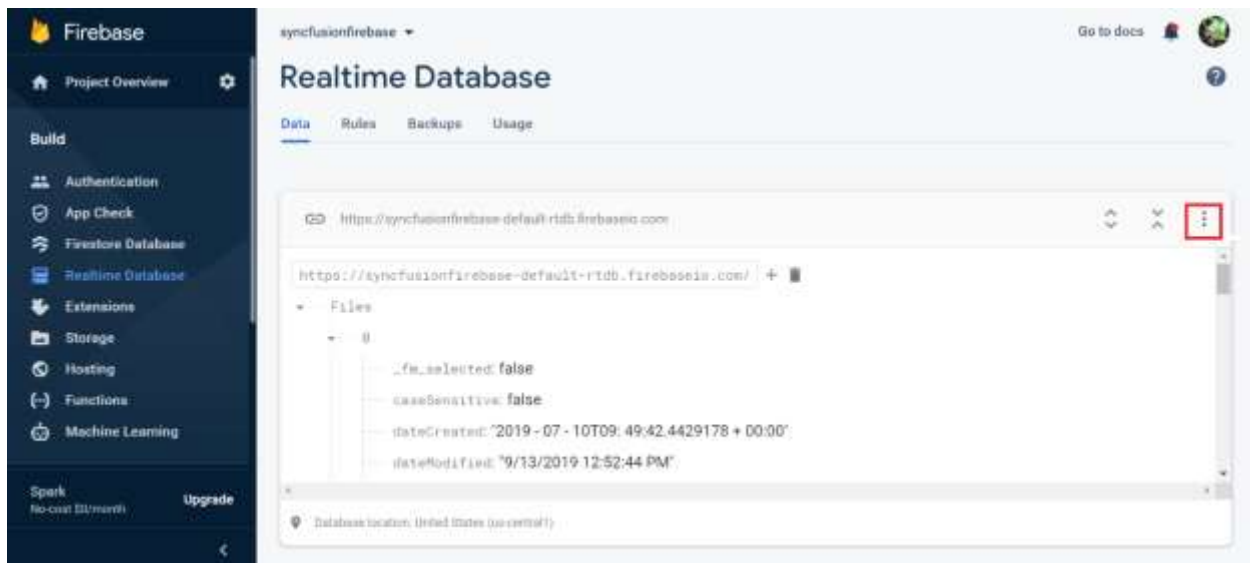

- To get started, create a root node and add any desired children to it. Please refer to the following code snippet for guidance on the structure of the JSON:

```
`ts
{
  "Files" : [ {
    "caseSensitive" : false,
    "dateCreated" : "8/22/2019 5:17:55 PM",
```

```
"dateModified" : "8/22/2019 5:17:55 PM",
"filterId" : "0/",
"filterPath" : "/",
"hasChild" : false,
"id" : "5",
"isFile" : false,
"isRoot" : true,
"name" : "Music",
"parentId" : "0",
"selected" : false,
"showHiddenItems" : false,
"size" : 0,
"type" : "folder"
},
{
  "caseSensitive" : false,
  "dateCreated" : "8/22/2019 5:18:03 PM",
  "dateModified" : "8/22/2019 5:18:03 PM",
  "filterId" : "0/",
  "filterPath" : "/",
  "hasChild" : false,
  "id" : "6",
  "isFile" : false,
  "isRoot" : true,
  "name" : "videos",
  "parentId" : "0",
  "selected" : false,
  "showHiddenItems" : false,
  "size" : 0,
  "type" : ""
}]
}
```

Here, the `Files` denotes the `rootNode` and the subsequent object refers to the children of the root node. `rootNode` will be taken as the root folder of the file system loaded which will be loaded in File Manager component.

- To import a JSON file into the Firebase Realtime Database, navigate to the **Data** tab and click on the action icon shown in the accompanying image. From there, select the **Import JSON** option and upload the JSON file that was created using the code provided above.

- To interact with the Firebase Realtime Database through your application, it is necessary to grant read and write permissions by defining appropriate rules in the Firebase project's **Rules tab**, as shown in the following code snippet. Once you have specified the rules, you can publish them by clicking the **Publish** button to enable the necessary authentication.

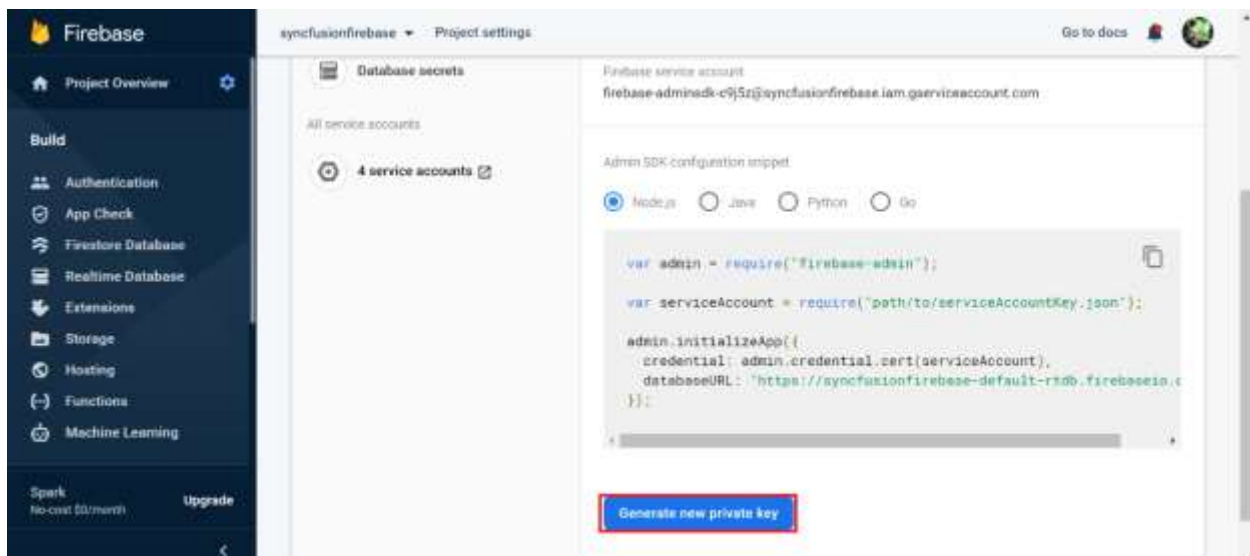

```
`ts
{
  / Visit https://firebase.google.com/docs/database/security to learn more about security rules. /
  "rules": {
    ".read": "auth!=null",
    ".write": "auth!=null"
  }
}
```

**Note:** By default, rules of a Firebase project will be **false**. To read and write the data, configure the **Rules** as given in the following code snippet in the *Rules* tab in the Firebase Realtime Database project.

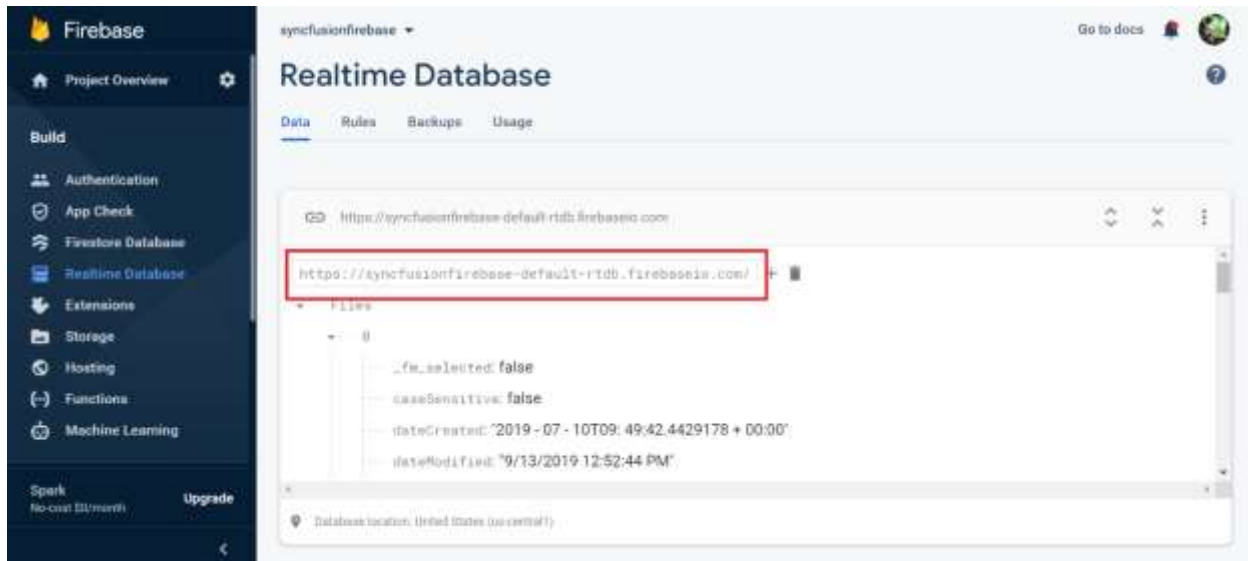

- Navigate to the project settings as instructed and then click on the **Service Account** tab.

- To obtain the access key JSON file, simply click on the **Generate new private key** button and then confirm by clicking the **Generate key** button in the pop-up window that appears.

- Next, you will need to clone the [firebase-realtime-database-apscore-file-provider](#) repository. Once cloned, simply open the project in Visual Studio and restore the NuGet package.
- Once you have generated the secret key, you will need to replace the JSON in the `access_key.json` file in the Firebase Realtime Database provider project with the newly generated key. This will enable authentication and allow you to perform read and write operations.
- In the **Data** tab, locate the project API URL and then paste it into the below mentioned section.

Register the Firebase Realtime Database by assigning *Firebase Realtime Database REST API link*, *rootNode*, and *serviceAccountKeyPath* parameters in the `RegisterFirebaseRealtimeDB` method of class `FirebaseRealtimeDBFileProvider` in the controller part of the ASP.NET Core application.

```
`ts
```

```
this.operation.RegisterFirebaseRealtimeDB(string apiUrl, string rootNode, string serviceAccountKeyPath)
`
```

#### Example:

```
`ts
```

```
this.operation.RegisterFirebaseRealtimeDB("{copy your API URL here}", "Files",
hostingEnvironment.ContentRootPath + "\\FirebaseRealtimeDBHelper\\access_key.json");
`
```

In the above code,

- `{copy your API URL here}` denotes Firebase Realtime Database REST API link.
- `Files` denotes newly created root node in Firebase Realtime Database.
- `hostingEnvironment.ContentRootPath + "\\FirebaseRealtimeDBHelper\\access_key.json` denotes service account key path which has authentication key for the Firebase Realtime Database data.

After configuring the Firebase Realtime Database service link, build and run the project. Now, the project will be hosted in `http://localhost:{port}` and just mapping the `ajaxSettings` property of the File Manager component to the appropriate controller methods allows to manage the files in the Firebase Realtime Database.

```
<template>
```

```
<div id="app">
```

```
<ejs-filemanager id="file-manager" :ajaxSettings="ajaxSettings">
</ejs-filemanager>
</div>
</template>
<script>
import Vue from "vue";

import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from "@syncfusion/ej2-vue-filemanager";

Vue.use(FileManagerPlugin);

export default {
  data () {
    return {
      // Initializing File Manager NodeJS file system service.
      ajaxSettings:
      {
        // Replace the hosted port number in the place of "{port}"
        url: "http://localhost:{port}/api/FirebaseProvider/FirebaseRealtimeFileOperations",
        getImageUrl: "http://localhost:{port}/api/FirebaseProvider/FirebaseRealtimeGetImage",
        uploadUrl: "http://localhost:{port}/api/FirebaseProvider/FirebaseRealtimeUpload",
        downloadUrl: "http://localhost:{port}/api/FirebaseProvider/FirebaseRealtimeDownload"
      }
    };
  },
  provide: {
    filemanager: [DetailsView, NavigationPane, Toolbar]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
```

```
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-filemanager/styles/material.css";
</style>
`ts
```

> **Note:** To learn more about the file actions that can be performed with Firebase Realtime Database file system provider, refer to this [link](#)

### IBM Cloud Object Storage file provider

The IBM Cloud Object Storage file provider module allows you work with the IBM Cloud Object Storage. It also provides the methods for performing various file actions such as creating a new folder, renaming files, and deleting files. The IBM Cloud Object Storage file provider serves the file provider support for the File Manager component with the IBM Cloud Object Storage. We can make use of IBM Cloud Object Storage file provider by installing the [ej2-filemanager-ibm-cos-node-file-provider](#) npm package or by cloning the [file provider](#) from the GitHub.

#### Using ej2-filemanager-ibm-cos-node-file-provider npm package

- Install the ej2-filemanager-ibm-cos-node-file-provider npm package by running the below command.

```
`ts
```

```
npm install @syncfusion/ej2-filemanager-ibm-cos-node-file-provider
```

```
,
```

- After installing the package, navigate to the ej2-filemanager-ibm-cos-node-file-provider package folder within the node-modules.
- Run the **npm install** command to install the dependent packages for file provider.

#### Cloning the filemanager-ibm-cos-node-file-provider from GitHub

- Clone the filemanager-ibm-cos-node-file-provider using the following command.

```
`ts
```

```
git clone https://github.com/SyncfusionExamples/filemanager-ibm-cos-node-file-provider.git
```

```
,
```

- After cloning, open the root folder and run the command **npm install** command.

To set the port in which the project to be hosted. Run the following command.

```
`ts
set PORT=3000 && node index.js
`
```

**Note:** By default, the service will run 8090 port.

Now, just mapping the **ajaxSettings** property of the FileManager component to the appropriate file operation methods in the index.js file will allow to manage the IBM Cloud Object Storage.

```
<template>
<div id="app">
  <ejs-filemanager id="file-manager" :ajaxSettings="ajaxSettings">
</ejs-filemanager>
</div>
</template>
<script>
import Vue from "vue";

import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from "@syncfusion/ej2-vue-filemanager";

Vue.use(FileManagerPlugin);

export default {
  data () {
    return {
      // Initializing File Manager NodeJS file system service.
      ajaxSettings:
      {
        // Replace the hosted port number in the place of "{port}"
        url: "http://localhost:{port}/",
        getImageUrl: "http://localhost:{port}/GetImage",
        uploadUrl: "http://localhost:{port}/Upload",
        downloadUrl: "http://localhost:{port}/Download"
      }
    };
  },
  provide: {
    filemanager: [DetailsView, NavigationPane, Toolbar]
  }
}
```

```

}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-icons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-filemanager/styles/material.css";
</style>
`

```

**Note:** To learn more about the file actions that can be performed with IBM Cloud Object Storage file provider, refer to this [link](#)

### Localization in Vue File manager component

The file manager can be localized to any culture by defining the texts and messages of the file manager in the corresponding culture. The default locale of the file manager is **en** (English). The following table represents the default texts and messages of the file manager in **en** culture.

KEY	Text/Message
----	----
NewFolder	New folder
Upload	Upload
Delete	Delete
Rename	Rename
Download	Download
Cut	Cut
Copy	Copy
Paste	Paste
SortBy	Sort by
Refresh	Refresh

Item-Selection	item selected
Items-Selection	items selected
View	View
Details	Details
SelectAll	Select all
Open	Open
Tooltip-NewFolder	New folder
Tooltip-Upload	Upload
Tooltip-Delete	Delete
Tooltip-Rename	Rename
Tooltip-Download	Download
Tooltip-Cut	Cut
Tooltip-Copy	Copy
Tooltip-Paste	Paste
Tooltip-SortBy	Sort by
Tooltip-Refresh	Refresh
Tooltip-Selection	Clear selection
Tooltip-View	View
Tooltip-Details	Details
Tooltip-SelectAll	Select all
Name	Name
Size	Size
DateModified	Modified
DateCreated	Date created
Path	Path
Created	Created
Modified	Modified
Location	Location
Type	Type
Permission	Permission
Ascending	Ascending
Descending	Descending
None	None

View-LargeIcons	Large icons
View-Details	Details
Search	Search
Button-Ok	OK
Button-Cancel	Cancel
Button-Yes	Yes
Button-No	No
Button-Create	Create
Button-Save	Save
Header-NewFolder	Folder
Content-NewFolder	Enter your folder name
Header-Rename	Rename
Content-Rename	Enter your new name
Header-Rename-Confirmation	Rename Confirmation
Content-Rename-Confirmation	If you change a file name extension
Are you sure you want to change it?	
Header-Delete	Delete File
Content-Delete	Are you sure you want to delete this file?
Header-Multiple-Delete	Delete Multiple Files
Content-Multiple-Delete	Are you sure you want to delete these {0} files?
Header-Folder-Delete	Delete Folder
Content-Folder-Delete	Are you sure you want to delete this folder?
Header-Duplicate	File exists
Content-Duplicate	already exists. Are you sure you want to replace it?
Header-Upload	Upload Files
Error	Error
Validation-Empty	The file or folder name cannot be empty.
Validation-Invalid	The file or folder name {0} contains invalid characters. Please use a different name.
Valid file or folder names cannot end with a dot or space, and cannot contain any of the following	
characters: \\ \: \* ? \ " < > \	
Validation-NewFolder-Exists	A file or folder with the name {0} already exists.
Validation-Rename-Exists	Cannot rename {0} to {1}
Folder-Empty	This folder is empty
File-Upload	Drag files here to upload

|Search-Empty|No results found|

|Search-Key|Try with different keywords|

|Filter-Empty|No results found|

|Filter-Key|Try with different filter|

|Sub-Folder-Error|The destination folder is the subfolder of the source folder|

|Same-Folder-Error|The destination folder is the same as the source folder.|

|Access-Denied|Access Denied|

|Access-Details|You don't have permission to access this folder|

|Header-Retry|File Already Exists|

|Content-Retry|A file with this name already exists in this folder. What would you like to do?|

|Button-Keep-Both|Keep both|

|Button-Replace|Replace|

|Button-Skip|Skip|

|ApplyAll-Label|Do this for all current items|

|KB|KB|

|Access-Message|{0} is not accessible. You need permission to perform the {1} action.|

|Network-Error|Network Error: Failed to send on XMLHttpRequest: Failed to load|

|Server-Error|Server Error: Invalid response from|

The below example shows adding the German culture locale(**de-DE**)

#### **APP.VUE**

```
<template>
<div id="app">
  <div class="wrapper">
    <ejs-filemanager id="locale_filemanager" :ajaxSettings="ajaxSettings"
:locale="locale">
      </ejs-filemanager>
    </div>
  </div>
</template>
<script>

### Accessibility in Vue File Manager component

The File Manager component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the File Manager component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

```
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The
component does not meet the requirement.</div>
```

### WAI-ARIA attributes

The File Manager component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the File Manager component:

Attributes	Purpose
role	Used to convey a significant and contextual message to the user.
aria-disabled	Indicates whether the File Manager component is in disabled state.
aria-haspopup	Indicates whether the toolbar item has a popup list or not.
aria-orientation	Indicates whether the File Manager element is oriented horizontally or vertically.
aria-expanded	Indicates whether the Treeview node has been expanded.
aria-owns	Contains the ID of the suggestion list to indicate popup as a child element.
aria-activedescendent	Holds the ID of the active list item to focus its descendant child element.
aria-level	Specifies the level of the element in Treeview Structure.
aria-selected	Indicates whether a particular node is in selected state.

- | **aria-placeholder** | Represents a hint (word or phrase) to the user about what to enter in the text field. |
- | **aria-label** | Provides an accessible name for the element. |
- | **aria-checked** | Indicates whether the checkbox is in checked state. |
- | **aria-labelledby** | Provides a label for the dialog. Typically, the "aria-labelledby" attribute will contain the id of the element used as the dialog's title. |
- | **aria-describedby** | This attribute points to the Dialog element describing the one it's set on. |
- | **aria-modal** | Indicates whether an element is a modal when display. |
- | **aria-colcount** | Specifies the number of columns in full table. |
- | **aria-colindexnt** | Defines the number of columns within a table in details view. |
- | **aria-rowspan** | Defines the number of rows a cell spanned within a table in details view. |
- | **aria-colspan** | Defines the number of columns a cell spanned within a table in details view. |
- | **aria-sort** | Indicates whether items in the table are sorted in ascending or descending order. |
- | **aria-grabbed** | When the folder/file item is chosen for dragging, the aria-grabbed attribute is set to "true." If it's set to "false," the element can be grabbed for drag-and-drop, but it won't be actively held. |
- | **aria-busy** | This attribute is set to false when table content is loaded. |
- | **aria-multiselectable** | Defines more than one item has been selected. |

### Keyboard interaction

The File Manager component followed the **keyboard interaction** guidelines, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the File Manager component.

- | **Press** | **To do this** |
- | --- | --- |
- | **Page Down** | Scrolls down to the next folder or file and selects the first item when files are loaded. |
- | **Page Up** | Scrolls up to previous folder and select the first item when files are loaded. |
- | **Enter** | Selects the focused item and navigate through the child elements. |
- | **Tab** | Focuses on the first element of toolbar and navigates through the next tab indexed element. |
- | **Esc(Escape)** | Closes the image when it is in open state. |
- | **Alt+N** | Creates a new folder dialog. |
- | **F5** | Refresh the file manager element. |
- | **Home** | Navigate through the first element of details view or large icons view. |

- | End | Navigate through the last element of details view or large icons view. |
- | Move Left | Scrolls left to the previous folder and select the first item when files are loaded |
- | Move Right | Scrolls right to the previous folder and select the first item when files are loaded |
- | Alt+Enter | Shows the get details info for selected folder. |
- | Shift+Right | Allows multiselection. Select the file or folder at the right of the previously selected folder. |
- | Shift+Left | Allows multiselection. Select the file or folder at the left of the previously selected folder. |
- | Shift+Down | Allows multiselection. Select the file or folder till the focused index. |
- | Shift+Delete | Permanently deletes the selected file or folder in the file manager element. |
- | Delete | Deletes the selected file or folder in the file manager element. |
- | Shift+Up | Allows multiselection. Select the file or folder till the focused index. |
- | Ctrl+C | Copies the selected file or folder in the file manager element. |
- | Ctrl+V | Pastes the copied/cut file or folder in the file manager element. |
- | Ctrl+X | Cuts the selected file or folder in the file manager element. |
- | Ctrl+A | Select all the files or folders in the details view or large icons view. |
- | F2 | Creates a rename dialog for a selected file or folder in the file manager element. |
- | Shift+F10 | Opens the context menu for the selected file or folder in the file manager element. |
- | Ctrl+D | Downloads the list of selected files or folders in the file manager element. |
- | Ctrl+Shift+1 | Changes the file manager layout to details view. |
- | Ctrl+Shift+2 | Changes the file manager layout to details view. |

### Ensuring accessibility

The File Manager component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the File Manager component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the File Manager component with accessibility tools.

```
{% previewsample "https://ej2.syncfusion.com/accessibility/file-manager.html" %}
```

## Access control in Vue File manager component

The [Vue FileManager](#) allows you to define access permissions for folders and files using a set of access rules to user(s).

- [Access Rules](#)
- [Permissions](#)

### Access Rules

The FileAccessController allows you to define security permissions for folders and files using a set of folder or file access rules.

To set up access rules for folders (including their files and sub-folders) and individual files, use the SetRules() method. The following table represents the AccessRule properties available for file and folder:

Properties	Applicable for file	Applicable for folder	Description
---	---	---	---
Copy	Yes	Yes	Allows access to copy a file or folder.
Read	Yes	Yes	Allows access to read a file or folder.
Write	Yes	Yes	Allows permission to write a file or folder.
WriteContents	No	Yes	Allows permission to write the content of folder.
Download	Yes	Yes	Allows permission to download a file or folder.
Upload	No	Yes	Allows permission to upload to the folder.
Path	Yes	Yes	Specifies the path to apply the rules, which are defined.
Role	Yes	Yes	Specifies the role to which the rule is applied.
IsFile	Yes	Yes	Specifies whether the rule is specified for folder or file.

The following syntax represents the access Rules for Administrator using file or folder.

```
`ts
//Administrator
//Access Rules for File
new AccessRule { Path = "/", Role = "Administrator", Read = Permission.Allow, Write =
Permission.Allow, Copy = Permission.Allow, Download = Permission.Allow, IsFile = true },
// Access Rules for folder
new AccessRule { Path = "**", Role = "Administrator", Read = Permission.Allow, Write = Permission.Allow,
Copy = Permission.Allow, WriteContents = Permission.Allow, Upload = Permission.Allow, Download =
Permission.Deny, IsFile = false },
`
```

The following syntax represent the access Rules for Default user using file or folder.

```
`ts
//Default User
```

```
//Access Rules for File
```

```
new AccessRule { Path = "/", Role = "Default User", Read = Permission.Deny, Write = Permission.Deny,
Copy = Permission.Deny, Download = Permission.Deny, IsFile = true },
```

```
// Access Rules for folder
```

```
new AccessRule { Path = "*", Role = "Default User", Read = Permission.Deny, Write = Permission.Deny,
Copy = Permission.Deny, WriteContents = Permission.Deny, Upload = Permission.Deny, Download =
Permission.Deny, IsFile = false },
```

```
,
```

### Permissions

It helps to explain how to apply security permission to file manager file or folder using access rules. The following table represent the value that determines the permission.

Value	Description
---	---
Allow	Allows you to do read, write, copy, and download operations.
Deny	Denies you to do read, write, copy, and download operations.

Use the **Role** property to apply created roles to the file manager. After that, the file manager displays folder or file and allow permission based on assigned roles.

The following syntax represent how to apply permission based on assigned roles

Permission denied for administrator to write a file or folder.

```
`ts
```

```
// For file
```

```
new AccessRule { Path = "/", Role = "Administrator", Read = Permission.Allow, Write = Permission.Deny,
IsFile = true},
```

```
// For folder
```

```
new AccessRule { Path = "*", Role = "Administrator", Read = Permission.Allow, Write = Permission.Deny,
IsFile = false},
```

```
,
```

The following syntax represent how to allow or deny permission based on file or folder access rule.

"Examples"

Permission denied for writing except for particular file or folder.

```
`ts
```

```
// Deny writing for particular folder
```

```
new AccessRule { Path = "/Documents", Role = "Document Manager", Read = Permission.Allow, Write =
Permission.Deny, Copy = Permission.Allow, WriteContents = Permission.Deny, Upload =
Permission.Deny, Download = Permission.Deny, IsFile = false },
```

```
// Deny writing for particular file
```

```
new AccessRule { Path = "/Pictures/Employees/Adam.png", Role = "Document Manager", Read =
Permission.Allow, Write = Permission.Deny, Copy = Permission.Deny, Download = Permission.Deny,
IsFile = true },
,
```

Permission denied for writing and uploading in root folder.

```
`ts
```

```
// Folder Rule
```

```
new AccessRule { Path = "/", Role = "Document Manager", Read = Permission.Allow, Write =
Permission.Deny, Copy = Permission.Deny, WriteContents = Permission.Deny, Upload =
Permission.Deny, Download = Permission.Deny, IsFile = false },
,
```

The following example demonstrate the file manager rendered with access control support.

## How To

Adding custom item to context menu in Vue File manager component

The context menu can be customized using the [contextMenuSettings](#), [menuOpen](#), and [menuClick](#) events.

The following example shows adding a custom item in the context menu.

The [contextMenuSettings](#) is used to add new menu item. The [menuOpen](#) event is used to add the icon to the new menu item. The [menuClick](#) event is used to add an event handler to the new menu item.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-filemanager id="file-manager" ref="file_instance"
:contextMenuSettings="contextMenuSettings" :ajaxSettings="ajaxSettings"
:menuOpen="menuOpen" :menuClick="menuClick">
      </ejs-filemanager>
    </div>
  </template>
<script>
import Vue from "vue";
import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from
"@syncfusion/ej2-vue-filemanager";
Vue.use(FileManagerPlugin);
export default {
  data () {
    return {
      ajaxSettings:
      {
        url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",
        getImageUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/GetImage",
        uploadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Upload",
        downloadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Download"
      },
      // Custom menu item added to context menu
      contextMenuSettings: {
        file: ["Custom", "Open", "|", "Delete", "Rename", "|",
"Details"],
```

```

        folder: ["Custom", "Open", "|", "Delete", "Rename", "|",
"Details", "Custom"],
        layout: ["Custom", "SortBy", "View", "Refresh", "|",
"NewFolder", "Upload", "|", "Details", "|", "SelectAll"],
        visible: true
    }
};
},
provide: {
    filemanager: [DetailsView, NavigationPane, Toolbar]
},
methods: {
    // Icon added to custom menu item in menuOpen event
    menuOpen: function(args){
        for(let i: number = 0; i<args.items.length; i++) {
            if(args.items[i].id === this.$refs.file_instance.$el.id
+"_cm_custom") {
                args.items[i].iconCss= "e-icons e-fe-tick";
            }
        }
    },
    // Displaying alert for custom menu in menuClick event
    menuClick: function(args) {
        if (args.item.text === "Custom") {
            alert("You have clicked custom menu item")
        }
    }
}
}

### Adding custom item to toolbar in Vue File manager component

You can modify the items displayed in the toolbar by utilizing the [toolbarItems](#) API. To display both default and customized items, it's essential to assign a unique **name** to each item. Additionally, you have the flexibility to alter the default items by adjusting properties such as **tooltipText**, **iconCss**, **Text**, **suffixIcon** and more. This level of customization allows you to tailor the toolbar to your specific requirements and design preferences. The names used in the code example below serve as unique identifiers for default toolbar items, while custom items can be assigned any unique name value to distinguish them from the defaults.

For instance, here's an example of how to add a custom checkbox to the toolbar using the **template** property. Here we have modified the default **New Folder** item and added a custom toolbar item for selection.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-filemanager id="file-manager" ref="fileManagerInstance"
:ajaxSettings="ajaxSettings" >
      <e-toolbaritems>
        <e-toolbaritem name="NewFolder"></e-toolbaritem>
        <e-toolbaritem name="Upload"></e-toolbaritem>
        <e-toolbaritem name="SortBy"></e-toolbaritem>
        <e-toolbaritem name="Refresh"></e-toolbaritem>
        <e-toolbaritem name="Cut"></e-toolbaritem>
        <e-toolbaritem name="Copy"></e-toolbaritem>
        <e-toolbaritem name="Paste"></e-toolbaritem>
        <e-toolbaritem name="Delete"></e-toolbaritem>
        <e-toolbaritem name="Download"></e-toolbaritem>
        <e-toolbaritem name="Rename"></e-toolbaritem>
        <e-toolbaritem name="Select"
:template="'checkboxTemplate'">
          <template v-slot:checkboxTemplate>
            <div><ejs-checkbox ref="checkBoxInstance"
:label='Select All' :checked=false :change="onChange"></ejs-checkbox></div>
          </template>
        </e-toolbaritem>
        <e-toolbaritem name="Selection"></e-toolbaritem>
        <e-toolbaritem name="View"></e-toolbaritem>
        <e-toolbaritem name="Details"></e-toolbaritem>
      </e-toolbaritems>
    </ejs-filemanager>
  </div>

Enable/disable toolbar item in Vue File manager component

The toolbar items can be enabled/disabled by specifying the items in [enableToolbarItems](#) or [disableToolbarItems](#) methods respectively.

The following example shows enabling and disabling toolbar items on button click.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-button id="enable" cssClass="e-success">Enable New Folder
  toolbar item</ejs-button>
    <ejs-button id="disable" cssClass="e-danger">Disable New Folder
  toolbar item</ejs-button>
    <ejs-filemanager :created="onCreated" id="file-manager"
  ref="fileManagerInstance" :height="height" :ajaxSettings="ajaxSettings">
    </ejs-filemanager>
  </div>
</template>

```

```

<script>
import Vue from "vue";
import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from
"@syncfusion/ej2-vue-filemanager";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(FileManagerPlugin);
Vue.use(ButtonPlugin);
export default {
  data () {
    return {
      ajaxSettings:
      {
        url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",
        getImageUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/GetImage",
        uploadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Upload",
        downloadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Download"
      },
      view: "Details",
      height: "330px"
    };
  },
  provide: {
    filemanager: [DetailsView, NavigationPane, Toolbar]
  },
  methods: {
    onCreated: function(args){
      // Click event for enable button
      document.getElementById("enable").addEventListener('click',
(event) => {
        // Enable new folder toolbar item

this.$refs.fileManagerinstance.enableToolbarItems(["newfolder"]);
      });
      // Click event for disable button
      document.getElementById("disable").addEventListener('click',
(event) => {
        // Disable new folder toolbar item

this.$refs.fileManagerinstance.disableToolbarItems(["newfolder"]);
      });
    }
  }
}
</script>
<style>

### Customize custom thumbnail in Vue File manager component

The default appearance of the file manager can customize with your own icon by using [showThumbnail](#) property.

The following example demonstrate how to add a custom icon in largeicons view.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-filemanager id="file-manager" :showThumbnail="showThumbnail"
    :ajaxSettings="ajaxSettings">
      </ejs-filemanager>
    </div>
  </template>
<script>
import Vue from "vue";
import { FileManagerPlugin, DetailsView, NavigationPane, Toolbar } from
"@syncfusion/ej2-vue-filemanager";
Vue.use(FileManagerPlugin);
export default {
  data () {
    return {
      ajaxSettings:
      {
        url: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/FileOperations",
        getImageUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/GetImage",
        uploadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Upload",
        downloadUrl: "https://ej2-aspcore-
service.azurewebsites.net/api/FileManager/Download"
      },
      showThumbnail: false
    };
  },
  provide: {
    filemanager: [DetailsView, NavigationPane, Toolbar]
```

```

    }
  }
</script>

### Nested items in Vue File manager component

FileManager can be rendered inside the other components like Tab, Dialog, and more.

- [Adding file manager inside the dialog](#)
- [Adding file manager inside the tab](#)

### Adding file manager inside the dialog

The following example shows the file manager component rendered inside the dialog. Click the browse button in the Uploader element to open the File Manager inside the Dialog control.

### APP.VUE

```
<template>
  <div>
    <div class="control-section">
      <div id='container' class="fileupload">
        <ejs-uploader ref="uploadObj" id='defaultfileupload'
name="UploadFiles">
          </ejs-uploader>
          <ejs-button id="openBtn" v-
on:click.native="btnClick">Browse...</ejs-button>
        </div>
        <div id='target' class="control-section">
          <ejs-dialog ref="uploadDialog" id="dialog" v-
bind:visible="false" :header='dialogHeader'
:animationSettings='animationSettings' :showCloseIcon='showCloseIcon'

{% previewsample "page.domainurl/code-snippet/file-manager/file-tab-cs1" %}

### Create the custom file provider using NodeJS

Here we manipulate the Azure Blob Storage to supply the necessary data for the File Manager. We achieve this by utilizing NodeJS to fetch the required data from the Azure blob storage.

NodeJS acts as the bridge between the File Manager component and Azure Blob Storage, allowing seamless communication and data retrieval. Through this integration, the File Manager can access and interact with the data stored in Azure Blob Storage, enabling smooth file management operations.

### Prerequisites

- Valid Azure blob storage account. ( accountName, accountKey, endpointSuffix)
- Node version 14 above.

### *Introduction to Azure Blob Storage*

Azure Blob Storage is a cloud-based object storage service provided by Microsoft Azure. It is designed to store and manage unstructured data, also known as "blobs" in the cloud. Blobs can be any type of data, such as images, videos, documents, backups, logs, and more.

### *Key concepts of Azure Blob Storage*

**Containers:** In Azure Blob Storage, data is organized into containers. Containers are logical units that can hold one or more blobs. Think of them as directories or folders that help organize the data.

**Blobs:** Blobs are the actual data objects stored in Azure Blob Storage.

By understanding the fundamental concepts and use cases of Azure Blob Storage, you will be well-prepared to proceed with setting up and interacting with it using NodeJS in the custom File Provider.

### *Create NodeJS project*

Following the steps to create the NodeJS project.

Create a new directory for your project and run the following command to initialize a new NodeJS project. This will create a package.json file.

```
`ts
npm init
`
```

Install the following packages.

- express
- @azure/storage-blob
- archiver
- body-parser
- cors
- esm
- multer

Open your text editor or integrated development environment (IDE) and create the index.js file start writing your NodeJS code. This file will serve as the entry point of your application.

```
`ts
const express = require('express');
const app = express();
const port = 3000;
app.get('/', (req, res) => {
  res.send('Hello, NodeJS!');
});
app.listen(port, () => {
  console.log(Server running on http://localhost:${port});
});
```

To start your NodeJS application, simply run the following command in your terminal, pointing to the entry point file:

```
`ts
node index.js
```

#### *Initialize container client*

We need to first get the BlobServiceClient. By using the connection string, we can obtain the BlobServiceClient. So, format the connection string as shown below.

```
`ts
Const connectionString =
DefaultEndpointsProtocol=https;AccountName=${accountName};AccountKey=${accountKey};E
ndpointSuffix=${EndpointSuffix};
```

We can obtain the BlobServiceClient and the **containerClient** using this connection String and the BlobServiceClient. the **containerName** is the container from your Azure blob storage account that you need to access.

```
`ts
import { BlobServiceClient } from "@azure/storage-blob";
const blobServiceClient = BlobServiceClient.fromConnectionString(connectionString);
const containerClient = blobServiceClient.getContainerClient(containerName);
```

#### *File actions*

Need to provide the following action to creating a new folder, copying and moving of files or folders, deleting, uploading, and downloading the files or folders in the file system

#### *Read*

Specify the directory name that needs to be accessed.

```
`ts
const directoryName = 'Files';
```

Create the **app.post** method with URL **‘/fileManager’**.

To identify the action by use this condition **req.body.action === ‘read’**

The following table represents the request parameters of **read** operations.

Parameter	Type	Default	Explanation
action	String	read	Name of the file operation.

path	String	-	Relative path from which the data has to be read.
showHiddenItems	Boolean	-	Defines show or hide the hidden items.
data	[FileManagerDirectoryContent](#)	-	Details about the current path (directory).

*Example for request:*

```
`ts
{
  action: "read",
  path: "/Videos/",
  showHiddenItems: false,
  data: [
    0:{
      name:"Videos",
      size:0,
      dateModified:"2023-09-14T14:28:27.000Z",
      dateCreated: "2023-09-14T11:16:57.000Z",
      hasChild:true,
      isFile:false,
      type:"Directory",
      filterPath:"/",
      fmicon: "e-fe-folder",
      fmiconClass: "e-fe-folder",
      fmid: "fetree0",
      fmmmodified: "September 14, 2023 19:58"
    }
  ]
}
```

The following table represents the response parameters of **read** operations.

Parameter	Type	Default	Explanation
----	----	----	----
cwd	<a href="#">FileManagerDirectoryContent</a>		Path (Current Working Directory) details.
files	FileManagerDirectoryContent[]		Details of files and folders present in given path or directory.
error	<a href="#">ErrorDetails</a>		Error Details

<a id="file-manager-directory-content"></a>

The following table represents the contents of **FileManagerDirectoryContent** in the file manager request and response.

Parameter	Type	Default	Explanation	Is required
----	----	----	----	----
name	String	-	File name	Yes
dateCreated	String	-	Date in which file was created (UTC Date string).	Yes
dateModified	String	-	Date in which file was last modified (UTC Date string).	Yes
filterPath	String	-	Relative path to the file or folder.	Yes
hasChild	Boolean	-	Defines this folder has any child folder or not.	Yes
isFile	Boolean	-	Say whether the item is file or folder.	Yes
size	Number	-	File size	Yes
type	String	-	File extension	Yes
permission	<a href="#">AccessRules</a>	-	File extension	Optional
caseSensitive	Boolean	-	Defines search is case sensitive or not.	Optional
action	String	read	Name of the file operation.	Optional
names	String[]	-	Name list of the items to be downloaded.	Optional
data	FileManagerDirectoryContent	-	Details of the download item.	Optional
uploadFiles	<a href="#">IList&lt;IFormFile&gt;</a>	-	File that are uploaded.	Optional
newName	String	-	New name for the item.	Optional
searchString	String	-	String to be searched in the directory.	Optional
targetPath	String	-	Relative path where the items to be pasted are located.	Optional
targetData	FileManagerDirectoryContent	-	Details of the copied item.	Optional
renameFiles	String[]	-	Details of the renamed item.	Optional

<a id="access-rules"></a>

The following table represents the **AccessRules** properties available for file and folder:

Properties	Applicable for file	Applicable for folder	Description
---	---	---	---
Copy	Yes	Yes	Allows access to copy a file or folder.
Read	Yes	Yes	Allows access to read a file or folder.
Write	Yes	Yes	Allows permission to write a file or folder.
WriteContents	No	Yes	Allows permission to write the content of folder.
Download	Yes	Yes	Allows permission to download a file or folder.

Upload	No	Yes	Allows permission to upload to the folder.
Path	Yes	Yes	Specifies the path to apply the rules, which are defined.
Role	Yes	Yes	Specifies the role to which the rule is applied.
IsFile	Yes	Yes	Specifies whether the rule is specified for folder or file.

*Example for response:*

```
`ts
{
  cwd:
  {
    filterPath: "/",
    hasChild: true,
    name: "Videos",
    size: 0,
    type: "File Folder"
  },
  files:[
    0:{
      dateCreated: "2023-09-14T11:16:57.000Z"
      dateModified: "2023-09-14T11:16:57.000Z"
      filterPath: "/Videos/"
      hasChild: false
      isFile: true
      name: "about.txt"
      size: 29
      type: ".txt"
    }
  ],
  error:null
}
```

[Get image](#)

Create the **app.get** method with URL **‘/fileManager/GetImage’**.

The following table represents the request parameters of **GetImage** operations.

Parameter	Type	Default	Explanation
-----------	------	---------	-------------

----	----	----	----
------	------	------	------

path	String	-	Relative path to the image file
------	--------	---	---------------------------------

The req.query.path contains the exact path of the images. For example: `"/Jack.png"`.

Download the blob (image) from Azure Blob Storage using the blobClient and stores the result in the downloadResponse variable.

Pipe the readableStreamBody from the blob to the res response. It means the image data will be streamed from the Azure Blob Storage directly to the client's browser when the image URL is accessed.

Handle the exception if the image is not available in the given path.

#### Download

Create the **app.post** method with URL **`"/fileManager/Download"`**.

The following table represents the request parameters of *download* operations.

Parameter	Type	Default	Explanation
-----------	------	---------	-------------

----	----	----	----
------	------	------	------

action	String	download	Name of the file operation
--------	--------	----------	----------------------------

path	String	-	Relative path to location where the files to download are present.
------	--------	---	--------------------------------------------------------------------

names	String[]	-	Name list of the items to be downloaded.
-------	----------	---	------------------------------------------

data	<a href="#">FileManagerDirectoryContent</a>	-	Details of the download item.
------	---------------------------------------------	---	-------------------------------

*Example for request:*

```
`ts
{
  action: 'download',
  path: '/Downloads/Testing/',
  names: [ 'About.txt' ],
  data: [
    0:{
      name: 'About.txt',
      type: '.txt',
      isFile: true,
      size: 29,
      dateModified: '2023-09-14T06:03:52.000Z',
      hasChild: false,
      filterPath: '/Downloads/Testing/',
      fmcreated: null,
```

```

fmmodified: 'September 14, 2023 11:33',
fmiconClass: 'e-fe-txt',
fmicon: 'e-fe-txt'
}
]
}
,

```

The **req.body.downloadInput** must be parsed to get the **downloadObj**. Download the blob from Azure Blob Storage using the blobClient.

Download the blob from Azure Blob Storage using the blobClient and Pipe the readableStreamBody to the response object.

Create the archive file to download the multiple Files, Folders and single folders, then pipe the archive to the response.

#### Upload

Create the **app.post** method with URL **'/fileManager/Upload'**.

The following table represents the request parameters of *Upload* operations.

Parameter	Type	Default	Explanation
---- ---- ---- ----			
action	String	Save	Name of the file operation.
path	String	-	Relative path to the location where the file has to be uploaded.
uploadFiles	<code>IList&lt;IFormFile&gt;</code>	-	File that are uploaded.

*Example for request:*

```

`ts
{
path: '/Pictures/',
action: 'save',
data: [
0:{
name: 'Pictures',
type: 'File Folder',
isFile: true,
size: 0,
dateModified: '2023-09-14T06:03:52.000Z',
hasChild: true,

```

```

filterPath: "",
fmid: 'fetree1',
},
],
filename: 'bird (2).jpg'
},
,

```

Multer is a popular middleware used to handle file uploads in Express-based web applications. Create the Multer config to store the upload files in buffer.

```

`ts
const multerConfig = {
storage: memoryStorage()
};
,

```

Need to handle the 3 cases here.

- Save
- Keep Both (action name will be **keepboth**)
- Replace (action name will be **replace**)

Create the **getBlockBlobClient** with the **req.body.filename**. If the blob does not exist, then upload the data to that blob. If the blob already exists, then create an error message containing "File Already Exists" and send the response.

[Create a new folder](#)

The following table represents the request parameters of *create* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	create	Name of the file operation.
path	String	-	Relative path in which the folder has to be created.
name	String	-	Name of the folder to be created.
data	<a href="#">FileManagerDirectoryContent</a>	-	Details about the current path (directory).

*Example for request:*

```

`ts
action: "create",
data: [
0:{

```

```
filterPath: "/",
hasChild: true,
isFile: false,
name: "files",
nodeId: "fe_tree",
size: 0,
type: ""
},
name: "Hello",
path: "/test/"
,
```

Check the existence of the folder, If the folder exists then send the error message containing “Folder already exists”. If it does not exist, then create the folder. Create the folder by creating the file in that folder’s path.

The following table represents the response parameters of *create* operations.

Parameter	Type	Default	Explanation
files	FileManagerDirectoryContent[]	-	Details of the created folder
error	<a href="#">ErrorDetails</a>	-	Error Details

*Example for response:*

```
`ts
{
  cwd: null,
  files: [
    0:{
      dateCreated: "2023-09-14T10:52:25.000Z",
      dateModified: "2023-09-14T10:52:25.000Z",
      filterPath: null,
      hasChild: false,
      isFile: false,
      name: "New",
      size: 0,
      type: "Directory"
    }
  ]
}
```

```
}
],
details: null,
error: null
},
`
```

Rename

The following table represents the request parameters of *rename* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	rename	Name of the file operation.
path	String	-	Relative path in which the item is located.
name	String	-	Current name of the item to be renamed.
newName	String	-	New name for the item.
data	<a href="#">FileManagerDirectoryContent</a>	-	Details of the item to be renamed.

Example for request:

```
`ts
{
  action: "rename",
  data: [
    0:{
      dateCreated: "2023-09-14T10:41:17.000Z",
      filterPath: "/Pictures/Nature/",
      hasChild: false,
      iconClass: "e-fe-image",
      isFile: true,
      name: "seaviews.jpg",
      size: 95866,
      type: ".jpg"
    }
  ],
  newName: "seaview.jpg",
  name: "seaviews.jpg",

```

```
path: "/Pictures/Nature/"
}
```

Renaming can be done by copy the folder or file from the source blob instance to target blob instance. If the file exists, then send the error message as response.

The following table represents the response parameters of *rename* operations.

Parameter	Type	Default	Explanation
files	FileManagerDirectoryContent[]	-	Details of the renamed item.
error	<a href="#">ErrorDetails</a>	-	Error Details

*Example for response:*

```
`ts
{
  cwd:null,
  files:[
    0:{
      name:"seaview.jpg",
      size:95866,
      dateModified:"2023-09-14T11:16:57.000Z",
      dateCreated:"2023-09-14T10:41:17.000Z",
      hasChild:false,
      isFile:true,
      type:".jpg",
      filterPath:"/Pictures/Nature/"
    }
  ],
  error:null,
  details:null
}
```

### Delete

The following table represents the request parameters of *delete* operations.

Parameter	Type	Default	Explanation
----	----	----	----

action	String	delete	Name of the file operation.
path	String	-	Relative path where the items to be deleted are located.
names	String[]	-	List of the items to be deleted.
data	[FileManagerDirectoryContent](#)	-	Details of the item to be deleted.

*Example for request:*

```
`ts
{
  action: "delete",
  path: "/",
  names: ["bird.jpg"],
  data: [
    0:{
      dateModified: "2023-09-14T09:12:53.000Z",
      filterPath: "/",
      hasChild: false,
      iconClass: "e-fe-image",
      isFile: true,
      name: "bird.jpg",
      size: 102182,
      type: ".jpg"
    }
  ]
}
```

To delete the file, directly get the file instance and delete the file. To delete the folder, we need to get all files inside that folder and delete all those files.

Handle the null exception if file or folder is not available.

The following table represents the response parameters of *delete* operations.

Parameter	Type	Default	Explanation
files	<a href="#">FileManagerDirectoryContent[]</a>		Details about the deleted item(s).
error	<a href="#">ErrorDetails</a>		Error Details

*Example for response:*

```
`ts
{
  cwd: null,
  details: null,
  error: null,
  files: [
    0:{
      dateModified: "2023-09-14T09:12:53.000Z",
      filterPath: "/",
      hasChild: false,
      iconClass: "e-fe-image",
      isFile: true,
      name: "bird.jpg",
      size: 102182,
      type: ".jpg"
    }
  ]
}
```

### Details

The following table represents the request parameters of *details* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	details	Name of the file operation.
path	String	-	Relative path where the items are located.
names	String[]	-	List of the items to get details.
data	<a href="#">FileManagerDirectoryContent</a>	-	Details of the selected item.

*Example:*

```
`ts
{
  action: "details",
  path: "/FileContents/",
  names: ["bird.jpg"],
```

```
data: [  
  0:{  
    dateModified: "2023-09-14T09:12:53.000Z",  
    filterPath: "/",  
    hasChild: false,  
    iconClass: "e-fe-image",  
    isFile: true,  
    name: "bird.jpg",  
    size: 102182,  
    type: ".jpg"  
  }  
]  
}
```

To get the file and folder details, iterate the **req.body.names** to get the details of files and folders. If the data is file, then get the file instance and get the properties using the **getProperties** method. If the data is Folder, then get the blobs details under that folder using **listBlobsFlat** method. Get the required properties and send final response. Handled the null exception if the file or folder is not available.

The following table represents the response parameters of *details* operations.

Parameter	Type	Default	Explanation
-----	-----	-----	-----
details	<a href="#">FileManagerDirectoryContent</a>	-	Details of the requested item(s).
error	<a href="#">ErrorDetails</a>	-	Error Details

*Example:*

```
`ts  
{  
  cwd:null,  
  files:null,  
  error:null,  
  details:  
  {  
    created: "2023-09-15T06:04:12.000Z"  
    isFile: true  
    location: "Files/bird.jpg"
```

```
modified: "2023-09-15T06:04:12.000Z"
multipleFiles: false
name: "bird.jpg"
size: "100.0 KB"
}
}
,
```

### Search

The following table represents the request parameters of *search* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	search	Name of the file operation.
path	String	-	Relative path to the directory where the files should be searched.
showHiddenItems	Boolean	-	Defines show or hide the hidden items.
caseSensitive	Boolean	-	Defines search is case sensitive or not.
searchString	String	-	String to be searched in the directory.
data	<a href="#">FileManagerDirectoryContent</a>	-	Details of the searched item.

*Example for request:*

```
`ts
{
  action: "search",
  path: "/asia/",
  searchString: "nature",
  showHiddenItems: false,
  caseSensitive: false,
  data: [
    0:{
      filterPath: "/",
      hasChild: true,
      name: "asia",
      size: 0,
      type: "File Folder",
      fmid: "fetree1"
```

```
}  
]  
}  
,
```

Replace the '\*' in the **req.body.searchString** and assign the result to new variable. Get all blobs under this directory and check that path contains the search string

The following table represents the response parameters of *search* operations.

Parameter	Type	Default	Explanation
-----------	------	---------	-------------

----	----	----	----
------	------	------	------

cwd	<a href="#">FileManagerDirectoryContent</a>	-	Path (Current Working Directory) details.
-----	---------------------------------------------	---	-------------------------------------------

files	FileManagerDirectoryContent[]	-	Files and folders in the searched directory that matches the search input.
-------	-------------------------------	---	----------------------------------------------------------------------------

error	<a href="#">ErrorDetails</a>	-	Error Details
-------	------------------------------	---	---------------

*Example for response:*

```
`ts  
{  
  cwd:  
  {  
    name:"asia",  
    size:0,  
    dateModified:"2023-09-14T14:28:27.000Z",  
    dateCreated:"2023-09-14T11:16:57.000Z",  
    hasChild:true,  
    isFile:false,  
    type:"File Folder",  
    filterPath:"/"  
  },  
  files:[  
    0: {  
      dateModified: "2023-09-15T06:22:00.000Z",  
      filterPath: "/asia/",  
      hasChild: false,  
      isFile: true,  
      name: "about.txt",
```

```
size: 42,  
type: ".txt"  
}  
],  
error:null,  
details:null  
}  
,
```

### Copy and move

The following table represents the request parameters of *copy* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	copy	Name of the file operation.
path	String	-	Relative path to the directory where the files should be copied.
names	String[]	-	List of files to be copied.
targetPath	String	-	Relative path where the items to be pasted are located.
data	<a href="#">FileManagerDirectoryContent</a>	-	Details of the copied item.
targetData	<a href="#">FileManagerDirectoryContent</a>	-	Details of the copied item.
renameFiles	String[]	-	Details of the renamed item.

*Example for request:*

```
`ts  
{  
  action: "copy",  
  path: "/",  
  names: ["bird.jpg"],  
  renameFiles: [],  
  targetPath: "/asia/",  
  targetData: {  
    filterPath: "/",  
    hasChild: true,  
    name: "asia",  
    size: 0,  
    type: "File Folder",
```

```
fmid: "fetree1",
},
data: [
0:{
dateCreated: "2023-09-15T06:04:12.000Z",
dateModified: "2023-09-15T06:04:12.000Z",
filterPath: "/",
hasChild: false,
isFile: true,
name: "bird.jpg",
size: 102182,
type: ".jpg",
fmcreated: "September 15, 2023 11:34",
fmhtmlAttr: {class: "e-large-icon", title: "bird.jpg"},
fmiconClass: "e-fe-image",
fmimageAttr: {alt: "bird.jpg"},
fmimageUrl: "http://localhost:3000/GetImage?path=%2Fbird.jpg&time=1694760243307",
fmmodified: "September 15, 2023 11:34",
}
]
}
`
```

Action name will be **move** for move action.

The following table represents the response parameters of *copy* operations.

Parameter	Type	Default	Explanation
----	----	----	----
cwd	<a href="#">FileManagerDirectoryContent</a>	-	Path (Current Working Directory) details.
files	<a href="#">FileManagerDirectoryContent[]</a>	-	Details of copied files or folders
error	<a href="#">ErrorDetails</a>	-	Error Details

*Example for response:*

```
`ts
{
cwd:null,
```

```
files:[
  0:{
    dateCreated: "2023-09-15T06:55:03.000Z"
    dateModified: "2023-09-15T06:55:03.000Z"
    filterPath: "/asia/"
    hasChild: false
    isFile: true
    name: "bird.jpg"
    previousName: null
    size: 102182
    type: ".jpg"
  }
],
error:null,
details:null
},
`
```

Need to handle two cases.

- Directory copy and move.
- File copy and move.

Create the **isRename** variable to store the is request is rename or not. If the **isRename** is false then check the existence of the folders, and if folder is existing, then send the error message. If **isRename** is true, then don't check the existence of the folder.

To move or copy the folders you need to get all the blobs from that folder and create the new path for each blob and copy the data from the old path to the new path. To move or copy the files copy the data from the source blob client to target client. If the action is move then delete the old blob.

**Note:** To get the complete project, refer to this [link](#)

## FloatingActionButton

### Getting Started with the Vue Floating action button Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLI](#) and integrating the Syncfusion Vue Floating action button component using the [Composition API](#) / [Options API](#).

Prerequisites

[System requirements for Syncfusion Vue UI components](#)

### Dependencies

The list of dependencies required to use the Floating Action Button component in your application is given as follows:

```
`js
|-- @syncfusion/ej2-vue-buttons
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-vue-base
\
```

### Setting up the Vue 2 project

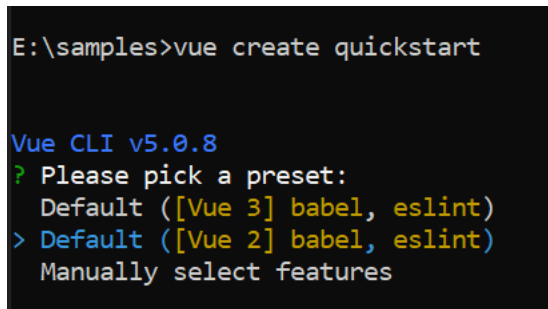

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```
`bash
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
\
```

or

```
`bash
yarn global add @vue/cli
vue create quickstart
cd quickstart
yarn run serve
\
```

When creating a new project, choose the option **Default ([Vue 2] babel, eslint)** from the menu.

```
E:\samples>vue create quickstart

Vue CLI v5.0.8
? Please pick a preset:
  Default ([Vue 3] babel, eslint)
> Default ([Vue 2] babel, eslint)
  Manually select features
```

Once the **quickstart** project is set up with default settings, proceed to add Syncfusion components to the project.

### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.npmjs.com). To use Vue components, install the required npm package.

This article uses the [Vue Floating action button component](#) as an example. Install the `@syncfusion/ej2-vue-buttons` package by running the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-buttons --save
```

```
,
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-buttons
```

```
,
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the `Material` theme is applied using CSS styles, which are available in installed packages. The necessary `Material` CSS styles for the Floating action button component and its dependents were imported into the `<style>` section of `src/App.vue` file.

#### ~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
```

### Add Syncfusion Vue component

Follow the below steps to add the Vue Floating action button component using `Composition API` or `Options API`:

1\ First, import and register the Floating action button component in the `script` section of the `src/App.vue` file. If you are using the `Composition API`, you should add the `setup` attribute to the `script` tag to indicate that Vue will be using the `Composition API`.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { FabComponent as EjsFab } from '@syncfusion/ej2-vue-buttons';
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { FabComponent } from '@syncfusion/ej2-vue-buttons';
export default {
```

```

components: {
  'ejs-fab': FabComponent
}
}
</script>

```

2\ In the **template** section, define the Floating action button component with the [content](#) property.

#### **COMPOSITION API (~SRC/APP.VUE)**

```

<template>
<div>
<div id="targetElement" style="position:relative;min-height:350px;border:1px
solid;"></div>
<!-- To render Floating Action Button -->
<ejs-fab id='fab' content='Add' target='#targetElement'></ejs-fab>
</div>
</template>

```

Here is the summarized code for the above steps in the **src/App.vue** file:

#### **COMPOSITION API (~SRC/APP.VUE)**

```

<template>
  <div>
    <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;"></div>
    <!-- To render Floating Action Button -->
    <ejs-fab id='fab' content='Add' target='#targetElement'></ejs-fab>
  </div>
</template>
<script setup>
  import { FabComponent as EjsFab } from "@syncfusion/ej2-vue-buttons";
  import { enableRipple } from '@syncfusion/ej2-base';
  enableRipple(true);
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>

```

#### **OPTIONS API (~SRC/APP.VUE)**

```

<template>
  <div>
    <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;"></div>
    <!-- To render Floating Action Button -->
    <ejs-fab id='fab' content='Add' target='#targetElement'></ejs-fab>
  </div>
</template>
<script>
  import { FabComponent } from "@syncfusion/ej2-vue-buttons";
  import { enableRipple } from '@syncfusion/ej2-base';
  enableRipple(true);
  export default {

```

```

        components: {
            'ejs-fab': FabComponent
        }
    }
</script>
<style>
    @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>

```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run serve
```

```
,
```

or

```
`bash
```

```
yarn run serve
```

```
,
```

```
{% previewsample "page.domainurl/code-snippet/floating-action-button/getting-started-cs1" %}
```

### Click event

The floating action button control triggers the `onclick` event when you click on the floating action button. You can use this event to perform the required action.

### COMPOSITION API (~SRC/APP.VUE)

```

<template>
  <div>
    <div id="targetElement" style="position:relative;min-height:350px;border:1px solid;"></div>
    <!-- To render Floating Action Button -->
    <ejs-fab id='fab' iconCss='e-icons e-edit' content='Edit' v-on:click.native="onClick" target='#targetElement'>
      </ejs-fab>
    </div>
  </template>
<script setup>
import { FabComponent as EjsFab } from "@syncfusion/ej2-vue-buttons";
const onClick = function () {
  alert("Edit is clicked!");
};
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>

```

### OPTIONS API (~SRC/APP.VUE)

```
<template>
  <div>
    <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;"></div>
    <!-- To render Floating Action Button -->
    <ejs-fab id='fab' iconCss='e-icons e-edit' content='Edit' v-
on:click.native="onClick" target='#targetElement'>
    </ejs-fab>
  </div>
</template>
<script>
import { FabComponent } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
  components: {
    'ejs-fab': FabComponent
  },
  methods: {
    onClick: function () {
      alert("Edit is clicked!");
    }
  }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/floating-action-button/events-cs2" %}

## Getting Started with Syncfusion Floating Action Button Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue Floating Action Button component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The [Link to the Video](#) is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

To get started quickly with Vue 3 Floating Action Button, you can check out this video:

### Prerequisites

#### [System requirements for Syncfusion Vue UI components](#)

#### Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm create vite@latest
```

```
,
```

```
or
```

```
`bash
```

```
yarn create vite
```

```
,
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as **my-project** for this article.

```
`bash
```

```
? Project name: » my-project
```

```
,
```

2. Select **Vue** as the framework. It will create a Vue 3 project.

```
`bash
```

```
? Select a framework: » - Use arrow-keys. Return to submit.
```

```
Vanilla
```

```
Vue
```

```
React
```

```
Preact
```

```
Lit
```

```
Svelte
```

```
Others
```

```
,
```

3. Choose **JavaScript** as the framework variant to build this Vite project using JavaScript and Vue.

```
`bash
```

```
? Select a variant: » - Use arrow-keys. Return to submit.
```

```
JavaScript
```

```
TypeScript
```

```
Customize with create-vue ↗
```

```
Nuxt ↗
```

```
,
```

4. Upon completing the aforementioned steps to create the **my-project**, run the following command to install its dependencies:

```
`bash
cd my-project
npm install
`
or
`bash
cd my-project
yarn install
`
```

Now that `my-project` is ready to run with default settings, let's add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue Floating Action Button component](#) as an example. To use the Vue Floating Action Button component in the project, the `@syncfusion/ej2-vue-buttons` package needs to be installed using the following command:

```
`bash
npm install @syncfusion/ej2-vue-buttons --save
`
or
`bash
yarn add @syncfusion/ej2-vue-buttons
`
```

#### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, `Material` theme is applied using CSS styles, which are available in installed packages. The necessary `Material` CSS styles for the Button component and its dependents were imported into the `<style>` section of `src/App.vue` file.

#### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

### Adding Syncfusion Vue Floating Action Button Component in the Application

Follow the below steps to add the Vue Floating Action Button component using **Composition API** or **Options API**:

1. First, import and register the Floating Action Button component in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### COMPOSITION API (~SRC/APP.VUE)

```
<script setup>
import { FabComponent as EjsFab } from "@syncfusion/ej2-vue-buttons";
</script>
```

#### OPTIONS API (~SRC/APP.VUE)

```
<script>
import { FabComponent } from "@syncfusion/ej2-vue-buttons";
//Component registration
export default {
  name: "App",
  components: {
    "ejs-fab": FabComponent
  }
}
</script>
```

2. Add the component definition in **template** section.

#### ~/SRC/APP.VUE

```
<template>
<ejs-fab content='Add'></ejs-fab>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

#### COMPOSITION API (~SRC/APP.VUE)

```
<template>
<div id="targetElement" style="position:relative;min-height:350px;min-width:
350px;border:1px solid;min-width: 300px;">
<ejs-fab id='fab' ref="fabIn" content='Add' target='#targetElement'></ejs-
fab>
</div>
</template>
<script setup>
import { FabComponent as EjsFab } from "@syncfusion/ej2-vue-buttons";
</script>
<style>
```

```
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
</style>
```

### **OPTIONS API (~SRC/APP.VUE)**

```
<template>
<div id="targetElement" style="position:relative;min-height:350px;border:1px
solid;">
<ejs-fab id='fab' content='Add' target='#targetElement'></ejs-fab>
</div>
</template>
<script>
import { FabComponent } from "@syncfusion/ej2-vue-buttons";
export default {
name: "App",
components: {
"ejs-fab": FabComponent
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
</style>
```

### [Run the project](#)

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
,
```

or

```
`bash
```

```
yarn run dev
```

```
,
```

The output will appear as follows:

For migrating from Vue 2 to Vue 3, refer to the [migration](#) documentation.

### Icons in Vue Floating action button component

You can customize the icon and text of Vue Floating Action Button(FAB) using [iconCss](#) and [content](#) properties.

#### FAB with icon

You can show icon only in Floating Action Button by setting [iconCss](#) property. You can show tooltip on hover to show additional details to end-user by setting [title](#) attribute.

```
<template>
<!-- To render Floating Action Button with icon only -->
<ejs-fab id='fab' iconCss='fab-icons fab-icon-people'></ejs-fab>
</template>
<script>
import Vue from 'vue';
import { FabPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(FabPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
```

,

### FAB with icon and text

You can show icon along with text in Floating Action Button by setting [iconCss](#) and [content](#) properties.

,

```
<template>
<!-- To render Floating Action Button with icon and text -->
<ejs-fab id='fab' iconCss='fab-icons fab-icon-people' content='Contacts'></ejs-fab>
</template>
<script>
import Vue from 'vue';
import { FabPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(FabPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
```

,

### Icon position

You can change the position of icon when showing along with content by setting [iconPosition](#) property. By default, the icon is positioned on the left side together with text.

,

```
<template>
<!-- To render Floating Action Button with icon position -->
<ejs-fab id='fab' iconCss='fab-icons fab-icon-people' content='Contacts' iconPosition='Right'></ejs-fab>
</template>
<script>
import Vue from 'vue';
import { FabPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(FabPlugin);
export default {}
</script>
<style>
```

```
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
```

Below example demonstrates a FAB with icon and text.

**APP.VUE**

```
<template>  
  <div>  
    <div id="targetElement" style="position:relative;min-height:350px;border:1px solid;"></div>  
    <!-- To render Floating Action Button with icon and text -->  
    <ejs-fab id='fab' iconCss='fab-icons fab-icon-people'  
content='Contacts' iconPosition='Right' target='#targetElement'></ejs-fab>  
  </div>  
</template>  
  
<script>  
import Vue from 'vue';  
import { FabPlugin } from "@syncfusion/ej2-vue-buttons";  
import { enableRipple } from '@syncfusion/ej2-base';  
enableRipple(true);  
Vue.use(FabPlugin);  
export default {}  
</script>  
  
<style>  
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';  
@font-face {  
  font-family: 'fab-icons';  
  src: url(data:application/x-font-ttf;charset=utf-8;base64,AEEAAAAKAIAAAwAgTlMvMjl1tSgIAAAEoAAAAMVnTYXDnYOfNAAABYAAAAFZnbHlmkfZLRAAAAKGAAABoaGVhZCF5f3EAAADQAAAAANmhoZWElUQQTA AAAArAAAACRobXR4SAAAAAAAAAYAAAAIBzG9jYTvenNR4AAAIgAAAAJmlheHABIQIXAAABC AAAACBuYW1lkWSegQAAGTAAAAIxcG9zdKKfPWYAABtkAAAAzQABAAAEAAAAAFWEAAAAAAD9AABAABAAAAA AAAAAAAAAAAAAEAABAAAAAQAbzQqW18PPPUACwQAAAAAN8znUAAAAAAN3zOdQAAAAAAD9AP0AAAAACA AAAAAAAAAAAAAEAAAAASAgABQAAAAAAGAAAAAoCgAAAP8AAAAAAAAAAQQA ZAABQAAAokCzAAAAII8CiQLMAAAB6wAyAQgAAAAIABQM AAAAAA AAAAAAAAAAAAAAAAAAAAAUGZFZA B5wDnEAQAAAAAXAQAAAAAAAABAAAAAABAAAAAQAAAA EAAAAABAAAAAQAAAAEAAAAABAAAAAQAAAAEAAAAABAAAAAQAAAAEAAAAABAAAAAQAAAAEAAAAA AgAAAAAUA MAUAQAABQABABCAAAABAAEAAEOcQ//8AAOcA//8AAAABAAQAAAABA IA AwAEA UABgAHAAgACQAKAAsADA ANAA4ADwAQABEAAAAAAAAABP APMBFQEggSaBK4FQAX sBrgGL1afcCB AI5gj8CR4KPA t0AAAABAAAAAAD9APoAD0AwC5AXAA ACUF CRUPDiMvDjU/Dh8CAR8LFQ8OIy8PPw4XAR8LHQEPDI8OPQE/DDMXJw8KHQEFagUVcSSBDw4VHW4zPwcBDWedAR8NPw41Lw4 jDwkBNzUvASufCTM/DT0BLw4rAQ8BA5AGBgYFB AQDA gIBA QECawMFBAUGBgCHBWgHCacIBwCHBG YGBQQEA wICA QEBAgMDB QQGBQYHBwCKwoJCv0nBwcGBgYFB AQDA wIBA QECagQBQUFBGChBwCHCAC ICACHBgYGBQQEA wMBAQEBAQIDA wQEBgUGBwKICQoLatwHBwCGBUFBAMCagEBAgMDBAUFBG yGBwg HBWG IBwC IBwYGBQUFBAMCagEBAgMDBAUFBQC GCQk JCQxMDAsKCQGHBgUDAgEBAQP+HwYHCagICQk KDQ4ODQ4NDAwMCwoJCACHBAQCAQIDBQYHCagKCwwMDQoLCgoREBAPdg0MCgHDagICagQGBGGJCQSMEBESERMSDQwMCwsJCAGGBQQCAQIDBAYGCakJCwwMDQ0NDQ4NDgoKCQkJCAcH/h4CAQMB4gcOBwgJCQkKCwoLEBAQEAsLCwkIBWyFAwMcAUFBwgJCgsLDA0KCgoKEREQ2QQEBQYGBgYHBwCHBwCHBWyHBQFUFBAMDAG IBAQE CAgQEBAU FBG YHBwCHBwCHBwyHBgYFB AQEA WICAQE CAWFvAgMEBAUGBQC GBWC HBwCHBwCHBwYFBQUEAWICAQEBAgidBAQFBQYGBwCHBwCHBwYHBgYGBQUEBAMDAQEBAV0DAwQE BQU GBgCHBGGHBwCHBGCGBGUEBQMDAwEBAQEBAgieAU EBgyGBgCHBwCHBwYFBYFBQUEBAMDAGEsbwCICQoLCwwKCQkKCQkJCeOHBGYFBQUEAWMDAgMEBQC HCAk LCgw NDA0NDA0MDAwLCWKJBwCGBAMCAOE

### Styles in Vue Floating action button component

This section explains the different styles of Floating Action Button.

#### FAB styles

The Vue Floating Action Button supports the following predefined styles that can be defined using the [cssClass](#) property. You can customize by replacing the `cssClass` property with the below defined class.

cssClass	Description
-----	-----
e-primary	Used to represent a primary action.
e-outline	Used to represent an appearance of button with outline.
e-info	Used to represent an informative action.
e-success	Used to represent a positive action.
e-warning	Used to represent an action with caution.
e-danger	Used to represent a negative action.

#### APP.VUE

```

<template>
  <div>
    <div id="targetElement" style="position:relative;min-height:350px;border:1px solid;"></div>
    <!-- To render Floating Action Button with applied warning style -->
    <ejs-fab id='fab' iconCss= 'e-icons e-edit' cssClass= 'e-warning'
target='#targetElement'></ejs-fab>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { FabPlugin } from "@syncfusion/ej2-vue-buttons";
  import { enableRipple } from '@syncfusion/ej2-base';
  enableRipple(true);
  Vue.use(FabPlugin);
  export default {}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';

```

```
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
```

```
{% previewsample "page.domainurl/code-snippet/floating-action-button/styles-cs1" %}
```

Predefined Floating Action Button styles provide only the visual indication. So, Floating Action Button [content](#) property should define the Floating Action Button style for the users of assistive technologies such as screen readers.

### Styles customization

To modify the Floating Action Button appearance, you need to override the default CSS of Floating Action Button component. Please find the list of CSS classes and its corresponding section in Floating Action Button component. Also, you have an option to create your own custom theme for the components using our [Theme Studio](#).

CSS Class	Purpose of Class
.e-fab.e-btn	To customize the FAB.
.e-fab.e-btn:hover	To customize the FAB on hover.
.e-fab.e-btn:focus	To customize the FAB on focus.
.e-fab.e-btn:active	To customize the FAB on active.
.e-fab.e-btn-icon	To customize the style of FAB icon.

### Show text on hover

By using [cssClass](#), you can customize the Floating Action Button to show text on hover with applied transition effect. For detailed information, refer `app.vue` file below.

The content will behave the same, when the `enableHtmlSanitizer` is enabled. Since we are adding only the valid tags in content, sanitizing the content will not affect it.

### APP.VUE

```
<template>
  <div>
    <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;"></div>
    <!-- To render Floating Action Button -->
    <ejs-fab id='fab' iconCss='e-icons e-edit' content='<span
class="text-container"><span class="textEle">Edit</span></span>'
cssClass='fab-hover' target='#targetElement'></ejs-fab>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { FabPlugin } from "@syncfusion/ej2-vue-buttons";
  import { enableRipple } from '@syncfusion/ej2-base';
  enableRipple(true);
  Vue.use(FabPlugin);
  export default {}
</script>
<style>
```

```

@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
/* start of onhover customization */
.e-fab.e-btn.fab-hover {
    padding: 6px 0px 10px 10px;
}
.fab-hover .text-container {
    overflow: hidden;
    width: 0;
    margin: 0;
    transition: width .5s linear 0s, margin .2s linear .5s;
}
.fab-hover:hover .text-container {
    width: 35px;
    margin: 0 5px;
    transition: width .5s linear .2s, margin .2s linear 0s;
}
/* end of onhover customization */
</style>

```

{% previewsample "page.domainurl/code-snippet/floating-action-button/styles-cs2" %}

### Positions in Vue Floating action button component

The floating action button can be positioned anywhere on the [target](#) using the [position](#) property. If the [target](#) is not defined, then FAB is positioned based on the browser viewport.

The position values of Floating Action Button are as follows:

- TopLeft
- TopCenter
- TopRight
- MiddleLeft
- MiddleCenter
- MiddleRight
- BottomLeft
- BottomCenter
- BottomRight

<template>

<!-- To render Floating Action Button in BottomLeft position -->

<ejs-fab id='fab' content='Add' position='BottomLeft'></ejs-fab>

</template>

<script>

import Vue from 'vue';

import { FabPlugin } from "@syncfusion/ej2-vue-buttons";

import { enableRipple } from '@syncfusion/ej2-base';

```

enableRipple(true);
Vue.use(FabPlugin);
export default {}
</script>

<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
`

```

Below example demonstrates different supported positions of FAB.

### APP.VUE

```

<template>
  <div>
    <div id="target" style="position:relative;min-height:350px;border:1px solid;"></div>
    <!-- To render Floating Action Button in TopLeft position -->
    <ejs-fab id="fab1" iconCss='fab-icons fab-icon-people'
position='TopLeft' target='#target'></ejs-fab>
    <!-- To render Floating Action Button in TopCenter position -->
    <ejs-fab id="fab2" iconCss='fab-icons fab-icon-people'
position='TopCenter' target='#target'></ejs-fab>
    <!-- To render Floating Action Button in TopRight position -->
    <ejs-fab id="fab3" iconCss='fab-icons fab-icon-people'
position='TopRight' target='#target'></ejs-fab>
    <!-- To render Floating Action Button in MiddleLeft position -->
    <ejs-fab id="fab4" iconCss='fab-icons fab-icon-people'
position='MiddleLeft' target='#target'></ejs-fab>
    <!-- To render Floating Action Button in MiddleCenter position -->
    <ejs-fab id="fab5" iconCss='fab-icons fab-icon-people'
position='MiddleCenter' target='#target'></ejs-fab>
    <!-- To render Floating Action Button in MiddleRight position -->
    <ejs-fab id="fab6" iconCss='fab-icons fab-icon-people'
position='MiddleRight' target='#target'></ejs-fab>
    <!-- To render Floating Action Button in BottomLeft position -->
    <ejs-fab id="fab7" iconCss='fab-icons fab-icon-people'
position='BottomLeft' target='#target'></ejs-fab>
    <!-- To render Floating Action Button in BottomCenter position -->
    <ejs-fab id="fab8" iconCss='fab-icons fab-icon-people'
position='BottomCenter' target='#target'></ejs-fab>
    <!-- To render Floating Action Button in BottomRight position -->
    <ejs-fab id="fab9" iconCss='fab-icons fab-icon-people'
position='BottomRight' target='#target'></ejs-fab>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { FabPlugin } from "@syncfusion/ej2-vue-buttons";
  import { enableRipple } from '@syncfusion/ej2-base';
  enableRipple(true);

```

```

{% previewsample "page.domainurl/code-snippet/floating-action-button/positions-cs1" %}

### Custom position

You can define the custom position of the Floating Action Button by override the **top**, **left**, **right**, and **bottom** CSS properties using [cssClass](#). For detailed information, refer **app.vue** file below.

### APP.VUE

```

<template>
  <div>
    <div id="targetElement" style="position:relative;min-height:350px;border:1px solid;"></div>
    <!-- To render Floating Action Button -->
    <ejs-fab id='fab' iconCss='e-icons e-edit' cssClass='custom-position' target='#targetElement'></ejs-fab>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { FabPlugin } from "@syncfusion/ej2-vue-buttons";
  import { enableRipple } from '@syncfusion/ej2-base';
  enableRipple(true);
  Vue.use(FabPlugin);
  export default {}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  .e-fab.e-btn.custom-position {
    left: 40px;
    top: 40px;
    bottom: unset;
    right: unset;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/floating-action-button/positions-cs2" %}

### Events in Vue Floating action button component

This section explains the available events in Floating Action Button component.

#### created

Event triggers after the creation of Floating Action Button.

,

```

<template>
  <!-- To render Floating Action Button -->
  <ejs-fab id='fab' iconCss='e-icons e-edit' content='Edit' :created="onCreate"></ejs-fab>
</template>
<script>
import Vue from 'vue';
import { FabPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(FabPlugin);
export default {
  methods: {
    onCreate: function () {

```

```
//Your required action here
```

```
}
```

```
}
```

```
}
```

```
</script>
```

```
<style>
```

```
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
```

```
</style>
```

```
,
```

[onclick](#)

Event triggers when the Floating Action Button is clicked.

```
,
```

```
<template>
```

```
<!-- To render Floating Action Button -->
```

```
<ejs-fab id='fab' iconCss='e-icons e-edit' content='Edit' v-on:click.native="onClick"></ejs-fab>
```

```
</template>
```

```
<script>
```

```
import Vue from 'vue';
```

```
import { FabPlugin } from "@syncfusion/ej2-vue-buttons";
```

```
Vue.use(FabPlugin);
```

```
export default {
```

```
  methods: {
```

```
    onClick: function () {
```

```
      //Your required action here
```

```
    }
```

```
  }
```

```
}
```

```
</script>
```

```
<style>
```

```
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
```

```
</style>
```

Below example demonstrates the click event of the Floating Action Button.

#### APP.VUE

```
<template>
  <div>
    <div id="targetElement" style="position:relative;min-height:350px;border:1px solid;"></div>
    <!-- To render Floating Action Button -->
    <ejs-fab id='fab' iconCss='e-icons e-edit' content='Edit' v-on:click.native="onClick" target='#targetElement'>
      </ejs-fab>
    </div>
  </template>
<script>
  import Vue from 'vue';
  import { FabPlugin } from "@syncfusion/ej2-vue-buttons";
  import { enableRipple } from '@syncfusion/ej2-base';
  enableRipple(true);
  Vue.use(FabPlugin);
  export default {
    methods: {
      onClick: function () {
        alert("Edit is clicked!");
      }
    }
  }
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/floating-action-button/events-cs1" %}

## Form Validator

### Validation rules in Vue Form validator component

#### Default Rules

The **FormValidator** has following default validation rules, which are used to validate the form.

Rules	Description	Example
required	The form input element must have any input values	a or 1 or -
email	The form input element must have valid email format values	form@syncfusion.com
url	The form input element must have valid url format values	<a href="http://syncfusion.com/">http://syncfusion.com/</a>
date	The form input element must have valid date format values	05/15/2017
dateISO	The form input element must have valid dateISO format values	2017-05-15

| **number** | The form input element must have valid **number** format values | 1.0 or 1 |

| **digit** | The form input element must have valid **digit** values | 1 |

| **maxLength** | Input value must have less than or equal to **maxLength** character length | if  
**maxLength**: 5, **check** is valid and **checking** is invalid |

| **minLength** | Input value must have greater than or equal to **minLength** character length | if  
**minLength**: 5, **testing** is valid and **test** is invalid |

| **rangeLength** | Input value must have value between **rangeLength** character length | if  
**rangeLength**: [4,5], **test** is valid and **key** is invalid |

| **range** | Input value must have value between **range** number | if **range**: [4,5], **4** is valid and **6** is  
invalid |

| **max** | Input value must have less than or equal to **max** number | if **max**: 3, **3** is valid and **4** is invalid |

| **min** | Input value must have greater than or equal to **min** number | if **min**: 4, **5** is valid and **2** is invalid  
|

### Error messages in Vue Form validator component

The **FormValidator** provides default error messages for all default validation rules.

It is tabulated as follows

Rules	message
-----	-----
<b>required</b>	This field is required.
<b>email</b>	Please enter a valid email address.
<b>url</b>	Please enter a valid URL.
<b>date</b>	Please enter a valid date.
<b>dateIso</b>	Please enter a valid date ( ISO ).
<b>number</b>	Please enter a valid number.
<b>digit</b>	Please enter only digits.
<b>maxLength</b>	Please enter no more than {0} characters.
<b>minLength</b>	Please enter at least {0} characters.
<b>rangeLength</b>	Please enter a value between {0} and {1} characters long.
<b>range</b>	Please enter a value between {0} and {1}.
<b>max</b>	Please enter a value less than or equal to {0}.
<b>min</b>	Please enter a value greater than or equal to {0}.
<b>regex</b>	Please enter a correct value.

### Customizing Error Messages

The default error message for a rule can be customizable by defining it along with concern rule object as follows.

#### APP.VUE

```
<template>
  <div class="wrap">
    <form id="form-element" class="form-horizontal">
      <div class="form-group">
        <div class="col-sm-3 control-label">Select Date</div>
        <div class="col-sm-6">
          <ejs-datepicker
            id="datepicker"
            name="date"
            class="form-control"
            placeholder="Select a date"
          ></ejs-datepicker>
          <div class="error-element"></div>
        </div>
      </div>
    </form>
  </template>
<script>
import Vue from "vue";
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
import { FormValidator } from "@syncfusion/ej2-vue-inputs";
import { queryParams } from "@syncfusion/ej2-base";
import { throws } from "assert";
Vue.use(DatePickerPlugin);
export default {
  name: "App",
  mounted() {
    var options = {
      rules: {
        date: { required: [true, "Select any value"] }
      },
      customPlacement: function(element, errorElement) {
        document.querySelector(".error-element").appendChild(errorElement);
      },
    };
    // defines FormValidator to validate the TimePicker
    var formObject = new FormValidator("#form-element", options);
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.wrap {
  margin-top: 10px;
}
.error-element {
  margin-top: 5px;
}
#list_event {
  margin-top: 60px;
  padding-left: 5px;
}
```

```

    min-width: 200px;
  }
  #evt {
    border: 1px solid #dcdcdc;
    padding: 10px;
    min-width: 10px;
  }
  .eventarea {
    min-width: 250px;
  }
  #EventLog b {
    color: #388e3c;
  }
  .evtbtn {
    margin-top: 40px;
    margin-left: 70px;
  }
}
</style>

```

{% previewsample "page.domainurl/code-snippet/form-validator/form-validation-events-cs1" %}

### Validation events in Vue Form validator component

Validation events have two types of events. These are

- validationBegin
- validationComplete

#### Validation Begin

**validationBegin** event triggers before the validation starts and also it invoke for each rules in validation process. Please find the below code snippet.

```

`ts
validationBegin: function(args) {
// ("Validation begin");
},
`

```

The following values are passed in **args**. You can use this values in event validation.

Fields	Description
----- -----	
<b>element</b>	Specifies the input element
<b>name</b>	Specifies the event name (validationBegin)
<b>param</b>	Specifies the param value (true/false)
<b>value</b>	Specifies the input value

### Validation Complete

**validationComplete** event triggered after validation is completed and also it invoke for each rules in validation process. Please find the below code snippet.

```
`ts
validationComplete: function(args) {
// ("Validation complete");
}
`
```

The following values are passed in **args**. You can use this values in event validation.

Fields	Description
<b>element</b>	Specifies the input element
<b>name</b>	Specifies the event name (validationComplete)
<b>param</b>	Specifies the param value (true/false)
<b>value</b>	Specifies the input value
<b>status</b>	Specifies the status (success/failure)
<b>inputName</b>	Specifies the type of input

Please find the simple sample for validation events.

### APP.VUE

```
<template>
  <div class="wrap">
    <form id="form-element" class="form-horizontal">
      <div class="form-group">
        <div class="col-sm-3 control-label">Select Date</div>
        <div class="col-sm-6">
          <ejs-datepicker
            id="datepicker"
            name="date"
            class="form-control"
            placeholder="Select a date"
          ></ejs-datepicker>
          <div class="error-element"></div>
        </div>
      </div>
      <div id="list_event">
        <h4>
          <b>Event Trace</b>
        </h4>
        <div id="evt">
          <ul id="eList"></ul>
        </div>
      </div>
    </form>
  </div>
</template>
```

```

    <div class="evtbtn">
      <ejs-button id="clear" @click.native="onClick">Clear</ejs-button>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
import { FormValidator } from "@syncfusion/ej2-vue-inputs";
import { queryParams } from "@syncfusion/ej2-base";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { throws } from "assert";
Vue.use(DatePickerPlugin);
Vue.use(ButtonPlugin);
export default {
  name: "App",
  methods: {
    onClick: function(event) {
      document.getElementById("eList").innerHTML = "";
    },
  },
  mounted() {
    var options = {
      rules: {
        date: { required: true }
      },
      validationBegin: function(args) {
        this.appendElement("Validation begin <hr>");
      },
      appendElement: function(html) {
        let span = document.createElement("span");
        span.innerHTML = html;
        let log = document.getElementById("eList");
        log.insertBefore(span, log.firstChild);
      },
      customPlacement: function(element, errorElement) {
        document.querySelector(".error-element").appendChild(errorElement);
      },
      validationComplete: function(args) {
        if (args.status === "success") {
          this.appendElement("Validation complete success <hr>");
        } else {
          this.appendElement("Validation complete failure <hr>");
        }
      },
    };
    // defines FormValidator to validate the TimePicker
    var formObject = new FormValidator("#form-element", options);
  }
};
</script>
<style>
.wrap {
  margin-top: 10px;
}
.error-element {
  margin-top: 5px;
}

```

```

}
#list_event {
  margin-top: 60px;
  padding-left: 5px;
  min-width: 200px;
}
#evt {
  border: 1px solid #dcdcdc;
  padding: 10px;
  min-width: 10px;
}
.eventarea {
  min-width: 250px;
}
#EventLog b {
  color: #388e3c;
}
.evtbtn {
  margin-top: 40px;
  margin-left: 70px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/form-validator/form-validation-events-cs2" %}

In the above code example, after completion of validation, the status of the validation process is passed as arguments to validationComplete method and the values are assigned according to the status of the validation.

## Gantt

### Getting Started with the Vue Gantt Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLILink to the Video](#) and integrating the Syncfusion Vue Gantt component

To get start quickly with Vue Gantt Chart, you can check on this video:

#### Prerequisites

[System requirements for Syncfusion Vue UI components](#)

#### Dependencies

Following is the list of dependencies to use the Gantt with all features:

```
`javascript
```

```
|-- @syncfusion/ej2-gantt
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-calendars
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-dropdowns
```

```
|-- @syncfusion/ej2-grids
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-layouts
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-richtexteditor
|-- @syncfusion/ej2-treegrid
\
```

### Setting up the Vue 2 project

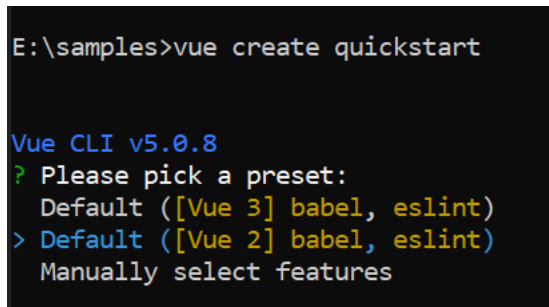

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```
`bash
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
\
```

or

```
`bash
yarn global add @vue/cli
vue create quickstart
cd quickstart
yarn run serve
\
```

When creating a new project, choose the option **Default ([Vue 2] babel, eslint)** from the menu.

```
E:\samples>vue create quickstart

Vue CLI v5.0.8
? Please pick a preset:
  Default ([Vue 3] babel, eslint)
> Default ([Vue 2] babel, eslint)
  Manually select features
```

Once the **quickstart** project is set up with default settings, proceed to add Syncfusion components to the project.

### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.npmjs.com). To use Vue components, install the required npm package.

This article uses the [Vue gantt component](#) as an example. Install the `@syncfusion/ej2-vue-gantt` package by running the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-gantt --save
```

```
`
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-gantt
```

```
`
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the `Material` theme is applied using CSS styles, which are available in installed packages. The necessary `Material` CSS styles for the Gantt component and its dependents were imported into the `<style>` section of `src/App.vue` file.

#### ~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-calendars/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-grids/styles/material.css';
@import '../node_modules/@syncfusion/ej2-richtexteditor/styles/material.css';
@import '../node_modules/@syncfusion/ej2-treegrid/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-gantt/styles/material.css";
</style>
```

**Note:** Use above CSS styles in `<style> </style>` tag for rendering all code snippets.

### Add Syncfusion Vue component

Follow the below steps to add the Vue Gantt component:

1\ First, import and register the Gantt component in the `script` section of the `src/App.vue` file.

### ~/SRC/APP.VUE

```
<script>
import { GanttComponent } from "@syncfusion/ej2-vue-gantt";
export default {
  components: {
    'ejs-gantt': GanttComponent
  }
}
</script>
```

2\ In the **template** section, define the Gantt component.

### ~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-gantt></ejs-gantt>
</div>
</template>
```

### Module injection

The Gantt components was segregated into individual feature-wise modules. To use its feature, you need to inject its feature service in the AppModule.

Find the relevant feature modules and descriptions as follows:

- [Edit](#) : Inject this module to use the editing feature.
- [Filter](#) : Inject this module to use the filtering feature.
- [Sort](#) : Inject this module to use the sorting feature.
- [Selection](#) : Inject this module to use the selection feature.
- [Toolbar](#) : Inject this module to use the toolbar items.
- [DayMarkers](#) : Inject this module to highlight the days.

Now, import the above-mentioned modules from the Gantt package and inject them using **providelike** following code:

### ~/SRC/APP.VUE

```
<script>
import { GanttComponent , Edit, Filter, Sort } from "@syncfusion/ej2-vue-gantt";
export default {
  provide: {
    gantt: [ Edit, Filter, Sort ]
  }
};
</script>
```

### Binding Gantt with data

Bind data with the Gantt component by using the [dataSource](#) property. It accepts an array of JavaScript object or the DataManager instance.

~/SRC/APP.VUE

```

<template>
<div>
<ejs-gantt ref='gantt' :dataSource="data"></ejs-gantt>
</div>
</template>
<script>
import { GanttComponent } from "@syncfusion/ej2-vue-gantt";
export default {
  components: {
    'ejs-gantt': GanttComponent
  },
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate: new
              Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
              Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
              Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation', StartDate: new
              Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new Date('04/04/2019'),
              Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
              Date('04/04/2019'), Duration: 3, Progress: 50 }
          ]
        },
      ],
    };
  },
};
</script>

```

## Mapping task fields

The data source fields that are required to render the tasks are mapped to the Gantt control using the [taskFields](#) property.

~/SRC/APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' :dataSource="data" id="GanttContainer"
    :taskFields = "taskFields" :height = "height"></ejs-gantt>
  </div>
</template>
<script>
import { GanttComponent } from "@syncfusion/ej2-vue-gantt";
export default {
  components: {
    'ejs-gantt': GanttComponent
  },
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate:
new Date('04/04/2019'), Duration: 3, Progress: 50 }
          ]
        },
      ],
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
    };
  },
};

```

```

};
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-calendars/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';

@import '../node_modules/@syncfusion/ej2-grids/styles/material.css';
@import '../node_modules/@syncfusion/ej2-richtexteditor/styles/material.css';
@import '../node_modules/@syncfusion/ej2-treegrid/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-gantt/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/gantt/getting-started-cs1" %}

Note : While creating a Syncfusion Vue components using [Direct Scripts](#), camelCased property (dataSource) names need to specify in the [kebab-cased](#) (data-source) equivalents.

### Defining timeline

The Gantt has an option to define timeline using [timelineSettings](#) property with various options. Using this property we can customize the Gantt timeline.

### ~/SRC/APP.VUE

```

<template>
  <div>
    <ejs-gantt id="GanttContainer" :dataSource="data" :taskFields =
      "taskFields" :height = "height" :timelineSettings="timelineSettings"></ejs-
      gantt>
    </div>
  </template>
<script>
import { GanttComponent } from "@syncfusion/ej2-vue-gantt";
export default {
  components: {
    'ejs-gantt': GanttComponent
  },
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
              StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },

```

```

        { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
        { TaskID: 4, TaskName: 'Soil test approval', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
    ]
},
{
    TaskID: 5,
    TaskName: 'Project Estimation',
    StartDate: new Date('04/02/2019'),
    EndDate: new Date('04/21/2019'),
    subtasks: [
        { TaskID: 6, TaskName: 'Develop floor plan for
estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
        { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
        { TaskID: 8, TaskName: 'Estimation approval', StartDate:
new Date('04/04/2019'), Duration: 3, Progress: 50 }
    ]
},
],
height: '450px',
taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    endDate: 'EndDate',
    duration: 'Duration',
    progress: 'Progress',
    dependency: 'Predecessor',
    child: 'subtasks'
},
timelineSettings: {
    topTier: {
        format: 'MMM dd, yyyy',
        unit: 'Week',
    },
    bottomTier: {
        unit: 'Day',
    },
},
},
};
},
};
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';

</style>
```

```
{% previewsample "page.domainurl/code-snippet/gantt/getting-started-cs2" %}
```

### Enabling toolbar

The [toolbar](#) property is used to add the toolbar items like Add, Remove, Edit, Update, Delete, Expand All, Collapse All in Gantt.

To use toolbar, inject the **Toolbar** module in the **provide** section.

### ~/SRC/APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
      :taskFields = "taskFields" :height = "height" :toolbar="toolbar"
      :editSettings= "editSettings"></ejs-gantt>
  </div>
</template>
<script>
import { GanttComponent, Edit, Selection, Toolbar, DayMarkers } from
"@syncfusion/ej2-vue-gantt";
export default {
  components: {
    'ejs-gantt': GanttComponent
  },
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
              StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
              estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
```

```

        { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
        { TaskID: 8, TaskName: 'Estimation approval', StartDate:
new Date('04/04/2019'), Duration: 3, Progress: 50 }
    ]
  },
],
  height: '450px',
  taskFields: {
    id: 'TaskID',

@import '../node_modules/@syncfusion/ej2-richtexteditor/styles/material.css';
@import '../node_modules/@syncfusion/ej2-treegrid/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-gantt/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/gantt/getting-started-cs3" %}

### Enabling editing

The editing feature enables you to edit the tasks in Gantt component. It can be enabled by using the [editSettings.allowEditing](#) and [editSettings.allowTaskbarEditing](#) properties.

To use Editing, inject the [Edit](#) module in the `provide` section.

The following editing options are available to update the tasks in Gantt:

- Cell
- Dialog
- Taskbar
- Connector line

### Cell editing

Modify the task details through cell editing by setting the edit [mode](#) property as `Auto`. To enable edit support [Edit](#) module should be injected in Gantt. If [Edit](#) module is not injected, you cannot do any editing action in Gantt.

### ~/SRC/APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :toolbar="toolbar" :columns =
    "columns" :editSettings= "editSettings"></ejs-gantt>
  </div>
</template>
<script>

</style>
```

```
{% previewsample "page.domainurl/code-snippet/gantt/getting-started-cs4" %}
```

**Note:** When the edit mode is set to **Auto**, you can change the cells to editable mode by double-clicking anywhere at the TreeGrid and edit the task details in the edit dialog by double-clicking anywhere at the chart.

### Dialog editing

Modify the task details through dialog by setting edit [mode](#) property as **Dialog**.

### ~/SRC/APP.VUE

### Enabling predecessors or task relationships

Predecessor or task dependency in the Gantt component is used to depict the relationship between the tasks.

Start to Start (SS) : You cannot start a task until the dependent task starts.

Start to Finish (SF) : You cannot finish a task until the dependent task finishes.

Finish to Start (FS) : You cannot start a task until the dependent task completes.

Finish to Finish (FF) : You cannot finish a task until the dependent task completes.

You can show the relationship in tasks, by using the [dependency](#) property as shown in the following code example:

### ~/SRC/APP.VUE

```

<template>
  <div>

```

```

    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height"
    highlightWeekends='true'></ejs-gantt>
  </div>
</template>
<script>
import { GanttComponent } from "@syncfusion/ej2-vue-gantt";

{% previewsample "page.domainurl/code-snippet/gantt/getting-started-cs8" %}

### Assigning resources

You can display and assign the resource for each task in the Gantt control. Create a collection of JSON object, which contains id, name, unit and group of the resources and assign it to the [resources](#) property. Map these fields to the Gantt control using the [resourceFields](#) property.

### ~/SRC/APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
      :taskFields= "taskFields" :height= "height" :treeColumnIndex= "1"
      :resourceFields= "resourceFields" :resources= "resources"
      :highlightWeekends= "true" :labelSettings= "labelSettings"></ejs-gantt>
    </div>
  </template>
<script>
import { GanttComponent } from "@syncfusion/ej2-vue-gantt";
export default {

{% previewsample "page.domainurl/code-snippet/gantt/getting-started-cs9" %}

### Enable filtering

The filtering feature enables you to view reduced amount of records based on filter criteria. Gantt provides support for menu filtering support for each columns. It can be enabled by setting the [allowFiltering](#) property to `true` along with injecting the `Filter` module module as shown in the following code example. Filtering feature can also be customized using the [filterSettings](#) property.

To use Filtering, inject the [Filter](#) module in the `provide` section.

### ~/SRC/APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
      :taskFields = "taskFields" :height = "height" :columns="columns"
      :toolbar="toolbar" :allowFiltering= "true"
      :timelineSettings="timelineSettings" :splitterSettings= "splitterSettings"
      :labelSettings= "labelSettings" :projectStartDate="projectStartDate"
      :projectEndDate= "projectEndDate"></ejs-gantt>
    </div>
  </template>
<script>

### Enable sorting

The sorting feature enables you to order the records. It can be enabled by setting the [allowSorting](#) property to true. Provide the [Sort](#) module as follows. If [Sort](#) module is not provided, you cannot sort when a header is clicked. The sorting feature can be customized using the [sortSettings](#)(../api/gantt/sortSettings/) property.

To use Sorting, inject the [Sort](#) module in the `provide` section.

### ~/SRC/APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
      :taskFields = "taskFields" :height = "height" :columns="columns"
      :splitterSettings= "splitterSettings" :allowSorting= 'true'></ejs-gantt>
    </div>
  </template>
<script>
import { GanttComponent, Sort } from "@syncfusion/ej2-vue-gantt";

```

```

export default {

{% previewsample "page.domainurl/code-snippet/gantt/getting-started-cs11" %}

### Defining eventmarkers

The [eventMarkers](#) property in Gantt component is used to highlight the important event in Gantt chart part. By using this feature, you can add the lines and label to highlight important days in your project.

To highlight the days, inject the **DayMarkers** module in the **provide** section.

### ~/SRC/APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height"
    :eventMarkers="eventMarkers"></ejs-gantt>
  </div>
</template>
<script>
import { GanttComponent, DayMarkers} from "@syncfusion/ej2-vue-gantt";
import { projectNewData } from './data-source.js';
export default {
  components: {
    'ejs-gantt': GanttComponent
  },
  data: function() {
    return{
      data: projectNewData,
      height: '450px',
      taskFields: {
        id: 'TaskID',

```

```

        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
    },
    eventMarkers: [
        {
            day: new Date('04/09/2019'),
            label: 'Research phase'
        }, {
            day: new Date('04/30/2019'),
            label: 'Design phase'
        }, {
            day: new Date('05/23/2019'),
            label: 'Production phase'
        }, {
            day: new Date('06/20/2019'),
            label: 'Sales and marketing phase'
        }
    ]
    };
},
provide: {
    gantt: [DayMarkers]
}
};
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-calendars/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-grids/styles/material.css';
@import '../node_modules/@syncfusion/ej2-richtexteditor/styles/material.css';
@import '../node_modules/@syncfusion/ej2-treegrid/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-gantt/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/gantt/getting-started-cs12" %}

### Run the application

Now run the `npm run serve` command in the console, it will build your application and open in the web browser.

The following example shows a basic Gantt:

~/SRC/APP.VUE

```

<template>
<div>
<ejs-gantt id="gantt" :dataSource="data" :taskFields = "taskFields"
:height="height"></ejs-gantt>
</div>
</template>
<script>
import { GanttComponent } from '@syncfusion/ej2-vue-gantt';
export default {
  components: {
    'ejs-gantt': GanttComponent
  },
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate:
new Date('04/04/2019'), Duration: 3, Progress: 50 }
          ]
        }
      ],
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
      }
    }
  }
}

```

```

    },
  },
};
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';

## Getting Started with the Vue Gantt Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue Gantt component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

### Prerequisites

#### [System requirements for Syncfusion Vue UI components](#)

#### Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm create vite@latest
```

```
,
```

```
or
```

```
`bash
```

```
yarn create vite
```

```
,
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as `my-project` for this article.

```
`bash
```

```
? Project name: » my-project
```

```
,
```

2. Select `Vue` as the framework. It will create a Vue 3 project.

```
`bash
```

```
? Select a framework: » - Use arrow-keys. Return to submit.
```

```
Vanilla
```

```
Vue
```

```
React
```

```
Preact
```

```
Lit
```

```
Svelte
```

```
Others
```

```
,
```

3. Choose `JavaScript` as the framework variant to build this Vite project using JavaScript and Vue.

```
`bash
```

```
? Select a variant: » - Use arrow-keys. Return to submit.
```

```
JavaScript
```

```
TypeScript
```

```
Customize with create-vue ↗
```

```
Nuxt ↗
```

```
,
```

4. Upon completing the aforementioned steps to create the `my-project`, run the following command to install its dependencies:

```
`bash
```

```
cd my-project
```

```
npm install
```

```
,
```

```
or
```

```
`bash
```

```
cd my-project
```

```
yarn install
```

```
,
```

Now that **my-project** is ready to run with default settings, let's add Syncfusion components to the project.

### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue Gantt component](#) as an example. To use the Vue Gantt component in the project, the `@syncfusion/ej2-vue-gantt` package needs to be installed using the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-gantt --save
```

```
,
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-gantt
```

```
,
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, **Material** theme is applied using CSS styles, which are available in installed packages. The necessary **Material** CSS styles for the Gantt component and its dependents were imported into the `<style>` section of **src/App.vue** file.

### ~/SRC/APP.VUE

```
<style>
<!-- Material theme used for this sample -->
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-treegrid/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-gantt/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

### Add Syncfusion Vue component

Follow the below steps to add the Vue Gantt component using **Composition API** or **Options API**:

1.First, import and register the Gantt component and its child directives in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<script setup>
import { GanttComponent as EjsGantt, ColumnsDirective as EColumns,
ColumnDirective as EColumn } from '@syncfusion/ej2-vue-gantt';
</script>
```

#### **OPTIONS API (~SRC/APP.VUE)**

```
<script>
import { GanttComponent, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-vue-gantt';
//Component registration
export default {
  name: "App",
  components: {
    'ejs-gantt': GanttComponent,
    'e-columns': ColumnsDirective,
    'e-column': ColumnDirective
  }
}
</script>
```

2.In the **template** section, define the Gantt component with the [dataSource](#) property and column definitions.

#### **~/SRC/APP.VUE**

```
<template>
<ejs-gantt :dataSource='data' :treeColumnIndex='1' child='subtasks'
:taskFields= 'taskFields'>
<e-columns>
<e-column field='TaskID' headerText='Task ID' textAlign='Right'
width=70></e-column>
<e-column field='TaskName' headerText='Task Name' textAlign='Left'
width=200></e-column>
<e-column field='StartDate' headerText='Start Date' textAlign='Right'
format='yMd' width=90></e-column>
<e-column field='Duration' headerText='Duration' textAlign='Right'
width=80></e-column>
</e-columns>
</ejs-gantt>
</template>
```

3.Declare the values for the **dataSource** property in the **script** section.

#### **COMPOSITION API (~SRC/APP.VUE)**

```

<script setup>
const data = [{
  TaskID: 1,
  TaskName: 'Planning',
  StartDate: new Date('02/03/2017'),
  EndDate: new Date('02/07/2017'),
  Progress: 100,
  Duration: 5,
  subtasks: [
    { TaskID: 2, TaskName: 'Plan timeline', StartDate: new Date('02/03/2017'),
      EndDate: new Date('02/07/2017'), Duration: 5, Progress: 100, },
    { TaskID: 3, TaskName: 'Plan budget', StartDate: new Date('02/03/2017'),
      EndDate: new Date('02/07/2017'), Duration: 5, Progress: 100, },
    { TaskID: 4, TaskName: 'Allocate resources', StartDate: new
      Date('02/03/2017'), EndDate: new Date('02/07/2017'), Duration: 5, Progress:
      100, },
    { TaskID: 5, TaskName: 'Planning complete', StartDate: new
      Date('02/07/2017'), EndDate: new Date('02/07/2017'), Duration: 0, Progress:
      0, }
  ],
},
{
  TaskID: 6,
  TaskName: 'Design',
  StartDate: new Date('02/10/2017'),
  EndDate: new Date('02/14/2017'),
  Duration: 3,
  Progress: 86,
  subtasks: [
    { TaskID: 7, TaskName: 'Software Specification', StartDate: new
      Date('02/10/2017'), EndDate: new Date('02/12/2017'), Duration: 3, Progress:

projectEndDate: new Date('05/10/2019')
};
},
provide: {
  gantt: [ Filter, Toolbar ]
}
};
</script>
<style>
<!-- Material theme used for this sample -->
@import
"https://ej2.syncfusion.com/vue/documentation/node\_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-treegrid/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-gantt/styles/material.css";
</style>

```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run serve
```

```
`
```

or

```
`bash
```

```
yarn run dev
```

The output will appear as follows:

```
![vueimage](./images/vue-gantt-image.png)
```

#### *Using local style*

Import the needed css styles for the Gantt component along with dependency styles in the `<style>` section of the `src/App.vue` file as follows.

```
<style>
<!-- Material theme used for this sample -->
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-treegrid/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-gantt/styles/material.css";
</style>
```

Note: Gantt component use other Syncfusion components too, the dependent component's CSS references need to be added for using all the Gantt functionalities.

#### *Using CDN link for style*

Using CDN link, you can directly refer to the Gantt control's style in the `index.html`.

Refer to the Gantt's CDN links as follows.

#### **Syntax:**

Styles: `https://cdn.syncfusion.com/ej2/{PACKAGE_NAME}/styles/material.css`

#### **Example:**

Styles: <https://cdn.syncfusion.com/ej2/ej2-gantt/styles/material.css>

```
`js
```

```
<!-- Material theme used for this sample -->
```

```
<link href="http://cdn.syncfusion.com/ej2/ej2-base/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-buttons/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-popups/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-navigations/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-lists/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-dropdowns/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-inputs/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-calendars/styles/material.css" rel="stylesheet"
type="text/css"/>

type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-grids/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-treegrid/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-gantt/styles/material.css" rel="stylesheet"
type="text/css"/>
```

### Binding Gantt with data

Bind data with the Gantt component by using the [dataSource](#) property. It accepts an array of JavaScript object or the DataManager instance.

```
<template>
<div>
<ejs-gantt ref='gantt' :dataSource="data" :taskFields= "taskFields"></ejs-gantt>
</div>
</template>
<script>
```

```
import { GanttComponent } from '@syncfusion/ej2-vue-gantt';
export default {
  name: "App",
  components: {
    'ejs-gantt': GanttComponent
  },
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ],
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
          ],
        }
      ]
    }
  }
}
```

```
},  
],  
taskFields: {  
  id: 'TaskID',  
  name: 'TaskName',  
  startDate: 'StartDate',  
  endDate: 'EndDate',  
  duration: 'Duration',  
  progress: 'Progress',  
  child: 'subtasks',  
}  
};  
},  
};  
</script>  
<style>  
<!-- Material theme used for this sample -->  
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";

@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-treegrid/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-vue-gantt/styles/material.css";  
</style>  
,
```

### Mapping task fields

The data source fields that are required to render the tasks are mapped to the Gantt control using the [taskFields](#) property.

```
,

<template>
<div>
<ejs-gantt ref='gantt' :dataSource="data" id="GanttContainer" :taskFields = "taskFields" :height =
"height"></ejs-gantt>
</div>
</template>
<script>
import { GanttComponent } from '@syncfusion/ej2-vue-gantt';
export default {
name: "App",
components: {
'ejs-gantt' : GanttComponent
},
data: function() {
return{
data: [
{
TaskID: 1,
TaskName: 'Project Initiation',
StartDate: new Date('04/02/2019'),
EndDate: new Date('04/21/2019'),
subtasks: [
{ TaskID: 2, TaskName: 'Identify Site location', StartDate: new Date('04/02/2019'), Duration: 4, Progress:
50 },
{ TaskID: 3, TaskName: 'Perform Soil test', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50
},
{ TaskID: 4, TaskName: 'Soil test approval', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50
},
]
},
{
TaskID: 5,
TaskName: 'Project Estimation',
```

```
StartDate: new Date('04/02/2019'),
EndDate: new Date('04/21/2019'),
subtasks: [
  { TaskID: 6, TaskName: 'Develop floor plan for estimation', StartDate: new Date('04/04/2019'), Duration:
  3, Progress: 50 },
  { TaskID: 7, TaskName: 'List materials', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
  { TaskID: 8, TaskName: 'Estimation approval', StartDate: new Date('04/04/2019'), Duration: 3, Progress:
  50 }
]
},
],
height: '450px',
taskFields: {
  id: 'TaskID',
  name: 'TaskName',
  startDate: 'StartDate',
  endDate: 'EndDate',
  duration: 'Duration',
  progress: 'Progress',
  child: 'subtasks'
},
};
},
};
</script>
<style>

### Defining timeline

The Gantt has an option to define timeline using [timelineSettings](#) property with various options. Using this property we can customize the Gantt timeline.

```

<template>
<div>
<ejs-gantt id="GanttContainer" :dataSource="data" :taskFields = "taskFields" :height = "height"
:timelineSettings="timelineSettings"></ejs-gantt>
</div>
</template>
<script>
import { GanttComponent } from '@syncfusion/ej2-vue-gantt';
export default {
name: "App",
components: {
'ejs-gantt' : GanttComponent
},
data: function() {
return{
data: [
{
TaskID: 1,
TaskName: 'Project Initiation',
StartDate: new Date('04/02/2019'),
EndDate: new Date('04/21/2019'),
subtasks: [

```

```
{ TaskID: 2, TaskName: 'Identify Site location', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
{ TaskID: 3, TaskName: 'Perform Soil test', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
{ TaskID: 4, TaskName: 'Soil test approval', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
],
},
{
  TaskID: 5,
  TaskName: 'Project Estimation',
  StartDate: new Date('04/02/2019'),
  EndDate: new Date('04/21/2019'),
  subtasks: [
    { TaskID: 6, TaskName: 'Develop floor plan for estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
    { TaskID: 7, TaskName: 'List materials', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
    { TaskID: 8, TaskName: 'Estimation approval', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 }
  ]
},
],
height: '450px',
taskFields: {
  id: 'TaskID',
  name: 'TaskName',
  startDate: 'StartDate',
  endDate: 'EndDate',
  duration: 'Duration',
  progress: 'Progress',
  dependency: 'Predecessor',
  child: 'subtasks'
},
timelineSettings: {
  topTier: {
```

```

format: 'MMM dd, yyyy',
unit: 'Week',
},
bottomTier: {
unit: 'Day',
},
},
};
},
};
</script>
<style>
<!-- Material theme used for this sample -->
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";

@import "../node_modules/@syncfusion/ej2-vue-gantt/styles/material.css";
</style>
`

```

### Enable Toolbar

The [toolbar](#) property is used to add the toolbar items like Add, Remove, Edit, Update, Delete, Expand All, Collapse All in Gantt.

To use toolbar, inject the **Toolbar** module in the **provide** section.

```

<template>
<div>

```

```
<ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data" :taskFields = "taskFields" :height =  
"height" :toolbar="toolbar" :editSettings= "editSettings"></ejs-gantt>  
</div>  
</template>  
<script>  
import { GanttComponent, Edit, Selection, Toolbar } from '@syncfusion/ej2-vue-gantt';  
export default {  
  name: "App",  
  components: {  
    'ejs-gantt' : GanttComponent  
  },  
  data: function() {  
    return{  
      data: [  
        {  
          TaskID: 1,  
          TaskName: 'Project Initiation',  
          StartDate: new Date('04/02/2019'),  
          EndDate: new Date('04/21/2019'),  
          subtasks: [  
            { TaskID: 2, TaskName: 'Identify Site location', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },  
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },  
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },  
          ],  
        },  
        {  
          TaskID: 5,  
          TaskName: 'Project Estimation',  
          StartDate: new Date('04/02/2019'),  
          EndDate: new Date('04/21/2019'),  
          subtasks: [  

```

```
{ TaskID: 6, TaskName: 'Develop floor plan for estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
{ TaskID: 7, TaskName: 'List materials', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
{ TaskID: 8, TaskName: 'Estimation approval', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 }
]
},
],
height: '450px',
taskFields: {
  id: 'TaskID',
  name: 'TaskName',
  startDate: 'StartDate',
  endDate: 'EndDate',
  duration: 'Duration',
  progress: 'Progress',
  dependency: 'Predecessor',
  child: 'subtasks'
},
toolbar: ['Add', 'Edit', 'Update', 'Delete', 'Cancel', 'ExpandAll', 'CollapseAll'],
editSettings: {
  allowAdding: true,
  allowEditing: true,
  allowDeleting: true,
  allowTaskbarEditing: true,
  showDeleteConfirmDialog: true
},
};
},
provide: {
  gantt: [ Edit, Selection, Toolbar ]
}
};
</script>
```

```

<style>

</style>
`

```

### Enabling editing

The editing feature enables you to edit the tasks in Gantt component. It can be enabled by using the [editSettings.allowEditing](#) and [editSettings.allowTaskbarEditing](#) properties.

To use Editing, inject the [Edit](#) module in the `provide` section.

The following editing options are available to update the tasks in Gantt:

- Cell
- Dialog
- Taskbar
- Connector line

### Cell editing

Modify the task details through cell editing by setting the `edit mode` property as `Auto`. To enable edit support [Edit](#) module should be injected in Gantt. If [Edit](#) module is not injected, you cannot do any editing action in Gantt.

```

<template>
<div>

<ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data" :taskFields = "taskFields" :height =
"height" :toolbar="toolbar" :columns = "columns" :editSettings= "editSettings"></ejs-gantt>

```

```
</div>
</template>
<script>
import { GanttComponent, Edit } from '@syncfusion/ej2-vue-gantt';
export default {
  name: "App",
  components: {
    'ejs-gantt': GanttComponent
  },
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
          ]
        }
      ]
    }
  }
}
```

```
{ TaskID: 7, TaskName: 'List materials', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
{ TaskID: 8, TaskName: 'Estimation approval', StartDate: new Date('04/04/2019'), Duration: 3, Progress:
50 }
]
},
],
height: '450px',
taskFields: {
id: 'TaskID',
name: 'TaskName',
startDate: 'StartDate',
endDate: 'EndDate',
duration: 'Duration',
progress: 'Progress',
child: 'subtasks'
},
columns: [
{ field: 'TaskID', headerText: 'Task ID', textAlign: 'Left', width: '100' },
{ field: 'TaskName', headerText: 'Task Name', width: '250' },
{ field: 'StartDate', headerText: 'Start Date', width: '150' },
{ field: 'Duration', headerText: 'Duration', width: '150' },
{ field: 'Progress', headerText: 'Progress', width: '150' },
],
toolbar: ['Edit'],
editSettings: {
allowEditing: true,
mode: "Auto"
},
};
},
provide: {
ganttt: [ Edit ]
}
```

```

};
</script>
<style>
<!-- Material theme used for this sample -->
@import "https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";

@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-treegrid/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-gantt/styles/material.css";
</style>
`

```

**Note:** When the edit mode is set to **Auto**, you can change the cells to editable mode by double-clicking anywhere at the TreeGrid and edit the task details in the edit dialog by double-clicking anywhere at the chart.

#### *Dialog editing*

Modify the task details through dialog by setting edit [mode](#) property as **Dialog**.

```

<template>
<div>
<ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data" :taskFields = "taskFields" :height =
"height" :toolbar="toolbar" :columns = "columns" :editSettings= "editSettings"></ejs-gantt>
</div>
</template>
<script>
import { GanttComponent, Edit } from '@syncfusion/ej2-vue-gantt';
export default {
name: "App",

```

```
components: {
  'ejs-gantt': GanttComponent
},
data: function() {
  return{
    data: [
      {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
          { TaskID: 2, TaskName: 'Identify Site location', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
          { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
          { TaskID: 4, TaskName: 'Soil test approval', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
        ],
      },
      {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
          { TaskID: 6, TaskName: 'Develop floor plan for estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
          { TaskID: 7, TaskName: 'List materials', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
          { TaskID: 8, TaskName: 'Estimation approval', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
        ],
      },
    ],
    height: '450px',
  }
}
```

```
taskFields: {
  id: 'TaskID',
  name: 'TaskName',
  startDate: 'StartDate',
  endDate: 'EndDate',
  duration: 'Duration',
  progress: 'Progress',
  child: 'subtasks'
},
columns: [
  { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left', width: '100' },
  { field: 'TaskName', headerText: 'Task Name', width: '250' },
  { field: 'StartDate', headerText: 'Start Date', width: '150' },
  { field: 'Duration', headerText: 'Duration', width: '150' },
  { field: 'Progress', headerText: 'Progress', width: '150' },
],
toolbar: ['Edit'],
editSettings: {
  allowEditing: true,
  mode: "Dialog"
},
};
},
provide: {
  gantt: [ Edit ]
}
};
</script>
`
```

**Note:** In dialog editing mode, the edit dialog will appear while performing double click action in both TreeGrid and chart sides.

#### *Taskbar editing*

Modify the task details through user interaction such as resizing and dragging the taskbar by enabling the [allowTaskbarEditing](#) property.

```
`  
  
<template>  
<div>  
<ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data" :taskFields = "taskFields" :height =  
"height" :toolbar="toolbar" :columns = "columns" :editSettings= "editSettings"></ejs-gantt>  
</div>  
</template>  
<script>  
import { GanttComponent, Edit } from '@syncfusion/ej2-vue-gantt';  
export default {  
  name: "App",  
  components: {  
    'ejs-gantt': GanttComponent  
  },  
  data: function() {  
    return{  
      data: [  
        {  
          TaskID: 1,  
          TaskName: 'Project Initiation',  
          StartDate: new Date('04/02/2019'),  
          EndDate: new Date('04/21/2019'),  
          subtasks: [  
            { TaskID: 2, TaskName: 'Identify Site location', StartDate: new Date('04/02/2019'), Duration: 4, Progress:  
              50 },  
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50  
              },  
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50  
              },  
          ]  
        },  
        {  
          TaskID: 5,  
          TaskName: 'Project Estimation',
```

```
StartDate: new Date('04/02/2019'),
EndDate: new Date('04/21/2019'),
subtasks: [
  { TaskID: 6, TaskName: 'Develop floor plan for estimation', StartDate: new Date('04/04/2019'), Duration:
    3, Progress: 50 },
  { TaskID: 7, TaskName: 'List materials', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
  { TaskID: 8, TaskName: 'Estimation approval', StartDate: new Date('04/04/2019'), Duration: 3, Progress:
    50 }
],
height: '450px',
taskFields: {
  id: 'TaskID',
  name: 'TaskName',
  startDate: 'StartDate',
  endDate: 'EndDate',
  duration: 'Duration',
  progress: 'Progress',
  child: 'subtasks'
},
columns: [
  { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left', width: '100' },
  { field: 'TaskName', headerText: 'Task Name', width: '250' },
  { field: 'StartDate', headerText: 'Start Date', width: '150' },
  { field: 'Duration', headerText: 'Duration', width: '150' },
  { field: 'Progress', headerText: 'Progress', width: '150' },
],
toolbar: ['Edit'],
editSettings: {
  allowTaskbarEditing:true
},
};
```

```

provide: {
  gantt: [ Edit ]
}
};
</script>
<style>
<!-- Material theme used for this sample -->
@import "https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
base/styles/material.css";

`

```

### Dependency editing

Modify the task dependencies using mouse interactions by enabling the [allowTaskbarEditing](#) property along with mapping the task dependency data source field to the [dependency](#) property.

```

<template>
<div>
<ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data" :taskFields = "taskFields" :height =
"height" :toolbar="toolbar" :columns = "columns" :editSettings= "editSettings"></ejs-gantt>
</div>
</template>
<script>
import { GanttComponent, Edit } from '@syncfusion/ej2-vue-gantt';

```

```
export default {
  name: "App",
  components: {
    'ejs-gantt': GanttComponent
  },
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate: new Date('04/02/2019'), Duration: 0, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new Date('04/02/2019'), Duration: 4, Predecessor: "2FS", Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new Date('04/04/2019'), Duration: 0, Predecessor: "6SS", Progress: 50 }
          ]
        },
      ]
    }
  }
}
```

```
],
height: '450px',
taskFields: {
  id: 'TaskID',
  name: 'TaskName',
  startDate: 'StartDate',
  endDate: 'EndDate',
  duration: 'Duration',
  progress: 'Progress',
  dependency: 'Predecessor',
  child: 'subtasks'
},
columns: [
  { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left', width: '100' },
  { field: 'TaskName', headerText: 'Task Name', width: '250' },
  { field: 'StartDate', headerText: 'Start Date', width: '150' },
  { field: 'Duration', headerText: 'Duration', width: '150' },
  { field: 'Progress', headerText: 'Progress', width: '150' },
],

```

### Enabling predecessors or task relationships

Predecessor or task dependency in the Gantt component is used to depict the relationship between the tasks.

Start to Start (SS) : You cannot start a task until the dependent task starts.

Start to Finish (SF) : You cannot finish a task until the dependent task finishes.

Finish to Start (FS) : You cannot start a task until the dependent task completes.

Finish to Finish (FF) : You cannot finish a task until the dependent task completes.

You can show the relationship in tasks, by using the [dependency](#) property as shown in the following code example:

```

<template>
<div>
<ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data" :taskFields = "taskFields" :height =
"height" highlightWeekends='true'></ejs-gantt>
</div>
</template>
<script>
import { GanttComponent } from '@syncfusion/ej2-vue-gantt';
export default {
name: "App",
components: {

```

```
'ejs-gantt' : GanttComponent
},
data: function() {
  return{
    data: [
      {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
          { TaskID: 2, TaskName: 'Identify Site location', StartDate: new Date('04/02/2019'), Duration: 0, Progress: 50 },
          { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
          { TaskID: 4, TaskName: 'Soil test approval', StartDate: new Date('04/02/2019'), Duration: 4, Predecessor: "2FS", Progress: 50 },
        ]
      },
      {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
          { TaskID: 6, TaskName: 'Develop floor plan for estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
          { TaskID: 7, TaskName: 'List materials', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
          { TaskID: 8, TaskName: 'Estimation approval', StartDate: new Date('04/04/2019'), Duration: 0, Predecessor: "6SS", Progress: 50 },
        ]
      },
    ],
    height: '450px',
    taskFields: {
```

```

id: 'TaskID',
name: 'TaskName',
startDate: 'StartDate',
endDate: 'EndDate',
duration: 'Duration',
progress: 'Progress',
dependency: 'Predecessor',
child: 'subtasks'
},
};
},
};
</script>
<style>

`

```

### Assigning resources

You can display and assign the resource for each task in the Gantt control.

Create a collection of JSON object, which contains id, name, unit and group of the resources and assign it to the [resources](#) property.

Map these fields to the Gantt control using the [resourceFields](#) property.

```
,  
  
<template>  
<div>  
<ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data" :taskFields= "taskFields" :height= "height"  
:treeColumnIndex= "1" :resourceFields= "resourceFields" :resources= "resources" :highlightWeekends=  
"true" :labelSettings= "labelSettings"></ejs-gantt>  
</div>  
</template>  
<script>  
import { GanttComponent } from '@syncfusion/ej2-vue-gantt';  
export default {  
  name: "App",  
  components: {  
    'ejs-gantt' : GanttComponent  
  },  
  data: function() {  
    return{  
      data: [  
        {  
          TaskID: 1,  
          TaskName: 'Project initiation',  
          StartDate: new Date('04/02/2019'),  
          EndDate: new Date('04/21/2019'),  
          subtasks: [  
            {TaskID: 2, TaskName: 'Identify site location', StartDate: new Date('04/02/2019'), Duration: 0,Progress:  
            50, resources: [1]},  
            {TaskID: 3, TaskName: 'Perform soil test', StartDate: new Date('04/02/2019'), Duration: 4, Predecessor:  
            '2',Progress: 50, resources: [2, 3, 5]},  
            {TaskID: 4, TaskName: 'Soil test approval', StartDate: new Date('04/02/2019'), Duration: 0, Predecessor:  
            '3', Progress: 50 },  
          ]  
        },  
        {  
          TaskID: 5,  
          TaskName: 'Project estimation',
```

```
StartDate: new Date('04/02/2019'),
EndDate: new Date('04/21/2019'),
subtasks: [
  {TaskID: 6, TaskName: 'Develop floor plan for estimation', StartDate: new Date('04/04/2019'),Duration:
  3, Predecessor: '4', Progress: 50, resources: [4]},
  {TaskID: 7, TaskName: 'List materials', StartDate: new Date('04/04/2019'),Duration: 3, Predecessor: '6',

`
```

### Enable filtering

The filtering feature enables you to view reduced amount of records based on filter criteria. Gantt provides support for menu filtering support for each columns. It can be enabled by setting the [allowFiltering](#) property to `true` along with injecting the [Filter](#) module as shown in the following code example. Filtering feature can also be customized using the [filterSettings](#) property.

To use Filtering, inject the [Filter](#) module in the `provide` section.

```
,

<template>
<div>
<ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data" :taskFields = "taskFields" :height =
"height" :columns="columns" :toolbar="toolbar" :allowFiltering= "true"
:timelineSettings="timelineSettings" :splitterSettings= "splitterSettings" :labelSettings= "labelSettings"
:projectStartDate="projectStartDate" :projectEndDate= "projectEndDate"></ejs-gantt>
</div>
</template>
<script>
import { GanttComponent, Filter, Toolbar } from '@syncfusion/ej2-vue-gantt';
export default {
name: "App",
components: {
'ejs-gantt' : GanttComponent
},
data: function() {
return{
data: [
{
TaskID: 1,
TaskName: 'Project Initiation',
StartDate: new Date('04/02/2019'),
EndDate: new Date('04/21/2019'),
subtasks: [
{ TaskID: 2, TaskName: 'Identify Site location', StartDate: new Date('04/02/2019'), Duration: 4, Progress:
50 },
{ TaskID: 3, TaskName: 'Perform Soil test', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50
},

```

```
{ TaskID: 4, TaskName: 'Soil test approval', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50
},
]
},
{
  TaskID: 5,
  TaskName: 'Project Estimation',
  StartDate: new Date('04/02/2019'),
  EndDate: new Date('04/21/2019'),
  subtasks: [
    { TaskID: 6, TaskName: 'Develop floor plan for estimation', StartDate: new Date('04/04/2019'), Duration:
    3, Progress: 50 },
    { TaskID: 7, TaskName: 'List materials', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
    { TaskID: 8, TaskName: 'Estimation approval', StartDate: new Date('04/04/2019'), Duration: 3, Progress:
    50 }
  ]
},
],
height: '450px',
taskFields: {
  id: 'TaskID',
  name: 'TaskName',
  startDate: 'StartDate',
  endDate: 'EndDate',
  duration: 'Duration',
  dependency: 'Predecessor',
  child: 'subtasks',
},
columns: [
  { field: 'TaskName', headerText: 'Task Name', width: '250' , clipMode: 'EllipsisWithTooltip' },
  { field: 'StartDate', headerText: 'Start Date' },
  { field: 'Duration', headerText: 'Duration' },
  { field: 'EndDate', headerText: 'End Date' },
  { field: 'Predecessor', headerText: 'Predecessor' }
```

```
],
toolbar: ['Search'],

```

,

### Enable Sorting

The sorting feature enables the user to order the records. It can be enabled by setting [allowSorting](#) property to true. Also, need to inject the `Sort` module in the `provide` section as follow. If we didn't inject the `Sort` module, then user not able to sort when click on headers. Sorting feature can be customized using [sortSettings](#) property.

,

```

<template>
<div>
<ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data" :taskFields = "taskFields" :height =
"height" :columns="columns" :splitterSettings= "splitterSettings" :allowSorting= 'true'></ejs-gantt>
</div>
</template>
<script>
import { GanttComponent, Sort } from '@syncfusion/ej2-vue-gantt';
export default {
name: "App",
components: {
'ej2-gantt' : GanttComponent
},
data: function() {
return{
data: [
{
TaskID: 1,

```

```
TaskName: 'Project Initiation',
StartDate: new Date('04/02/2019'),
EndDate: new Date('04/21/2019'),
subtasks: [
  { TaskID: 2, TaskName: 'Identify Site location', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
  { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
  { TaskID: 4, TaskName: 'Soil test approval', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
],
{
  TaskID: 5,
  TaskName: 'Project Estimation',
  StartDate: new Date('04/02/2019'),
  EndDate: new Date('04/21/2019'),
  subtasks: [
    { TaskID: 6, TaskName: 'Develop floor plan for estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
    { TaskID: 7, TaskName: 'List materials', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
    { TaskID: 8, TaskName: 'Estimation approval', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
  ],
},
height: '450px',
taskFields: {
  id: 'TaskID',
  name: 'TaskName',
  startDate: 'StartDate',
  duration: 'Duration',
  progress: 'Progress',
  child: 'subtasks'
},
```

```
allowSorting: true,
splitterSettings: {
  columnIndex: 3
},
columns: [
  { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left', width: '100' },
  { field: 'TaskName', headerText: 'Task Name', width: '250' },
  { field: 'StartDate', headerText: 'Start Date', width: '150' },
  { field: 'Duration', headerText: 'Duration', width: '150' },
  { field: 'Progress', headerText: 'Progress', width: '150' },
],
};
},
provide: {
  gantt: [ Sort ]
}
};
</script>
<style>
<!-- Material theme used for this sample -->
@import "https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-base/styles/material.css";

</style>
```

```
,
```

### Defining eventmarkers

The [eventMarkers](#) property in Gantt component is used to highlight the important event in Gantt chart part. By using this feature, you can add the lines and label to highlight important days in your project.

To highlight the days, inject the `DayMarkers` module in the `provide` section.

```
,
```

```
<template>
```

```
<div>
```

```
<ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data" :taskFields = "taskFields" :height =  
"height" :eventMarkers="eventMarkers"></ejs-gantt>
```

```
</div>
```

```
</template>
```

```
<script>
```

```
import { GanttComponent, DayMarkers } from '@syncfusion/ej2-vue-gantt';
```

```
export default {
```

```
  name: "App",
```

```
  components: {
```

```
    'ejs-gantt' : GanttComponent
```

```
  },
```

```
  data: function() {
```

```
    return{
```

```
      data: projectNewData,
```

```
      height: '450px',
```

```
      taskFields: {
```

```
        id: 'TaskID',
```

```
        name: 'TaskName',
```

```
        startDate: 'StartDate',
```

```
        endDate: 'EndDate',
```

```
        duration: 'Duration',
```

```
        progress: 'Progress',
```

```
        dependency: 'Predecessor',
```

```
        child: 'subtasks'
```

```
      },
```

```
eventMarkers: [  
  {  
    day: new Date('04/09/2019'),  
    label: 'Research phase'  
  }, {  
    day: new Date('04/30/2019'),  
    label: 'Design phase'  
  }, {  
    day: new Date('05/23/2019'),  
    label: 'Production phase'  
  }, {  
    day: new Date('06/20/2019'),  
    label: 'Sales and marketing phase'  
  }  
]  
};  
  
provide: {  
  gantt: [DayMarkers]  
}  
};  
</script>  
  
<style>

```

### Running the application

Run the application using the following command.

```
`bash
npm run serve
```

Web server will be initiated, Open the quick start app in the browser at port `localhost:8080`.

### Module in Vue Gantt component

The modules that are available in Gantt are as follows.

Module	Description
<a href="#">Sort</a>	Inject this module to use sorting feature.
<a href="#">Filter</a>	Inject this module to use filtering feature.
<a href="#">Reorder</a>	Inject this module to use reorder feature.
<a href="#">ExcelExport</a>	Inject this module to use excel export feature.
<a href="#">PdfExport</a>	Inject this module to use PDF export feature.
<a href="#">RowDD</a>	Inject this module to use row drag and drop feature.
<a href="#">Resize</a>	Inject this module to use resize feature.
<a href="#">Toolbar</a>	Inject this module to use toolbar feature.
<a href="#">Edit</a>	Inject this module is use editing feature.
<a href="#">Selection</a>	Inject this module to use selection feature.
<a href="#">DayMarkers</a>	Inject this module to use event markers.
<a href="#">ContextMenu</a>	Inject this module to use context menu feature.
<a href="#">ColumnMenu</a>	Inject this module to use column menu feature.
<a href="#">VirtualScroll</a>	Inject this module to use virtual scroll feature.
<a href="#">CriticalPath</a>	Inject this module to use critical path feature.

These modules should be injected into the Gantt using the **Gantt.Inject** method.

## Data Binding

### Data binding in Vue Gantt component

The Gantt uses **DataManager**, which supports both RESTful JSON data services binding and local JavaScript object array binding. The [Link to the Video](#) property can be assigned either with the instance of DataManager or JavaScript object array collection. Gantt provides support to bind two kinds of data,

- Local data
- Remote data

To learn about Gantt Chart data binding quickly, you can check on this video:

#### Local data

To bind local data to Gantt, you can assign a JavaScript object array to the [dataSource](#) property. The local data source can also be provided as an instance of the **DataManager**.

In local data binding, the data source for rendering the Gantt component is retrieved from the same application locally.

The following are the two types of data binding possible with the Gantt component:

- Hierarchical data binding.
- Self-referential data binding (Flat data).

#### Hierarchical data binding

The [child](#) property is used to map the child records in hierarchical data.

The following code example shows how to bind the hierarchical local data into the Gantt component.

#### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' :dataSource="data" id="GanttContainer"
    :taskFields = "taskFields" :height = "height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          isParent:true,
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:

#### Self-referential data binding (Flat data)

The Gantt component can be bound with self-referential data by mapping the data source field values to the [id](#) and [parentID](#) properties.

- ID field: This field contains unique values used to identify each individual task and it is mapped to the [id](#) property.
- Parent ID field: This field contains values that indicate parent tasks and it is mapped to the [parentID](#) property.

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' :dataSource="data" id="GanttContainer"
:taskFields = "taskFields" :height = "height" :treeColumnIndex='1'></ejs-
gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        { TaskID: 1,TaskName: 'Project Initiation',StartDate: new
Date('04/02/2019'),EndDate: new Date('04/21/2019')},
        { TaskID: 2, TaskName: 'Identify Site location', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50,ParentId:1 },
        { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50, ParentId:1 },
        { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50,ParentId:1 },
        { TaskID: 5, TaskName: 'Project Estimation',StartDate: new
Date('04/02/2019'),EndDate: new Date('04/21/2019')},
        { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50, ParentId:2 },
        { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50,ParentId:2 },
        { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50, ParentId:2 }
      ],
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        parentID: 'ParentId'
      }
    };
  },
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/data-binding-cs2" %}

#### Remote data

To bind remote data to the Gantt component, assign service data as an instance of **DataManager** to the [dataSource](#) property.

#### APP.VUE

```

<template>
  <div>

```

```

        <ejs-gantt ref='gantt' :dataSource="data" id="GanttContainer"
:taskFields = "taskFields" :height = "height"></ejs-gantt>
    </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
Vue.use(GanttPlugin);
export default {
    data: function() {
        return{
            data: new DataManager({
                url: 'https://ej2services.syncfusion.com/production/web-
services/api/GanttData',
                adaptor: new WebApiAdaptor,
                crossDomain: true
            }),
            height: '450px',
            taskFields: {
                id: 'TaskId',
                name: 'TaskName',
                startDate: 'StartDate',
                progress: 'Progress',
                duration: 'Duration',
                dependency: 'Predecessor',
                child: 'SubTasks'
            }
        };
    },
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/data-binding-cs3" %}

### URL Adaptor

In Gantt, we can fetch data from SQL database using **ADO.NET** Entity Data Model and update the changes on CRUD action to the server by using **DataManager** support. To communicate with the remote data we are using **UrlAdaptor** of **DataManager** property to call the server method and get back resultant data in JSON format. We can know more about **UrlAdaptor** from [here](#).

Please refer the [link](#) to create the **ADO.NET** Entity Data Model in Visual studio,

We can define data source for Gantt as instance of **DataManager** using **url** property of **DataManager**. Please Check the below code snippet to assign data source to Gantt.

,

```

<template>
<div>

<ejs-gantt ref='gantt' :dataSource="data" id="GanttContainer" :taskFields = "taskFields" :height =
"height"></ejs-gantt>

</div>

```

```

</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: new DataManager({
        url: '/Home/UrlDatasource',
        adaptor: new UrlAdaptor
      }),
      height: '450px',
      taskFields: {
        id: 'TaskId',
        name: 'TaskName',
        startDate: 'StartDate',
        progress: 'Progress',
        duration: 'Duration',
        dependency: 'Predecessor',
        child: 'SubTasks'
      }
    };
  },
};
</script>
`ts
GanttDataSourceEntities db = new GanttDataSourceEntities();
public ActionResult UrlDatasource(DataManagerRequest dm)
{
  List<GanttData>DataList = db.GanttDatas.ToList();

```

```

var count = DataList.Count();
return Json(new { result = DataList, count = count });
}
`

```

#### Remote Save Adaptor

You may need to perform all Gantt Actions on the client-side except the CRUD operations, which should be interacted with the server-side to persist data. It can be achieved in Gantt by using **RemoteSaveAdaptor**.

Datasource must be set to the **json** property and set **RemoteSaveAdaptor** to the **adaptor** property. CRUD operations can be mapped to the server-side using the **batchUrl** properties.

You can use the following code example to use **RemoteSaveAdaptor** in Gantt.

```

`
<template>
<div>
<ejs-gantt ref='gantt' :dataSource="data" id="GanttContainer" :taskFields = "taskFields" :height =
"height"></ejs-gantt>
</div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit } from "@syncfusion/ej2-vue-gantt";
import { DataManager, RemoteSaveAdaptor } from '@syncfusion/ej2-data';
Vue.use(GanttPlugin);
export default {
data: function() {
return{
data: new DataManager({
batchUrl: 'Home/BatchUpdate',
adaptor: new RemoteSaveAdaptor
}),
height: '450px',
taskFields: {
id: 'TaskId',
name: 'TaskName',
startDate: 'StartDate',

```

```

progress: 'Progress',
duration: 'Duration',
dependency: 'Predecessor',
child: 'SubTasks'
},
editSettings: {
allowAdding: true,
allowEditing: true,
allowDeleting: true,
allowTaskbarEditing: true,
showDeleteConfirmDialog: true
},
};
},
};
</script>
`

```

The following code example describes the CRUD operations handled at server-side.

```

public IActionResult BatchUpdate([FromBody] CRUDModel batchmodel)
{
    public class CRUDModel
    {
        public List<GanttDataSource> added { get; set; }
        public List<GanttDataSource> changed { get; set; }
        public List<GanttDataSource> deleted { get; set; }
        public object key { get; set; }
        public string action { get; set; }
        public string table { get; set; }
    }

    public IActionResult BatchUpdate([FromBody] CRUDModel batchmodel)
    {
        if (batchmodel.changed != null)

```

```
{
for (var i = 0; i < batchmodel.changed.Count(); i++)
{
var value = batchmodel.changed[i];
GanttDataSource result = DataList.Where(or => or.taskId == value.taskId).FirstOrDefault();
result.taskId = value.taskId;
result.taskName = value.taskName;
result.startDate = value.startDate;
result.endDate = value.endDate;
result.duration = value.duration;
result.progress = value.progress;
result.parentID = value.parentID;
}
}
if (batchmodel.deleted != null)
{
for (var i = 0; i < batchmodel.deleted.Count(); i++)
{
DataList.Remove(DataList.Where(or => or.taskId.Equals(batchmodel.deleted[i].taskId)).FirstOrDefault());
RemoveChildRecords(batchmodel.deleted[i].taskId);
}
}
if (batchmodel.added != null)
{
for (var i = 0; i < batchmodel.added.Count(); i++)
{
DataList.Add(batchmodel.added[i]);
}
}
return Json(new { addedRecords = batchmodel.added, changedRecords = batchmodel.changed,
deletedRecords = batchmodel.deleted });
}

public void RemoveChildRecords(int key)
```

```

{
var childList = DataList.Where(x => x.parentID == key).ToList();
foreach (var item in childList)
{
DataList.Remove(item);
RemoveChildRecords(item.taskId);
}
}

return Json(new { addedRecords = batchmodel.added, changedRecords = batchmodel.changed,
deletedRecords = batchmodel.deleted });
}
,

```

#### Load child on demand

To render child records on demand, assign a remote service URL in the instance of DataManager to the `Url` property. To interact with the remote data source, provide the endpoint URL and also define the [hasChildMapping](#) property in taskFields of Gantt Chart.

The `hasChildMapping` property maps the field name in the data source, which denotes whether the current record holds any child records. This is useful internally to show expand icon while binding child data on demand.

When [loadChildOnDemand](#) is disabled, all the root nodes are rendered in a collapsed state at initial load. On expanding the root node, the child nodes will be loaded from the remote server.

When `enableVirtualization` is enabled and `loadChildOnDemand` is disabled, only the current viewport root nodes are rendered in a collapsed state.

When a root node is expanded, its child nodes are rendered and maintained in a collection locally, such that on consecutive expand/collapse actions on the root node, the child nodes are loaded locally instead of from the remote server.

When the `loadChildOnDemand` is enabled, parent records are rendered in an expanded state.

```

<template>
<div id="app">
<ejs-gantt ref='gantt' id="GanttContainer"
:dataSource= "dataSource"
:taskFields= "taskFields"
:allowSelection= "true"
:allowResizing= "true"
:height= "height"

```

```
:treeColumnIndex= "1"
:highlightWeekends= "true"
:columns= "columns"
:enableVirtualization="true"
:loadChildOnDemand = "false"
:projectStartDate= "projectStartDate"
:projectEndDate= "projectEndDate"
:splitterSettings= "splitterSettings"

</ejs-gantt>
</div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, GanttComponent, Selection, VirtualScroll } from "@syncfusion/ej2-vue-gantt";
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
Vue.use(GanttPlugin);
export default {
  data() {
    return {
      data: new DataManager({
        url: 'https://services.syncfusion.com/vue/production/api/GanttLoadOnDemand',
        adaptor: new WebApiAdaptor,
        crossDomain: true
      }),
      projectStartDate: new Date('01/02/2000'),
      projectEndDate: new Date('12/01/2002'),
      splitterSettings: {
        columnIndex: 3
      },
      taskFields: {
        id: 'taskId',
        name: 'taskName',
```

```

        taskName = "Task " + x,
        startDate = childStartDate,
        endDate = childStartDate.AddDays(5),
        duration = duration.ToString(),
        progress = rand.Next(100),
        parentID = Parent.taskId,
        predecessor = (j > 1 ? (x - 1) + "FS" : ""),
        isParent = false,
        IsExpanded = false
    });
}
}
}
return tree;
}
}
`

```

### Limitations

- Filtering, sorting and searching are not supported in load on demand.

- Only Self-Referential type data is supported with remote data binding in Gantt Chart.
- Load-on-demand supports only the validated data source

#### [Sending additional parameters to the server](#)

We can pass additional parameters using `addParams` method of `Query` class. In server side we have inherited and shown the additional parameter value in Syncfusion DataManager class itself. We pass an additional parameter in load time using [load](#) event. We can also pass additional parameter to the CRUD model. Please Check the below code snippet to send additional parameter to Gantt.

`

```
<template>
<div>

<ejs-gantt ref='gantt' :dataSource="data" id="GanttContainer" :taskFields = "taskFields" :height =
"height" :toolbar="toolbar" :editSettings= "editSettings" :load= "load"></ejs-gantt>

</div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit, Toolbar } from "@syncfusion/ej2-vue-gantt";
import { DataManager, UrlAdaptor, Query } from '@syncfusion/ej2-data';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: new DataManager({
        url: 'http://localhost:50039/Home/UrlDatasource',
        adaptor: new UrlAdaptor,
        batchUrl: 'http://localhost:50039/Home/BatchSave'
      }),
      height: '450px',
      taskFields: {
        id: 'TaskId',
        name: 'TaskName',
        startDate: 'StartDate',
        progress: 'Progress',
        duration: 'Duration',
        dependency: 'Predecessor',
```

```

parentID: 'parentID'
},
toolbar: ['Add', 'Edit', 'Delete', 'Cancel', 'ExpandAll', 'CollapseAll', 'Update'],
editSettings: {
allowAdding: true,
allowEditing: true,
allowDeleting: true
},
};
load: function(args) {
this.query = new Query().addParams('ej2Gantt', "test");
}
},
provide: {
gant: [ Edit, Toolbar ]
}
};
</script>
`ts
namespace URLAdaptor.Controllers
{
public class HomeController : Controller
{
...///
//inherit the class to show age as property of DataManager
public class Test : DataManagerRequest
{
public string ej2Gantt { get; set; }
}
public ActionResult UrlDatasource([FromBody]Test dm)
{
if (DataList == null)

```

```

{
ProjectData datasource = new ProjectData();
DataList = datasource.GetUrlDataSource();
}

var count = DataList.Count();

return Json(new { result = DataList, count = count }, JsonRequestBehavior.AllowGet);
}

...///

public class ICRUDModel<T> where T : class
{
public object key { get; set; }
public T value { get; set; }
public List<T> added { get; set; }
public List<T> changed { get; set; }
public List<T> deleted { get; set; }
public IDictionary<string, object> @params { get; set; }
}

...///
}
}
`

```

You can find the full sample from [here](#).

#### Handling HTTP error

During server interaction from the Gantt, some server-side exceptions may occur, and you can acquire those error messages or exception details in client-side using the [actionFailure](#) event.

The argument passed to the `actionFailure` event contains the error details returned from the server.

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' :dataSource="data" id="GanttContainer"
:taskFields = "taskFields" :height = "height" :actionFailure=
"actionFailure"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { DataManager } from '@syncfusion/ej2-data';

```

```

Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: new DataManager({
        url: 'http://some.com/invalidUrl',
      }),
      height: '450px',
      taskFields: {
        id: 'TaskId',
        name: 'TaskName',
        startDate: 'StartDate',
        progress: 'Progress',
        duration: 'Duration',
        dependency: 'Predecessor',
        parentID: 'parentID'
      },

      actionFailure: function(args){
        let gantt = document.getElementsByClassName("e-gantt")[0].ej2_instances[0]; // Gantt instance
        let span = document.createElement('span');
        this.element.parentNode.insertBefore(span, gantt.element);
        span.style.color = '#FF0000'
        span.innerHTML = 'Server exception: 404 Not found';
      },
    };
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/data-binding-cs4" %}

### Binding with Ajax

You can use Gantt [dataSource](#) property to bind the data source to Gantt from external Ajax request. In the below code we have fetched the data source from the server with the help of Ajax request and provided that to `dataSource` property by using `onSuccess` event of the Ajax.

### APP.VUE

```

<template>
  <div>
    <ejs-button id="databind" cssClass="e-info" v-on:click.native="databind">Bind Data</ejs-button>
    <br>
    <br>
    <ejs-gantt ref='gantt' :dataSource="data" id="GanttContainer"
      :taskFields = "taskFields" :height = "height"
      :projectStartDate="projectStartDate" :projectEndDate=
      "projectEndDate"></ejs-gantt>
    </div>
  </template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { Ajax } from '@syncfusion/ej2-base';
Vue.use(GanttPlugin);

```

```

export default {
  data: function() {
    return{
      height: '450px',
      taskFields: {
        id: 'TaskId',
        name: 'TaskName',
        startDate: 'StartDate',
        progress: 'Progress',
        duration: 'Duration',
        dependency: 'Predecessor',
        child: 'SubTasks'
      },
      projectStartDate: new Date('02/24/2019'),
      projectEndDate: new Date('07/20/2019')
    };
  },
  methods: {
    databind: function(e){
      let ajax = new
      Ajax("https://ej2services.syncfusion.com/production/web-
      services/api/GanttData", "GET");
      this.showSpinner();
      ajax.send();
      ajax.onSuccess = function (data) {
        this.hideSpinner();
        this.dataSource = (JSON.parse(data)).Items;
        this.refresh();
      };
    },
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/data-binding-cs5" %}

Note: If you bind the dataSource from this way, then it acts like a local dataSource. So you cannot perform any server side crud actions.

### Split task

The **Split-task** feature allows you to split a task or interrupt the work during planned or unforeseen circumstances. We can split the task either in load time or dynamically, by defining the segments either in hierarchical or self-referential way.

### Hierarchical

To split a task at load time in hierarchical way, we need to define the segment details in datasource and this field should be mapped by using the [taskFields.segments](#) property.

```
`ts
```

```
[
```

```
{
```

```
TaskID: 1, TaskName: 'Identify Site location', StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50,
```

Segments: [

{ StartDate: new Date("04/02/2019"), Duration: 2 },

{ StartDate: new Date("04/04/2019"), Duration: 2 }

]

}

]

,

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50,
              Segments: [
                { StartDate: new Date("04/02/2019"), Duration: 2 },
                { StartDate: new Date("04/04/2019"), Duration: 2 }
              ] },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4 , Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
          ]
        }
      ]
    }
  }
}
```

```

        { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 }
    ]
  },
  ],
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    endDate: 'EndDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks',
    segments: 'Segments'
  }
};
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/data-binding-cs6" %}

#### Self-referential

We can also define segment details as a flat data and this collection can be mapped by using [segmentData](#) property. The segment id field of this collection is mapped by using the [taskFields.segmentId](#) property.

`ts

```

taskFields: {
  segmentId: "segmentId"
},
segmentData: [
  { segmentId: 1, StartDate: new Date("02/04/2019"), Duration: 2 },
  { segmentId: 1, StartDate: new Date("02/05/2019"), Duration: 5 },
  { segmentId: 4, StartDate: new Date("04/02/2019"), Duration: 2 },
  { segmentId: 4, StartDate: new Date("04/04/2019"), Duration: 2 }
],
`

```

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :segmentData =
"segmentData"></ejs-gantt>
  </div>
</template>

```

```

<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50,
              Segments: [
                { StartDate: new Date("04/02/2019"), Duration: 2 },
                { StartDate: new Date("04/04/2019"), Duration: 2 }
              ],
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4 , Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 }
          ]
        }
      ],
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
        segments: 'Segments'
      },
      segmentData: [
        { segmentId: 2, StartDate: new Date("04/02/2019"), Duration:
2 },
        { segmentId: 2, StartDate: new Date("04/04/2019"), Duration:
2 },

```

```

                { segmentId: 4, StartDate: new Date("04/02/2019"), Duration:
2 },
                { segmentId: 4, StartDate: new Date("04/04/2019"), Duration:
2 }
            ]
        };
    }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/data-binding-cs7" %}

Note: Segment id field contains id of a task which should be split at load time.

#### *Improve performance by disabling validations*

The [autoCalculateDateScheduling](#) property can help you reduce the time taken for the Gantt chart to render on the initial load. When this API is enabled, parent-child validation, data validation, and predecessor validation are restricted, allowing the Gantt chart to load more quickly. Since we are disabling the validations, data source provided to gantt should have all data such as start date, end date, duration, as proper data.

#### **APP.VUE**

```

<template>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Selection, VirtualScroll, Edit } from "@syncfusion/ej2-vue-gantt";
import {tempData} from "../datasource.js";
Vue.use(GanttPlugin);
var virtualData = [];
var projId = 1;
for (var i = 0; i < 50; i++) {
    var x = virtualData.length + 1;
    var parent_1 = {};
    parent_1['TaskID'] = x;
    parent_1['TaskName'] = 'Project' + (projId++);
    virtualData.push(parent_1);
    for (var j = 0; j < tempData.length; j++) {
        var subtasks = {};
        subtasks['TaskID'] = tempData[j].TaskID + x;
        subtasks['TaskName'] = tempData[j].TaskName;
        subtasks['StartDate'] = tempData[j].StartDate;
        subtasks['Duration'] = tempData[j].Duration;
        subtasks['Progress'] = tempData[j].Progress;
        subtasks['parentID'] = tempData[j].parentID + x;
        virtualData.push(subtasks);
    }
}
new Vue({
  el: '#app',
  template: `
    <div>
      <ejs-gantt ref='gantt'
        :dataSource= "data"

```

```

        :height= "height"
        :treeColumnIndex= "1"
        :highlightWeekends= "true"
        :columns= "columns"
        :autoCalculateDateScheduling='false',
        :editSettings= "editSettings"
        :splitterSettings= "splitterSettings">
    </ejs-gantt>
</div>
`,
data: function() {
    return{
data : virtualData,
        taskFields: {
            id: 'TaskID',
            name: 'TaskName',
            startDate: 'StartDate',
            endDate: 'EndDate',
            duration: 'Duration',
            progress: 'Progress',
            parentID: 'parentID'
        },
        columns: [
            { field: 'TaskID' },
            { field: 'TaskName' },
            { field: 'StartDate' },
            { field: 'Duration' },
            { field: 'Progress' }
        ],
        height: '450px',
        labelSettings: {
            taskLabel: 'Progress'
        },
        splitterSettings: {
            columnIndex: 2
        },
        editSettings:{
            allowAdding:true
        },
    }
}
,
provide: {
    gantt: [ Selection, VirtualScroll,Edit]
}
});
</script>

```

### Limitations

Gantt has the support for both Hierarchical and Self-Referential data binding. When rendering the Gantt control with SQL database, we suggest you to use the Self-Referential data binding to maintain the

parent-child relation. Because the complex json structure is very difficult to manage it in SQL tables, we need to write a complex queries and we have to write a complex algorithm to find out the proper record details while updating/deleting the inner level task in Gantt data source. We cannot implement both data binding for Gantt control and this is not a recommended way. If both child and parentID are mapped, the records will not render properly because, when task id of a record defined in the hierarchy structure is assigned to parent id of another record, in such case the records will not properly render. As the self-referential will search the record with particular id in flat data only, not in the inner level of records. If we map the parentID field, it will be prioritized and Gantt will be rendered based on the parentID values.

### Immutable in Vue Gantt component

The immutable mode optimizes the Gantt re-rendering performance by using the object reference and [deep compare](#) concept. When performing the Gantt actions, it will only re-render the modified or newly added rows and prevent the re-rendering of the unchanged rows.

To enable this feature, you have to set the [enableImmutableMode](#) property as **true**.

This feature uses the primary key value for data comparison. So, you need to provide the [isPrimaryKey](#) column.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :toolbar="toolbar"
    :editSettings= "editSettings" :enableImmutableMode='true'></ejs-
gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit, Selection, Toolbar } from "@syncfusion/ej2-vue-gantt";
import { projectNewData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: projectNewData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      toolbar: ['Add', 'Edit', 'Delete', 'Cancel', 'Update', 'Indent',
'Outdent'],
      editSettings: {
        allowAdding: true,
        allowEditing: true,
        allowDeleting: true,
        allowTaskbarEditing: true,

```

```

        showDeleteConfirmDialog: true
    },
    },
    provide: {
        gantt: [ Edit, Selection, Toolbar]
    }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/immutable-cs1" %}

### Limitations

The following features are not supported in the immutable mode:

- Column reorder
- Virtualization

### Loading animation in Vue Gantt component

The loading indicator is used to display a visual indicator while the Gantt is fetching data or performing certain actions, such as sorting or filtering. The gantt support two indicator types, which is achieved by setting the [loadingIndicator.indicatorType](#) property to Shimmer or Spinner. The default value of the indicator type is "Spinner."

In the following sample, the Shimmer indicator is displayed while the gantt is scrolled when using the virtual data.

### APP.VUE

```

<template>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Selection, VirtualScroll, Sort, Filter } from
"@syncfusion/ej2-vue-gantt";
import{tempData} from "./datasource.js";
Vue.use(GanttPlugin);
var virtualData = [];
var projId = 1;
for (var i = 0; i < 50; i++) {
    var x = virtualData.length + 1;
    var parent_1 = {};
    parent_1['TaskID'] = x;
    parent_1['TaskName'] = 'Project' + (projId++);
    virtualData.push(parent_1);
    for (var j = 0; j < tempData.length; j++) {
        var subtasks = {};
        subtasks['TaskID'] = tempData[j].TaskID + x;
        subtasks['TaskName'] = tempData[j].TaskName;
        subtasks['StartDate'] = tempData[j].StartDate;
        subtasks['Duration'] = tempData[j].Duration;
        subtasks['Progress'] = tempData[j].Progress;
        subtasks['parentID'] = tempData[j].parentID + x;
        virtualData.push(subtasks);
    }
}

```

```

new Vue({
  el: '#app',
  template: `
    <div>
      <ejs-gantt ref='gantt'
        :dataSource= "data"
        :taskFields= "taskFields"
        :allowSelection= "true"

## Columns

### Columns in Vue Gantt component

The column displays information from a bound data source, and you can edit the values of column to update the task details through TreeGrid. The operations such as sorting, filtering, and searching can be performed based on column definitions. To display a Gantt column, the [field](#) property should be mapped from the data source to the column.

If the column [field](#) is not specified in the dataSource, the column values will be empty.

The [Link to the Video](#) property is used to define the expander column in the Gantt component to expand and collapse the child rows.

To learn about Gantt Chart Customize Column Data, you can check on this video:

### Defining columns

Using the [columns](#) property, you can define the columns in Gantt. If the columns are not defined, then the default columns will be rendered based on the mapped data source fields in the [taskFields](#) property. Refer to the following code example for defining the columns in Gantt along with their widths.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :columns = "columns"
    :splitterSettings = "splitterSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
            new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
            Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
            Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
```

```

TaskName: 'Project Estimation',
StartDate: new Date('04/02/2019'),
EndDate: new Date('04/21/2019'),
subtasks: [
    { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
    { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
    { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 }
],
},
],
taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks',
},
splitterSettings:{
    columnIndex:2
},
height:'450px',
columns: [
    { field: 'TaskID', width: '150' },
    { field: 'TaskName', width: '250' }
]
},
};
</script>

```

```
{% previewsample "page.domainurl/code-snippet/gantt/columns-cs14" %}
```

### Custom column header

The column header text can be defined using the `headerText` property, and you can customize the column headers using the `headerTemplate` property.

## APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields="taskFields" :height="height"
    :splitterSettings="splitterSettings">
      <e-columns>
        <e-column field='TaskName' :headerTemplate='projectName'
width=150></e-column>
        <e-column field='StartDate' :headerTemplate='dateTemplate'
width=150></e-column>
        <e-column field='Duration' :headerTemplate='durationTemplate'
width=150></e-column>
        <e-column field='Progress' :headerTemplate='progressTemplate'
width=150></e-column>
      </e-columns>
    </ejs-gantt>
  </div>
</template>
```

```

    </e-columns>
  </ejs-gantt>
</div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      projectName: function () {
        return { template : Vue.component('columnTemplate',{
          template: `<div class="image">
            
Task Name
          </div>`,
          data: function() {
            return {
              data: {}
            }
          },
          computed: {
            image: function() {
              return "Taskname.png";
            }
          }
        })}
      },
      dateTemplate: function () {
        return { template : Vue.component('columnTemplate',{
          template: `<div class="image">
            
Start Date
          </div>`,
          data: function() {
            return {
              data: {}
            }
          },
          computed: {
            image: function() {
              return "Startdate.png";
            }
          }
        })}
      },
      durationTemplate: function () {
        return { template : Vue.component('columnTemplate',{
          template: `<div class="image">
            
Duration
          </div>`,
          data: function() {
            return {

```

```

        data: {}
    },
    computed: {
        image: function() {
            return "Duration.png";
        }
    }
    }
    }
    },
    progressTemplate: function () {
        return { template : Vue.component('columnTemplate',{
            template: `<div class="image">
                
Progress
                </div>`,
            data: function() {
                return {
                    data: {}
                }
            },
            computed: {
                image: function() {
                    return "progress.png" ;
                }
            }
        })
    },
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
    },
    height: '450px',
    splitterSettings: {
        columnIndex: 4
    },
    columns: [
        { field: 'TaskName', headerTemplate: '#projectName', width:
'150' },
        { field: 'StartDate', headerTemplate: '#dateTemplate', width:
'150' },
        { field: 'Duration', headerTemplate: '#durationTemplate',
headerText: 'Duration', width: '150' },
        { field: 'Progress', headerTemplate: '#progressTemplate',
headerText: 'Progress', width: '150' },
    ],
    };
    },
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/columns-cs15" %}

### Format

To format the cell values based on a specific culture, use the [columns.format](#) property. The Gantt component uses the [Internationalization](#) library to format **number** and **date** values.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :columns = "columns"
    :rowHeight = "rowHeight" :splitterSettings = "splitterSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
      },
      rowHeight:50,
      splitterSettings:{
        columnIndex:3
      },
      height:'450px',
      columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'Progress', headerText: 'Progress', width:
'150',format: 'C' },
        { field: 'TaskName', headerText: 'Task Name', width: '150' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Duration', headerText: 'Duration', width: '150' }
      ]
    };
  },
};
</script>
```

{% previewsample "page.domainurl/code-snippet/gantt/columns-cs16" %}

By default, the number and date values are formatted in **en-US** culture.

### Number formatting

The number or integer values can be formatted using the following format strings.

Format | Description | Remarks

{ type:'date', format:'dd/MM/yyyy' } | 04/07/1996

{ type:'date', format:'dd.MM.yyyy' } | 04.07.1996

{ type:'date', skeleton:'short' } | 7/4/96

{ type: 'dateTime', format: 'dd/MM/yyyy hh:mm a' } | 04/07/1996 12:00 AM

{ type: 'dateTime', format: 'MM/dd/yyyy hh:mm:ss a' } | 07/04/1996 12:00:00 AM

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :columns = "columns"
:rowHeight = "rowHeight" :splitterSettings = "splitterSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
      },
      rowHeight:50,
      splitterSettings:{
        columnIndex:3
      },
      height:'450px',
      columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '150' },
        { field: 'StartDate', headerText: 'Start Date', width: '150',
format: { format: 'dd/MM/yyyy', type: 'date' } },
        { field: 'Duration', headerText: 'Duration', width: '150' },
        { field: 'Progress', headerText: 'Progress', width:
'150',format: 'C' },
      ]
    };
  },
};
</script>
```

```
{% previewsample "page.domainurl/code-snippet/gantt/columns-cs17" %}
```

### [Change tree/expander column](#)

The tree/expander column is a column in the Gantt component, that has icons to expand or collapse the parent records. You can define the tree column index in the Gantt component by using the [treeColumnIndex](#) property and the default value of this property is 0. The following code example shows how to use this property.

#### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
      :taskFields = "taskFields" :height = "height" :treeColumnIndex='2'
      :splitterSettings = "splitterSettings" :allowResizing = 'true'></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
      },
      splitterSettings:{
        columnIndex:3
      },
      height:'450px',
    };
  },
};
</script>
```

```
{% previewsample "page.domainurl/code-snippet/gantt/columns-cs19" %}
```

### [Show or Hide columns dynamically](#)

You can show or hide gantt columns dynamically using external buttons by invoking the [showColumn](#) or [hideColumn](#) method.

#### APP.VUE

```
<template>
  <div>
    <ejs-button id="show" cssClass="e-info" v-
      on:click.native="show">Show</ejs-button>
```

```

        <ejs-button id="hide" cssClass="e-info" v-
on:click.native="hide">Hide</ejs-button>
        <br>
        <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :columns = "columns"
:splitterSettings = "splitterSettings"></ejs-gantt>
    </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(ButtonPlugin);
Vue.use(GanttPlugin);
export default {
    data: function() {
        return{
            data: editingData,
            taskFields: {
                id: 'TaskID',
                name: 'TaskName',
                startDate: 'StartDate',
                duration: 'Duration',
                progress: 'Progress',
                child: 'subtasks',
            },
            height: '450px',
            splitterSettings:{
                position: '80%'
            },
            columns: [
                { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
                { field: 'TaskName', headerText: 'Task Name', width: '150' },
                { field: 'StartDate', headerText: 'Start Date', width: '150' },
                { field: 'Duration', headerText: 'Duration', width: '150' },
                { field: 'Progress', headerText: 'Progress', width: '150' },
            ]
        };
    }
    methods: {
        show: function(e){
            var ganttChart =
document.getElementById('GanttContainer').ej2_instances[0];
            ganttChart.showColumn(["Duration"]);
        },
        hide: function(e){
            var ganttChart =
document.getElementById('GanttContainer').ej2_instances[0];
            ganttChart.hideColumn(["Duration"]);
        },
    },
};
</script>

```

```
{% previewsample "page.domainurl/code-snippet/gantt/columns-cs20" %}
```

### Controlling Gantt column actions

You can enable or disable gantt action for a particular column by setting the [allowFiltering](#), [allowSorting](#), [allowReordering](#), and [allowEditing](#) properties.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
      :taskFields = "taskFields" :height = "height" :columns = "columns"
      :allowFiltering = 'true' :splitterSettings = "splitterSettings"
      :allowSorting = 'true' :allowReordering = 'true' :editSettings =
        "editSettings"></ejs-gantt>
    </div>
  </template>
<script>
import Vue from "vue";
import { GanttPlugin, Sort, Filter, Reorder, Edit } from "@syncfusion/ej2-
vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
      },
      height: '450px',
      splitterSettings: {
        position: '80%'
      },
      editSettings: {
        allowEditing: true
      },
      columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '150',
allowSorting: false },
        { field: 'StartDate', headerText: 'Start Date', width: '150',
allowEditing: false },
        { field: 'Duration', headerText: 'Duration', width: '150',
allowFiltering: false },
        { field: 'Progress', headerText: 'Progress', width: '150',
allowReordering: false },
      ],
    };
  },
  provide: {
```

```

      gantt: [ Sort, Filter, Reorder, Edit ]
    }
  };
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/columns-cs2" %}

### Column type

Column type can be specified using the `columns.type` property. It specifies the type of data the column binds.

If the `format` is defined for a column, the column uses `type` to select the appropriate format option [number](#) or [date](#).

Gantt column supports the following types:

- string
- number
- boolean
- date
- datetime

If the `type` is not defined, it will be determined from the first record of the [dataSource](#).

In case if the first record of the [dataSource](#) is null/blank value for a column then it is necessary to define the `type` for that column.

### Column reordering in Vue Gantt component

The column reordering can be done by dragging a column header from one index to another index within the TreeGrid. To enable reordering, set the [allowReordering](#) property to `true`.

To reorder the columns, inject the `Reorder` module in the `provide` section.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :columns = "columns"
    :allowReordering = 'true' :splitterSettings = "splitterSettings"></ejs-
    gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Reorder } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: editingData,
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',

```

```

        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
    },
    height: '450px',
    splitterSettings: {
        columnIndex: 3
    },
    columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '150' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Duration', headerText: 'Duration', width: '150' },
        { field: 'Progress', headerText: 'Progress', width: '150' },
    ]
    };
    },
    provide: {
        gantt: [Reorder]
    }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/columns-cs7" %}

You can disable the reordering of a particular column by setting the [columns.allowReordering](#) property to **false**.

#### Reorder Events

During the reorder action, the gantt component triggers the below three events.

1. The [columnDragStart](#) event triggers when column header element drag (move) starts.
2. The [columnDrag](#) event triggers when column header element is dragged (moved) continuously.
3. The [columnDrop](#) event triggers when a column header element is dropped on the target column.

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :columns = "columns"
:allowReordering = 'true' :splitterSettings = "splitterSettings"
:columnDrag='columnDrag' :columnDrop='columnDrop'
:columnDragStart='columnDragStart'></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Reorder } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {

```

```

data: function() {
  return{
    data: editingData,
    taskFields: {
      id: 'TaskID',
      name: 'TaskName',
      startDate: 'StartDate',
      duration: 'Duration',
      progress: 'Progress',
      child: 'subtasks',
    },
    height: '450px',
    splitterSettings: {
      columnIndex: 3
    },
    columns: [
      { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',

      { field: 'StartDate', headerText: 'Start Date', width: '150' },
      { field: 'Duration', headerText: 'Duration', width: '150' },
      { field: 'Progress', headerText: 'Progress', width: '150' },
    ]
  };
},
provide: {
  gantt: [Reorder]
},
methods: {
  columnDragStart: function() {
    alert('columnDragStart event is Triggered');
  },
  columnDrag: function() {
    alert('columnDrag event is Triggered');
  },
  columnDrop: function() {
    alert('columnDrop event is Triggered');
  }
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/columns-cs8" %}

### Reorder multiple columns

Multiple columns can be reordered at a time by using the [reorderColumns](#) method.

### APP.VUE

```

<template>
  <div>
    <ejs-button id="reorder" cssClass="e-info" v-
on:click.native="change">Reorder</ejs-button>
    <br><br><br>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height="height" :columns = "columns"

```

```

:allowReordering = 'true' :splitterSettings = "splitterSettings"></ejs-
gantt>
</div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Reorder } from "@syncfusion/ej2-vue-gantt";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
      },
      height: '450px',
      splitterSettings: {
        columnIndex: 3
      },
      columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '150' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Duration', headerText: 'Duration', width: '150' },
        { field: 'Progress', headerText: 'Progress', width: '150' },
      ]
    };
  },
  provide: {
    gantt: [Reorder]
  },
  methods: {
    change: function(e) {
      var ganttChart =
document.getElementById('GanttContainer').ej2_instances[0];
      ganttChart.reorderColumns(['TaskID', 'TaskName'], 'Progress');
    }
  },
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/columns-cs9" %}

### Column resizing in Vue Gantt component

The column width can be resized by clicking and dragging the right edge of the column header. While dragging, the width of the column will be resized immediately. Each column can be auto resized by

double-clicking the right edge of the column header to fit the width of that column based on the widest cell content. To resize the column, set the [columns.allowResizing](#) property to `true`. The following code example shows how to enable the column resize feature in the Gantt component.

To resize the column, inject the `Resize` module in the `provide` section.

#### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :columns = "columns"
    :splitterSettings = "splitterSettings" :allowResizing = 'true'></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Resize } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
      },
      splitterSettings:{
        columnIndex:4
      },
      height:'450px',
      columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '150' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Duration', headerText: 'Duration', width: '150' },
        { field: 'Progress', headerText: 'Progress', width: '150' },
      ]
    };
  },
  provide: {
    gantt: [Resize]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/gantt/columns-cs10" %}

You can disable resizing for a particular column by setting the [columns.allowResizing](#) to `false`.

*Defining minimum and maximum column width*

The column resizing can be restricted between minimum and maximum widths by defining the [columns->minWidth](#) and [columns->maxWidth](#) properties.

In the following example, the minimum and maximum widths are defined for the **Duration**, and **Task Name** columns.

**APP.VUE**

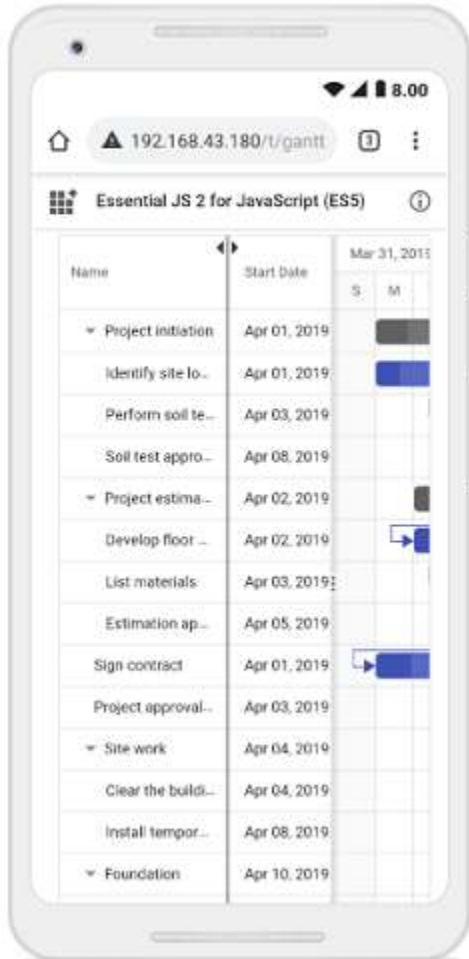

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :columns = "columns"
    :splitterSettings="splitterSettings" :allowResizing = 'true'></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Resize } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
      },
      height: '450px',
      columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width:
'200',minWidth: '150' ,maxWidth: '250' },
        { field: 'Duration', headerText: 'Duration', width:
'100',minWidth: '50' ,maxWidth: '200' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Progress', headerText: 'Progress', width: '150' },
      ],
      splitterSettings:{
        columnIndex:4
      },
    };
  },
  provide: {
    gantt: [Resize]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/gantt/columns-cs11" %}

*Touch interaction*

When the right edge of the column header cell is **tapped**, a floating handler will be visible over the right border of the column. To [resize](#) the column, drag the floating handler as needed.

The following screenshot represents the Gantt column resizing in touch device.

*Column template in Vue Gantt component*

A column template is used to customize the column's look. The following code example explains how to define the custom template in Gantt using the [template](#) property.

**APP.VUE**

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields="taskFields" :height="height"
      :rowHeight="rowHeight" :splitterSettings="splitterSettings"
    :allowResizing='true' :resourceFields="resourceFields"
      :resources="resources">
      <e-columns>
        <e-column field='TaskID' headerText='Task ID' textAlign='Left'
width='100'></e-column>
```

```

    <e-column field='TaskName' headerText='Task Name' width='150'></e-
column>
    <e-column field='resources' headerText='Resources' width='250'
:template="cTemplate"></e-column>
    <e-column field='StartDate' headerText='Start Date' width='150'></e-
column>
    <e-column field='Duration' headerText='Duration' width='150'></e-
column>
    <e-column field='Progress' headerText='Progress' width='150'></e-
column>
  </e-columns>
  <template v-slot:cTemplate="{data}">
    <div class="columnTemplate" v-
if="data.ganttProperties.resourceNames">
      
      <div style="display:inline-
block;width:100%;position:relative;left:30px">
        {{data.ganttProperties.resourceNames}}</div>
      </div>
    </template>
  </ejs-gantt>
</div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { editingData , editingResources } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),

        resourceInfo: 'resources',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
    },
    rowHeight: 50,
    splitterSettings: {
        columnIndex: 3
    },
    height: '450px',
    resourceFields: {
        id: 'resourceId',
        name: 'resourceName',
    },
    resources: editingResources
}
},
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/columns-cs13" %}

### Column menu in Vue Gantt component

The column menu has options to integrate features like sorting, filtering, and autofit. It will show a menu with the integrated feature when users click the Multiple icon of the column. To enable the column menu, you should set the [showColumnMenu](#) property to `true`.

The default items are displayed in the following table:

Item	Description
SortAscending	Sort the current column in ascending order.
SortDescending	Sort the current column in descending order.
AutoFit	Auto fit the current column.
AutoFitAll	Auto fit all columns.
Filter	Show the filter option as given in <code>filterSettings.type</code>

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :columns = "columns"
    :allowFiltering = 'true' :splitterSettings = "splitterSettings"
    :showColumnMenu = 'true' :allowSorting = 'true'></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Sort, Filter, ColumnMenu } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
      },
      height: '450px',
      splitterSettings: {
        position: '100%'
      },
      columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '150' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },

```

```

        { field: 'Duration', headerText: 'Duration', width: '150' },
        { field: 'Progress', headerText: 'Progress', width: '150' },
    ],
    };
},
    provide: {
        gantt: [ Sort, Filter, ColumnMenu ]
    }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/columns-cs3" %}

You can disable the column menu for a particular column by setting the `columns.showColumnMenu` to `false`.

### Column Menu Events

During the resizing action, the gantt component triggers the below two events.

1. The [columnMenuOpen](#) event triggers before the column menu opens.
2. The [columnMenuClick](#) event triggers when the user clicks the column menu of the gantt.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :columns = "columns"
    :allowFiltering = 'true' :splitterSettings = "splitterSettings"
    :showColumnMenu = 'true' :allowSorting = 'true'
    :columnMenuClick='columnMenuClick'
    :columnMenuOpen='columnMenuOpen'></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Sort, Filter, ColumnMenu } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
      },
      height: '450px',
      splitterSettings: {
        position: '100%'
      }
    }
  }
}

```

```

    },
    columns: [
      { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
      { field: 'TaskName', headerText: 'Task Name', width: '150' },
      { field: 'StartDate', headerText: 'Start Date', width: '150' },
      { field: 'Duration', headerText: 'Duration', width: '150' },
      { field: 'Progress', headerText: 'Progress', width: '150' },
    ],
  },
  provide: {
    gantt: [ Sort, Filter, ColumnMenu ]
  },
  methods: {
    columnMenuOpen: function(){
      alert('columnMenuOpen event is Triggered');
    },
    columnMenuClick: function(){
      alert('columnMenuClick event is Triggered');
    }
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/columns-cs4" %}

#### Custom Column Menu Item

Custom column menu items can be added by defining the [columnMenuItems](#).

Actions for this customized items can be defined in the [columnMenuClick](#) event.

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :columns = "columns"
:splitterSettings = "splitterSettings" :showColumnMenu = 'true'
:allowSorting = 'true' :columnMenuClick='columnMenuClick'
:columnMenuItems='columnMenuItems'
:sortSettings='sortSettings'></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Sort, Filter, ColumnMenu } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      columnMenuItems: [{text:'Clear Sorting', id:'ganttclearsorting'}],
      taskFields: {
        id: 'TaskID',

```

```

        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
    },
    height: '450px',
    splitterSettings: {
        position: '100%'
    },
    columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '150' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Duration', headerText: 'Duration', width: '150' },
        { field: 'Progress', headerText: 'Progress', width: '150' },
    ],
    sortSettings: { columns: [{ direction: "Ascending", field:
"TaskName" }] }
    };
},
    provide: {
        gantt: [ Sort, Filter, ColumnMenu ]
    },
    methods: {
        columnMenuClick: function(args) {
            if(args.item.id === 'ganttclearsorting'){
                var ganttChart =
document.getElementById('GanttContainer').ej2_instances[0];
                ganttChart.clearSorting();
            }
        }
    }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/columns-cs5" %}

#### *Customize menu items for particular columns*

Sometimes, you have a scenario that to hide an item from column menu for particular columns. In that case, you need to define the [columnMenuOpenEventArgs.hide](#) as true in the [columnMenuOpen](#) event.

The following sample, **Filter** item was hidden in column menu when opens for the **Task Name** column.

#### **APP.VUE**

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :columns = "columns"
:allowFiltering = 'true' :splitterSettings = "splitterSettings"
:showColumnMenu = 'true' :allowSorting = 'true'
:columnMenuOpen='columnMenuOpen'></ejs-gantt>
  </div>
</template>
<script>

```

```

import Vue from "vue";
import { GanttPlugin, Sort, Filter, ColumnMenu } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: editingData,
      taskFields: {
        id: 'TaskID',

### Responsive columns in Vue Gantt component

You can toggle the column visibility based on media queries, which are defined in the [hideAtMedia](#). The [hideAtMedia](#) accepts valid [Media Queries](#).

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :columns = "columns"
:splitterSettings = "splitterSettings" :allowResizing = 'true'></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Resize } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: editingData,
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
      },
      height: '450px',
      splitterSettings: {
        columnIndex: 4
      },
      columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width:
'200',hideAtMedia: '(min-width: 700px)' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Duration', headerText: 'Duration', width: '100',
hideAtMedia: '(max-width: 500px)' },
        { field: 'Progress', headerText: 'Progress', width: '150' },
      ]
    };
  },
  provide: {
    gantt: [ Resize ]
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/columns-cs18" %}

Check box columns in Vue Gantt component

To render boolean values as checkbox in columns, you need to set [displayAsCheckBox](#) property as **true**.

#### APP.VUE

```

<template>
  <div>

```

```

    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :columns = "columns"
:splitterSettings = "splitterSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { checkBoxData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: checkBoxData,
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
      },
      height: '450px',
      splitterSettings:{
        position: '80%'
      },
      columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '150' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Duration', headerText: 'Duration', width: '150' },
        { field: 'verified', headerText: 'Verified', displayAsCheckBox:
true, type: 'boolean' },
        { field: 'Progress', headerText: 'Progress', width: '150' },
      ]
    };
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/columns-cs1" %}

### Column spanning in Vue Gantt component

The gantt has option to span the adjacent cells. You need to define the [colSpan](#) attribute to span cells in the [QueryCellInfo](#) event.

In the following demo, **Work 1** cells have been spanned.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :columns="columns"

```

```

:splitterSettings = "splitterSettings" :queryCellInfo='queryCellInfoEvent'
gridLines='Both'></ejs-gantt>
</div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { colSpanData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: colSpanData,
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
      },
      height: '450px',
      splitterSettings: {
        position: '80%'
      },
      columns: [
        { field: 'TaskID', headerText: 'Task ID' },
        { field: 'TaskName', headerText: 'Task Name' },
        { field: 'work1', headerText: 'Work 1' },
        { field: 'work2', headerText: 'Work 2' },
        { field: 'StartDate', headerText: 'Start Date' },
        { field: 'Duration', headerText: 'Duration' },
        { field: 'Progress', headerText: 'Progress' }
      ],
    };
  },
  methods: {
    queryCellInfoEvent: function (args) {
      switch (args.data.TaskID) {
        case 1:
          if ((args.column.field == 'work1') && (args.data.taskData.work1
== 'support')) {
            args.colSpan = 2;
          }
          break;
        case 2:
          if ((args.column.field == 'work1') && (args.data.taskData.work1
== 'support')) {
            args.colSpan = 2;
          }
          break;
        case 3:
          if ((args.column.field == 'work1') && (args.data.taskData.work1
== 'support')) {
            args.colSpan = 2;
          }
          break;
      }
    }
  }
}

```

```

        case 4:
            if ((args.column.field == 'work1') && (args.data.taskData.work1
== 'support')) {
                args.colSpan = 2;
            }
            break;
        case 5 :
            if ((args.column.field == 'work1') && (args.data.taskData.work1
== 'support')) {
                args.colSpan = 2;
            }
            break;
        case 7:
            if ((args.column.field == 'work1') && (args.data.taskData.work1
== 'support')) {
                args.colSpan = 2;
            }
            break;
    }
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/columns-cs12" %}

## Timeline

### Time line in Vue Gantt component

In the Gantt component, timeline is used to represent the project duration as individual cells with defined unit and formats.

#### Timeline view modes

Gantt contains the following in-built timeline view modes:

- Hour – Minute
- Day – Hour
- Week – Day
- Month – Week
- Year – Month

Timescale mode in the Gantt component can be defined using the [timelineViewMode](#) property, and you can define a timescale mode for the top tier and bottom tier using the [topTier.unit](#) and [bottomTier.unit](#) properties.

#### Week timeline mode

In the **Week** timeline mode, the upper part of the schedule header displays the weeks, whereas the bottom half of the header displays the days. Refer to the following code example.

#### APP.VUE

```

<template>
  <div>

```

```

    <ejs-gantt id="GanttContainer" :dataSource="data" :taskFields =
    "taskFields" :height = "height" :timelineSettings="timelineSettings"></ejs-
    gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
estimation', StartDate: new Date('04/04/2019'), Duration: 4, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 4, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate:
new Date('04/04/2019'), Duration: 4, Progress: 50 }
          ]
        },
      ],
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
      },
      timelineSettings: {
        timelineViewMode: 'Week',
      },
    };
  }
};

```

```

    },
  };
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/timeline-cs1" %}

### Month timeline mode

In the **Month** timeline mode, the upper part of the schedule header displays the months, whereas the bottom header of the schedule displays its corresponding weeks. Refer to the following code example.

### APP.VUE

```

<template>

*Week start day customization*

In the Gantt component, you can customize the week start day using the [weekStartDay](#) property. By default, the [weekStartDay](#) is set to 0, which specifies the Sunday as a start day of the week. But, you can customize the week start day by using the following code example.

**APP.VUE**

```
<template>
  <div>
    <ejs-gantt id="GanttContainer" :dataSource="data" :taskFields =
      "taskFields" :height = "height" :timelineSettings="timelineSettings"></ejs-
      gantt>
    </div>
  </template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
              StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
              estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
              Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate:
              new Date('04/04/2019'), Duration: 3, Progress: 50 }
          ]
        },
      ],
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',

```

```

        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
    },
    timelineSettings: {
        timelineViewMode: 'Week',
        weekStartDay: 3
    },
};
},
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/timeline-cs6" %}

#### *Customize automatic timescale update action*

In the Gantt component, the schedule timeline will be automatically updated when the tasks date values are updated beyond the project start date and end date ranges. This can be enabled or disabled using the [updateTimescaleView](#) property.

#### **APP.VUE**

```

<template>
  <div>
    <ejs-gantt id="GanttContainer" :dataSource="data" :taskFields =
    "taskFields" :height = "height" :timelineSettings="timelineSettings"
    :editSettings="editSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
              StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),

```

```

        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate:
new Date('04/04/2019'), Duration: 3, Progress: 50 }
        ]
    },
],
height: '450px',
taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    endDate: 'EndDate',
    duration: 'Duration',

    gantt: [ Edit ]
},
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/timeline-cs7" %}

#### *Timeline cells tooltip*

In the Gantt component, you can enable or disable the mouse hover tooltip of timeline cells using the [timelineSettings.showTooltip](#) property. The default value of this property is `true`. The following code example shows how to enable the timeline cells tooltip in Gantt.

#### **APP.VUE**

```

<template>
  <div>
    <ejs-gantt ref='gantt' :dataSource="data" id="GanttContainer"
:taskFields = "taskFields" :height = "height" :columns="columns"
:timelineSettings="timelineSettings" ></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";

```

```

import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      timelineSettings: {
        showTooltip: true
      },
      columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '250' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Duration', headerText: 'Duration', width: '150' },
        { field: 'Progress', headerText: 'Progress', width: '150' },
      ]
    };
  },
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/tooltip-cs2" %}

### Top tier and bottom tier in Vue Gantt component

The Gantt component contains two tiers layout in timeline, you can customize the top tier and bottom tier using the [topTier](#) and [bottomTier](#) properties. Timeline tier's unit can be defined by using the [unit](#) property, and the [format](#) property is used to define the date format of timeline cell. The [count](#) property is used to define the number of units to be combined as a single cell and the [formatter](#) property is used to define the custom method to format the date value of timeline cell.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt id="GanttContainer" :dataSource="data" :taskFields =
"taskFields" :height = "height" :timelineSettings="timelineSettings"></ejs-
gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{

```

```

data: [
  {
    TaskID: 1,
    TaskName: 'Project Initiation',
    StartDate: new Date('04/02/2019'),
    EndDate: new Date('04/21/2019'),
    subtasks: [
      { TaskID: 2, TaskName: 'Identify Site location',
StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
      { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
      { TaskID: 4, TaskName: 'Soil test approval', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
    ]
  },
  {
    TaskID: 5,
    TaskName: 'Project Estimation',
    StartDate: new Date('04/02/2019'),
    EndDate: new Date('04/21/2019'),
    subtasks: [
      { TaskID: 6, TaskName: 'Develop floor plan for
estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
      { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
      { TaskID: 8, TaskName: 'Estimation approval', StartDate:
new Date('04/04/2019'), Duration: 3, Progress: 50 }
    ]
  },
],
height: '450px',
taskFields: {
  id: 'TaskID',
  name: 'TaskName',
  startDate: 'StartDate',
  endDate: 'EndDate',
  duration: 'Duration',
  progress: 'Progress',
  dependency: 'Predecessor',
  child: 'subtasks'
},
timelineSettings: {
  topTier: {
    format: 'MMM',
    unit: 'Month'
  },
  bottomTier: {
    unit: 'Day',
    count: 2
  }
},
};
};
</script>

```

```
{% previewsample "page.domainurl/code-snippet/gantt/timeline-cs8" %}
```

### Combining timeline cells

In the Gantt component, the timeline cells in top and bottom tiers can be combined with number of timeline units. This can be achieved by using the [topTier.count](#) and [bottomTier.count](#) properties. Refer to the following sample.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt id="GanttContainer" :dataSource="data" :taskFields =
    "taskFields" :height = "height" :timelineSettings="timelineSettings"></ejs-
    gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('09/16/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
            new Date('04/02/2019'), Duration: 120, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
            Date('04/02/2019'), Duration: 120, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
            Date('04/02/2019'), Duration: 120 , Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/04/2019'),
          EndDate: new Date('09/18/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
            StartDate: new Date('04/04/2019'), Duration: 120, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
            Date('04/04/2019'), Duration: 120, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
            Date('04/04/2019'), Duration: 120, Progress: 50 }
          ]
        }
      ],
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',

```

```

        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
    },
    timelineSettings: {
        timelineUnitSize: 100,
        topTier: {
            unit: 'Year'
        },
        bottomTier: {
            unit: 'Month',
            count: 6
        }
    },
    };
},
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/timeline-cs9" %}

#### *Format value of timeline cell*

In the Gantt component, you can format the value of top and bottom timeline cells using the standard date format string or the custom formatter method. This can be done using the [topTier.format](#), [topTier.formatter](#), [bottomTier.format](#) and [bottomTier.formatter](#) properties. The following example shows how to use the formatter method for timeline cells.

#### **APP.VUE**

```

<template>
  <div>
    <ejs-gantt id="GanttContainer" :dataSource="data" :taskFields =
      "taskFields" :height = "height" :timelineSettings="timelineSettings"
      :projectStartDate="projectStartDate" :projectEndDate="projectEndDate"></ejs-
      gantt>
    </div>
  </template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('09/16/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
              new Date('04/02/2019'), Duration: 120, Progress: 50 },

```

```

        { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 120, Progress: 50 },
        { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 120 , Progress: 50 },
    ]
},
{
    TaskID: 5,
    TaskName: 'Project Estimation',
    StartDate: new Date('04/04/2019'),
    EndDate: new Date('09/18/2019'),
    subtasks: [
        { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 120, Progress: 50 },
        { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 120, Progress: 50 },
        { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 120, Progress: 50 }
    ]
},
],
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
    },
    timelineSettings: {
        topTier: {
            unit: 'Month',
            count: 3,
            formatter: (date) => {
                var month = date.getMonth();
                if (month >= 0 && month <= 2) {
                    return 'Q1';
                } else if (month >= 3 && month <= 5) {
                    return 'Q2';
                } else if (month >= 6 && month <= 8) {
                    return 'Q3';
                } else {
                    return 'Q4';
                }
            }
        },
        bottomTier: {
            unit: 'Month',
            format: 'MMM'
        }
    },
    projectStartDate: new Date('01/04/2019'),
    projectEndDate: new Date('12/30/2019')
};

```

```

},
}
</script>

```

```
{% previewsample "page.domainurl/code-snippet/gantt/timeline-cs10" %}
```

### Timeline cell width

In the Gantt component, you can define the width value of timeline cell using the [timelineSettings.timelineUnitSize](#) property. This value will be set to the bottom timeline cell, and the width value of top timeline cell will be calculated automatically based on bottom tier cell width using the [topTier.unit](#) and [timelineSettings.timelineUnitSize](#) properties. Refer to the following example.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt id="GanttContainer" :dataSource="data" :taskFields =
      "taskFields" :height = "height" :timelineSettings="timelineSettings"></ejs-
      gantt>
    </div>
  </template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
              StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
              estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
              Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate:
              new Date('04/04/2019'), Duration: 3, Progress: 50 }
          ]
        }
      ]
    }
  }
}

```

```

    },
    ],
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
    },
    timelineSettings: {

### Zooming in Vue Gantt component

The zooming support provides options to increase or decrease the width of timeline cells and also provides options to change the timeline units dynamically. This support enables you to view the tasks in a project clearly from minute to decade timespan. To enable the zooming features, define the **ZoomIn**, **ZoomOut**, and **ZoomToFit** items to toolbar items collections, and this action can be performed on external actions such as button click using the [zoomIn](#), [zoomOut](#), and [fitToProject](#) built-in methods. The following zooming options are available to view the project:

#### Zoom in

This support is used to increase the timeline width and timeline unit from years to minutetimespan. When the **ZoomIn** icon was clicked, the timeline cell width is increased when the cellsize exceeds the specified range and the timeline unit is changed based on the current zoom levels.

#### Zoom out

This support is used to increase the timeline width and timeline unit from minutes to years timespan. When the **ZoomOut** icon was clicked, the timeline cell width is decreased when the cell size falls behind the specified range and the timeline view mode is changed based on the current zooming levels.

#### Zoom to fit

This support is used to view all the tasks available in a project within available area on the chart part of Gantt. When users click the **ZoomToFit** icon, then all the tasks are rendered within the available chart container width.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :toolbar="toolbar"></ejs-
    gantt>
  </div>

```

```

</template>
<script>
import Vue from "vue";
import { GanttPlugin, Toolbar } from "@syncfusion/ej2-vue-gantt";
import { projectNewData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: projectNewData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
      },

    };
  },
  provide: {
    gantt: [Toolbar ]
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/zooming-cs1" %}

### Customizing zooming levels

In Gantt, the zoom in and zoom out actions are performed based on the predefined zooming levels in the `zoomingLevels` property. You can customize the zooming actions by defining the required zooming collection to the `zoomingLevels` property.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
      :dataBound="dataBound" :taskFields = "taskFields" :height = "height"
      :toolbar="toolbar"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Toolbar } from "@syncfusion/ej2-vue-gantt";
import { projectNewData } from './data-source.js';
let customZoomingLevels = [{
  topTier: { unit: 'Month', format: 'MMM, yy', count: 1 },
  bottomTier: { unit: 'Week', format: 'dd', count: 1 },
  timelineUnitSize: 33, level: 0,
  timelineViewMode: 'Month', weekStartDay: 0,
  updateTimescaleView: true, weekendBackground: null, showTooltip: true
},

```

```

    {
      topTier: { unit: 'Month', format: 'MMM, yyyy', count: 1 },
      bottomTier: { unit: 'Week', format: 'dd MMM', count: 1 },
      timelineUnitSize: 66, level: 1,
      timelineViewMode: 'Month', weekStartDay: 0,

      timelineViewMode: 'Week', weekStartDay: 0,
      updateTimescaleView: true, weekendBackground: null, showTooltip: true
    },
    {
      topTier: { unit: 'Day', format: 'E dd yyyy', count: 1 },
      bottomTier: { unit: 'Hour', format: 'hh a', count: 12 },
      timelineUnitSize: 66, level: 5,
      timelineViewMode: 'Day', weekStartDay: 0,
      updateTimescaleView: true, weekendBackground: null, showTooltip: true
    },
    {
      topTier: { unit: 'Day', format: 'E dd yyyy', count: 1 },
      bottomTier: { unit: 'Hour', format: 'hh a', count: 6 },
      timelineUnitSize: 99, level: 6,
      timelineViewMode: 'Day', weekStartDay: 0,
      updateTimescaleView: true, weekendBackground: null, showTooltip: true
    },
  ];
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: projectNewData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
      }
    }
  }
}

```

```

    },
    toolbar: ['ZoomIn', 'ZoomOut', 'ZoomToFit'],
    dataBound: function () {
        var ganttObj =
document.getElementById('GanttContainer').ej2_instances[0];
        ganttObj.zoomingLevels = customZoomingLevels;
    },
    };
},
provide: {
    gantt: [Toolbar ]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/zooming-cs2" %}

### *Zoom action by methods*

You can perform the various zoom actions dynamically or on external click action using the following methods:

- Zoom in - [zoomIn](#)
- Zoom out - [zoomOut](#)
- Fit to project - [fitToProject](#)

### **APP.VUE**

```

<template>
  <div>
    <ejs-button id="zoomIn" cssClass="e-info" v-
on:click.native="zoomIn">ZoomIn</ejs-button>
    <ejs-button id="zoomOut" cssClass="e-info" v-
on:click.native="zoomOut">ZoomOut</ejs-button>
    <ejs-button id="fitToProject" cssClass="e-info" v-
on:click.native="fitToProject">FitToProject</ejs-button>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { projectNewData } from './data-source.js';
Vue.use(GanttPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return{
      data: projectNewData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',

```

```

        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
    }
    };
},
methods: {
    zoomIn: function() {
        this.$refs.gantt.zoomIn();
    },
    zoomOut: function() {
        this.$refs.gantt.zoomOut();
    },
    fitToProject: function() {
        this.$refs.gantt.fitToProject();
    }
},
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/zooming-cs3" %}

### Event markers in Vue Gantt component

The event markers in the Gantt component is used to highlight the important events in a project. Event markers can be initialized by using the [eventMarkers](#) property, and you can define date and label for the event markers using the [day](#) and [label](#) properties. You can also customize it using the [cssClass](#) properties. The following code example shows how to add event markers in the Gantt component.

To highlight the days, inject the [DayMarkers](#) module in the `provide` section.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :eventMarkers =
    "eventMarkers"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, DayMarkers } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        resourceInfo: 'resources',
        duration: 'Duration',

```

```

        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
    },
    eventMarkers: [
        {
            day: '04/10/2019',
            cssClass: 'e-custom-event-marker',
            label: 'Project approval and kick-off'
        }
    ]
    };
},
provide: {
    gantt: [DayMarkers]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/eventmarkers-cs1" %}

### Holidays in Vue Gantt component

Non-working days in a project can be displayed in the Gantt component using the [holidays](#) property. Each holiday can be defined with the following properties:

- [from](#): Defines start date of the holiday(s).
- [to](#): Defines end date of the holiday(s).
- [label](#): Defines the description or label for the holiday.
- [cssClass](#): Formats the holidays label in the Gantt chart.

To highlight the days, inject the [DayMarkers](#) module in the `provide` section.

The following code example shows how to display the non-working days in the Gantt component.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :holidays = "holidays"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, DayMarkers } from "@syncfusion/ej2-vue-gantt";
import { projectNewData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: projectNewData,
      height: '450px',
      taskFields: {
        id: 'TaskID',

```

```

        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    holidays: [{
        from: "04/04/2019",
        to: "04/05/2019",
        label: " Public holidays",
        cssClass: "e-custom-holiday"
    },
    {
        from: "04/12/2019",
        to: "04/12/2019",
        label: " Local holidays",
        cssClass: "e-custom-holiday"
    }
    ]
};
},
provide: {
    gantt: [DayMarkers]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/holidays-cs1" %}

## Splitter in Vue Gantt component

### Splitter

In the Gantt component, the Splitter separates the TreeGrid section from the Chart section. You can change the position of the Splitter when loading the Gantt component using the [splitterSettings](#) property. By splitting the TreeGrid from the chart, the width of the TreeGrid and chart sections will vary in the component. The [splitterSettings.position](#) property denotes the percentage of the TreeGrid section's width to be rendered and this property supports both pixels and percentage values. You can define the splitter position as column index value using the [splitterSettings.columnIndex](#) property. You can also define the splitter position with built-in splitter view modes by using the [splitterSettings.view](#) property. The following list is the possible values for this property:

- **Default:** Shows Grid side and Gantt side.
- **Grid:** Shows Grid side alone in Gantt.
- **Chart:** Shows chart side alone in Gantt.

### APP.VUE

```

<template>
    <div>
        <ejs-gantt id="GanttContainer" :dataSource="data" :taskFields =
"taskFields" :height = "height" :splitterSettings="splitterSettings"></ejs-
gantt>
    </div>
</template>
<script>

```

```
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      splitterSettings: {
        position: "50%"
      },
    };
  },
};
</script>
```

{% previewsample "page.domainurl/code-snippet/gantt/appearance-customization-cs8" %}

### Change splitter position dynamically

In Gantt, we can change the splitter position dynamically by using [setSplitterPosition](#) method. Either We can change the splitter position with splitter position or columnIndex values by passing these values as arguments to [setSplitterPosition](#) method. The following code example shows how to use this methods.

### APP.VUE

```
<template>
  <div>
    <ejs-button id="changebypostion" cssClass="e-info" v-
on:click.native="change">Change By Postion</ejs-button>
    <br><br>
    <ejs-button id="changebyindex" cssClass="e-info" v-
on:click.native="changei">Change By Index</ejs-button>
    <br><br>
    <table>
      <tr>
        <td style="width: 70%">
          <ejs-dropdownlist id="splitter-type" value='Default'
:dataSource="dataSource" :fields = "fields" :change ="change"> Splitter View
</ejs-dropdownlist>
        </td>
      </tr>
    </table>
    <ejs-gantt id="GanttContainer" :dataSource="data" :taskFields =
"taskFields" :height = "height"></ejs-gantt>
  </div>
</template>
<script>
```

```

import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
Vue.use(ButtonPlugin);
Vue.use(DropDownListPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      dataSource: [
        { id: 'Default', mode: 'Default' },
        { id: 'Grid', mode: 'Grid' },
        { id: 'Chart', mode: 'Chart' },
      ],
      fields: { text: 'mode', value: 'id' },
    };
  },
  methods: {
    changep: function(e){
      var ganttChart =
document.getElementById('GanttContainer').ej2_instances[0];
      ganttChart.setSplitterPosition('50%', 'position');
    }
    changei: function(e){
      var ganttChart =
document.getElementById('GanttContainer').ej2_instances[0];
      ganttChart.setSplitterPosition(1, 'columnIndex');
    }
    change: function (e) {
      var ganttChart =
document.getElementById('GanttContainer').ej2_instances[0];
      var viewType = e.value;
      ganttChart.setSplitterPosition(viewType, 'view');
    }
  },
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/appearance-customization-cs9" %}

## Scheduling Tasks

### Task scheduling in Vue Gantt component

The Gantt provides support for automatic and manual task scheduling modes. It is used to indicate whether the start date and end date of all the tasks will be automatically validated or not. [taskMode](#) is the property used to change the schedule mode of a task.

The Gantt control supports three types of mode. They are:

- **Auto**: All the tasks are automatically validate.
- **Manual**: All the tasks are manually validate by the user.
- **Custom**: Both Auto and Manual tasks are render by mapped from data source.

Note: The default value of [taskMode](#) is [Link to the Video](#).

To learn about Gantt Chart Scheduling Concepts, you can check on this video:

### *Automatically scheduled tasks*

When the [taskMode](#) property is set as **Auto**, the start date and end date of all the tasks in the project will be automatically validated. That is, dates are validated based on various factors such as working time, holidays, weekends and predecessors.

### **APP.VUE**

```
<template>
  <div>
    <ejs-gantt ref = 'gantt' id = "GanttContainer" :dataSource = "data"
    :taskFields = "taskFields" :treeColumnIndex = "1" :height = "height"
    :editSettings = "editSettings" :toolbar = "toolbar" :taskMode= "taskMode" >
    </ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit, Selection, Toolbar } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function () {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project initiation',
          StartDate: new Date('03/29/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            {
              TaskID: 2, TaskName: 'Identify site location', StartDate:
new Date('03/29/2019'), Duration: 2,
              Progress: 30, Work: 16, resources: [{ resourceId: 1, Unit:
70 }, 6]
            },
            {

```

```

        TaskID: 3, TaskName: 'Perform soil test', StartDate: new
Date('03/29/2019'), Duration: 4,
        resources: [2, 3, 5], Work: 96
    },
    {
        TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('03/29/2019'), Duration: 1,
        Work: 16, resources: [8, { resourceId: 9, Unit: 50 }],
Progress: 30
    },
]
},
{
    TaskID: 5,
    TaskName: 'Project estimation', StartDate: new Date('03/29/2019'),
EndDate: new Date('04/21/2019'),
    subtasks: [
        {
            TaskID: 6, TaskName: 'Develop floor plan for estimation',

Unit: 50 }], Work: 30
        },
        {
            TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/01/2019'), Duration: 3,
            Work: 48, resources: [4, 8]
        },
        {
            TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/01/2019'),
            Duration: 2, Work: 60, resources: [12, { resourceId: 5,
Unit: 70 }]
        }
    ]
},
{
    TaskID: 9, TaskName: 'Sign contract', StartDate: new
Date('04/01/2019'), Duration: 1,
    Progress: 30, resources: [12], Work: 24
}
],
    height: '450px',
    taskMode: 'Auto',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        endDate: 'EndDate',
        dependency: 'Predecessor',
        child: 'subtasks'
    },
    editSettings: {
        allowEditing: true,
        allowDeleting: true,

```

```

        allowTaskbarEditing: true,
        showDeleteConfirmDialog: true
    },
    toolbar: ['Add', 'Edit', 'Update', 'Delete', 'Cancel',
'ExpandAll', 'CollapseAll', 'Search'],
    };
},
provide: {
    gantt: [Edit, Selection, Toolbar]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/task-scheduling-cs1" %}

### *Manually scheduled tasks*

When the [taskMode](#) property is set as **Manual**, the start date and end date of all the tasks in the project will be same as given in the data source. That is, dates are not validated based on various factors such as dependencies between tasks, holidays, weekends, working time.

We can restrict this mode in predecessor validation alone. That is, we can automatically validate the dates based on predecessor values by enabling the [validateManualTasksOnLinking](#) property.

### **APP.VUE**

```

<template>
  <div>

```

{% previewsample "page.domainurl/code-snippet/gantt/task-scheduling-cs2" %}

### Custom

When the [taskMode](#) property is set as Custom, the scheduling mode for each tasks will be mapped from the data source field. The [Boolean](#) property [taskFields.manual](#) is used to map the manual scheduling mode field from the data source.

{% previewsample "page.domainurl/code-snippet/gantt/task-scheduling-cs3" %}

#### *Unscheduled tasks*

Unscheduled tasks are planned for a project without any definite schedule dates. The Gantt control supports rendering the unscheduled tasks. You can create or update the tasks with anyone of start date, end date, and duration values or none. You can enable or disable the unscheduled tasks by using the [allowUnscheduledTasks](#) property. The following images represent the various types of unscheduled tasks in Gantt.

Taskbar state | Auto | Manual

End Date Only |

Note: A milestone is a task that has no start and end dates, but it has a duration value of zero

[Define unscheduled tasks in data source](#)

You can define the various types of unscheduled tasks in the data source as follows

#### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :editSettings= "editSettings"
    :allowUnscheduledTasks='true'></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          isParent:true,
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', Duration:
3, Progress: 50},
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', EndDate: new
Date('04/08/2019'), Progress: 50 },
          ]
        },
      ],
    }
  },
}
```

```

    {
      TaskID: 5,
      TaskName: 'Project Estimation',
      StartDate: new Date('04/02/2019'),
      EndDate: new Date('04/21/2019'),
      isParent:true,
      subtasks: [
        { TaskID: 6, TaskName: 'Develop floor plan for estimation',
          StartDate: new Date('04/04/2019'), Progress: 50, resources:
            [4],isParent:false },
        { TaskID: 7, TaskName: 'List materials', StartDate: new
          Date('04/04/2019'), Progress: 50 },
        { TaskID: 8, TaskName: 'Estimation approval',Duration:
          0,Progress: 50}
      ]
    },
  ],
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    endDate: 'EndDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  editSettings: {
    allowEditing:true,
    allowTaskbarEditing:true
  }
};
},
provide: {
  gantt: [ Edit ]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/task-scheduling-cs4" %}

#### NOTE

If the [allowUnscheduledTasks](#) property is set to false, then the Gantt control automatically calculates the scheduled date values with a default value of duration 1 and the project start date is considered as the start date for the task.

#### Working time range

In the Gantt control, working hours in a day for a project can be defined by using the [dayWorkingTime](#) property. Based on the working hours, automatic date scheduling and duration validations for a task are performed.

The following code snippet explains how to define the working time range for the project in Gantt.

#### APP.VUE

```
<template>
```

```

<div>
  <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :highlightWeekends='true'
:splitterSettings= "splitterSettings" :dayWorkingTime="dayWorkingTime"
:timelineSettings="timelineSettings"></ejs-gantt>
</div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit, DayMarkers } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      splitterSettings: {
        columnIndex: 1
      },
      dayWorkingTime: [
        {from: 9,
        to: 18 }
      ],
      timelineSettings:{
        timelineViewMode:'Day'
      }
    };
  },
  provide: {
    gantt: [ DayMarkers, Edit ]
  },
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/task-scheduling-cs5" %}

#### NOTE

- \* Individual tasks can lie between any time within the defined working time range of the project.
- \* The [dayWorkingTime](#) property is used to define the working time for the whole project.

#### *Weekend/Non-working days*

Non-working days/weekend are used to represent the non-productive days in a project. You can define the non-working days in a week using the [workWeek](#) property in Gantt.

#### **APP.VUE**

```

<<template>
  <div>
    <ejs-gantt id="GanttContainer" :dataSource="data" :taskFields =
"taskFields" :height = "height" :highlightWeekends='true'
:workWeek="workWeek"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, DayMarkers } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      workWeek: ["Sunday", "Monday", "Tuesday", "Wednesday", "Thursday"],
    };
  },
  provide: {
    gantt: [ DayMarkers ]
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/task-scheduling-cs6" %}

By default, Saturdays and Sundays are considered as non-working days/weekend in a project.

In the Gantt control, you can make weekend as working day by setting the [includeWeekend](#) property to true.

#### Duration units

In Gantt, the task's duration value can be measured by the following duration units,

- Day
- Hour
- Minute

In Gantt, we can define duration unit for whole project by using [durationUnit](#) property, when we defines the value for this property, this unit will be applied for all task which don't has duration unit value. And each task in the project can be defined with different duration units and the duration unit of a task can be defined by the following ways,

- Using [taskFields.durationUnit](#) property, to map the duration unit data source field.

- Defining the duration unit value along with the duration field in the data source.

#### Mapping the duration unit field

The below code snippet explains the mapping of duration unit data source field to the Gantt control using the [taskFields.durationUnit](#) property.

#### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :splitterSettings =
    "splitterSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        durationUnit: 'DurationUnit',
        child: 'subtasks'
      },
      splitterSettings:{
        columnIndex:4
      }
    };
  },
};
</script>
```

{% previewsample "page.domainurl/code-snippet/gantt/scheduling-tasks-cs1" %}

#### NOTE

The default value of the [durationUnit](#) property is **day**.

#### Defining duration unit along with duration field

A duration unit for a task can be defined along with duration value, the following code snippet explains the duration unit for a task along with duration value.

#### APP.VUE

```
<template>
  <div>
```

```

    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :splitterSettings =
"splitterSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          isParent:true,
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: '3days', DurationUnit:'day', Progress:
50,isParent:false },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: '12hours',DurationUnit:'hour', Progress: 70,
resources: [2, 3, 5],isParent:false },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: '1800minutes',DurationUnit:'minute',
Predecessor:"2FS", Progress: 80,isParent:false },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          isParent:true,
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: '12hours', DurationUnit:'hour',
Progress: 50, resources: [4],isParent:false },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: '3days', Progress: 50, DurationUnit:'day',
resources: [4, 8],isParent:false },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: '480minutes',Predecessor:"6SS",
DurationUnit:'minute', Progress: 70, resources: [12, 5],isParent:false }
          ]
        },
      ],
      height:'450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',

```

```

        child: 'subtasks'
      },
      splitterSettings: {
        columnIndex: 4
      }
    };
  },
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/scheduling-tasks-cs2" %}

#### NOTE:

The edit type of the duration column in Gantt is string to edit the duration field along with duration units.

#### Task dependency in Vue Gantt component

Task dependency or task relationship can be established between two tasks in Gantt. This dependency affects the project schedule. If you change the predecessor of a task, it will affect the successor task, which will affect the next task, and so on. Relationship can be established between parent-parent tasks, child-child tasks, parent-child and child-parent task.

In Gantt, you can enable or disable the parent predecessor using [allowParentDependency](#) property.

By default, the `allowParentDependency` property will be `true`.

#### Task relationship types

Task relationships are categorized into four types based on the start and finish dates of the task.

##### Start to Start(SS)

You cannot start a task until the dependent task also starts.

##### Start to Finish(SF)

You cannot finish a task until the dependent task is started.

##### Finish to Start(FS)

You cannot start a task until the dependent task is completed.

### Finish to Finish(FF)

You cannot finish a task until the dependent task is completed.

### Define task relationship

Task relationship is defined in the data source as a string value, and this value is mapped to the Gantt component by using the [taskFields.dependency](#) property. The following code example demonstrates how to enable the predecessor in the Gantt component.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),

#### *Predecessor offset with duration units*

In the Gantt component, the predecessor offset can be defined with the following duration units:

- Day
- Hour
- Minute

You can define an offset with various offset duration units for predecessors by using the following code example.

#### **APP.VUE**

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :columns="columns"></ejs-
    gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
            new Date('04/02/2019'), Duration: 0, Progress: 50 },

```

```

        { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
        { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/04/2019'), Duration: 4,Predecessor:"2FS+2days", Progress: 50 },
        { TaskID: 5, TaskName: 'Clear the building site', StartDate:
new Date('04/04/2019'), Duration: 2, Progress: 30, Predecessor: '4FF+960m'}
    ]
},
{
    TaskID: 6,
    TaskName: 'Project Estimation',
    StartDate: new Date('04/02/2019'),
    EndDate: new Date('04/21/2019'),
    subtasks: [
        { TaskID: 7, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
        { TaskID: 8, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
        { TaskID: 9, TaskName: 'Estimation approval', StartDate: new
Date('04/06/2019'), Duration: 0,Predecessor:"7SS+16h", Progress: 50 }
    ]
},
],
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
    },

    ]
};
},
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/taskdependency-cs2" %}

#### [Disabling automatic dependency offset updates](#)

By default, the dependency offsets are automatically updated in the Gantt chart whenever a task's start or end date is changed. However, if you want to disable this feature, you can do so by disabling the

[updateOffsetOnTaskbarEdit](#) property. Once this property is disabled, you can only update the offset value by editing the predecessor column cell or the offset column in the dependency tab of the edit dialog.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :toolbar="toolbar"

#### [Validate predecessor links on editing](#)

In the Gantt component, the task relationship link can be broken by editing the start date, end date, and duration value of task. When the task relationship is broken on any edit action, this can be handled in the Gantt component using the following two ways:

- `actionBegin` event.
- Predecessor validation dialog.

#### [Using `actionBegin` event](#)

When the task relationship link is broken on any edit action, then the [actionBegin](#) event will be triggered with `requestType` argument as `validateLinkedTask`. You can validate the editing action within the [actionBegin](#) event using the `validateMode` event argument. The `validateMode` event argument has the following properties:

Argument | Default value | Description

`args.validateMode.respectLink` | `false` | In this validation mode, the predecessor links will be considered as high priority. With this mode enabled, when the successor task is moved before predecessor task's end date, the editing will be reverted and dates will be validated based on the dependency links.

`args.validateMode.removeLink` | `false` | In this validation mode, the taskbar editing will be considered as high priority, where in the case of inappropriate task dates the dependency links will be removed and tasks will be moved to the edited date.

`args.validateMode.preserveLinkWithEditing | true` | In this validation mode, taskbar editing will be considered along with the dependency links. This relationship will be maintained by updating offset value of predecessors.

By default, the `preserveLinkWithEditing` validation mode will be enabled, so the predecessors are updated with offset values.

The following sample explains enabling the `respectLink` validation mode while editing the linked tasks in the `actionBegin` event.

### APP.VUE

        gantt: [ Edit ]
    }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/taskdependency-cs3" %}

#### Using validation dialog

When disabling all the validation modes in the [actionBegin](#) event, a validation pop-up will be displayed prompting users to select the validation mode to validate taskbar editing.

This validation pop-up will display different options based on the successor task's start date after editing.

If you move the successor task that starts after the predecessor task's end date, then a dialog will be rendered with the following options:

- Cancel, Keep the existing link.
- Remove the link and move the task to start on edited date.
- Move the task to start on edited date and keep the link.

If you move the successor task that starts before the predecessor task's end date, then a dialog will be rendered with the following options:

- Cancel, Keep the existing link.
- Remove the link and move the task to start on edited date.

The following code example shows how to enable the predecessor validation dialog in Gantt.

#### APP.VUE

## Taskbar

### Taskbar in Vue Gantt component

#### Taskbar template

You can design your own taskbars to view the tasks in Gantt using the [taskbarTemplate](#) property. You can customize the parent taskbars and milestones with custom templates using the [parentTaskbarTemplate](#) and [milestoneTemplate](#) properties.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields="taskFields" :height="height"
    :rowHeight="rowHeight" :taskbarTemplate="'taskbarTemplate'"
    :parentTaskbarTemplate="'parentTaskbarTemplate'"
    :milestoneTemplate="'milestoneTemplate'">
      <template v-slot:taskbarTemplate="{data}">
        <div class="e-gantt-child-taskbar e-custom-moments"
        style="height:100%;border-radius:5px;">
          <span class="e-task-label"
            style="position:absolute;top:5px;font-size:12px;text-
            overflow:ellipsis;height:90%;overflow:hidden;">{{data.TaskName}}</span>
        </div>
      </template>
      <template v-slot:parentTaskbarTemplate="{data}">
        <div class="e-gantt-child-taskbar e-custom-parent"
        style="height:100%;border-radius:5px;">
          <span class="e-task-label"
            style="position:absolute;top:5px;font-size:12px;text-
            overflow:ellipsis;height:90%;overflow:hidden;">{{data.TaskName}}</span>
        </div>
      </template>
    </div>
  </div>

```

```

    <template v-slot:milestoneTemplate="{data}">
      <div class="e-gantt-milestone" style="position:absolute;">
        <div class="e-milestone-top"
          style="border-right-width:26px; margin-top: -9px;border-left-
width:26px;border-bottom-width:26px;"></div>
        <div class="e-milestone-bottom"
          style="top:26px;border-right-width:26px; border-left-width:26px;
border-top-width:26px;"></div>
      </div>
    </template>
  </ejs-gantt>
</div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [

</style>

```

{% previewsample "page.domainurl/code-snippet/gantt/appearance-customization-cs2" %}

### Taskbar customization

#### Taskbar height

The height of child taskbars and parent taskbars can be customized by using [taskbarHeight](#) property. The following code example shows how to use the [taskbarHeight](#) property.

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
      :taskFields = "taskFields" :height = "height" :taskbarHeight="taskbarHeight"
      :rowHeight="rowHeight"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";

```

```

Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          isParent:true,
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 0, Progress: 50,isParent:false },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50, resources: [2, 3,
5],isParent:false },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4,Predecessor:"2FS", Progress:
50,isParent:false },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          isParent:true,
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50, resources:
[4],isParent:false },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50, resources: [4,
8],isParent:false },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 0,Predecessor:"6SS", Progress: 50, resources:
[12, 5],isParent:false }
          ]
        },
      ],
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      taskbarHeight:60,
      rowHeight: 60
    };
  },
};
</script>

```

```
{% previewsample "page.domainurl/code-snippet/gantt/appearance-customization-cs1" %}
```

#### NOTE

The [taskbarHeight](#) value should be lower than [rowHeight](#) property value and these properties accept only pixel values.

#### Conditional formatting

The default taskbar UI can be replaced with custom templates by using the [queryTaskbarInfo](#) event. The following code example shows customizing the taskbar UI based on task progress values in Gantt component.

#### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :queryTaskbarInfo =
    "queryTaskbarInfo"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          isParent:true,
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
            new Date('04/02/2019'), Duration: 0, Progress: 50,isParent:false },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
            Date('04/02/2019'), Duration: 4, Progress: 70, resources: [2, 3,
            5],isParent:false },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
            Date('04/02/2019'), Duration: 4,Predecessor:"2FS", Progress:
            50,isParent:false },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          isParent:true,

        baselineColor:'red',
        tooltipSettings:{
            showTooltip:true
        }
        height: '450px',
    };
},
provide: {
    gantt: [ Selection, DayMarkers ]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/tooltip-cs1" %}

The default value of the [tooltipSettings.showTooltip](#) property is `true`.

#### Tooltip template

#### Taskbar tooltip

The default tooltip in the Gantt component can be customized using the [tooltipSettings.taskbar](#) property.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' :dataSource="data" id="GanttContainer"
    :taskFields="taskFields" :height="height"
    :tooltipSettings="tooltipSettings">
      <template v-slot:taskbarTooltipTemplate="{data}">
        <div>TaskID: {{data.TaskID}}</div>
      </template>
    </ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
import taskbarTemplate from './taskbartemplate.vue';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        baselineStartDate:"BaselineStartDate",
        baselineEndDate:"BaselineEndDate",
        progress: 'Progress',
        dependency: 'Predecessor',

```

```

        child: 'subtasks'
      },
      tooltipSettings: {
        showTooltip: true,
        taskbar: "taskbarTooltipTemplate"
      },
    };
  },
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/tooltip-cs4" %}

#### Connector line tooltip

The default connector line tooltip in the Gantt component can be customized using the [tooltipSettings.connectorLine](#) property. The following code example shows how to use the [tooltipSettings.connectorLine](#) property.

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' :dataSource="data" id="GanttContainer"
      :taskFields="taskFields" :height="height"
      :tooltipSettings="tooltipSettings">
      <template v-slot:connectorLineTooltipTemplate="{data}">
        <div>Offset : {{data.offsetString}}</div>
      </template>
    </ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
      },
      tooltipSettings: {
        showTooltip: true,
        connectorLine: "connectorLineTooltipTemplate"
      }
    };
  },
},

```

```
};
</script>
```

{% previewsample "page.domainurl/code-snippet/gantt/tooltip-cs5" %}

### Baseline tooltip

A baseline tooltip can be customized using the [tooltipSettings.baseline](#) property. The following code example shows how to customize the baseline tooltip in Gantt.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :renderBaseline="true" :taskFields="taskFields"
      :columns="columns" :treeColumnIndex="1" :includeWeekend="true"
    :timelineSettings="timelineSettings"
      :height="height" :dayWorkingTime="dayWorkingTime"
    :projectStartDate="projectStartDate"
      :projectEndDate="projectEndDate" :tooltipSettings="tooltipSettings"
    baselineColor='red'>
      <template v-slot:baselineTooltipTemplate="{data}">
        <div>Baseline StartDate : {{format(data.BaselineStartDate)}}</div>
      </template>
    </ejs-gantt>
  </div>
</template>
<script>

{% previewsample "page.domainurl/code-snippet/gantt/tooltip-cs7" %}

### Baseline in Vue Gantt component

The baseline feature enables users to view the deviation between the planned dates and actual dates of the tasks in a project. Baseline dates or planned dates of a task may or may not be same as the actual task dates. The baseline can be enabled by setting the [renderBaseline](#) property to `true` and the baseline color can be changed using the [baselineColor](#) property. To render the baseline, you should map the baseline start and end date values from the data source. This can be done using the [baselineStartDate](#) and [baselineEndDate](#) properties. The following code example shows how to enable a baseline in the Gantt component.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:renderBaseline="true" baselineColor='red' :taskFields="taskFields"
:columns="columns" :treeColumnIndex="1" :allowSelection="true"
:includeWeekend="true" :timelineSettings="timelineSettings" :height="height"
:dayWorkingTime="dayWorkingTime" :projectStartDate="projectStartDate"
:projectEndDate="projectEndDate"></ejs-gantt>
  </div>
</template>

```

```

    </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Selection } from "@syncfusion/ej2-vue-gantt";
import { baselineData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: baselineData,
      taskFields: {
        id: 'TaskId',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        baselineStartDate: 'BaselineStartDate',
        baselineEndDate: 'BaselineEndDate'
      },
      columns: [
        { field: 'TaskName', headerText: 'Service Name', width:
'250', clipMode: 'EllipsisWithTooltip' },
        { field: 'BaselineStartDate', headerText: 'Planned start
time' },
        { field: 'BaselineEndDate', headerText: 'Planned end time'
},
        { field: 'StartDate', headerText: 'Start time' },
        { field: 'EndDate', headerText: 'End time' },
      ],
      timelineSettings: {
        timelineUnitSize: 65,
        topTier: {
          unit: 'None',
        },
        bottomTier: {
          unit: 'Minutes',
          count: 15,
          format: 'hh:mm a'
        },
      },
      dateFormat: 'hh:mm a',
      height: '450px',
      dayWorkingTime: [{ from: 1, to: 24 }],
      projectStartDate: new Date('03/05/2018 09:30:00 AM'),
      projectEndDate: new Date('03/05/2018 07:00:00 PM'),
    };
  },
  provide: {
    gantt: [ Selection ]
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/baseline-cs1" %}

## Task labels in Vue Gantt component

### Task labels

The Gantt component maps any data source fields to task labels using the [labelSettings.leftLabel](#), [labelSettings.rightLabel](#), and [labelSettings.taskLabel](#) properties. You can customize the task labels with templates.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:height = "height" :taskFields = "taskFields" :labelSettings="labelSettings"
:projectStartDate="projectStartDate" :projectEndDate="projectEndDate"></ejs-
gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      labelSettings: {
        leftLabel: 'Task ID: ${taskData.TaskID}',
        rightLabel: 'Progress Value: ${taskData.Progress}',
        taskLabel: '${Progress}%'
      },
      projectStartDate: new Date('03/28/2019'),
      projectEndDate: new Date('04/14/2019'),
    };
  },
};
</script>
```

{% previewsample "page.domainurl/code-snippet/gantt/appearance-customization-cs4" %}

## Data markers in Vue Gantt component

Data markers are a set of events used to represent the schedule events for a task. Data markers are defined in data source as array of objects, and this value is mapped to the Gantt control using the [taskFields.indicators](#) property. You can represent more than one data marker in a task.

Data markers can be defined using the following properties:

- [date](#): Defines the date of indicator.
- [iconClass](#): Defines the icon class of indicator.
- [name](#): Defines the name of indicator.
- [tooltip](#): Defines the tooltip of indicator.

Note: Data Marker **tooltip** will be rendered only if tooltip property has value.

The following code example demonstrates how to implement data markers in the Gantt chart.

#### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            {
              TaskID: 2, TaskName: 'Identify Site location',
              StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50,
              Indicators: [
                {
                  'date': '04/08/2019',
                  'iconClass': 'e-btn-icon e-notes-info e-icons e-
icon-left e-gantt e-notes-info::before',
                  'name': 'Custom String',
                  'tooltip': 'Follow up'
                },
                {
                  'date': '04/11/2019',
                  'iconClass': 'e-btn-icon e-notes-info e-icons e-
icon-left e-gantt e-notes-info::before',
                  'name': '<span style="color:red">String
Template</span>',
                }
              ]
            },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
            {
              TaskID: 4, TaskName: 'Soil test approval', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50, },

```

```

    ],
    {
      TaskID: 5,
      TaskName: 'Project Estimation',
      StartDate: new Date('04/02/2019'),
      EndDate: new Date('04/21/2019'),
      subtasks: [
        {
          TaskID: 6, TaskName: 'Develop floor plan for
estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50,
          Indicators: [
            {
              'date': '04/10/2019',
              'iconClass': 'e-btn-icon e-notes-info e-icons e-
icon-left e-gantt e-notes-info::before',
              'name': 'Indicator title',
              'tooltip': 'tooltip'
            }
          ]
        },
        { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
        { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 }
      ]
    },
  ],
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    resourceInfo: 'resources',
    duration: 'Duration',
    progress: 'Progress',
    dependency: 'Predecessor',

    indicators: 'Indicators'
  }
};
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/data-markers-cs1" %}

### Critical path in Vue Gantt component

The critical path in a project is indicated by a single task or a series of tasks. If a task in critical path is delayed, the entire project will be delayed. A task is considered to be critical if any delay to this task would affect the project end date.

The critical path can be enabled in Gantt by using the built-in toolbar button or [enableCriticalPath](#) property.

The following code example shows how to display the critical path in the Gantt control:

**APP.VUE**

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :holidays = "holidays"
    :enableCriticalPath="true" :editSettings="editSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, CriticalPath, Edit, Toolbar } from "@syncfusion/ej2-vue-gantt";
import { projectNewData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: projectNewData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      editSettings: {
        allowAdding: true,
        allowEditing: true,
        allowDeleting: true,
        allowTaskbarEditing: true,
        showDeleteConfirmDialog: true
      },
      toolbar: ['CriticalPath'],
    };
  },
  provide: {
    gantt: [CriticalPath, Edit, Toolbar]
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/criticalpath-cs1" %}

**Customize taskbar in critical path**

The taskbar in critical path can be customized by using [queryTaskbarInfo](#) event and [isCritical](#) property of row [data](#) in the event argument.

The following code example shows how to customize the critical path taskbar in the Gantt control:

**APP.VUE**

```

<template>
  <div>

```

```

<ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height"
:queryTaskbarInfo="queryTaskbarInfo" :holidays = "holidays"
:enableCriticalPath="true" :editSettings="editSettings"></ejs-gantt>
</div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, CriticalPath, Edit, Toolbar } from "@syncfusion/ej2-vue-gantt";
import { projectNewData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: projectNewData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      editSettings: {
        allowAdding: true,
        allowEditing: true,
        allowDeleting: true,
        allowTaskbarEditing: true,
        showDeleteConfirmDialog: true
      },
      toolbar: ['CriticalPath'],
      queryTaskbarInfo: function(args) {
        if ((args.data.isCritical || args.data.slack === '0 day') &&
!args.data.hasChildRecords) {
          args.taskbarBgColor = 'rgb(242, 210, 189)';
          args.progressBarBgColor = 'rgb(201, 169, 166)';
        }
      }
    };
  },
  provide: {
    gantt: [CriticalPath, Edit, Toolbar]
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/customizeCriticalPath-cs1" %}

### Toolbar in Vue Gantt component

The Gantt component provides the toolbar support to handle Gantt actions. The [toolbar](#) property accepts the collection of built-in toolbar items and `ItemModel` objects for custom toolbar items.

To use toolbar feature, inject the `Toolbar` module in the [Link to the Video](#) section.

To learn about Gantt Chart Toolbar Options, you can check on this video:

### Built-in toolbar items

Built-in toolbar items execute standard actions of the Gantt component, and these items can be added to toolbar by defining the [toolbar](#) as a collection of built-in items. It renders the button with icon and text.

The following table shows built-in toolbar items and its actions.

Built-in Toolbar Items   Actions	
----- -----	
ExpandAll	Expands all the rows.
CollapseAll	Collapses all the rows.
Add	Adds a new record.
Edit	Edits the selected record.
Indent	Indent the selected record to one level.
Outdent	Outdent the elected record to one level.
Update	Updates the edited record.
Delete	Deletes the selected record.
Cancel	Cancels the edit state.
Search	Searches the records by the given key.
PrevTimeSpan	Navigate the Gantt timeline to previous time span.
NextTimeSpan	Navigate the Gantt timeline to Next time span.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :toolbar="toolbar"
    :editSettings= "editSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit, Selection, Toolbar } from "@syncfusion/ej2-vue-gantt";
import { projectNewData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: projectNewData,
      height: '450px',

}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/toolbar-cs1" %}

\* The [toolbar](#) has options to define both built-in and custom toolbar items.

#### Custom toolbar items

Custom toolbar items can be added to the toolbar by defining the [toolbar](#) property as a collection of **ItemModels**.

Actions for this customized toolbar items are defined in the [toolbarClick](#) event.

By default, the custom toolbar items are at left position. You can change the position by using the **align** property. In the following sample, the **Quick Filter** toolbar item is positioned at right.

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :toolbarClick="toolbarClick"
    :columns="columns" :toolbar="toolbar" :allowFiltering='true'></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Toolbar, Filter } from "@syncfusion/ej2-vue-gantt";
import { ClickEventArgs } from "@syncfusion/ej2-navigations";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
    }
  }
}

```

```

        taskFields: {
            id: 'TaskID',
            name: 'TaskName',
            startDate: 'StartDate',
            endDate: 'EndDate',
            duration: 'Duration',
            progress: 'Progress',
            dependency: 'Predecessor',
            child: 'subtasks'
        },
        columns: [
            { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
            { field: 'TaskName', headerText: 'Task Name', width: '250' },
            { field: 'StartDate', headerText: 'Start Date', width: '150' },
            { field: 'Duration', headerText: 'Duration', width: '150' },
            { field: 'Progress', headerText: 'Progress', width: '150' }
        ],
        toolbarClick: (args: ClickEventArgs) => {
            if (args.item.id === 'toolbarfilter') {
                var ganttObj =
document.getElementById('GanttContainer').ej2_instances[0];
                ganttObj.filterByColumn('TaskName', 'startswith',
'Identify');
            }
        },
        toolbar: [{text: 'Quick Filter', tooltipText: 'Quick Filter',

    .e-quickfilter::before {
        content: '\e7ee';
    }
</style>

```

{% previewsample "page.domainurl/code-snippet/gantt/toolbar-cs2" %}

\* The [toolbar](#) has options to define both built-in and custom toolbar items.

\* If a toolbar item does not match the built-in items, it will be treated as a custom toolbar item.

#### Built-in and custom items in toolbar

The Gantt component has an option to use both built-in and custom toolbar items at the same time.

In the following example, the **ExpandAll** and **CollapseAll** are built-in toolbar items and **Test** is the custom toolbar item.

#### APP.VUE

```

<template>
  <div>

```

```

<ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :columns="columns"
:toolbarClick="toolbarClick" :toolbar="toolbar"
:allowFiltering='true'></ejs-gantt>
</div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Toolbar, Filter } from "@syncfusion/ej2-vue-gantt";
import { EmitType } from '@syncfusion/ej2-base';
import { ClickEventArgs } from '@syncfusion/ej2-navigations';
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
      },
      columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '250' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Duration', headerText: 'Duration', width: '150' },
        { field: 'Progress', headerText: 'Progress', width: '150' },
      ],
      toolbarClick: (args: ClickEventArgs) => {
        if (args.item.text === 'Click') {
          alert("Custom toolbar click...");
        }
      },
      toolbar: ['ExpandAll', 'CollapseAll', { text: 'Click',
tooltipText: 'Click',id: 'Click' }],
    };
  },
  provide: {
    gantt: [ Toolbar, Filter ]
  },
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/toolbar-cs3" %}

### Enable/disable toolbar items

You can enable or disable the toolbar items by using the `enableItems` method.

**APP.VUE**

```

<template>
  <div>
    <ejs-button id="enable" cssClass="e-info" v-
on:click.native="enable">Enable</ejs-button>
    <ejs-button id="disable" cssClass="e-info" v-
on:click.native="disable">Disable</ejs-button>
    <br>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :toolbar="toolbar"
:toolbarClick="toolbarClick" :allowFiltering='true'></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Toolbar, Filter } from "@syncfusion/ej2-vue-gantt";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { ClickEventArgs } from '@syncfusion/ej2-navigations';
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
      },
      toolbar: ['QuickFilter', 'ClearFilter'],
      toolbarClick: (args: ClickEventArgs) => {
        if (args.item.text === 'QuickFilter') {
          var ganttChart =
document.getElementById('GanttContainer').ej2_instances[0];
          ganttChart.filterByColumn('TaskName', 'startswith',
'Identify');
        }
        if (args.item.text === 'ClearFilter') {
          var ganttChart =
document.getElementById('GanttContainer').ej2_instances[0];
          ganttChart.clearFiltering();
        }
      },
    };
  },
  provide: {
    gantt: [ Toolbar, Filter ]
  },
  methods: {

```

```

        enable: function(e) {
            var ganttChart =
document.getElementById('GanttContainer').ej2_instances[0];
            ganttChart.toolbarModule.enableItems([ganttChart.element.id +
'_QuickFilter', ganttChart.element.id + '_ClearFilter'], true); // enable
toolbar items.
        },
        disable: function(e) {
            var ganttChart =
document.getElementById('GanttContainer').ej2_instances[0];
            ganttChart.toolbarModule.enableItems([ganttChart.element.id +
'_QuickFilter', ganttChart.element.id + '_ClearFilter'], false); // disable
toolbar items.
        },
    },
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/toolbar-cs4" %}

### Add input elements in toolbar

In the Gantt toolbar, you can add EJ2 editor elements like numeric text box, drop-down list, and date picker controls. The following code snippets demonstrates how to add EJ2 editors to the Gantt toolbar.

### APP.VUE

```

<template>
  <div>
    <ejs-numerictextbox id="inputEle" format='c2' value='1'
width='150'></ejs-numerictextbox>
    <br>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Toolbar } from "@syncfusion/ej2-vue-gantt";
import { NumericTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
import { projectNewData } from './data-source.js';
Vue.use(GanttPlugin);
Vue.use(NumericTextBoxPlugin);
export default {
  data: function() {
    return{
      data: projectNewData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
      }
    }
  }
}

```

```

    },
    };
  },
  provide: {
    gantt: [Toolbar ]
  }
};
</script>

```

```
{% previewsample "page.domainurl/code-snippet/gantt/toolbar-cs5" %}
```

## Managing Tasks

### Managing tasks in Vue Gantt component

The Gantt component has options to dynamically insert, delete, and update tasks in the project. The primary key column is necessary to manage the tasks and perform CRUD operations in Gantt. To define the primary key, set the [columns.isPrimaryKey](#) property to **true** in the particular column.

To use CRUD, inject the [Edit](#) module in the **provide** section.

**Note:** If the [Edit](#) module is not injected, you cannot edit the tasks through the TreeGrid cells.

The following code example demonstrates how to enable cell editing in the Gantt component.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :columns = "columns"
    :editSettings= "editSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
              StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,

```

```

        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate:
new Date('04/04/2019'), Duration: 3, Progress: 50 }
        ]
    },
],
height: '450px',
taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    endDate: 'EndDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
},
columns: [
    { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
    { field: 'TaskName', headerText: 'Task Name', width: '250'
},
    { field: 'StartDate', headerText: 'Start Date', width: '150'
},
    { field: 'Duration', headerText: 'Duration', width: '150' },
    { field: 'Progress', headerText: 'Progress', width: '150' },
],
editSettings: {
    allowEditing: true,
    mode: "Auto"
},
];
},
provide: {
    gantt: [ Edit ]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/managing-tasks-cs11" %}

**Note:** When the edit mode is set to **Auto**, on performing double-click action on TreeGrid side, the cells will be changed to editable mode and on performing double-click action on chart side, the edit dialog will appear for editing the task details.

*Cell edit type and its params*

The [columns.editType](#) is used to define the edit type for any particular column.

You can set the [columns.editType](#) based on data type of the column.

- **numericedit** - [NumericTextBox](#) component for integers, double, and decimal data types.
- **defaultedit** - [TextBox](#) component for string data type.
- **dropdownedit** - [DropDownList](#) component to show all unique values related to that field.
- **booleanedit** - [CheckBox](#) component for boolean data type.
- **datepickeredit** - [DatePicker](#) component for date data type.
- **datetimepickeredit** - [DateTimePicker](#) component for date time data type.

Also, you can customize the behavior of the editor component through the [columns.edit.params](#).

The following table describes cell edit type component and their corresponding edit params of the column.

Edit Type | Component | Example

[Cell editing](#) | To perform **double tap** on a specific cell, initiate the cell to be in edit state.

[Dialog editing](#) | To perform **double tap** on a specific row, initiate the edit dialog to be opened.

[Taskbar editing](#) | Taskbar editing action is initiated using the **tap** action on the taskbar. **Parent taskbar** : Once you tap on the parent taskbar, it will be changed to editing state. Perform only dragging

action on parent taskbar editing. **Child taskbar**

: Once you tap the child taskbar, it will be changed to editing state.

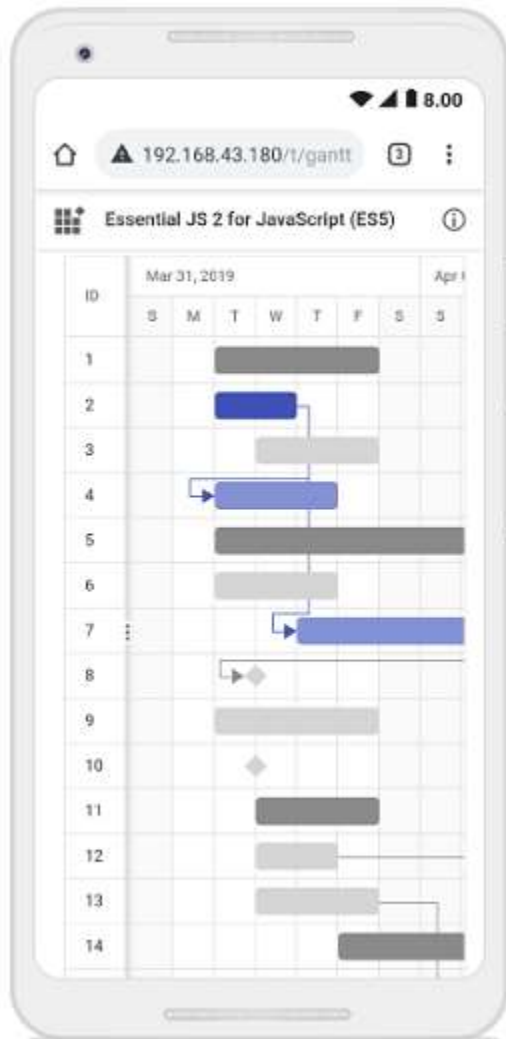

**Dragging taskbar** : To drag a taskbar to the

left or right in editing state. **Resizing taskbar** : To resize a taskbar, drag the left/right resize icon. **Progress resizing** : To change the progress, drag the progress resize icon to the left or right direction.

[Task dependency editing](#)

You can **tap** the left/right connector point to initiate [task dependencies](#) edit mode and again tap another taskbar to establish the dependency line between two taskbars.

The following table explains the taskbar state in dependency edit mode.

Taskbar state | Description

Parent taskbar | You cannot create dependency relationship to parent tasks. <br>

Taskbar without dependency | If you tap a valid child taskbar, it will create FS type dependency line between tasks, otherwise exits from task dependency edit mode. <br>

Taskbar with dependency | If you tap the second taskbar, which has already been directly connected,

it will ask to remove it. <br>

**Removing dependency** | Once you tap the taskbar with direct dependency, then confirmation dialog will be shown for removing dependency. <br>

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :editSettings= "editSettings"
:load= "load"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit, Selection } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
StartDate: new Date('04/02/2019'), Duration: 3, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
new Date('04/02/2019'), Duration: 4,Predecessor:"2FS", Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
```

```

        { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
        { TaskID: 8, TaskName: 'Estimation approval', StartDate:
new Date('04/04/2019'), Duration: 4, Predecessor: "6SS", Progress: 50 }
    ]
  },
],
height: '450px',
taskFields: {
  id: 'TaskID',
  name: 'TaskName',
  startDate: 'StartDate',
  duration: 'Duration',
  progress: 'Progress',
  dependency: 'Predecessor',
  child: 'subtasks'
},
editSettings: {
  allowTaskbarEditing: true
},
load: function() {
  var ganttObj =
document.getElementById('GanttContainer').ej2_instances[0];
  ganttObj.isAdaptive = true; // Forcing desktop layout to
change as mobile layout
}
};
},
provide: {
  gantt: [ Edit, Selection ]
}
};
</script>
<style>
@import '../node_modules/@syncfusion/ej2-vue-gantt/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/gantt/touch-cs1" %}

Note: In mobile device, you cannot create dependency other than **FS** by taskbar editing. By using cell/dialog editing, you can add all type of dependencies.

#### Taskbar editing tooltip

The taskbar editing tooltip can be customized using the [tooltipSettings.editing](#) property. The following code example shows how to customize the taskbar editing tooltip in Gantt.

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' :dataSource='data' id='GanttContainer'
:taskFields='taskFields' :height='height'
:editSettings='editSettings' :tooltipSettings='tooltipSettings'>
      <template v-slot:editingTooltipTemplate='{data}'>
        <div>Duration : {{data.duration}}</div>
      </template>
    </div>
  </div>

```

```

    </ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        baselineStartDate: "BaselineStartDate",
        baselineEndDate: "BaselineEndDate",
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
      },
      editSettings: {
        allowEditing: true,
        allowTaskbarEditing: true
      },
      tooltipSettings: {
        showTooltip: true,
        editing: "editingTooltipTemplate"
      },
    };
  },
  provide: {
    gantt: [ Edit ]
  },
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/tooltip-cs6" %}

### Adding new tasks in Vue Gantt component

Tasks can be dynamically added to the Gantt project by enabling the [editSettings.allowAdding](#) property.

#### Toolbar

A row can be added to the Gantt component from the toolbar while the [editSettings.allowAdding](#) property is set to `true`. On clicking the toolbar add icon, you should provide the task information in the add dialog.

### APP.VUE

```

<template>
  <div>

```

```

    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :toolbar="toolbar"
:editSettings= "editSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit, Toolbar } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate:
new Date('04/04/2019'), Duration: 3, Progress: 50 }
          ]
        },
      ],
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      editSettings:{
        allowAdding:true
      },
      toolbar: ['Add']
    };
  },
};

```

```

    provide: {
      gantt: [ Edit, Toolbar ]
    }
  };
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/managing-tasks-cs1" %}

By default, the new row will be added to the top most row in the Gantt component.

### Context menu

A row can also be added above, below or child of the selected row by using context menu support. For this, we need to enable the property [enableContextMenu](#) and inject the [ContextMenu](#) module into the Gantt control.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="contextMenu" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :editSettings="editSettings"
    :toolbar="toolbar" :enableContextMenu="true" :allowSorting="true"
    :allowResizing= "true"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, ContextMenu, Edit, Toolbar, Selection } from
"@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
      },
      editSettings: {
        allowAdding: true
      },
      toolbar: ['Add']
    };
  },
  provide: {
    gantt: [ ContextMenu, Edit, Toolbar, Selection]
  }
};
</script>

```

```
{% previewsample "page.domainurl/code-snippet/gantt/managing-tasks-cs2" %}
```

### Using method

You can add rows to the Gantt component dynamically using the [addRecord](#) method and you can define the add position of the default new record by using the [rowPosition](#) property. You can also pass the `rowIndex` as an additional parameter.

- Top of all the rows
- Bottom to all the existing rows
- Above the selected row
- Below the selected row
- As child to the selected row

### APP.VUE

```
<template>
  <div>
    <ejs-button id="addRow" cssClass="e-info" v-
on:click.native="add">Add Row</ejs-button>
    <br><br><br>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :editSettings=
"editSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit } from "@syncfusion/ej2-vue-gantt";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";

            TaskName: 'Identify Site location',
            StartDate: new Date('04/02/2019'),
            Duration: 3,
            Progress: 50
        };
        ganttObj.editModule.addRecord(record, 'Below', 2);
    }
},
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/managing-tasks-cs3" %}

### Editing tasks in Vue Gantt component

The editing feature can be enabled in the Gantt component by enabling the [editSettings.allowEditing](#) and [Link to the Video](#) properties.

The following editing options are available to update the tasks in Gantt,

- Cell
- Dialog
- Taskbar
- Connector line

To get start quickly with Gantt Chart Editing Options, you can check on this video:

#### Cell editing

By setting the edit mode to auto using the [mode](#) property, the tasks can be edited through TreeGrid cells by double-clicking.

**Note:** If the [Edit](#) module is not injected, you cannot edit the tasks through the TreeGrid cells.

The following code example demonstrates how to enable cell editing in the Gantt component.

#### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :columns = "columns"
:editSettings= "editSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
```

```

        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate:
new Date('04/04/2019'), Duration: 3, Progress: 50 }
        ]
    },
    ],
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '250'
},
        { field: 'StartDate', headerText: 'Start Date', width: '150'
},
        { field: 'Duration', headerText: 'Duration', width: '150' },
        { field: 'Progress', headerText: 'Progress', width: '150' },
    ],
    editSettings: {
        allowEditing: true,
        mode: "Auto"
    },
    };
    },
    provide: {
        gantt: [ Edit ]
    }
    };
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/managing-tasks-cs6" %}

**Note:** When the edit mode is set to **Auto**, on performing double-click action on TreeGrid side, the cells will be changed to editable mode and on performing double-click action on chart side, the edit dialog will appear for editing the task details.

#### Dialog editing

Modify the task details through the edit dialog by setting the edit [mode](#) property as **Dialog**.

#### APP.VUE

```

<template>
  <div>

```

```

    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :columns = "columns"
:editSettings= "editSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";

{% previewsample "page.domainurl/code-snippet/gantt/managing-tasks-cs9" %}

**Note:** You can also define the custom fields in the add/edit dialog General tab using the [fields](#) property.

### Task dependencies

In the Gantt component, you can update the dependencies between the tasks and link the tasks interactively. The task dependencies can be mapped from the data source using the [dependency](#) property.

You can update the task dependencies using the following ways:

- Mouse interactions: Using connector points in the taskbar, you can perform drag and drop action to create task dependency links.
- Edit dialog: Create or remove the task dependencies using the **Dependency** tab in the edit dialog.
- Cell editing: Create or remove the task links using cell editing.

The following code example demonstrates how to enable task dependency editing in the Gantt chart using the [editSettings](#) property.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"

### Updating with Dialog

**Note:** When the edit mode is set to **Auto**, on performing double-click action on TreeGrid side, the cells will be changed to editable mode and on performing double-click action on chart side, the edit dialog will appear for editing the task details.

#### Update task values using method

The tasks value can be dynamically updated by using the [updateRecordById](#) method. You can call this method on any custom action. The following code example shows how to use this method to update a task.

### APP.VUE

```

<template>
  <div>
    <ejs-button id="updateRecord" cssClass="e-info" v-
on:click.native="update">update</ejs-button>
    <br><br>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :editSettings=
"editSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit } from "@syncfusion/ej2-vue-gantt";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(GanttPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {

```

```

return{
  data: [
    {
      TaskID: 1,
      TaskName: 'Project Initiation',
      StartDate: new Date('04/02/2019'),
      EndDate: new Date('04/21/2019'),
      subtasks: [
        { TaskID: 2, TaskName: 'Identify Site location',
StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
        { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
        { TaskID: 4, TaskName: 'Soil test approval', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
      ]
    },
    {
      TaskID: 5,
      TaskName: 'Project Estimation',
      StartDate: new Date('04/02/2019'),
      EndDate: new Date('04/21/2019'),
      subtasks: [
        { TaskID: 6, TaskName: 'Develop floor plan for
estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
        { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
        { TaskID: 8, TaskName: 'Estimation approval', StartDate:
new Date('04/04/2019'), Duration: 3, Progress: 50 }
      ]
    },
  ],
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    endDate: 'EndDate',
    duration: 'Duration',
    progress: 'Progress',
    dependency: 'Predecessor',
    child: 'subtasks'
  },
  editSettings: {
    allowEditing: true
  },
};

},
provide: {
  gantt: [ Edit ]
},
methods: {
  update: function(e){
    var ganttObj =
document.getElementById('GanttContainer').ej2_instances[0];
    var data = {
      TaskID: 3,
      TaskName: 'Updated by index value',

```

```

        StartDate: new Date('04/03/2019'),
        Duration: 4,
        Progress: 50,
    };
    ganttObj.updateRecordByID(data);
},
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/managing-tasks-cs18" %}

NOTE: Using the [updateRecordById](#) method, you cannot update the task ID value.

### Deleting tasks in Vue Gantt component

#### Deleting tasks

A task delete option in the Gantt component can be enabled by enabling the [editSettings.allowDeleting](#) property. Tasks can be deleted by clicking the delete toolbar item or using the `deleteRow` method. You can call this method dynamically on any custom actions like button click. The following code example shows how to enable the delete option in the Gantt component.

#### APP.VUE

```

<template>
  <div>
    <ejs-button id="deleteRecord" cssClass="e-info" v-
on:click.native="update">delete</ejs-button>
    <br><br>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :columns = "columns"
:editSettings= "editSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit, Selection } from "@syncfusion/ej2-vue-gantt";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(GanttPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        }
      ]
    }
  }
}

```

```

    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate:
new Date('04/04/2019'), Duration: 3, Progress: 50 }
        ]
    },
],
height: '450px',
taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    endDate: 'EndDate',
    duration: 'Duration',
    progress: 'Progress',
    dependency: 'Predecessor',
    child: 'subtasks'
},
columns: [
    { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
    { field: 'TaskName', headerText: 'Task Name', width: '250'
},
    { field: 'StartDate', headerText: 'Start Date', width: '150'
},
    { field: 'Duration', headerText: 'Duration', width: '150' },
    { field: 'Progress', headerText: 'Progress', width: '150' },
],
editSettings: {
    allowDeleting: true,
    showDeleteConfirmDialog: true
},
};
},
provide: {
    gantt: [ Edit, Selection ]
},
methods: {
    update: function(e){
        var ganttObj =
document.getElementById('GanttContainer').ej2_instances[0];
        ganttObj.editSettings.showDeleteConfirmDialog = true ;
        ganttObj.editModule.deleteRow();
    },
}
};
</script>

```

```
{% previewsample "page.domainurl/code-snippet/gantt/managing-tasks-cs4" %}
```

NOTE: You should select any one of the rows in the Gantt component to perform task delete action.

You should set the [editSettings.allowDeleting](#) value to `true` to delete the record dynamically.

#### *Delete confirmation message*

Delete confirmation message is used to get the confirmation from users before deleting a task. This confirmation message can be enabled by setting the [editSettings.showDeleteConfirmDialog](#) property to `true`.

The following code snippet explains how to enable the delete confirmation message in Gantt.

#### **APP.VUE**

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :toolbar="toolbar" :columns =
    "columns" :editSettings= "editSettings"></ejs-gantt>
  </div>
</template>
<script>

{% previewsample "page.domainurl/code-snippet/gantt/managing-tasks-cs5" %}

### Task bar editing in Vue Gantt component

#### Taskbar editing

Modify the task details through user interaction such as resizing and dragging the taskbar by enabling the [allowTaskbarEditing](#) property.

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :columns = "columns"
:editSettings= "editSettings"></ejs-gantt>
  </div>
</template>
<script>

```

```

import Vue from "vue";
import { GanttPlugin, Edit } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate:
new Date('04/04/2019'), Duration: 3, Progress: 50 }
          ]
        }
      ],
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',

        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '250' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Duration', headerText: 'Duration', width: '150' },
        { field: 'Progress', headerText: 'Progress', width: '150' },
      ],
      editSettings: {

```

```

        allowTaskbarEditing:true
    },
    };
    },
    provide: {
        gantt: [ Edit ]
    }
    };
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/managing-tasks-cs15" %}

### Prevent editing for specific tasks

On taskbar edit action, the [taskbarEditing](#) event will be triggered. You can prevent the taskbar from editing using the [taskbarEditing](#) event. This can be done by setting cancel property of [taskbarEditing](#) event argument to true. And we can hide the taskbar editing indicators like taskbar resizer, progress resizer and connector points by using [queryTaskbarInfo](#) event. The following code example shows how to achieve this.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
      :taskFields = "taskFields" :height = "height"
      :taskbarEditing="taskbarEditing" :columns = "columns" :editSettings=
      "editSettings" :queryTaskbarInfo = "queryTaskbarInfo"></ejs-gantt>
    </div>
  </template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
              StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',

### In dent and out dent in Vue Gantt component

Indent and Outdent of a task are used to update the level of the task in hierarchical order of the task. It can be performed by enabling the ['editSettings.allowEditing'](#) property.

**Indent** - Selected task can be indented to the level of task to the hierarchical order. It can be performed by using in-built context menu or toolbar items. It can also be invoked by using the `indent` method dynamically on any action like external button click. The following code example shows how to enable indent option in the Gantt chart.

**Outdent** - Selected task can be outdented to the level of task from the hierarchical order. It can be performed by using in-built context menu or toolbar items. It can also be invoked by using the `outdent` method dynamically on any action like external button click. The following code example shows how to enable outdent option in the Gantt chart.

Splitting and merging tasks in Vue Gantt component

*Splitting task at load time*

To split task at load time, we can define segment details in both hierarchical and self-referential way.

Refer below link for more details.

- [Split task at load time](#)

*Split task dynamically*

The task can be split dynamically, either by using the context menu or dialog.

- **Dialog:** Segments tab is rendered in add/edit dialog, when the [taskFields.segments](#) or [taskFields.segmentId](#) property is mapped. Using this tab, we can split the task based on the original start and end date of a particular task.
- **Context menu:** When the [taskFields.segments](#) or [taskFields.segmentId](#) property is mapped and the [enableContextMenu](#) property is enabled, **Split Task** item will be included in the context menu.

## APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :editSettings= "editSettings"
    :toolbar="toolbar" :enableContextMenu="true"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, ContextMenu, Edit, Selection, Toolbar } from
"@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50,
              Segments: [

```

```

        { StartDate: new Date("04/02/2019"), Duration: 2 },
        { StartDate: new Date("04/04/2019"), Duration: 2 }
    ] },
    { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
    { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
    ]
},
{
    TaskID: 5,
    TaskName: 'Project Estimation',
    StartDate: new Date('04/02/2019'),
    EndDate: new Date('04/21/2019'),
    subtasks: [
        { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
        { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
        { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 }
    ]
}
],

    gantt: [ ContextMenu, Edit, Selection, Toolbar ]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/managing-tasks-cs14" %}

### Merge tasks

The split tasks can be merged either by using the **Merge Task** item of the Context menu or by using the dialog. We can also merge the tasks, by simply dragging the segments together in the UI.

### Limitations of Split tasks

1. Parent and milestone tasks cannot be split into segments.
2. The task must have a width greater than the timeline unit cell in order to be split.
3. Split task is not supported in the **Resource view**.

### Maintaining data in server in Vue Gantt component

All the modified data in Gantt control can be maintained in the database using RESTful web services.

All the CRUD operations in the gantt are done through DataManager. The DataManager has an option to bind all the CRUD related data in server-side.

In the below section, we have explained how to get the edited data details on the server-side using the **UrlAdaptor**.

### URL Adaptor

In Gantt, we can fetch data from SQL database using **ADO.NET** Entity Data Model and update the changes on CRUD action to the server by using **DataManager** support. To communicate with the remote data we are using **UrlAdaptor** of **DataManager** property to call the server method and get back resultant data in JSON format. We can know more about **UrlAdaptor** from [here](#).

Please refer the [link](#) to create the **ADO.NET** Entity Data Model in Visual studio,

We can define data source for Gantt as instance of **DataManager** using **url** property of **DataManager**. Please Check the below code snippet to assign data source to Gantt.

```
<template>
<div>
<ejs-gantt ref='gantt' :dataSource="data" id="GanttContainer" :taskFields = "taskFields" :height =
"height"></ejs-gantt>
</div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
Vue.use(GanttPlugin);
export default {
data: function() {
return{
data: new DataManager({
url: '/Home/UrlDatasource',
```

```

adaptor: new UrlAdaptor
}},
height: '450px',
taskFields: {
id: 'TaskId',
name: 'TaskName',
startDate: 'StartDate',
progress: 'Progress',
duration: 'Duration',
dependency: 'Predecessor',
child: 'SubTasks'
}
};
},
};
</script>
`ts
GanttDataSourceEntities db = new GanttDataSourceEntities();
public ActionResult UrlDatasource(DataManagerRequest dm)
{
List<GanttData>DataList = db.GanttDatas.ToList();
var count = DataList.Count();
return Json(new { result = DataList, count = count });
}
`

```

We can also do CRUD operations over Gantt data and save the changes to database. By using **BatchUrl** property of **DataManager**, we can communicate with the controller method to update the data source on CRUD operation. In gantt CRUD actions on task are dependent with other tasks. For example on editing the child record on chart side, corresponding parent item also will get affect and predecessor dependency task as well get affected. So in Gantt all the CRUD operations are considered to be batch editing where you will get all the affected records as collection. Please check the below code snippet to assign controller method to this property.

```
<template>
```

```
<div>

<ejs-gantt ref='gantt' :dataSource="data" id="GanttContainer" :taskFields = "taskFields" :height =
"height"></ejs-gantt>

</div>

</template>

<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: new DataManager({
        url: '/Home/UrlDatasource',
        adaptor: new UrlAdaptor,
        batchUrl: "Home/BatchSave"
      }),
      height: '450px',
      taskFields: {
        id: 'TaskId',
        name: 'TaskName',
        startDate: 'StartDate',
        progress: 'Progress',
        duration: 'Duration',
        dependency: 'Predecessor',
        child: 'SubTasks'
      }
    };
  },
};
</script>
`
```

```

`ts
public class ICRUDModel<T> where T : class
{
    public object key { get; set; }
    public T value { get; set; }
    public List<T> added { get; set; }
    public List<T> changed { get; set; }
    public List<T> deleted { get; set; }
}

public ActionResult BatchSave([FromBody]ICRUDModel<GanttData> data)
{
    List<GanttData> uAdded = new List<GanttData>();
    List<GanttData> uChanged = new List<GanttData>();
    List<GanttData> uDeleted = new List<GanttData>();
    //...
    return Json(new { addedRecords = uAdded, changedRecords = uChanged, deletedRecords = uDeleted });
}
`

```

This server method will be triggered for all the CRUD operations like adding, editing and deleting actions. We can handle those each operations separately inside this method with corresponding data received in this method argument. Also, when using the `UrlAdaptor`, you need to return the data as JSON from the controller action and the JSON object must contain a property as `result` with `dataSource` as its value and one more property `count` with the `dataSource` total records count as its value.

#### *Insert action*

Using the `added` argument of the `BatchUrl` method we can insert the newly added row to database and return the same to client side. please find the below code example for details.

```

`ts
GanttDataSourceEntities db = new GanttDataSourceEntities();

public ActionResult BatchSave([FromBody]ICRUDModel<GanttData> data)
{
    List<GanttData> uAdded = new List<GanttData>();
    //Performing insert operation
    if (data.added != null && data.added.Count() > 0)
    {
        foreach (var rec in data.added)

```

```

{
    uAdded.Add(this.Create(rec));
}
}

return Json(new { addedRecords = uAdded });
//...
}

public GanttData Create(GanttData value)
{
    db.GanttDatas.Add(value);
    db.SaveChanges();
    return value;
}

```

#### *Editing action*

Using the `changed` argument of the `BatchUrl` method we can update the modified records to database and return the same to client side. please find the below code example for details.

```

`ts

GanttDataSourceEntities db = new GanttDataSourceEntities();

public ActionResult BatchSave([FromBody]ICRUDModel<GanttData> data)
{
    List<GanttData> uChanged = new List<GanttData>();
    //Performing update operation
    if (data.changed != null && data.changed.Count() > 0)
    {
        foreach (var rec in data.changed)
        {
            uChanged.Add(this.Edit(rec));
        }
    }

    return Json(new { changedRecords = uChanged });
    //...
}

public GanttData Edit(GanttData value)

```

```

{
    GanttData result = db.GanttDatas.Where(currentData => currentData.TaskId ==
    value.TaskId).FirstOrDefault();
    if (result != null)
    {
        result.TaskId = value.TaskId;
        result.TaskName = value.TaskName;
        result.StartDate = value.StartDate;
        result.EndDate = value.EndDate;
        result.Duration = value.Duration;
        result.Progress = value.Progress;
        result.Predecessor = value.Predecessor;
        db.SaveChanges();
        return result;
    }
    else
    {
        return null;
    }
}
`ts

```

#### Delete action

Using the `deleted` argument of the `BatchUrl` method we can remove the deleted records from database and return the same to client side. on deleting the record we need to remove its corresponding child records as well if it exist from the data base. please find the below code example for details.

```

`ts
GanttDataSourceEntities db = new GanttDataSourceEntities();
public ActionResult BatchSave([FromBody]ICRUDModel<GanttData> data)
{
    List<GanttData> uDeleted = new List<GanttData>();
    //Performing delete operation
    if (data.deleted != null && data.deleted.Count() > 0)
    {
        foreach (var rec in data.deleted)

```

```

{
    uDeleted.Add(this.Delete(rec.TaskId));
}
}

return Json(new { deletedRecords = uDeleted });
}

public GanttData Delete(string value)
{
    var result = db.GanttDatas.Where(currentData => currentData.TaskId == value).FirstOrDefault();
    db.GanttDatas.Remove(result);
    RemoveChildRecords(value);
    db.SaveChanges();
    return result;
}

public void RemoveChildRecords(string key)
{
    var childList = db.GanttDatas.Where(x => x.ParentId == key).ToList();
    foreach (var item in childList)
    {
        db.GanttDatas.Remove(item);
        RemoveChildRecords(item.TaskId);
    }
}
,

```

## Validation in Vue Gantt control

### Column validation

Column validation validates the editing and adding data and it display errors for invalid fields before saving data. This is effective in both inline and dialog editing.

Gantt uses [Form Validator](#) component for column validation. You can set [validation rules](#) by defining the [columns.validationRules](#). The value cannot be saved unless the validation rule get satisfied.

### APP.VUE

{% previewsample "page.domainurl/code-snippet/gantt/managing-tasks-cs22" %}

#### Custom validation

You can define your own custom validation rules for the specific columns by using callback function to it's [validation rule](#).

In the below demo, custom validation applied for **TaskName** column.

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :toolbar= "toolbar" :columns =
"columns" :editSettings= "editSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit, Selection, Toolbar } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [

```

```

        { TaskID: 2, TaskName: 'Identify Site location',
StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
        { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
        { TaskID: 4, TaskName: 'Soil test approval', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
    ]
},
{
    TaskID: 5,
    TaskName: 'Project Estimation',
    StartDate: new Date('04/02/2019'),
    EndDate: new Date('04/21/2019'),
    subtasks: [
        { TaskID: 6, TaskName: 'Develop floor plan for
estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
        { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
        { TaskID: 8, TaskName: 'Estimation approval', StartDate:
new Date('04/04/2019'), Duration: 3, Progress: 50 }
    ]
},
],
height: '450px',
taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    endDate: 'EndDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
},
columns: [
    { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
    { field: 'TaskName', headerText: 'Task Name', width: '250',
validationRules: { required: true, minLength: [(args) => {return
args['value'].length <= 8;}, 'Value should be within 8 letters'] } },
    { field: 'StartDate', editType: 'datetimepickeredit', edit: {
params: { format: 'M/d/y hh:mm a' } },
format: { format: 'M/d/y hh:mm a', type: 'dateTime' },
validationRules: { required: true, date: true } },
    { field: 'Duration', headerText: 'Duration', width: '150',
validationRules: { required: true } },
    { field: 'Progress', headerText: 'Progress', width: '150',
validationRules: { required: true } },
],
toolbar: ['Add', 'Edit', 'Update', 'Delete', 'Cancel'],
editSettings: {
    allowAdding: true,
    allowEditing: true,
    allowDeleting: true,
    allowTaskbarEditing: true,
    showDeleteConfirmDialog: true
},
};

```

```

    },
    provide: {
      gantt: [ Edit, Selection, Toolbar ]
    }
  };
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/managing-tasks-cs23" %}

#### Dependency and resource grid validation

Validation rules can also be implemented for the dependency and resource grid in the add or edit dialog by employing the event [actionBegin](#).

Within the actionBegin event, validationRules can be configured for columns in the grid of the dependency and resource tabs using the requestType `beforeOpenEditDialog` or `beforeOpenAddDialog`.

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
      :taskFields= "taskFields" :height= "height" :toolbar= "toolbar"

</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/managing-tasks-cs24" %}

### Scrolling in Vue Gantt component

The scrollbar will be displayed in the gantt when content exceeds the element **width** or **height**. The vertical and horizontal scrollbars will be displayed based on the following criteria:

- The vertical scrollbar appears when the total height of rows present in the gantt exceeds its element height.
- The horizontal scrollbar appears when the sum of columns width exceeds the grid pane size.
- The [height](#) and [width](#) are used to set the gantt height and width, respectively.

The default value for **height** and **width** is **auto**.

### Set width and height

We can even set pixel values to width and height of gantt container using [width](#) and [height](#) properties.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :width = "width"
:editSettings="editSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit } from "@syncfusion/ej2-vue-gantt";
import { projectNewData } from './data-source.js';
Vue.use(GanttPlugin);
export default {

```

```

data: function() {
  return{
    data: projectNewData,
    height: '350px',
    width: '600px',
    taskFields: {
      id: 'TaskID',
      name: 'TaskName',
      startDate: 'StartDate',
      duration: 'Duration',
      progress: 'Progress',
      child: 'subtasks'
    },
    editSettings: {
      allowAdding: true,
      allowEditing: true,
      allowDeleting: true,
      allowTaskbarEditing: true,
      showDeleteConfirmDialog: true
    },
  };
},
provide: {
  gantt: [Edit]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/scrolling-cs1" %}

### Responsive with the parent container

Specify the [width](#) and [height](#) as **100%** to make the gantt element fill its parent container.

Setting the **height** to **100%** requires the gantt parent element to have explicit height. Also, the component will be responsive when the parent container is resized.

### APP.VUE

```

<template>
  <div>
    <p class="e-text"> The parent container can be resizable by dragging the
    bottom-right corner.</p>
    <div class='e-ganttresize'>
      <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
      :taskFields = "taskFields" :height = "height" :width = "width"
      :editSettings="editSettings"></ejs-gantt>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit } from "@syncfusion/ej2-vue-gantt";
import { projectNewData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {

```

```

    return{
      data: projectNewData,
      height: '100%',
      width: '100%',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      editSettings: {
        allowAdding: true,
        allowEditing: true,
        allowDeleting: true,
        allowTaskbarEditing: true,
        showDeleteConfirmDialog: true
      },
    };
  },
  provide: {
    gantt: [Edit]
  }
};
</script>
<style>
.e-ganttresize {
  resize: both;
  overflow: auto;
  border: 1px solid red;
  padding: 10px;
  height: 300px;
  min-height: 250px;
  min-width: 250px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/gantt/scrolling-cs2" %}

### Scroll To Date method

In the Gantt control, When We use the [scrollToDate](#) method, it will scroll the timeline horizontally to the date that we specified in the method's argument.

The following code examples show how the scroll To Date method works in Gantt:

### APP.VUE

```

<template>
  <div>
    <ejs-button id="scrolldate" cssClass="e-info" v-
on:click.native="change">Scroll To Date</ejs-button>
    <ejs-gantt id="GanttContainer" :dataSource="data" :taskFields =
"taskFields" :height = "height" :splitterSettings="splitterSettings"></ejs-
gantt>
    <br><br><br>
  </div>
</template>

```

```

    </div>
  </template>
  <script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { projectNewData } from './data-source.js';
Vue.use(GanttPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return {
      data: projectNewData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      splitterSettings: {
        position: "50%"
      }
    };
  },
  methods: {
    changep: function(e) {
      var ganttChart =
document.getElementById('GanttContainer').ej2_instances[0];
      ganttChart.scrollToDate('04/26/2019');
    }
  }
};
  </script>

```

{% previewsample "page.domainurl/code-snippet/gantt/how-to/scrolltodate-cs1" %}

### Set the vertical scroll position

In the Gantt component, you can set the vertical scroller position dynamically by clicking the custom button using the [setScrollTop](#) method.

### APP.VUE

```

<template>
  <div>
    <ejs-button id="scrolltop" cssClass="e-info" v-
on:click.native="changep">Set Scroll Top</ejs-button>
    <ejs-gantt id="GanttContainer" :dataSource="data" :taskFields =
"taskFields" :height = "height" :splitterSettings="splitterSettings"></ejs-
gantt>
    <br><br><br>
  </div>
</template>
<script>

```

```

import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return {
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      splitterSettings: {
        position: "50%"
      }
    };
  },
  methods: {
    changep: function(e) {
      var ganttChart =
document.getElementById('GanttContainer').ej2_instances[0];
      ganttChart.ganttChartModule.scrollObject.setScrollTop(500);
    }
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/how-to/setscrolltop-cs1" %}

## Virtual scroll in Vue Gantt component

Virtual Scroll support in Gantt allows you to load large amount of data without performance degradation. To enable Virtual Scrolling, you need to inject `VirtualScroll` module in Gantt.

### Row virtualization

Row virtualization allows you to load and render a large number of tasks in Gantt with effective performance. In this mode, all tasks are fetched initially from the datasource and rendered in the DOM within a compact viewport area.

The number of records displayed in the Gantt is determined by the height.

This mode can be enable by setting the `enableVirtualization` property to `true`.

### APP.VUE

```

<template>
</template>
<script>
import Vue from "vue";

```

```

import { GanttPlugin, Selection, VirtualScroll } from "@syncfusion/ej2-vue-gantt";
import { tempData } from "../datasource.js";
Vue.use(GanttPlugin);
var virtualData = [];
var projId = 1;
for (var i = 0; i < 50; i++) {
    var x = virtualData.length + 1;
    var parent_1 = {};
    parent_1['TaskID'] = x;
    parent_1['TaskName'] = 'Project' + (projId++);
    virtualData.push(parent_1);
    for (var j = 0; j < tempData.length; j++) {
        var subtasks = {};
        subtasks['TaskID'] = tempData[j].TaskID + x;
        subtasks['TaskName'] = tempData[j].TaskName;
        subtasks['StartDate'] = tempData[j].StartDate;
        subtasks['Duration'] = tempData[j].Duration;
        subtasks['Progress'] = tempData[j].Progress;
        subtasks['parentID'] = tempData[j].parentID + x;
        virtualData.push(subtasks);
    }
}
new Vue({
  el: '#app',
  template: `
    <div>
      <ejs-gantt ref='gantt'
        :dataSource= "data"
        :taskFields= "taskFields"
        :allowSelection= "true"
        :enableVirtualization= "true"
        :labelSettings= "labelSettings"
        :height= "height"
        :treeColumnIndex= "1"
        :highlightWeekends= "true"
        :columns= "columns"
        :splitterSettings= "splitterSettings">
      </ejs-gantt>
    </div>
  `,
  data: function() {
    return {
      data : virtualData,
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        parentID: 'parentID'
      },
      columns: [
        { field: 'TaskID' },
        { field: 'TaskName' },
        { field: 'StartDate' },

```

```

        { field: 'Duration' },
        { field: 'Progress' }
    ],
    height: '450px',
    labelSettings: {
        taskLabel: 'Progress'
    },
    splitterSettings: {
        columnIndex: 2
    }
}
},
provide: {
    gantt: [ Selection, VirtualScroll ]
}
});
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/virtual-scroll-cs1" %}

### Timeline virtualization

Timeline virtualization allows you to load a data source having large timespan with high performance. Initially, it renders the timeline with thrice the width of the gantt element, while other timeline cells render on-demand during horizontal scrolling.

This mode can be enable by setting the [enableTimelineVirtualization](#) property to `true`.

### APP.VUE

```

<template>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Selection, VirtualScroll, Edit } from "@syncfusion/ej2-vue-gantt";
import {tempData} from "../datasource.js";
Vue.use(GanttPlugin);
var virtualData = [];
var projId = 1;
for (var i = 0; i < 50; i++) {
    var x = virtualData.length + 1;
    var parent_1 = {};
    parent_1['TaskID'] = x;
    parent_1['TaskName'] = 'Project' + (projId++);
    virtualData.push(parent_1);
    for (var j = 0; j < tempData.length; j++) {
        var subtasks = {};
        subtasks['TaskID'] = tempData[j].TaskID + x;
        subtasks['TaskName'] = tempData[j].TaskName;
        subtasks['StartDate'] = tempData[j].StartDate;
        subtasks['Duration'] = tempData[j].Duration;
        subtasks['Progress'] = tempData[j].Progress;
        subtasks['parentID'] = tempData[j].parentID + x;
        virtualData.push(subtasks);
    }
}

```

```

}

        allowAdding:true
      },
      projectStartDate: new Date('04/01/2019'),
      projectEndDate: new Date('12/31/2025')
    }
  }
})

```

```

,
provide: {
  gantt: [ Selection, VirtualScroll, Edit]
}
});
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/virtual-scroll-cs3" %}

### Limitations for virtual scroll

- Due to the element height limitation in browsers, the maximum number of records loaded is limited by the browser capacity.
- Cell selection will not be persisted.
- The number of records rendered will be determined by the `height` property.
- It is necessary to mention the height of the Gantt in pixels when enabling Virtual Scrolling.

## Resources in Project View

### Resources in Vue Gantt component

In Gantt, the resources are represented by staff, equipment and materials etc. In Gantt control you can show or allocate the resources (human resources) for each task.

#### Resource collection

The resource collection contains details about resources that are used in the project. Resources are JSON object that contains id, name, unit and group of the resources and this collection is mapped to the Gantt control using the [resources](#) property. These resource fields are mapped to the Gantt control using the [resourceFields](#) property.

#### Resource fields | Description

[id](#) | This field is used to assign resources to the tasks.

[name](#) | This field is used to map the resource names. These names are displayed as one of Gantt columns and also can display as labels using the [labelSettings](#) property.

[unit](#) | It indicates the amount of work that can be done by a resource for the task in a day.

[group](#) | This field is used to group the resources and the tasks assigned to that particular resource into category.

The following code snippets shows resource collection and how it assigned to Gantt control.

```
`ts
```

```

var projectResources: object[] = resources: [
{ resourceid: 1, resourceName: 'Martin Tamer', resourceGroup: 'Planning Team', resourceUnit: 50},
{ resourceid: 2, resourceName: 'Rose Fuller', resourceGroup: 'Testing Team', resourceUnit: 70 },
{ resourceid: 3, resourceName: 'Margaret Buchanan', resourceGroup: 'Approval Team' },
{ resourceid: 4, resourceName: 'Fuller King', resourceGroup: 'Development Team' },
{ resourceid: 5, resourceName: 'Davolio Fuller', resourceGroup: 'Approval Team' },

```

```

{ resourceId: 6, resourceName: 'Van Jack', resourceGroup: 'Development Team', resourceUnit: 40 },
];
export default {
  data: function() {
    return{
      resourceFields: {
        id: 'resourceId', //resource Id Mapping
        name: 'resourceName', //resource Name mapping
        unit: 'resourceUnit', //resource Unit mapping
        group: 'resourceGroup' //resource Group mapping
      },
      resources: projectResources //resource collection dataSource
    };
  },
};

```

#### *Assign resource*

We can assign resources for a task at initial load, using the resource id value of the resources as a collection. This collection is mapped from the dataSource to the Gantt control using the [resourceInfo](#) property.

Resources are assigned to tasks in following ways.

#### *Assign resource alone*

If the unit is not specified for specific resource, the amount of work done will be consider as 100% by default. In such cases, the resource unit will not be displayed in Gantt UI.

```

{ TaskID: 2, TaskName: 'Identify site location', StartDate: new Date('04/02/2019'), Duration: 0, Progress: 50, resources: [1] }

```

#### *Assign resources with unit*

We can assign the quantity of work done by the resources for the specific task as like below code snippet.

```

{ TaskID: 3, TaskName: 'Perform soil test', StartDate: new Date('03/29/2019'), Duration: 4,
  resources: [{resourceId: 2, eUnit: 70}, {resourceId: 1, Unit: 70}] }

```

When resource unit is defined in resource collection, the amount of work done by that particular resource will be same for all the tasks.

The following code snippet shows how to assign the resource for each task and map to Gantt control.

```

### Add/Edit resource collection

By using cell/ dialog edit option, we can add/remove the multiple resources for a particular task. Resource Unit can be change for a each task on resource tab in edit dialog by double click on the unit cell.

## Work in Vue Gantt component

*Work*

The work is the total hours required to complete a task. Work can be mapped from the data source field using the property [taskFields.work](#). Work can be measured in Hour, Day, Minute. By default, work is measured in Hour and it can be changed, by using the property [workUnit](#).

Note: When the work field is mapped from the data source, the default task type will be FixedWork.

```

{% previewsample "page.domainurl/code-snippet/gantt/work-cs1" %}

### Task type

The work, duration and resource unit fields of a task depends upon each other and will change automatically on editing any one of these fields. But we can also set these field's values as constant using the [taskType](#) property. `FixedUnit` is the default [taskType](#). The following values can be set to the [taskType](#)

property,

- `FixedDuration` - Duration task field will remain constant while updating resource unit or work field.
- `FixedWork` - Work field will remain constant while updating resource unit or duration fields.
- `FixedUnit` - Resource units will remain constant while updating duration or work field.

```

```

    }
  });
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/work-cs2" %}

Following table explains how the work, duration and resource unit fields will gets updated on changing any of the fields

Task Type | Changes in Duration | Changes in work | Changes in Resource Units

Fixed Duration | Work field updates | Resource unit updates | Work field updates

Fixed Work | Resource unit updates. Note: For manually scheduled task work will update. | Duration field updates. Note: For manually scheduled task resource unit updates. | Duration will update. Note: For manually scheduled task work field updates.

Fixed Unit | Work field updates | Duration field updates. Note: For manually scheduled task resource unit updates. | Duration will update. Note: For manually scheduled task work field updates.

Note: 1. Fixed Unit is the default taskType in Gantt. 2. The above calculations are not applicable for Milestones.

## Resource View

### Resource view in Vue Gantt component

The resource breakdown view is used to visualize the tasks assigned to each resource in hierarchy manner. Resources are displayed as parents and all the tasks assigned to each resource are displayed as its child records. It can be initialized by setting the [viewType](#) property to [Link to the Video](#).

To learn about Gantt Chart Resource view Concepts, you can check on this video:

### Resource task

A task assigned to one or more resources are termed as resource task and it is added as child task to the respective resource. Already assigned task can also be shared or moved with other resources by adding a resource name to the task or removing resource name from the task by cell or dialog editing.

Note: Currently there is no support for unscheduled task in Resource view Gantt.

### Resource overallocation

When a resource is assigned too much of work to complete within a day of resource's available time then it is called as overallocation.

The available working time of resources for completing the task in a day will be calculated based on the `dayWorkingTime` property and `resource unit`.

The range of overallocation dates can be highlighted by a square bracket. It can be enabled by setting the `showOverallocation` property as `true`. The following code example demonstrates how to hide or show the over allocation by clicking the custom button.

Note: By default, the `showOverAllocation` property value is `false`.

### Unassigned task

A task not assigned to any one of the resource are termed as unassigned tasks. The unassigned tasks are grouped with a name as **Unassigned Task** and displayed at the bottom of Gantt data collection . It is validated at load time during Gantt record creation by default based on a task **resourceInfo** mapping property in the Gantt chart data source. If the resource is assigned to the unassigned grouped tasks, the task will be moved as child to the respective resource.

### Enable taskbar drag and drop

In Gantt, you can enable taskbar drag and drop between resources by using the [allowTaskbarDragAndDrop](#) property. This allows you to move a taskbar from one resource to another vertically, making it easier to schedule tasks and manage resources.

## Resource Multi Taskbar in Vue Gantt component

### Resource multi taskbar

To visualize multiple tasks assigned to each resource in a row when the records are in the collapsed state. It can be enabled by settings the `enableMultiTaskbar` property value as `true`.

The collapse or expand action of a resource record can be achieved only by using the tree grid side arrow icon. Because it will be disabled on chart side action for this support.

When a resource has multiple tasks scheduled on the same date, then the tasks will be overlapped one another. Taskbar editing is also possible to change the task scheduling on the collapsed state.

Note: By default, the `enableMultiTaskbar` property value is `false`.

#### Disable taskbar overlap

In Gantt, you can disable taskbar overlap between resource tasks using the [allowTaskbarOverlap](#) property. This prevents the taskbars for different tasks from overlapping on the same row, making it easier to distinguish between the different tasks and manage resources effectively.

When `allowTaskbarOverlap` is set to false, the resources are displayed in a single row and the row height will be extended to occupy the tasks of the resource when it is in a collapsed state. This view allows you to easily identify any overallocation of tasks for a resource in a project.

It's important to note that when `allowTaskbarOverlap` is disabled, task dependencies or relationships cannot be established between tasks that are rendered in multiple lines for the same resource. If you need to establish dependencies between tasks for the same resource, you may want to consider enabling taskbar overlap.

## Filtering

### Filtering in Vue Gantt component

Filtering allows you to view specific or related records based on filter criteria. This can be done in the Gantt Component by using the filter menu support and toolbar search support. To enable filtering in the Gantt Component, set the [allowFiltering](#) to `true`. Menu filtering support can be configured using the [filterSettings](#) property and toolbar searching can be configured using the [searchSettings](#) property.

To use the filter, inject the [Filter](#) module in the `provide` section.

### Filter hierarchy modes

The Gantt supports a set of filtering modes with the [filterSettings.hierarchyMode](#) property. The following are the types of filter hierarchy modes available in the Gantt component:

- **Parent:** This is the default filter hierarchy mode in Gantt. The filtered records are displayed with its parent records. If the filtered records do not have any parent record, then only the filtered records will be displayed.
- **Child:** Displays the filtered records with its child record. If the filtered records do not have any child record, then only the filtered records will be displayed.
- **Both:** Displays the filtered records with its both parent and child records. If the filtered records do not have any parent and child records, then only the filtered records will be displayed.
- **None:** Displays only the filtered records.

        progress: 'Progress',
        child: 'subtasks'
    },
    splitterSettings: {
        columnIndex: 3
    },
    filterSettings: {
        columns: [{ field: 'TaskName', matchCase: false, operator:
'startswith', predicate: 'and', value: 'Identify' },
        { field: 'TaskID', matchCase: false, operator: 'equal',
predicate: 'and', value: 2 }]
    },
    };
    },
    provide: {
        gantt: [ Filter ]
    }
    };
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/filtering-cs4" %}

### Filter operators

The filter operator for a column can be defined in the `filterSettings.columns.operator` property.

The available operators and its supported data types are:

Operator	Description	Supported Types
startswith	Checks whether the value begins with the specified value.	String
endswith	Checks whether the value ends with the specified value.	String
contains	Checks whether the value contains the specified value.	String
equal	Checks whether the value is equal to the specified value.	String &#124; Number &#124; Boolean &#124; Date
notequal	Checks for values not equal to the specified value.	String &#124; Number &#124; Boolean &#124; Date
greaterthan	Checks whether the value is greater than the specified value.	Number &#124; Date
greaterthanorequal	Checks whether a value is greater than or equal to the specified value.	Number &#124; Date
lessthan	Checks whether the value is less than the specified value.	Number &#124; Date
lessthanorequal	Checks whether the value is less than or equal to the specified value.	Number &#124; Date

By default, the `filterSettings.columns.operator` value is `equal`.

### Diacritics

By default, the Gantt component ignores the diacritic characters while filtering. To include diacritic characters, set the `filterSettings.ignoreAccent` to `true`.

In the following sample, type **Project** in the **TaskName** column to filter diacritic characters.

### APP.VUE

```

methods: {
    filter: function(e) {
        var ganttObj =
document.getElementById('GanttContainer').ej2_instances[0];

```

```

        ganttObj.filterByColumn('TaskName','startswith','Iden','and');
    }
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/filtering-cs6" %}

### Clear filtered columns

You can clear all the filtering condition done in the Gantt component by using the [clearFiltering](#) method.

The following code snippet explains the above behavior.

### APP.VUE

```

<template>
  <div>
    <ejs-button id="ClearfilterRecord" cssClass="e-info" v-
on:click.native="filter">Clear Filter</ejs-button>
    <br><br><br>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :columns="columns"
:splitterSettings = "splitterSettings" :filterSettings="filterSettings"
:allowFiltering= "true"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Filter } from "@syncfusion/ej2-vue-gantt";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { projectNewData } from './data-source.js';
Vue.use(GanttPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new

    }
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/filtering-cs7" %}

[Custom component in filter menu](#)

The [column.filter.ui](#) is used to add custom filter components to a particular column.

To implement a custom filter UI, define the following functions:

- **create**: Creates a custom component.
- **write**: Wire events for a custom component.
- **read**: Read the filter value from the custom component.

In the following sample, the dropdown is used as a custom component in the TaskName column.

#### APP.VUE

```

### Filter menu in Vue Gantt component

The Gantt Component provides the menu filtering support for each column. You can enable the filter menu by setting the `allowFiltering` to `true`. The filter menu UI will be rendered based on its column type, which allows you to filter data. You can filter the records with different operators.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :columns="columns"
    :splitterSettings = "splitterSettings" :filterSettings="filterSettings"
    :allowFiltering= "true"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Filter, } from "@syncfusion/ej2-vue-gantt";
import { projectNewData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),

    progress: 'Progress',
    child: 'subtasks'
  },
  splitterSettings:{
    columnIndex:3
  },
  filterSettings: {
    type:'Menu'
  },
  };
},
provide: {
  gantt: [ Filter]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/filtering-cs2" %}

[allowFiltering](#) must be set as `true` to enable filter menu.

Setting [columns.allowFiltering](#) as `false` will prevent filter menu rendering for a particular column.

Excel like filter in Vue Gantt component

You can enable Excel like filter by defining [filterSettings.type](#) as `Excel`. The excel menu contains an option such as Sorting, Clear filter, Sub menu for advanced filtering.

**APP.VUE**

```

### Searching in Vue Gantt component

You can search records in the Gantt component by using the [search](#) method with search key as a parameter. The Gantt component provides an option to integrate the search text box in the toolbar by adding the search item to the [toolbar](#) property.

To search records, inject the [Filter](#) module in the `provide` section.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :splitterSettings =
    "splitterSettings" :toolbar="toolbar"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Toolbar, Filter } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),

    ]
}],
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
    },
    toolbar: ['Search'],
    splitterSettings:{
        columnIndex:3
    },
};
},
provide: {
    gantt: [ Toolbar, Filter ]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/filtering-cs9" %}

### Initial search

In the Gantt component, you can load a task with some search criteria and this can be done by using the [searchSettings](#) property. To apply search at initial rendering, set the value for [fields](#), [operator](#), [key](#), and [ignoreCase](#) in the [searchSettings](#) property.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :splitterSettings =
"splitterSettings" :columns="columns" :toolbar="toolbar"

</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/filtering-cs10" %}

By default, Gantt searches all the bound column values. To customize this behavior, define the [searchSettings.fields](#) property.

#### Search operators

The search operator can be defined in the [searchSettings.operator](#) property to configure specific searching.

The following operators are supported in searching:

#### Operator | Description

startsWith | Checks whether a value begins with the specified value.

endsWith | Checks whether a value ends with the specified value.

contains | Checks whether a value contains the specified value.

equal | Checks whether a value is equal to the specified value.

notEqual | Checks for values not equal to the specified value.

By default, the [searchSettings.operator](#) value is `contains`.

#### Search by external button

To search the Gantt records from an external button, invoke the [search](#) method.

#### APP.VUE

```

<template>

        clearSearch: function(e){
            var ganttObj =
document.getElementById('GanttContainer').ej2_instances[0];
            ganttObj.searchSettings.key='';
        }
    }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/filtering-cs13" %}

## Sorting in Vue Gantt component

Sorting enables you to sort data in the ascending or descending order. To sort a column, click the column header.

To sort multiple columns, press and hold the CTRL key and click the column header. You can clear sorting of any one of the multi-sorted columns by pressing and holding the SHIFT key and clicking the specific column header.

To enable sorting in the Gantt component, set the [allowSorting](#) property to `true`. Sorting options can be configured through the [sortSettings](#) property.

To sort data, inject the [Sort](#) module in the `provide` section.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :columns="columns"
    :splitterSettings= "splitterSettings" :allowSorting= 'true'></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Sort } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
              StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
              estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
              Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate:
              new Date('04/04/2019'), Duration: 3, Progress: 50 }
          ]
        }
      ]
    }
  }
}
```

```

    },
    ],
    height: '450px',
    taskFields: {
      id: 'TaskID',
      name: 'TaskName',
      startDate: 'StartDate',
      duration: 'Duration',
      progress: 'Progress',
      child: 'subtasks'
    },
    splitterSettings: {
      columnIndex: 3
    },
    columns: [
      { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
      { field: 'TaskName', headerText: 'Task Name', width: '250' },
      { field: 'StartDate', headerText: 'Start Date', width: '150' },
      { field: 'Duration', headerText: 'Duration', width: '150' },
      { field: 'Progress', headerText: 'Progress', width: '150' }
    ],
  ],
};
},
provide: {
  gantt: [ Sort ]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/sorting-cs1" %}

\* Gantt columns are sorted in the ascending order. If you click the already sorted column, the sort direction toggles.

\* To disable sorting for a particular column, set the [columns.allowSorting](#) property to `false`.

#### Sorting column on Gantt initialization

The Gantt component can be rendered with sorted columns initially, and this can be achieved by using the [sortSettings](#) property. You can add columns that are sorted initially in the [sortSettings.columns](#) collection defined with [field](#) and [direction](#) properties. The following code example shows how to add the sorted column to Gantt initialization.

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :columns="columns"
:splitterSettings= "splitterSettings" :sortSettings="sortSettings"
:allowSorting= 'true'></ejs-gantt>
  </div>
</template>
<script>

```

```

import Vue from "vue";
import { GanttPlugin, Sort } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
              StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
              estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
              Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate:
              new Date('04/04/2019'), Duration: 3, Progress: 50 }
          ]
        }
      ],
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      splitterSettings: {
        columnIndex: 3
      },
      columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
          width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '250' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Duration', headerText: 'Duration', width: '150' },
        { field: 'Progress', headerText: 'Progress', width: '150' },
      ]
    }
  }
}

```

```

    ],
    sortSettings: { columns: [{ field: 'TaskID', direction:
'Descending' }, { field: 'TaskName', direction: 'Ascending' }] },
    };
  },
  provide: {
    gantt: [ Sort ]
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/sorting-cs2" %}

### Sorting column dynamically

Columns in the Gantt component can be sorted dynamically using the [sortColumn](#) method. The following code example demonstrates how to invoke the [sortColumn](#) method by clicking the custom button.

### APP.VUE

```

<template>
  <div>
    <ejs-button id="sortColumn" cssClass="e-info" v-
on:click.native="sort">Sort Column</ejs-button>
    <br>
    <br>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :columns="columns"
:splitterSettings= "splitterSettings" :allowSorting= 'true'></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Sort } from "@syncfusion/ej2-vue-gantt";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(GanttPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
      ],
    }
  }
}

```

```

        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate:
new Date('04/04/2019'), Duration: 3, Progress: 50 }
        ]
    },
],
height: '450px',
taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
},
splitterSettings: {
    columnIndex: 3
},
columns: [
    { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
    { field: 'TaskName', headerText: 'Task Name', width: '250'
},
    { field: 'StartDate', headerText: 'Start Date', width: '150'
},
    { field: 'Duration', headerText: 'Duration', width: '150' },
    { field: 'Progress', headerText: 'Progress', width: '150' },
],
];
},
provide: {
    gantt: [ Sort ]
},
methods: {
    sort: function(e){
        var ganttObj =
document.getElementById('GanttContainer').ej2_instances[0];
        ganttObj.sortModule.sortColumn('TaskID', "Descending", false);
    },
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/sorting-cs3" %}

### Clear all the sorting dynamically

In the Gantt component, you can clear all the sorted columns and return to previous position using the [clearSorting](#) public method. The following code snippet shows how to clear all the sorted columns by clicking the custom button.

#### APP.VUE

```
<template>
  <div>
    <ejs-button id="Clearsort" cssClass="e-info" v-
on:click.native="sort">Clear Sorting</ejs-button>
    <br>
    <br>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :columns="columns"
:splitterSettings= "splitterSettings" :sortSettings="sortSettings"
:allowSorting= 'true'></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Sort } from "@syncfusion/ej2-vue-gantt";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(GanttPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate:
new Date('04/04/2019'), Duration: 3, Progress: 50 }
          ]
        }
      ],
    }
  }
}
```

```

    ],
    height: '450px',
    taskFields: {
      id: 'TaskID',
      name: 'TaskName',
      startDate: 'StartDate',
      duration: 'Duration',
      progress: 'Progress',
      child: 'subtasks'
    },
    columns: [
      { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
      { field: 'TaskName', headerText: 'Task Name', width: '250'
},
      { field: 'StartDate', headerText: 'Start Date', width: '150'
},
      { field: 'Duration', headerText: 'Duration', width: '150' },
      { field: 'Progress', headerText: 'Progress', width: '150' },
    ],
    splitterSettings: {
      columnIndex: 3
    },
    sortSettings: { columns: [{ field: 'TaskID', direction:
'Descending' }, { field: 'TaskName', direction: 'Ascending' }] },
  };
},
provide: {
  gantt: [ Sort ]
},
methods: {
  sort: function(e){
    var ganttObj =
document.getElementById('GanttContainer').ej2_instances[0];
    ganttObj.clearSorting();
  },
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/sorting-cs4" %}

### Sorting events

During the sort action, the Gantt component triggers two events. The [actionBegin](#) event triggers before the sort action starts, and the [actionComplete](#) event triggers after the sort action is completed.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :columns="columns"
:splitterSettings= "splitterSettings" :actionBegin="actionBegin"
:actionComplete="actionComplete" :allowSorting= 'true'></ejs-gantt>
  </div>
</template>

```

```

<script>
import Vue from "vue";
import { GanttPlugin, Sort } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
              StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
              estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
              Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate:
              new Date('04/04/2019'), Duration: 3, Progress: 50 }
          ]
        }
      ],
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      splitterSettings: {
        columnIndex: 3
      },
      columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
          width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '250' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Duration', headerText: 'Duration', width: '150' },
      ]
    }
  }
}

```

```
        { field: 'Progress', headerText: 'Progress', width: '150' },
      ],
      actionBegin: function(args) {
        alert(args.requestType + ' ' + args.type); //custom Action
      },
      actionComplete: function(args) {
        alert(args.requestType + ' ' + args.type); //custom Action
      },
    };
  },
  provide: {
    gantt: [ Sort ]
  },
};
</script>
```

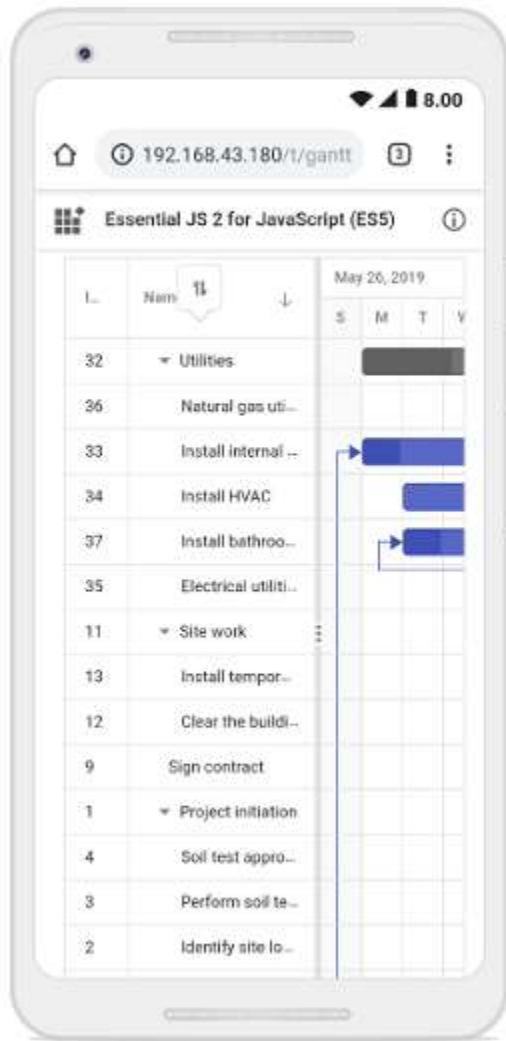

{% previewsample "page.domainurl/code-snippet/gantt/sorting-cs5" %}

The `args.requestType` is the current action name. For example, for sorting the `args.requestType`, value is `sorting`.

#### Touch interaction

To perform **tap** action on a column header, trigger [sorting](#) operation to the selected column. A popup is displayed for multi-column sorting. To sort multiple columns, tap the popup, and then tap the desired column headers.

The following screenshot shows Gantt touch sorting,

## Selection

### Selection in Vue Gantt component

Selection provides an option to highlight a row or a cell. It can be done using arrow keys or by scrolling down the mouse. To disable selection in the Gantt component, set the [allowSelection](#) to `false`.

To select data, inject the [Selection](#) module in the `provide` section.

The Gantt component supports two types of selection that can be set by using the [selectionSettings.type](#) property. They are:

- `Single`: Sets a single value by default and allows only selection of a single row or a cell.
- [Link to the Video](#): Allows you to select multiple rows or cells. To perform the multi-selection, press and hold the CTRL key and click the desired rows or cells.

To learn about Gantt Chart Selection, you can check on this video:

*Selection mode*

The Gantt component supports three types of selection modes that can be set by using the [selectionSettings.mode](#). They are:

- **Row**: Allows you to select only rows, and the row value is set by default.
- **Cell**: Allows you to select only cells.
- **Both**: Allows you to select rows and cells at the same time.

**APP.VUE**

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height"
    :selectionSettings="selectionSettings"></ejs-gantt>
  </div>
</template>

### [Toggle selection](#)

The toggle selection allows you to select and deselect a specific row or cell. To enable toggle selection, set the `enableToggle` property of the `selectionSettings` to `true`. If you click the selected row or cell, then it will be deselected and vice versa. By default, the `enableToggle` property is set to `false`.

### **APP.VUE**

```

<template>

        var rowIndexes = [];
        ganttObj.treeGrid.grid.dataSource.forEach((data, index) => {
            if (data.TaskID === 3 || data.TaskID === 4) {
                rowIndexes.push(index);
            }
        });
        ganttObj.selectRows(rowIndexes);
    }
    };
    },
    provide: {
        gantt: [ Selection ]
    }
    };
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/selection-cs15" %}

#### *Touch interaction*

When you **tap** gantt row, tapped row will be selected.

**Single selection** : To select a single row or cell, perform **single tap** on it.

**Multiple selection** : To perform multiple selection, **tap** on the multiple selection popup, and then tap the desired rows or cells.

[See Also](#)

- [Touch interaction](#)

#### Row selection in Vue Gantt component

The row selection in the Gantt component can be enabled or disabled using the [allowSelection](#) property. You can get the selected row object using the [getSelectedRecords](#) method. The following code example shows how to disable the row selection in Gantt.

#### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
      :taskFields = "taskFields" :height = "height" :allowSelection='false'></ejs-gantt>
  </div>
</template>
<script>
```

```

import Vue from "vue";
import { GanttPlugin, Selection } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',

### Selecting a row dynamically

You can select a single row dynamically using the [selectRow](#) method. Similarly, you can use the [selectRows](#) method to dynamically select multiple rows. The following code demonstrates how to select a single or multiple rows dynamically by clicking the custom button.

### APP.VUE

```

<template>
  <div>
    <ejs-button id="selectRow" cssClass="e-info" v-
on:click.native="select">Select Row</ejs-button>
    <ejs-button id="selectRows" cssClass="e-info" v-
on:click.native="Multiselect">Select Multiple Rows</ejs-button>
    <br>
    <br>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" ></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Selection } from "@syncfusion/ej2-vue-gantt";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(GanttPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },

```

```

        { TaskID: 4, TaskName: 'Soil test approval', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
    ],
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [

</script>

```

```
{% previewsample "page.domainurl/code-snippet/gantt/selection-cs7" %}
```

### Multiple row selection

You can select multiple rows by setting the [selectionSettings.type](#) property to multiple. You can select more than one row by holding down the CTRL key while selecting multiple rows. The following code example explains how to enable multiple selection in Gantt.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height"
:selectionSettings="selectionSettings"></ejs-gantt>
  </div>
</template>

        dependency: 'Predecessor',
        child: 'subtasks'
    },
    selectionSettings: {
        mode: 'Row',
        type: 'Multiple',
    }
};
},
provide: {
    gantt: [ Selection ]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/selection-cs8" %}

#### *Customize row selection action*

While selecting a row in Gantt, the [rowSelecting](#) and [rowSelected](#) events will be triggered. The [rowSelecting](#) event will be triggered on initialization of row selection, and you can get the previously selected row and current selecting row's information, which is used to prevent selection of a particular row. The [rowSelected](#) event will be triggered on completion of row selection action, and you can get the current selected row's information through this event. The following code example demonstrates how to prevent the selection of a row using the [rowSelecting](#) event.

#### **APP.VUE**

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :rowSelecting="rowSelecting"
    :selectionSettings="selectionSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Selection } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
              StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },

```

```

        { TaskID: 4, TaskName: 'Soil test approval', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
    ],
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate:
new Date('04/04/2019'), Duration: 3, Progress: 50 }
        ]
    },
],
height: '450px',
taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    endDate: 'EndDate',
    duration: 'Duration',
    progress: 'Progress',
    dependency: 'Predecessor',
    child: 'subtasks'
},
rowSelecting: function (args) {
    if (args.data.TaskID == 4) {
        args.cancel = true;
    }
},
selectionSettings: {
    mode: 'Row'
}
};
},
provide: {
    gantt: [ Selection ]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/selection-cs10" %}

In the Gantt component, when you click an already selected row, selection will be cleared. While deselecting a row in Gantt, the [rowDeselecting](#) and [rowDeselected](#) events will occur. The [rowDeselecting](#) event will occur on initialization of deselecting row, and you can get the current deselecting row's information to prevent the deselection of particular row. The [rowDeselected](#) event will occur on completion of row deselection action, and you can get the current deselected row's information.

### Cell selection in Vue Gantt component

You can select a cell in the Gantt component by setting the [selectionSettings.mode](#) property to cell. You can get the selected cell information using the [getSelectedRowCellIndexes](#) method. This method returns the result as an object collection, which has `cellIndexes` and `rowIndex` information of the selected cells.

Refer to the following code example to enable the cell selection in Gantt.

#### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
      :taskFields = "taskFields" :height = "height"
      :selectionSettings="selectionSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Selection } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
              StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
              estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
              Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate:
              new Date('04/04/2019'), Duration: 3, Progress: 50 }
          ]
        }
      ],
      height: '450px',
      taskFields: {
        id: 'TaskID',
```

```

        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
    },
    selectionSettings: {
        mode: 'Cell'
    }
};
},
provide: {
    gantt: [ Selection ]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/selection-cs1" %}

### Selecting multiple cells

You can select multiple cells by setting the [selectionSettings.type](#) property to multiple and the [selectionSettings.mode](#) property to cell. Multiple cells can be selected by holding the CTRL key and selecting the cells. The following code example demonstrates how to select multiple cells.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height"
    :selectionSettings="selectionSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Selection } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
              StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
              new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        }
      ]
    }
  }
}

```

```

    },
    {
      TaskID: 5,
      TaskName: 'Project Estimation',
      StartDate: new Date('04/02/2019'),
      EndDate: new Date('04/21/2019'),
      subtasks: [
        { TaskID: 6, TaskName: 'Develop floor plan for estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
        { TaskID: 7, TaskName: 'List materials', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
        { TaskID: 8, TaskName: 'Estimation approval', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 }
      ]
    },
  ],
  height: '450px',

};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/selection-cs2" %}

### Selecting a cell dynamically

You can select a cell dynamically using the [selectCell](#) method. Refer to the following code example for details.

### APP.VUE

```

<template>
  <div>
    <ejs-button id="selectCell" cssClass="e-info" v-on:click.native="select">Select Cell</ejs-button>
    <br>
    <br>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data" :taskFields = "taskFields" :height = "height" :selectionSettings="selectionSettings"></ejs-gantt>
  </div>

```

```

    </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Selection } from "@syncfusion/ej2-vue-gantt";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(GanttPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate:
new Date('04/04/2019'), Duration: 3, Progress: 50 }
          ]
        },
      ],
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
      },
      selectionSettings: {
        mode: 'Cell'
      }
    };
  },
};

```

```

provide: {
  gantt: [ Selection ]
},
methods: {
  select: function(e) {
    var ganttObj =
document.getElementById('GanttContainer').ej2_instances[0];
    ganttObj.selectionModule.selectCell({ cellIndex: 1, rowIndex: 1
  });
  },
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/selection-cs3" %}

#### Customize cell selection action

While selecting a cell in Gantt, the [cellSelecting](#) and [cellSelected](#) event will be triggered. The [cellSelecting](#) event will be triggered on initialization of cell selection action, and you can get the current selecting cell information to prevent the selection of a particular cell in a particular row. The [cellSelected](#) event will be triggered on completion of cell selection action, and you can get the current selected cell's information. The following code example demonstrates how to prevent the selection of the cell using the [cellSelecting](#) event.

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :cellSelecting="cellSelecting"
:selectionSettings="selectionSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Selection } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);

## Rows

### Rows in Vue Gantt component

Row represents a task information from the data source, and it is possible to perform the following actions in Gantt rows.

#### Row height

It is possible to change the height of the row in Gantt by setting row height in pixels to the [rowHeight](#) property. The following code example explains how to change the row height in the Gantt at load time.

#### APP.VUE

```
<template>
```

```

<div>
  <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :rowHeight="rowHeight"></ejs-
gantt>
</div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { projectNewData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          isParent:true,
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 3, Progress: 50,isParent:false },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 3, Progress: 70, resources: [2, 3,
5],isParent:false },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 3, Predecessor:"2FS", Progress:
80,isParent:false },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          isParent:true,
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 4, Progress: 50, resources:
[4],isParent:false },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 4, Progress: 50, DurationUnit:'day',
resources: [4, 8],isParent:false },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 4,Predecessor:"6SS", DurationUnit:'minute',
Progress: 70, resources: [12, 5],isParent:false }
          ]
        },
      ],
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',

```

```

        progress: 'Progress',
        child: 'subtasks'
    },
    rowHeight: 60
};
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/rows-cs1" %}

#### [Expand/Collapse Row](#)

In Gantt parent tasks are expanded/collapsed by using expand/collapse icons, expand all/collapse all toolbar items and by using public methods. By default all tasks in Gantt was rendered in expanded state but you can change this status in Gantt.

#### [Collapse all tasks at Gantt load](#)

All tasks available in Gantt was rendered in collapsed state by setting [collapseAllParentTasks](#) property as **true**. The following code example shows how to use [collapseAllParentTasks](#) property.

#### **APP.VUE**

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height"
    :collapseAllParentTasks="collapseAllParentTasks"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { projectNewData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          isParent:true,
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 3, Progress: 50,isParent:false },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 3, Progress: 70, resources: [2, 3,
5],isParent:false },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 3, Predecessor:"2FS", Progress:
80,isParent:false },
          ]
        },
      ],
    }
  }
}

```

```

        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        isParent:true,
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
              StartDate: new Date('04/04/2019'), Duration: 4, Progress: 50, resources:
                [4],isParent:false },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
              Date('04/04/2019'), Duration: 4, Progress: 50, DurationUnit:'day',
              resources: [4, 8],isParent:false },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
              Date('04/04/2019'), Duration: 4,Predecessor:"6SS", DurationUnit:'minute',
              Progress: 70, resources: [12, 5],isParent:false }
        ]
    },
    ],
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    collapseAllParentTasks: 'true',
};
},
};
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/rows-cs2" %}

#### Define expand/collapse status of tasks

In Gantt, you can render some tasks in collapsed state and some tasks in expanded state, this can done by defining expand status of the task in data source. This value was mapped to Gantt component by using [expandState](#) property. The following code example shows how to use this property.

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
      :taskFields = "taskFields" :height = "height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { projectNewData } from '../data-source.ts';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{

```

```

        data: [
            {
                TaskID: 1,
                TaskName: 'Project Initiation',
                StartDate: new Date('04/02/2019'),
                EndDate: new Date('04/21/2019'),
                isExpand:true,
                subtasks: [
                    { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 3, Progress: 50,isParent:false },
                    { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 3, Progress: 70, resources: [2, 3,
5],isParent:false },
                    { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 3, Predecessor:"2FS", Progress:
80,isParent:false },
                ]
            },
            {
                TaskID: 5,
                TaskName: 'Project Estimation',
                StartDate: new Date('04/02/2019'),
                EndDate: new Date('04/21/2019'),
                isExpand:false,
                subtasks: [
                    { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 4, Progress: 50, resources:
[4],isParent:false },
                    { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 4, Progress: 50, DurationUnit:'day',
resources: [4, 8],isParent:false },
                    { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 4,Predecessor:"6SS", DurationUnit:'minute',
Progress: 70, resources: [12, 5],isParent:false }
                ]
            },
        ],
        height: '450px',
        taskFields: {
            id: 'TaskID',
            name: 'TaskName',
            startDate: 'StartDate',
            duration: 'Duration',
            progress: 'Progress',
            expandState:'isExpand',
            child: 'subtasks'
        },
    };
},
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/rows-cs3" %}

### Customize expand/collapse action

On expand action [expanding](#) and [expanded](#) event will be triggered with current expanding row's information. Similarly on collapse action [collapsing](#) and [collapsed](#) event will be triggered. Using this events and it's arguments you can customize the expand/collapse action. The following code example shows how to prevent the particular row from expand/collapse action using [expanding](#) and [collapsing](#) event.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :collapsing="collapsing"
    :expanding="expanding"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";

        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    collapsing: function(args){
        if(args.data.TaskID==1)
            args.cancel=true;
    },
    expanding: function(args){
        if(args.data.TaskID==5)
            args.cancel=true;
    }
};
},
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/rows-cs4" %}

#### Customize rows

You can customize the appearance of a row in grid side, by using the [rowDataBound](#) event and in chart side by using [queryTaskbarInfo](#) event

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :queryTaskbarInfo =
"queryTaskbarInfo" :rowBound = "rowBound"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),

```

```

        isParent:true,
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 0, Progress: 50,isParent:false },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 70, resources: [2, 3,
5],isParent:false },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4,Predecessor:"2FS", Progress:
50,isParent:false },
        ]
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        isParent:true,
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50, resources:
[4],isParent:false },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 80, resources: [4,
8],isParent:false },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 0,Predecessor:"6SS", Progress: 70, resources:
[12, 5],isParent:false }
        ]
    },
],
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    rowBound: function(args) {
        if (args.data['TaskID'] == 4) {
            args.rowElement.style.background = 'cyan';
        }
    },
    queryTaskbarInfo: function(args) {
        if (args.data['TaskID'] == 4) {
            args.rowElement.style.background = 'cyan';
        }
    }
};
},
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/rows-cs11" %}

*Styling alternate rows*

You can change the background colour of alternative rows in Gantt chart, by overriding the class as shown below.

```
.e-altrow, tr.e-chart-row:nth-child(even) {
background-color: #f2f2f2;
}
```

**APP.VUE**

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height"></ejs-gantt>
  </div>
</template>

8],isParent:false },
        { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 0,Predecessor:"6SS", Progress: 70, resources:
[12, 5],isParent:false }
    ]
},
],
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    }
};
},
};
</script>
<style>
    .e-altrow, tr.e-chart-row:nth-child(even) {
        background-color: #f2f2f2;
    }
</style>

```

{% previewsample "page.domainurl/code-snippet/gantt/rows-cs12" %}

### Row spanning

Gantt chart has an option to span row cells. You can achieve this using [rowSpan](#) attribute to span cells in the [QueryCellInfo](#) event.

In the following demo, **Soil test approval** cell is spanned to two rows in the **TaskName** column.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :queryCellInfo =
"queryCellInfo"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),

```

```

        EndDate: new Date('04/21/2019'),
        isParent:true,
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 0, Progress: 50,isParent:false },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 70, resources: [2, 3,
5],isParent:false },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4,Predecessor:"2FS", Progress:
50,isParent:false },
        ]
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        isParent:true,
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50, resources:
[4],isParent:false },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 80, resources: [4,
8],isParent:false },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 0,Predecessor:"6SS", Progress: 70, resources:
[12, 5],isParent:false }
        ]
    },
],
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    }
    queryCellInfo: function(args) {
        if (args.data['TaskID'] == 4 && args.column.field ===
'TaskName') {
            args.rowSpan = 2;
        }
    }
};
},
};
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/rows-cs13" %}

*Customize rows and cells*

While rendering the TreeGrid part in Gantt, the [rowDataBound](#) and [queryCellInfo](#) events trigger for every row and cell. Using these events, you can customize the rows and cells. The following code example shows how to customize the cell and row elements using these events.

**APP.VUE**

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
      :taskFields = "taskFields" :height = "height" :columns = "columns"
      :splitterSettings = "splitterSettings" :rowDataBound = "rowDataBound"
      :queryCellInfo = 'queryCellInfo'></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        dependency: 'Predecessor',
        progress: 'Progress',
        child: 'subtasks'
      },
      columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '150' },
        { field: 'Progress', headerText: 'Progress', width: '150' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Duration', headerText: 'Duration', width: '150' },
      ],
      splitterSettings:{
        columnIndex:3
      },
      queryCellInfo: function (args) {
        if (args.column.field == "Progress") {
          if (args.data.Progress < 25)
            args.cell.style.backgroundColor="lightgreen"
          else
            args.cell.style.backgroundColor="yellow"
        }
      },
      rowDataBound: function (args) {
        if(args.data.TaskID==4)
          args.row.style.backgroundColor="red"
      }
    }
  }
}
```

```

    };
  },
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/appearance-customization-cs6" %}

### Clip mode

The clip mode provides options to display its overflow cell content and it can be defined by the [columns.clipMode](#) property.

The following are three types of `clipMode`:

- **Clip**: Truncates the cell content when it overflows its area.
- **Ellipsis**: Displays ellipsis when content of the cell overflows its area.
- **EllipsisWithTooltip**: Displays ellipsis when content of the cell overflows its area; it displays the tooltip content when hover over ellipsis.

### NOTE

By default, all the column's [clipMode](#) property is defined as `EllipsisWithTooltip`.

### Cell tooltip

You can enable or disable the Grid cell tooltip using the [columns.clipMode](#) property.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' :dataSource='data' id='GanttContainer'
    :taskFields = "taskFields" :height = "height" :columns="columns"></ejs-
    gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },

```

```

        { field: 'TaskName', headerText: 'Task Name', width: '150',
clipMode: 'EllipsisWithTooltip' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Duration', headerText: 'Duration', width:
'150', clipMode: 'Clip' },
        { field: 'Progress', headerText: 'Progress', width: '150' },
    ]
    };
},
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/tooltip-cs3" %}

### Drag and Drop in Vue Gantt component

#### Drag and drop

You can dynamically rearrange the rows in the Gantt control by using the `allowRowDragAndDrop` property. Using this property, row drag and drop can be enabled or disabled in Gantt. Using this feature, rows can be dropped at above and below as a sibling or child to the existing rows

To use row drag and drop feature, inject the `RowDD` and `Edit` modules in the `provide` section.

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt :dataSource="data" :allowRowDragAndDrop='true'
:taskFields = "taskFields" :height = "height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, RowDD, Edit, Selection } from "@syncfusion/ej2-vue-
gantt";
import { ganttData } from "../data-source.js";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: ganttData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
      }
    };
  },
  provide: {
    gantt: [ RowDD, Edit, Selection ]
  }
}

```

```
};
</script>
```

{% previewsample "page.domainurl/code-snippet/gantt/rows-cs5" %}

### Multiple row drag and drop

Gantt also supports dragging multiple rows at a time and drop them on any rows above, below, or at child positions. In Gantt, you can enable the multiple drag and drop by setting the `selectionSettings.type` to `Multiple` and you should enable the `allowRowDragAndDrop` property.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt :dataSource="data" :allowRowDragAndDrop='true'
    :selectionSettings="selectionSettings" :taskFields = "taskFields" :height =
    "height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, RowDD, Edit, Selection } from "@syncfusion/ej2-vue-gantt";
import { ganttData } from "../data-source.js";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: ganttData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
      },
      selectionSettings: {
        type: 'Multiple'
      }
    };
  },
  provide: {
    gantt: [ RowDD, Edit, Selection ]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/gantt/rows-cs6" %}

### Taskbar drag and drop between rows

The Gantt feature empowers users to efficiently reorganize records by seamlessly moving taskbar and rearranging their positions through a simple drag-and-drop action. Using this feature, rows can be dropped at above and below as a sibling or child to the existing rows.

This mode can be enable by setting the [allowTaskbarDragAndDrop](#) property to `true`.

To use row drag and drop feature, inject the `RowDD` and `Edit` module in Gantt.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :allowRowDragAndDrop="true"
    :allowTaskbarDragAndDrop="true" :editSettings="editSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit, RowDD } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          isParent:true,
          subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 0, Progress: 50,isParent:false },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 70, resources: [2, 3,
5],isParent:false },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4,Predecessor:"2FS", Progress:
50,isParent:false },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          isParent:true,
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50, resources:
[4],isParent:false },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 80, resources: [4,
8],isParent:false },
          ]
        }
      ]
    }
  }
}
```

```

        { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 0,Predecessor:"6SS", Progress: 70, resources:
[12, 5],isParent:false }
    ],
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    editSettings : {
        allowAdding: true,
        allowEditing: true,
        allowDeleting: true,
        allowTaskbarEditing: true,
        showDeleteConfirmDialog: true
    }
};
},
provide: {
    gantt: [ Edit, RowDD]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/rows-cs14" %}

### Drag and drop events

We provide various events to customize the row drag and drop action, the following table explains about the available events and its details.

#### Event Name | Description

**rowDragStartHelper** | Triggers when clicking the drag icon or Gantt row.

**rowDragStart** | Triggers when drag action starts in Gantt.

**rowDrag** | Triggers while dragging the Gantt row.

**rowDrop** | Triggers when a drag row was dropped on the target row.

### Customize row drag and drop action

In Gantt, the **rowDragStartHelper** and **rowDrop** events are triggered on row drag and drop action. Using this event, you can prevent dragging of particular record, validate the drop position, and cancel the drop action based on the target record and dragged record. The following topics explains about this.

#### Prevent dragging of particular record

You can prevent drag action of the particular record by setting the **cancel** property to **true**, which is available in the **rowDragStartHelper** event argument based on our requirement. In the following sample, drag action was restricted for first parent record and its child records.

**APP.VUE**

```

<template>
  <div>
    <ejs-gantt :dataSource="data" :allowRowDragAndDrop='true'
    :taskFields = "taskFields" :height = "height"
    :rowDragStartHelper="rowDragStartHelper"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, RowDD, Edit, Selection } from "@syncfusion/ej2-vue-gantt";
import { ganttData } from "../data-source.js";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: ganttData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
      },
      rowDragStartHelper: function(args) {
        var record = args.data[0] ? args.data[0] : args.data;
        var taskId = record.ganttProperties.taskId;
        if (taskId <= 4) {
          args.cancel = true;
        }
      }
    };
  },
  provide: {
    gantt: [ RowDD, Edit, Selection ]
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/rows-cs7" %}

**Validating drop position**

You can prevent drop action based on the drop position and target record, by this, you can prevent dropping particular task on a specific task or specific position. This can be achieved by setting the **cancel** property to **true**, which is available in the **rowDrop** event argument.

In the following sample, we have prevented the drop action based on the position. In this sample, you cannot drop row as child in any of the available rows.

**APP.VUE**

```

<template>
  <div>
    <ejs-gantt :dataSource="data" :allowRowDragAndDrop='true'
:taskFields = "taskFields" :height = "height" :rowDrop="rowDrop"></ejs-
gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, RowDD, Edit, Selection } from "@syncfusion/ej2-vue-
gantt";
import { ganttData } from "../data-source.js";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: ganttData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
      },
      rowDrop: function(args) {
        if (args.dropPosition == "middleSegment") {
          args.cancel = true;
        }
      }
    };
  },
  provide: {
    gantt: [ RowDD, Edit, Selection ]
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/rows-cs8" %}

#### Prevent reordering a row as child to another row

You can prevent the default behavior of dropping rows as children to the target by setting the `cancel` property to `true` in `rowDrop` event argument. You can also change the drop position after cancelling using `reorderRows` method.

In the below example drop action is cancelled and dropped above to target row.

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' :dataSource="data"
:allowRowDragAndDrop='true' :taskFields = "taskFields" :height = "height"
:rowDrop="rowDrop"></ejs-gantt>

```

```

</div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, RowDD, Edit, Selection } from "@syncfusion/ej2-vue-gantt";
import { ganttData } from "../data-source.js";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: ganttData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
      }
    };
  },
  provide: {
    gantt: [ RowDD, Edit, Selection ]
  },
  methods: {
    rowDrop: function(args) {
      if (args.dropPosition == 'middleSegment') {
        args.cancel = true;
        this.$refs.gantt.reorderRows([args.fromIndex],
args.dropIndex, 'above');
      }
    }
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/rows-cs9" %}

#### Perform row drag and drop action programmatically

Gantt provides option to perform row drag and drop action programmatically by using the `reorderRows` method, this method can be used for any external actions like button click.

The following arguments are used to specify the positions to drag and drop a row:

- **fromIndexes**: Index value of source(dragging) row.
- **toIndex**: Value of target index.
- **position**: Drop positions such as above, below, or child.

The following code example shows how to drag and drop a row on button click action.

#### APP.VUE

```

<template>
  <div>
    <ejs-button id="dynamicDrag" cssClass="e-info" v-
on:click.native="dynamicDrag">Drop records as child</ejs-button>
    <br><br>
    <ejs-gantt ref='gantt' :dataSource="data"
:allowRowDragAndDrop='true' :taskFields = "taskFields" :height =
"height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, RowDD, Edit, Selection } from "@syncfusion/ej2-vue-
gantt";

## Export

### Excel Export

#### *Excel export in Vue Gantt component*

Gantt supports client-side exporting, which allows you to export its data to the Excel and CSV formats. Use the [excelExport](#) and [csvExport](#) methods for exporting. To enable Excel export in the Gantt, set the [Link to the Video](#) to true.

To get a configured Gantt chart Exporting, you can follow the steps outlined in the video linked below:

To export data to Excel and CSV, inject the `ExcelExport` module in Gantt.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields="taskFields" :toolbar="toolbar" :toolbarClick="toolbarClick"
    :allowExcelExport='true' :height="height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Toolbar, ExcelExport, Selection } from
"@syncfusion/ej2-vue-gantt";
import { ClickEventArgs } from '@syncfusion/ej2-navigations';
import { ganttData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: ganttData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      toolbar: ['ExcelExport', 'CsvExport'],
      toolbarClick: (args: ClickEventArgs) => {
        if (args.item.id === 'GanttContainer_excelexport') {
          var ganttObj =
document.getElementById('GanttContainer').ej2_instances[0];
          ganttObj.excelExport();
        } else if (args.item.id === 'GanttContainer_csvexport') {
          var ganttObj =
document.getElementById('GanttContainer').ej2_instances[0];
          ganttObj.csvExport();
        }
      },
    };
  },
  provide: {
    gantt: [Toolbar, ExcelExport]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/gantt/excel-export-cs2" %}

#### Custom data source in Vue Gantt component

The excel export provides an option to define `datasource` dynamically before exporting. To export data dynamically, define the `dataSource` in `exportProperties`.

**APP.VUE**

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields="taskFields" :toolbar="toolbar" :toolbarClick="toolbarClick"
    :allowExcelExport='true' :height="height" :treeColumnIndex="1"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Toolbar, ExcelExport, Selection } from
"@syncfusion/ej2-vue-gantt";
import { ClickEventArgs } from '@syncfusion/ej2-navigations';
import { ganttData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: ganttData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      toolbar: ['ExcelExport', 'CsvExport'],
      toolbarClick: (args: ClickEventArgs) => {
        if (args.item.id === 'GanttContainer_excelexport') {
          var excelExportProperties: ExcelExportProperties = {
            dataSource: ganttData[1];
          };
          var ganttObj =
document.getElementById('GanttContainer').ej2_instances[0];
          ganttObj.excelExport(excelExportProperties);
        }
      },
    };
  },
  provide: {
    gantt: [Toolbar, ExcelExport]
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/excel-export-cs1" %}

### [Multiple gantt exporting in Vue Gantt component](#)

In Gantt, the Excel export provides support to export multiple Gantt data in new sheet or same sheet.

#### [Same sheet](#)

The Excel export provides support to export multiple Gantt data in the same sheet. To export in same sheet, define `multipleExport.type` as `AppendToSheet` in `ExcelExportProperties`. You can also

provide blank rows between exported multiple Gantt data. These blank rows count can be defined using `multipleExport.blankRows`.

### APP.VUE

```
<template>
  <div>
    <p><b>First Gantt:</b></p>
    <ejs-gantt ref='gantt1' id="GanttContainer1" :dataSource="fData"
:taskFields="taskFields" :toolbar="toolbar" :toolbarClick="toolbarClick"
:allowExcelExport='true' :height="height1" :treeColumnIndex="1"
:projectStartDate="projectStartDate" :projectEndDate="projectEndDate"></ejs-
gantt>
    <p><b>Second Gantt:</b></p>
    <ejs-gantt ref='gantt2' id="GanttContainer2" :dataSource="sData"
:taskFields="taskFields" :allowExcelExport='true' :height="height2"
:treeColumnIndex="1"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Toolbar, ExcelExport, Selection } from
"@syncfusion/ej2-vue-gantt";
import { ClickEventArgs } from '@syncfusion/ej2-navigations';
import { ganttData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      fData: [ganttData[0]],
      sData: [ganttData[1]],
      height1: '280px',
      height2: '250px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      toolbar: ['ExcelExport'],
      projectStartDate: new Date('03/31/2019'),
      projectEndDate: new Date('04/14/2019'),
      toolbarClick: (args: ClickEventArgs) => {
        if (args.item.id === 'GanttContainer1_excelexport') {
          var appendExcelExportProperties: ExcelExportProperties =
{
          multipleExport: {type: 'AppendToSheet',blankRows: 2}
        };
          var FirstGantt =
document.getElementById('GanttContainer1').ej2_instances[0];
          var FirstGanttExport =
FirstGantt.excelExport(appendExcelExportProperties,true);
          FirstGanttExport.then((fData) => {
            var SecondGantt =
document.getElementById('GanttContainer2').ej2_instances[0];
```

```

SecondGantt.excelExport(appendExcelExportProperties, false, fData);
    });
    },
    };
},
provide: {
    gantt: [Toolbar, ExcelExport]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/excel-export-cs3" %}

By default, `multipleExport.blankRows` value is 5.

#### [New sheet](#)

The Excel exporting provides support to export multiple Gantt in new sheet. To export in new sheet, define `multipleExport.type` as `NewSheet` in `ExcelExportProperties`.

#### **APP.VUE**

```

<template>

        if (args.item.id === 'GanttContainer_excelexport') {
          var excelExportProperties: ExcelExportProperties = {
            includeHiddenColumn: true
          };
          var ganttObj =
document.getElementById('GanttContainer').ej2_instances[0];
          ganttObj.excelExport(excelExportProperties);
        } else if (args.item.id === 'GanttContainer_csvexport') {
          var excelExportProperties: ExcelExportProperties = {
            includeHiddenColumn: true
          };
          var ganttObj =
document.getElementById('GanttContainer').ej2_instances[0];
          ganttObj.csvExport(excelExportProperties);
        }
      },
    };
  },
  provide: {
    gantt: [Toolbar, ExcelExport]
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/excel-export-cs5" %}

Show or hide columns on exported Excel

In Gantt, while exporting, you can show a hidden column or hide a visible column using the [toolbarClick](#) and [excelExportComplete](#) events.

In the `toolbarClick` event, using the `args.item.id` property, you can show or hide columns by setting the `column.visible` property to `true` or `false` respectively.

Similarly, in the `excelExportComplete` event, you can revert the columns visibility back to the previous state.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields="taskFields" :columns="columns"
    :toolbar="toolbar" :toolbarClick="toolbarClick"
    :excelExportComplete="excelExportComplete" :allowExcelExport='true'
    :height="height" :treeColumnIndex="1"></ejs-gantt>
  </div>
</template>
<script>

  }
};

```

```

        var ganttObj =
document.getElementById('GanttContainer').ej2_instances[0];
        ganttObj.excelExport(excelExportProperties);
    },
    },
    };
    },
    provide: {
        gantt: [Toolbar, ExcelExport]
    }
    };
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/excel-export-cs8" %}

By default, material theme is applied to the exported Excel document.

#### Add header and footer

The Excel export also allows users to include header and footer contents to the exported Excel document.

#### APP.VUE

## Pdf Export

### Export

#### Pdf export in Vue Gantt component

PDF export allows exporting Gantt data to PDF document. You need to use the [pdfExport](#) method for exporting. To enable PDF export in the Gantt, set the [Link to the Video](#) to true.

To get a configured Gantt chart for exporting, you can follow the steps outlined in the video linked below:

To export data to PDF document, inject the PdfExport module in Gantt.

Note: Currently, we do not have support for exporting manually scheduled tasks.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields="taskFields" :toolbar="toolbar" :toolbarClick="toolbarClick"
    :allowPdfExport='true' :height="height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Toolbar, PdfExport, Selection } from "@syncfusion/ej2-
vue-gantt";
import { ClickEventArgs } from '@syncfusion/ej2-
navigations/src/toolbar/toolbar';
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      toolbar: ['PdfExport'],
      toolbarClick: (args) => {
        if (args.item.id === 'GanttContainer_pdfexport') {
          var ganttChart =
document.getElementById('app').ej2_instances[0];
          ganttChart.pdfExport();
        }
      },
    };
  },
  provide: {
    gantt: [Toolbar, PdfExport]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/gantt/pdf-export-cs13" %}

### Indicators in PDF exporting

The PDF export functionality allows users to export Gantt charts enriched with dynamic indicators and accompanying images.

These indicators, represented by images, can be effortlessly defined using the [base64](#) encoding value in the data object of datasource. This data object field should be mapped to indicator property of [task fields](#).

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields="taskFields" :toolbar="toolbar" :toolbarClick="toolbarClick"
    :allowPdfExport='true' :height="height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Toolbar, PdfExport, Selection } from "@syncfusion/ej2-
vue-gantt";
import { ClickEventArgs } from '@syncfusion/ej2-
navigations/src/toolbar/toolbar';
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
        indicators: 'Indicators'
      },
      toolbar: ['PdfExport'],
      toolbarClick: (args) => {
        if (args.item.id === 'GanttContainer_pdfexport') {
          var ganttChart =
document.getElementById('app').ej2_instances[0];
          ganttChart.pdfExport();
        }
      },
    };
  },
  provide: {
    gantt: [Toolbar, PdfExport]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/gantt/pdf-export-cs13" %}

### Exporting Gantt data as a blob object

In Gantt, you can export the Gantt chart data as a blob object, which allows you to preview or modify the data before exporting it.

To export the Gantt chart data as a blob object, follow these steps:

step 1: pdfExport fourth argument set as **true**.

step 2: Then , pdfExpComplete return as blob object.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :allowExcelExport='true' :excelExportComplete='excelExpComplete'
    :pdfExportComplete='pdfExportComplete' :taskFields="taskFields"
    :toolbar="toolbar" :toolbarClick="toolbarClick" :allowPdfExport='true'
    :height="height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Toolbar, PdfExport, Selection, ExcelExport } from
"@syncfusion/ej2-vue-gantt";
import { ClickEventArgs } from '@syncfusion/ej2-
navigations/src/toolbar/toolbar';
import { projectNewData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: projectNewData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      toolbar: ['PdfExport', 'ExcelExport'],
    };
  },
  methods: {
    toolbarClick: (args) => {
      var ganttChart =
document.getElementById('GanttContainer').ej2_instances[0];
      if (args.item.id === 'GanttContainer_pdfexport') {
        ganttChart.pdfExport(null, null, null, true);
      }
      if (args.item.id === 'GanttContainer_excelexport') {
        ganttChart.ganttObj.excelExport(excelExportProperties);
      }
    },
  },
}
```

```

        excelExpComplete: function (args) {
            //This event will be triggered when excel exporting.
            args.promise.then((e) => {
                //In this `then` function, we can get blob data through the
                arguments after promise resolved.
                this.exportBlob(e.blobData);
            });
        },
        pdfExportComplete: function (args) {
            //This event will be triggered when pdf exporting.
            args.promise.then((e) => {
                //In this `then` function, we can get blob data through the
                arguments after promise resolved.
                this.exportBlob(e.blobData);
            });
        },
        exportBlob: function (blob) {
            let a = document.createElement('a');
            document.body.appendChild(a);
            a.style.display = 'none';
            let url = window.URL.createObjectURL(blob);
            a.href = url;
            a.download = 'Export';
            a.click();
            window.URL.revokeObjectURL(url);
            document.body.removeChild(a);
        }
    },
    provide: {
        gantt: [Toolbar, PdfExport, Selection, ExcelExport]
    }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/exporting-gantt-blobdata-cs1" %}

### Single page exporting in gantt

In Gantt, we have provided support to export the Gantt component where each rows are auto-fit to the PDF document page width by setting [isFitToWidth](#) as true in `fitToWidthSettings` of `PdfExportProperties`.

Also, we can customize the chart width and grid width in exported file using [chartWidth](#) and [gridWidth](#) by defining it as percentage in string.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields="taskFields" :toolbar="toolbar" :toolbarClick="toolbarClick"
    :allowPdfExport='true' :height="height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";

```

```

import { GanttPlugin, Toolbar, PdfExport, Selection } from "@syncfusion/ej2-vue-gantt";
import { ClickEventArgs } from '@syncfusion/ej2-navigations/src/toolbar/toolbar';
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks',
      },
      toolbar: ['PdfExport'],
      toolbarClick: (args) => {
        if (args.item.id === 'GanttContainer_pdfexport') {
          var exportProperties = {
            fitToWidthSettings: {
              isFitToWidth: true,
            }
          };
          var ganttChart =
document.getElementById('app').ej2_instances[0];
          ganttChart.pdfExport(exportProperties);
        }
      },
    };
  },
  provide: {
    gantt: [Toolbar, PdfExport]
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/single-page" %}

### Exporting with column template

The PDF export functionality allows to export Grid columns that include images, hyperlinks, and custom text to an PDF document using [pdfQueryCellInfo](#) event.

In the following sample, the hyperlinks and images are exported to PDF using [hyperlink](#) and [image](#) properties in the [pdfQueryCellInfo](#) event.

Note: PDF Export supports base64 string to export the images.

### APP.VUE

  },
  provide: {
    gantt: [Toolbar, PdfExport]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/gantt/pdf-export-cs2" %}

### How to change page size

Page size can be customized for the exported document using the property `pdfExportProperties.pageSize`.

The supported page sizes are:

- Letter
- Note
- Legal
- A0
- A1
- A2
- A3
- A5
- A6
- A7
- A8
- A9
- B0
- B1
- B2
- B3
- B4
- B5
- Archa
- Archb
- Archc
- Archd
- Arche
- Flsa
- HalfLetter
- Letter11x17
- Ledger

### APP.VUE

</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/pdf-export-cs3" %}

[Export current view data](#)

PDF export provides an option to export the current view data into PDF. To export current view data alone, define the `exportType` to `CurrentViewData`.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields="taskFields" :toolbar="toolbar" :toolbarClick="toolbarClick"
:allowPdfExport='true' :height="height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Toolbar, PdfExport, Selection, Filter,
PdfExportProperties } from "@syncfusion/ej2-vue-gantt";
import { ClickEventArgs } from '@syncfusion/ej2-
navigations/src/toolbar/toolbar';
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {

```

```

data: function() {
  return{
    data:editingData,
    height:'450px',
    taskFields: {
      id: 'TaskID',
      name: 'TaskName',
      startDate: 'StartDate',
      duration: 'Duration',
      progress: 'Progress',
      child: 'subtasks'
    },
    toolbar: ['PdfExport'],
    toolbarClick: (args) => {
      if (args.item.id === 'GanttContainer_pdfexport') {
        var exportProperties: PdfExportProperties = {
          exportType: 'CurrentViewData'
        };
        var ganttChart =
document.getElementById('GanttContainer').ej2_instances[0];
        ganttChart.pdfExport(exportProperties);
      }
    },
  };
},
provide: {
  gantt: [Toolbar, PdfExport]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/pdf-export-cs4" %}

#### Enable footer

By default, we render the default footer for a PDF file, this can be enabled or disabled by using the `enableFooter` property.

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields="taskFields" :toolbar="toolbar" :toolbarClick="toolbarClick"
:allowPdfExport='true' :height="height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Toolbar, PdfExport, Selection, PdfExportProperties }
from "@syncfusion/ej2-vue-gantt";
import { ClickEventArgs } from '@syncfusion/ej2-
navigations/src/toolbar/toolbar';
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {

```

```

return{
  data:editingData,
  height:'450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  toolbar: ['PdfExport'],
  toolbarClick: (args) => {
    if (args.item.id === 'GanttContainer_pdfexport') {
      var exportProperties: PdfExportProperties = {
        enableFooter: false
      };
      var ganttChart =
document.getElementById('GanttContainer').ej2_instances[0];
      ganttChart.pdfExport(exportProperties);
    }
  },
};
},
provide: {
  gantt: [Toolbar, PdfExport]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/pdf-export-cs5" %}

#### [Export hidden columns](#)

PDF export provides an option to export hidden columns of Gantt by defining the `includeHiddenColumn` to `true`.

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields="taskFields" :columns="columns" :toolbar="toolbar"
:toolbarClick="toolbarClick" :allowPdfExport='true' :height="height"></ejs-
gantt>
  </div>
</template>
<script>

navigations/src/toolbar/toolbar';
import { ganttData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {

```

```

return{
  data: ganttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  columns: [
    { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
    { field: 'TaskName', headerText: 'Task Name', width: '150',
visible: false },
    { field: 'StartDate', headerText: 'Start Date', width: '150' },
    { field: 'Duration', headerText: 'Duration', width: '150' },
    { field: 'Progress', headerText: 'Progress', width: '150' },
  ],
  toolbar: ['PdfExport'],
  toolbarClick: (args) => {
    if (args.item.id === 'GanttContainer_pdfexport') {
      var exportProperties: PdfExportProperties = {
        includeHiddenColumn: true
      };
      var ganttChart =
document.getElementById('GanttContainer').ej2_instances[0];
      ganttChart.pdfExport(exportProperties);
    }
  },
};
},
provide: {
  gantt: [Toolbar, PdfExport]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/pdf-export-cs6" %}

#### Export predecessor lines

By using `showPredecessorLines`, you can hide or show predecessor lines in the exported PDF document.

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields="taskFields" :columns="columns" :toolbar="toolbar"
:toolbarClick="toolbarClick" :allowPdfExport='true' :height="height"></ejs-
gantt>
  </div>
</template>
<script>

```

```

import Vue from "vue";
import { GanttPlugin, Toolbar, PdfExport, Selection, PdfExportProperties }
from "@syncfusion/ej2-vue-gantt";
import { ClickEventArgs } from '@syncfusion/ej2-
navigations/src/toolbar/toolbar';
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '150' },
        { field: 'StartDate', headerText: 'Start Date', width: '150',
visible: false },
        { field: 'Duration', headerText: 'Duration', width: '150' },
        { field: 'Progress', headerText: 'Progress', width: '150' },
      ],
      toolbar: ['PdfExport'],
      toolbarClick: (args) => {
        if (args.item.id === 'GanttContainer_pdfexport') {
          var exportProperties: PdfExportProperties = {
            showPredecessorLines: true
          };
          var ganttChart =
document.getElementById('GanttContainer').ej2_instances[0];
          ganttChart.pdfExport(exportProperties);
        }
      },
    };
  },
  provide: {
    gantt: [Toolbar, PdfExport]
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/pdf-export-cs7" %}

[Show or hide columns on exported PDF](#)

You can show a hidden column or hide a visible column while exporting the Gantt using the [toolbarClick](#) and [beforePdfExport](#) events.

You can show or hide columns by setting the `column.visible` property to `true` or `false` respectively.

In the following example, there is a hidden column **Duration** in the Gantt. While exporting, we have changed **Duration** to visible column and **StartDate** to hidden column.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields="taskFields" :columns="columns" :toolbar="toolbar"
    :toolbarClick="toolbarClick" :allowPdfExport='true'
    :beforePdfExport="beforePdfExport" :height="height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Toolbar, PdfExport, Selection } from "@syncfusion/ej2-
vue-gantt";
import { ClickEventArgs } from '@syncfusion/ej2-
navigations/src/toolbar/toolbar';
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '150' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Duration', headerText: 'Duration', width: '150',
visible: false },
        { field: 'Progress', headerText: 'Progress', width: '150' },
      ],
      toolbar: ['PdfExport'],
      toolbarClick: (args) => {
        if (args.item.id === 'GanttContainer_pdfexport') {
          var ganttChart =
document.getElementById('GanttContainer').ej2_instances[0];
          ganttChart.pdfExport();
        }
      },
      beforePdfExport : (args) => {
        var obj =
(document.getElementById('GanttContainer')).ej2_instances[0]
        obj.treeGrid.columns[3].visible = true;
        obj.treeGrid.columns[2].visible = false;
      }
    }
  }
}
```

```

    };
  },
  provide: {
    gantt: [Toolbar, PdfExport]
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/pdf-export-cs8" %}

### Conditional cell formatting

TreeGrid cells in the exported PDF can be customized or formatted using the [pdfQueryCellInfo](#) event. In this event, you can format the treegrid cells of exported PDF document based on the column cell value.

In the following sample, the background color is set for **Progress** column in the exported document by using the **args.style** and **backgroundColor** properties.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields="taskFields" :columns="columns" :toolbar="toolbar"
    :toolbarClick="toolbarClick" :allowPdfExport='true'
    :pdfQueryCellInfo="pdfQueryCellInfo" :height="height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";

PdfQueryTimelineCellInfoEventArgs } from "@syncfusion/ej2-vue-gantt";
import { ClickEventArgs } from '@syncfusion/ej2-
navigations/src/toolbar/toolbar';
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data:editingData,
      height:'450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '150' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Duration', headerText: 'Duration', width: '150',
visible: false },
        { field: 'Progress', headerText: 'Progress', width: '150' },

```

```

    ],
    toolbar: ['PdfExport'],
    toolbarClick: (args) => {
        if (args.item.id === 'GanttContainer_pdfexport') {
            var ganttChart =
document.getElementById('GanttContainer').ej2_instances[0];
            ganttChart.pdfExport();
        }
    },
    pdfQueryCellInfo: (args) => {
        if (args.column.field === 'Progress') {
            if (args.value < 50) {
                args.style = {backgroundColor: '#F08080'};
            } else {
                args.style = {backgroundColor: '#A569BD'};
            }
        }
    }
};

},
provide: {
    gantt: [Toolbar, PdfExport]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/pdf-export-cs9" %}

#### Timeline cell formatting

Timeline cells in the exported PDF document can be customized or formatted using the [pdfQueryTimelineCellInfo](#) event.

In the following sample, the header background color is set for timeline cells in the exported document by using the `args.headerBackgroundColor` property.

#### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields="taskFields"
:columns="columns" :toolbar="toolbar" :toolbarClick="toolbarClick"

```

### Customized Theme

PDF export provides an option to customize the Gantt style in the exported PDF documents.

To customize the Gantt style in exported PDF, define the 'ganttStyle' in `pdfExportProperties`.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields="taskFields" :toolbar="toolbar" :toolbarClick="toolbarClick"
    :allowPdfExport='true' :height="height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Toolbar, PdfExport, Selection, PdfExportProperties }
from "@syncfusion/ej2-vue-gantt";
import { PdfColor, PdfPaddings } from '@syncfusion/ej2-pdf-export';
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },

*Customizing header and footer of PDF export in ##Platform\_Name## Gantt control*

PDF export provides an option to specify and customize text, page number, line and image in header and footer of exported PDF document by using [pdfExportProperties](#).

[Write a text in header and footer](#)

This functionality helps to customize the text that appears in the header or footer sections of a PDF document. Text can be added to [header](#) or [footer](#) of exported PDF document by using [pdfExportProperties](#).

- **type** property in the content array indicates the content type, such as 'Text'.
- **Value** property determines the text.
- **Position** property determines the horizontal and vertical positions of the text element.
- **style** property define the visual styling properties for the text element

`ts

```

let exportProperties: PdfExportProperties = {
header: {
fromTop: 0,
height: 130,
contents: [
{
type: 'Text',

```

```

value: 'INVOICE',
position: { x: 380, y: 0 },
style: { textBrushColor: '#C25050', fontSize: 25 },
},
]
}
,

```

#### Draw a line in header and footer

This functionality helps to customize the line that appears in the header or footer sections of the PDF document. A line can be added to [header](#) or [footer](#) of the exported PDF document by using [pdfExportProperties](#).

- **type** determines content type, such as 'Line'.
- **style** is used to set properties like the color (penColor), size (penSize), and style (dashStyle) of the line.
- **points** specifies the coordinates for the start and end points of the line.

Supported line styles:

- dash
- dot
- dashdot
- dashdotdot
- solid

```

`ts
let exportProperties: PdfExportProperties = {
header: {
fromTop: 0,
height: 130,
contents: [
{
type: 'Line',
style: { penColor: '#000080', penSize: 2, dashStyle: 'Solid' },
points: { x1: 0, y1: 4, x2: 685, y2: 4 }
}
]
}

```

```
}
,
```

### Add page number in header and footer

This feature allows to customize the page number that appears in the header or footer sections of the PDF document. Page numbers can be added in [header](#) or [footer](#) of the exported PDF document by using [pdfExportProperties](#).

- `type` indicates that the content is a page number.
- `pageNumberType` specifies the type of numbering to be used.
- `format` is an optional attribute that allows you to customize the text format of the page number.
- `position` defines the coordinates (x, y) where the page number will be located.
- `style` sets the styling properties of the page number text, such as color (`textBrushColor`), font size (`fontSize`), and horizontal alignment (`hAlign`).

Supported page number types:

- LowerLatin - a, b, c,
- UpperLatin - A, B, C,
- LowerRoman - i, ii, iii,
- UpperRoman - I, II, III,
- Number - 1,2,3.

```
`ts
```

```
let exportProperties: PdfExportProperties = {
  header: {
    fromTop: 0,
    height: 130,
    contents: [
      {
        type: 'PageNumber',
        pageNumberType: 'Arabic',
        format: 'Page ${current} of ${total}', //optional
        position: { x: 0, y: 25 },
        style: { textBrushColor: '#ffff80', fontSize: 15, hAlign: 'Center' }
      }
    ]
  }
}
```

### Insert an image in header and footer

This feature allows to customize the image that appears in the header or footer sections of the PDF document. Image (Base64 string) can be added in the exported document in [header](#) or [footer](#) of the exported PDF document by using [pdfExportProperties](#).

- `type` indicates that the content is an image.
- `src` specifies the source of the image, which should be Base64 string.
- `Position` determines the horizontal and vertical positions of the image will be located.
- `size` sets the dimensions of the image.

Note: PDF Export supports base64 string to export the images.

```
`ts
// Replace it with a valid Base64-encoded image.
let image: string = "/9j/4AAQSkZJRgABAQEAAeAB4AAD..."
let exportProperties: PdfExportProperties = {
  header: {
    fromTop: 0,
    height: 130,
    contents: [
      {
        type: 'Image',
        src: image,
        position: { x: 40, y: 10 },
        size: { height: 100, width: 250 },
      }
    ]
  }
}
```

The below code illustrates the pdf export customization.

### APP.VUE

```

### Context menu in Vue Gantt component

The Gantt control allows you to perform quick actions by using context menu. When right-clicking the context menu, the context menu options are shown. To enable this feature, set the [enableContextMenu](#) to true. The default context menu options are enabled using the [editSettings](#) property. The context menu options can be customized using the [contextMenuItems](#) property.

To use the context menu, inject the [ContextMenu](#) module in the `provide` section.

The default items are listed in the following table.

Items	Description
AutoFit	Auto-fits the current column.
AutoFitAll	Auto-fits all columns.
SortAscending	Sorts the current column in ascending order.
SortDescending	Sorts the current column in descending order.
TaskInformation	Edits the current task.
Add	Adds a new row to the Gantt.
Indent	Indent the selected record to one level.
Outdent	Outdent the selected record to one level.
DeleteTask	Deletes the current task.
Save	Saves the edited task.

**Cancel** | Cancels the edited task.

**DeleteDependency** | Deletes the current dependency task link.

**Convert** | Converts current task to milestone or vice-versa.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="contextMenu" :dataSource="data"
      :taskFields = "taskFields" :height = "height" :editSettings="editSettings"
      :enableContextMenu="true" :allowSorting="true" :allowResizing= "true"></ejs-
gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, ContextMenu, Edit, Sort, Resize, Selection } from
"@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
      },
      editSettings: {
        allowAdding: true,
        allowEditing: true,
        allowDeleting: true
      }
    };
  },
  provide: {
    gantt: [ ContextMenu, Edit, Sort, Resize, Selection]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/gantt/contextmenu-cs1" %}

### Custom context menu items

The custom context menu items can be added by defining the [contextMenuItems](#) as a collection of [contextMenuItemModel](#). Actions for the customized items can be defined in the [contextMenuClick](#) event and the visibility of customized items can be defined in the [contextMenuOpen](#) event.

To create custom context menu items for header area, define the target property as `.e-gridheader`.

The following sample shows context menu item for parent rows to expand or collapse child rows in the content area and a context menu item to hide columns in the header area.

#### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="customContextMenu" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :editSettings="editSettings"
    :enableContextMenu="true" :allowSorting="true" :allowResizing= "true"
    :contextMenuItems="contextMenuItems" :contextMenuClick = "contextMenuClick"
    :contextMenuOpen="contextMenuOpen"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, ContextMenu, Edit, Sort, Resize, Selection } from
"@syncfusion/ej2-vue-gantt";

Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
      },
      editSettings: {
        allowAdding: true,
        allowEditing: true,
        allowDeleting: true
      },
      contextMenuItems: ['AutoFitAll', 'AutoFit', 'TaskInformation',
        'DeleteTask', 'Save', 'Cancel', 'SortAscending', 'SortDescending', 'Add',
        'DeleteDependency', 'Convert',
        { text: 'Collapse the Row', target: '.e-content', id: 'collapserow'
      },
        { text: 'Expand the Row', target: '.e-content', id: 'expandrow' },
        { text: 'Hide Column', target: '.e-gridheader', id: 'hidecols' }
      ],
    };
  },
  provide: {
    gantt: [ ContextMenu, Edit, Sort, Resize, Selection]
  },
  methods: {
    contextMenuClick: function (args) {
      var record = args.rowData;
```

```

var ganttObj =
document.getElementById('customContextMenu').ej2_instances[0];
if (args.item.id === 'collapserow') {
    ganttObj.collapseByID(Number(record.ganttProperties.taskId));
}
if (args.item.id === 'expandrow') {
    ganttObj.expandByID(Number(record.ganttProperties.taskId));
}
if (args.item.id === 'hidecols') {
    ganttObj.hideColumn(args.column.headerText);
}
},
contextMenuOpen: function (args) {
var record = args.rowData;
if (args.type !== 'Header') {
    if (!record.hasChildRecords) {
        args.hideItems.push('Collapse the Row');
        args.hideItems.push('Expand the Row');
    } else {
        if (record.expanded) {
            args.hideItems.push("Expand the Row");
        } else {
            args.hideItems.push("Collapse the Row");
        }
    }
}
}
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/customContextMenu-cs1" %}

You can show an specific item in context menu for header/content area in the Gantt control by defining the **target** property.

### Touch interaction

To perform **long press** action on a row, [context menu](#) is opened, and then tap a menu item to trigger its action.

### State persistence in Vue Gantt component

State persistence refers to the Gantt's state maintained in the browser's [localStorage](#) even if the browser is refreshed or if you move to the next page within the browser.

State persistence stores gantt's model object in the local storage when the [enablePersistence](#) is defined as true.

### Get or set localStorage value

If the [enablePersistence](#) property is set to true, the gantt property value is saved in the `window.localStorage` for reference. You can get/set the localStorage value by using the `getItem/setItem` method in the `window.localStorage`.

```
`ts
```

```
//get the Gantt model.
```

```
let value: string = window.localStorage.getItem('ganttGantt'); //"ganttGantt" is component name +
component id.
```

```
let model: Object = JSON.parse(model);
```

```
,
```

```
`ts
```

```
//set the Gantt model.
```

```
window.localStorage.setItem('ganttGantt', JSON.stringify(model)); //"ganttGantt" is component name +
component id.
```

```
,
```

You can refer to our [Vue Gantt](#) feature tour page for its groundbreaking feature representations. You can also explore our [Vue Gantt example](#) to know how to present and manipulate data.

### Prevent columns from persisting

When the [enablePersistence](#) property is set to true, the Gantt properties such as [Filtering](#), [Sorting](#), and [Columns](#) will persist. You can use the `addOnPersist` method to prevent these Gantt properties from persisting.

The following example demonstrates how to prevent Gantt columns from persisting. In the [dataBound](#) event of the Gantt, you can override the `addOnPersist` method and remove the columns from the key list given for persistence.

Note: When the `enablePersistence` property is set to true, the Gantt features such as column template, column formatter, header text, and value accessor will not persist.

### APP.VUE

```
<template>
  <div id="app">
    <button id="add" @click="clickAdd">Add Columns</button>
    <button id="remove" @click="clickRemove">Remove Columns</button>
    <br /><br />
    <ejs-gantt ref="gantt" :dataSource='data' :enablePersistence='true'
height='230px' id="Gantt" :taskFields = "taskFields" :dataBound='dataBound'>
      <e-columns>
        <e-column field='TaskID' headerText='Task ID'
textAlign='Right' width=120></e-column>
        <e-column field='TaskName' headerText='Task Name'
width=150></e-column>
        <e-column field='StartDate' headerText='Start Date'
width=150 ></e-column>
        <e-column field='Duration' headerText='Duration' width=150
></e-column>
      </e-columns>
    </ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { projectNewData } from './data-source.js';
Vue.use(GanttPlugin);
```

```

export default {
  data() {
    return {
      data: projectNewData,
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      }
    };
  },
  methods: {
    dataBound: function () {
      let cloned = this.$refs.gantt.ej2Instances.addOnPersist;
      this.$refs.gantt.ej2Instances.addOnPersist = function (key: any) {
        key = key.filter((item) => item !== "columns");
        return cloned.call(this, key);
      };
    },
    clickAdd: function () {
      let obj = { field: "Progress", headerText: 'Progress', width: 100 };
      this.$refs.gantt.ej2Instances.columns.push(obj); //you can add the columns by using the Gantt columns method
      this.$refs.gantt.ej2Instances.treeGrid.refreshColumns();
    },
    clickRemove: function () {
      this.$refs.gantt.ej2Instances.columns.pop();
      this.$refs.gantt.ej2Instances.treeGrid.refreshColumns();
    }
  }
}
</script>
<style>
</style>

```

{% previewsample "page.domainurl/code-snippet/gantt/column-prevent-cs1" %}

### Persist the header template and header Text

By default, the Gantt properties such as column template, header text, header template, column formatter, and value accessor will not persist when [enablePersistence](#) is set to true. Because the column template and header text can be customized at the application level.

If you wish to restore all these column properties, then you can achieve it by cloning the gantt columns property using JavaScript Object's assign method and storing this along with the persist data manually. While restoring the settings, this column object must be assigned to the gantt's columns property to restore the column settings as demonstrated in the following sample.

### APP.VUE

```

<template>
  <div id="app">
    <button id="restore" @click="clickRestore">Restore</button>
    <br /><br />
  </div>
</template>

```

```

    <ejs-gantt ref="gantt" :dataSource='data' :enablePersistence='true'
height='230px' id="Gantt" :taskFields = "taskFields">
    <e-columns>
        <e-column field='TaskID' headerText='Task ID'
textAlign='Right' width=120></e-column>
        <e-column field='TaskName' headerText='Task Name' width=150
:headerTemplate="hTemplate"></e-column>
        <e-column field='StartDate' headerText='Start Date'
width=150 ></e-column>
        <e-column field='Duration' headerText='Duration' width=150
></e-column>
    </e-columns>
</ejs-gantt>
</div>
</template>

### Accessibility in Vue Gantt component

The Gantt component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Gantt component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation | 

|

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The Gantt component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Gantt component:

The following ARIA attributes are used in Gantt:

| Attributes | Purpose |

| --- | --- |

| **grid (role)** | This attribute is added to the **e-table** element present in the Gantt, which represents Grid part |

| **gridcell (role)** | This attribute is added to the **td** elements present within the **e-table**, which represents the work cells of Gantt |

| **columnheader (role)** | This attribute is added to the **th** elements within the **e-table**, which represents the header cells of Grid table |

| **separator (role)** | This attribute is added to the **e-split-bar** element, which represents the splitter between the Grid table and Chart |

| **dialog (role)** | This attribute is added to the **e-dialog** element, which represents the pop-up dialog |

| **toolbar (role)** | This attribute is added to the **e-gantt-toolbar** element, which represents the toolbars of Gantt |

| **aria-label** | It indicates the element's information  
It is assigned to the Gantt UI elements such as timeline cell, taskbar, left label, right label, dependency line, and event markers. |

| **aria-selected** | This attribute is assigned to the Gantt chart row, and it defaults to **false**. The value is changed to **true** when the user selects a grid cell or task |

| **aria-expanded** | This attribute is assigned to the Gantt chart parent task row. The value is changed to **true** when the user clicks a parent taskbar to expand. After the user clicked a parent taskbar to collapse, the attribute value is changed to **false** |

| **aria-grabbed** | This attribute is assigned to the taskbars of Gantt when the user tries to achieve taskbar editing |

### Keyboard navigation

The Gantt component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Gantt component.

| **Press** | **To do this** |

| --- | --- |

| **Home** | Selects the first row. |

| **End** | Selects the last row. |

| **DownArrow** | Moves the cell focus/row or cell selection downward. |

| **UpArrow** | Moves the cell focus/row or cell selection upward. |

| **LeftArrow** | Moves the cell focus/row or cell selection left side. |

| **RightArrow** | Moves the cell focus/row or cell selection right side. |

| **Ctrl + Up Arrow** | Collapses all tasks. |

| **Ctrl + Down Arrow** | Expands all tasks. |

| **Ctrl + Shift + Up Arrow** | Collapses the selected row. |

| **Ctrl + Shift + Down Arrow** | Expands the selected row. |

| **Enter** | Saves request. |

| **Esc** | Cancels request. |

| **Insert** | Adds a new row. |

| **Ctrl + Insert** | Opens addRowDialog. |

| **Ctrl + F2** | Opens editRowDialog. |

- | Delete | Deletes the selected row. |
- | Shift + F5 | FocusTask |
- | Ctrl + Shift + F | Focus search |
- | Shift + DownArrow | Extends the row/cell selection downwards. |
- | Shift + UpArrow | Extends the row/cell selection upwards. |
- | Shift + LeftArrow | Extends the cell selection to the left side. |
- | Shift + RightArrow | Extends the cell selection to the right side. |
- | Tab / Shift + Tab | To focus the close icon in the message. |
- | Alt + j | Focus Gantt component. |

### Ensuring accessibility

The Gantt component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Gantt component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Gantt component with accessibility tools.

```
{% previewsample "https://ej2.syncfusion.com/accessibility/gantt.html" %}
```

## Global local in Vue Gantt component

### Localization

The [Localization](#) library allows you to localize default text content of the Gantt.

The Gantt component has static text on some features (like toolbar area text, etc.) that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [locale](#) value and translation object.

The following list of properties and its values are used in the Gantt.

Locale key words |Text

emptyRecord |No records to display

id |ID

name |Name

startDate |Start Date

endDate |End Date

duration |Duration

progress |Progress

dependency |Dependency

notes | Notes

baselineStartDate | Baseline Start Date

baselineEndDate | Baseline End Date

type | Type

offset | Offset

resourceName | Resources

resourceID | Resource ID

day | day

hour | hour

minute | minute

days | days

hours | hours

minutes | minutes

generalTab | General

customTab | Custom Columns

writeNotes | Write Notes

addDialogTitle | New Task

editDialogTitle | Task Information

add | Add

edit | Edit

update | Update

delete | Delete

cancel | Cancel

search | Search

task | task

tasks | tasks

zoomIn | Zoom in

zoomOut | Zoom out

zoomToFit | Zoom to fit

expandAll | Expand all

collapseAll | Collapse all

nextTimeSpan | Next timespan

prevTimeSpan | Previous timespan

saveButton | Save

taskBeforePredecessor\_FS | You moved "{0}" to start before "{1}" finishes and the two tasks are linked. As the result, the links cannot be honored. Select one action below to perform

taskAfterPredecessor\_FS | You moved "{0}" away from "{1}" and the two tasks are linked. As the result, the links cannot be honored. Select one action below to perform

taskBeforePredecessor\_SS | You moved "{0}" to start before "{1}" starts and the two tasks are linked. As the result, the links cannot be honored. Select one action below to perform

taskAfterPredecessor\_SS | You moved "{0}" to start after "{1}" starts and the two tasks are linked. As the result, the links cannot be honored. Select one action below to perform

taskBeforePredecessor\_FF | You moved "{0}" to finish before "{1}" finishes and the two tasks are linked. As the result, the links cannot be honored. Select one action below to perform

taskAfterPredecessor\_FF | You moved "{0}" to finish after "{1}" finishes and the two tasks are linked. As the result, the links cannot be honored. Select one action below to perform

taskBeforePredecessor\_SF | You moved "{0}" away from "{1}" to starts and the two tasks are linked. As the result, the links cannot be honored. Select one action below to perform

taskAfterPredecessor\_SF | You moved "{0}" to finish after "{1}" starts and the two tasks are linked. As the result, the links cannot be honored. Select one action below to perform

okText | Ok

confirmDelete | Are you sure you want to Delete Record?

from | From

to | To

taskLink | Task Link

lag | Lag

start | Start

finish | Finish

enterValue | Enter the value

taskInformation | Task Information

deleteTask | Delete Task

deleteDependency | Delete Dependency

convert | Convert

save | Save

above | Above

below | Below

child | Child

milestone | Milestone

toTask | To Task

toMilestone | To Milestone

eventMarkers | Event markers

leftTaskLabel | Left task label

rightTaskLabel | Right task label

timelineCell | Timeline cell

confirmPredecessorDelete | Are you sure you want to remove dependency link?taskMode | Task Mode

changeScheduleMode | Change Schedule Mode

subTasksStartDate | SubTasks Start Date

subTasksEndDate | SubTasks End Date

scheduleStartDate | Schedule Start Date

scheduleEndDate | Schedule End Date

auto | Auto

zoomToFit | Zoom to fit

excelExport | Excel export

csvExport | CSV export

pdfExport | Pdf export

unit | Unit

work | Work

taskType | Task Type

unassignedTask | Unassigned Task

group | Group

*Loading translations*

To load translation object in an application use [load](#) function of [L10n](#) class.

The below example demonstrates the Gantt in **Deutsch** culture.

#### **APP.VUE**

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" locale = "de-DE"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { L10n, setCulture } from '@syncfusion/ej2-base';
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { projectNewData } from './data-source.js';
setCulture('de-DE');
L10n.load({
```

```

    'de-DE': {
      'gantt': {
        "id": "Ich würde",
        "name": "Name",
        "startDate": "Anfangsdatum",
        "duration": "Dauer",
        "progress": "Fortschritt",
      }
    }
  });
Vue.use(GanttPlugin);
export default {
  data: function() {
    return {
      data: projectNewData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      }
    };
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/global-cs1" %}

### Internationalization

The [Internationalization](#) library is used to globalize number, date, and time values in gantt component.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" locale = "de-DE"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { L10n, loadCldr, setCulture } from '@syncfusion/ej2-base';
import * as cagregorian from './ca-gregorian.js';
import * as numbers from './numbers.js';
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { projectNewData } from './data-source.js';
setCulture('de-DE');
L10n.load({
  'de-DE': {
    'gantt': {
      "id": "Ich würde",
      "name": "Name",
      "startDate": "Anfangsdatum",

```

```

        "duration": "Dauer",
        "progress": "Fortschritt",
    }
}
});
loadCldr(cagregorian,numbers);
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: projectNewData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      }
    };
  }
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/global-cs2" %}

\* In the above sample, **Timeline** is formatted by **NumberFormatOptions** and **DateFormatOptions**.

\* By default, **locale** value is **en-US**. If you want to change **en-US** culture, then set the **locale**.

### Right to left (RTL)

RTL provides an option to switch the text direction and layout of the Gantt component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Urdu, etc.). To enable RTL Gantt, set the **enableRtl** to true.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :toolbar='toolbar'
    :enableRtl='true' locale = "ar-AE"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { L10n, loadCldr, setCulture } from '@syncfusion/ej2-base';
import { GanttPlugin, Toolbar } from "@syncfusion/ej2-vue-gantt";
import { projectNewData } from './data-source.js';
setCulture('ar-AE');
L10n.load({
  'ar-AE': {
    "gantt": {
      "emptyRecord": "لا سجلات لعرضها",
      "id": "هوية شخصية",
    }
  }
});

### Style and appearance in Vue Gantt component

To modify the Gantt Chart appearance, you need to override the default CSS of gantt chart. Please find the list of CSS classes and its corresponding section in Gantt Chart. Also, you have an option to create your own custom theme for all the JavaScript controls using our [Theme Studio](#).

Section | CSS Class | Purpose of Class

**Root** | e-gantt | This class is in the root element (div) of the gantt chart control.

**Header** | e-gridheader | This class is added in the root element of header element. In this class, You can override thin line between header and content of the gantt chart.

| e-table | This class is added at 'table' of the gantt chart header. This CSS class makes table width as 100 %.

| e-columnheader | This class is added at 'tr' of the gantt chart header.

**Grid Content** | e-gridcontent | This class is added at root of body content. This is to override background color of the body.

| e-table | This class is added to table of content. This CSS class makes table width as 100 %.

| e=row | This class is added to rows of gantt chart.

**|e-altrow** | This class is added to alternate rows of gantt chart. This is to override alternate row color of the gantt chart.

**|e-rowcell** | This class is added to all cells in the gantt chart. This is to override cells appearance and styling.

**Chart Content** |e-gantt-chart| This class is added to the chart side of the gantt chart.

**|e-chart-row** | This class is added to rows of gantt chart.

**Timeline** |e-timeline-header-container| This class is added to timeline of the gantt chart.

**|e-header-cell-label** | This class is added to the header cell of the timeline.

**|e-weekend-header-cell** | This class is added to the weekend cells.

**Taskbar** |e-taskbar-main-container| This class is added to taskbar of the gantt chart.

**|e-gantt-parent-taskbar** | This class is added to the parent task bar of the gantt chart.

**|e-gantt-milestone** | This class is added to the milestone tasks of the gantt chart.

**|e-gantt-unscheduled-taskbar** | This class is added to the unscheduled tasks.

**|e-gantt-manualparenttaskbar** | This class is added to the manual scheduled parent taskbar.

**|e-gantt-child-manualtaskbar** | This class is added to the manual scheduled child taskbar.

**|e-gantt-unscheduled-manualtask** | This class is added to the manual unscheduled tasks.

**Splitter** |e-split-bar| This class is added to the gantt chart splitter.

**|e-resize-handler** | This class is added to the resize handler of the gantt chart splitter.

**|e-arrow-left** | This class is added to the left arrow of the resize handler.

**|e-arrow=right** | This class is added to the right arrow of the resize handler.

**Connector Lines** |e-line| This class is added to the connector lines.

**|e-connector-line-right-arrow** | This class is added to the right arrow of the connector line.

**|e-connector-line-left-arrow** | This class is added to the left arrow of the connector line.

**Labels** |e-task-label| This class is added to the task labels.

**|e-right-label-container** | This class is added to the right label.

**|e-left-label-container** | This class is added to the left label.

**Event Markers** |e-event-markers| This class is added to the event markers.

**Baseline** |e-baseline-bar| This class is added to the baseline.

**|e-baseline-gantt-milestone-container** | This class is added to the baseline of milestone tasks.

**Tooltip** |e-gantt-tooltip| This class is added to the tooltip.

### Grid lines

In Gantt component, you can show or hide the grid lines in the TreeGrid side and chart side by using the [gridLines](#) property.

The following options are available in Gantt component for rendering grid lines,

- Horizontal: The horizontal grid lines alone will be visible.
- Vertical: The vertical grid lines alone will be visible.
- Both: Both the horizontal and vertical grid lines will be visible on the TreeGrid and chart sides.
- None: Gridlines will not be visible on TreeGrid and chart sides.

By default, the [gridLines](#) property is set with **Horizontal** type.

The following code example shows how to change the gridlines rendering mode in the Gantt component.

#### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:height = "height" :taskFields = "taskFields" :gridLines="gridLines"></ejs-
gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
      },
      gridLines : 'Both',
    };
  },
};
</script>
```

{% previewsample "page.domainurl/code-snippet/gantt/appearance-customization-cs7" %}

#### Timezone in Vue Gantt component

The Gantt makes use of the current system time zone by default. If it needs to follow some other user-specific time zone, then the **timezone** property needs to be used.

#### Understanding date manipulation in JavaScript

The **new Date()** in JavaScript returns the exact current date object with complete time and timezone information. For example, it may return value such as **Wed Dec 12 2018 05:23:27 GMT+0530 (India Standard Time)** which indicates that the current date is December 12, 2018 and the current time is 5.23 AM on browsers following the IST timezone.

Display same time everywhere with no time difference

Setting **timezone** to UTC for Gantt will display the same time as in the database for all the users in different time zone.

### APP.VUE

```
<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields="taskFields" :height="height" :includeWeekend="true"
    :timelineSettings="timelineSettings" :timezone="timezone"
    :durationUnit="durationUnit" :dateFormat="dateFormat"
    >
    </ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Selection } from "@syncfusion/ej2-vue-gantt";
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          TaskID: 1,
          TaskName: 'Project Initiation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 2, TaskName: 'Site location', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
          ]
        },
        {
          TaskID: 5,
          TaskName: 'Project Estimation',
          StartDate: new Date('04/02/2019'),
          EndDate: new Date('04/21/2019'),
          subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 }
          ]
        }
      ],
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',

```

```

        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
    },
    timelineSettings: {
        timelineUnitSize: 65,
        topTier: {
            unit: "Day",
            format: "MMM dd, yyyy",
        },
        bottomTier: {
            unit: "Hour",
            format: "hh:mm a",
        },
    },
    dateFormat: "hh:mm a",
    selectionSettings: {
        mode: 'Both',
    },
    durationUnit: "Hour",
    timezone: "UTC"
};
},
provide: {
    gantt: [ Selection ]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/timezone-cs1" %}

### CRUD operations with timezone

CRUD operations can be performed with timezone, and the gantt is rendered based on the timezone specified in the load time. All the editing actions will be done based on the user timezone, but on database save action, we have reversed this conversion to local time and provided data to client side events for the better understanding. Refer to the following code example.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
      :taskFields="taskFields" :height="height" :includeWeekend="true"
      :editSettings="editSettings" :timelineSettings="timelineSettings"
      :timezone="timezone" :durationUnit="durationUnit" :dateFormat="dateFormat"
      :actionComplete= "actionComplete"
    >
    </ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Selection, Edit } from "@syncfusion/ej2-vue-gantt";

```

```
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: [
        {
          taskID: 1,
          taskName: 'Project Schedule',
          startDate: new Date('02/04/2019 08:00'),
          endDate: new Date('03/10/2019')
        },
        {
          taskID: 2,
          taskName: 'Planning',
          startDate: new Date('02/04/2019 08:00'),
          endDate: new Date('02/10/2019'),
          parentID: 1
        },
        {
          taskID: 3,
          taskName: 'Plan timeline',
          startDate: new Date('02/04/2019 08:00'),
          endDate: new Date('02/10/2019'),
          duration: 6,
          progress: '60',
          parentID: 2
        },
        {

## Timezone methods

### offset

This method is used to calculate the difference between passed UTC date and timezone.

Parameters	Type	Description
----- -----	-----	-----
Date	Date	UTC time as date object.
Timezone	String	Timezone.

Returns **number**

`ts

// Assume your local timezone as IST/UTC+05:30

let timezone: Timezone = new Timezone();

let date: Date = new Date(2018,11,5,15,25,11);

```
let timeZoneOffset: number = timezone.offset(date,"Europe/Paris");  
console.log(timeZoneOffset); //-60
```

,

#### *convert*

This method is used to convert the passed date from one timezone to another timezone.

Parameters	Type	Description
----- ----- -----		
Date	Date	UTC time as date object.
fromOffset	number/string	Timezone from which date need to be converted.
toOffset	number/string	Timezone to which date need to be converted.

Returns **Date**

`ts

```
// Assume your local timezone as IST/UTC+05:30  
let timezone: Timezone = new Timezone();  
let date: Date = new Date(2018,11,5,15,25,11);  
let convertedDate: Date = timezone.convert(date, "Europe/Paris", "Asia/Tokya");  
let convertedDate1: Date = timezone.convert(date, 60, -360);  
console.log(convertedDate); //2018-12-05T08:55:11.000Z  
console.log(convertedDate1); //2018-12-05T16:55:11.000Z
```

,

#### *remove*

This method is used to remove the time difference between passed UTC date and timezone.

Parameters	Type	Description
----- ----- -----		
Date	Date	UTC as date object.
Timezone	String	Timezone.

Returns **Date**

`ts

```
// Assume your local timezone as IST/UTC+05:30  
let timezone: Timezone = new Timezone();  
let date: Date = new Date(2018,11,5,15,25,11);  
let convertedDate: Date = timezone.remove(date, "Europe/Paris");  
console.log(convertedDate); //2018-12-05T14:25:11.000Z
```

,

## How To

### Open add edit dialog in Vue Gantt component

In the Gantt component, add and edit dialogs can be opened dynamically by using [openAddDialog](#) and [openEditDialog](#) methods. The following code example shows how to open add and dialog on separate button click actions.

#### APP.VUE

```
<template>
  <div>
    <ejs-button id="editDialog" cssClass="e-info" v-
on:click.native="edit">edit</ejs-button>
    <br><br>
    <ejs-button id="addDialog" cssClass="e-info" v-
on:click.native="add">add</ejs-button>
    <br><br>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields= "taskFields" :height="height"
:editDialogFields="editDialogFields" :editSettings="editSettings"
:resourceNameMapping= "resourceNameMapping"
:resourceIdMapping="resourceIdMapping" :resources= "resources"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Edit, Selection } from "@syncfusion/ej2-vue-gantt";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { editingData , editingResources } from './data-source.js';
Vue.use(GanttPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return{
      data: editingData,
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks',
        notes: 'info',
        resourceInfo: 'resources'
      },
      editDialogFields: [
        { type: 'General', headerText: 'General' },
        { type: 'Dependency' },
        { type: 'Resources' },
        { type: 'Notes' }
      ],
      height: '450px',
      resourceNameMapping: 'resourceName',
      resourceIdMapping: 'resourceId',
      resources: editingResources,
```

```

        editSettings: {
            allowEditing: true,
            allowTaskbarEditing: true
        }
    };
},
provide: {
    gantt: [ Edit, Selection ]
},
methods: {
    edit: function(e) {
        var ganttObj =
document.getElementById('GanttContainer').ej2_instances[0];
        ganttObj.editModule.dialogModule.openEditDialog();
    },
    add: function(e) {
        var ganttObj =
document.getElementById('GanttContainer').ej2_instances[0];
        ganttObj.editModule.dialogModule.openAddDialog();
    }
}
});
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/how-to/open-add-edit-cs1" %}

NOTE: You should select any one of the row in the Gantt to open the edit dialog.

### Change schedule dates in Vue Gantt component

In the Gantt component, you can change the schedule start and end dates by clicking the custom button programmatically using the [updateProjectDates](#) method. You can pass the start and end dates as method arguments to the [updateProjectDates](#) method. You can also pass the Boolean value as an additional parameter, which is used to round-off the schedule start and end dates displayed in Gantt timeline.

### APP.VUE

```

<template>
  <div>
    <ejs-button id="changedate" cssClass="e-info" v-
on:click.native="change">Change Date</ejs-button>
    <br><br><br>
    <ejs-gantt id="GanttContainer" :dataSource="data" :taskFields =
"taskFields" :height = "height"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin } from "@syncfusion/ej2-vue-gantt";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return{

```

```

        data: editingData,
        height: '450px',
        taskFields: {
            id: 'TaskID',
            name: 'TaskName',
            startDate: 'StartDate',
            duration: 'Duration',
            progress: 'Progress',
            child: 'subtasks'
        },
    },
    methods: {
        change: function(e) {
            var ganttObj =
document.getElementById('GanttContainer').ej2_instances[0];
            ganttObj.updateProjectDates(new Date('03/10/2019'), new
Date('06/20/2019'), true);
        }
    },
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/how-to/changescheduledates-cs1" %}

### Copypasterecords in Vue Gantt component

You can copy and paste a record in the Gantt chart by using the `addRecord` method and `custom context menu`. It is also possible to copy and paste the parent record with multiple hierarchical child records on the required position.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="customContextMenu" :dataSource="data"
:taskFields = "taskFields" :height = "height" :editSettings="editSettings"
:enableContextMenu="true" :contextMenuItems="contextMenuItems"
:contextMenuClick = "contextMenuClick" :contextMenuOpen= "contextMenuOpen"
:addChildRecords= "addChildRecords"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, ContextMenu, Edit, Selection } from "@syncfusion/ej2-
vue-gantt";
import { editingData } from './data-source.js';
Vue.use(GanttPlugin);
var copiedRecord;
export default {
  data: function() {
    return{
      data: editingData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',

```

```

        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
    },
    editSettings: {
        allowAdding: true,
        allowEditing: true,
        allowDeleting: true
    },
    contextMenuItems: [{ text: 'Copy', target: '.e-content', id: 'copy'
},
    { text: 'Paste', target: '.e-content', id: 'paste' }
],
    };
},
provide: {
    gantt: [ ContextMenu, Edit, Selection]
},
methods: {
    contextMenuClick: function (args) {
        var gantt =
document.getElementById('customContextMenu').ej2_instances[0];
        if (args.item.id === 'copy') {
            copiedRecord = args.rowData;
            copiedRecord.taskData.TaskID = gantt.currentViewData.length + 1;
        }
        if (args.item.id === 'paste') {
            gantt.addRecord(copiedRecord.taskData, 'Below', args.rowData.index);
            if(copiedRecord.hasChildRecords) {
                addChildRecords(copiedRecord, args.rowData.index + 1);
            }
            copiedRecord = undefined;
        }
    },
    contextMenuOpen: function (args) {
        if (args.type !== 'Header') {
            if (copiedRecord) {
                args.hideItems.push('Copy');
            } else {
                args.hideItems.push('Paste');
            }
        }
    },
    addChildRecords(record, index) {
        for(var i=0; i<record.childRecords.length; i++) {
            var childRecord = record.childRecords[i];
            childRecord.taskData.TaskID = gantt.currentViewData.length + 1;
            gantt.addRecord(childRecord.taskData, 'Child', index);
            if(childRecord.hasChildRecords) {
                addChildRecords(childRecord, index + (i+1));
            }
        }
    }
}
}
}

```

```
};  
</script>
```

```
{% previewsample "page.domainurl/code-snippet/gantt/how-to/copypasterecords-cs1" %}
```

### Maintain record index in Vue Gantt component

Row dropped record's index position can be maintained in the Gantt chart by changing the database table index position using the `rowDrop` event. In this event, the `fromIndex` and `dropIndex` values can be passed to the server side using Ajax request. On the server side, the `insert` and `insertAtTop` methods are used to update the row index position. The following code snippets explain the solution.

```
`ts
```

```
<template>
```

```
<div>
```

```
<ejs-gantt :dataSource="data" :allowRowDragAndDrop='true' :taskFields = "taskFields" :height =  
"height"></ejs-gantt>
```

```
</div>
```

```
</template>
```

```
<script>
```

```
import Vue from "vue";
```

```
import { GanttPlugin, RowDD, Edit, Selection } from "@syncfusion/ej2-vue-gantt";
```

```
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
```

```
Vue.use(GanttPlugin);
```

```
export default {
```

```
  data: function() {
```

```
    return{
```

#### Custom field in Vue Gantt component

Generally in Gantt, Custom fields are displayed in the Custom Tab of the Add/Edit dialogs. However, they can be included in the General Tab of Add/Edit Dialog Box using `actionBegin` and `actionComplete` events. These events are used to append the custom field to the dialog box. The following code snippets demonstrate the solution.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-gantt ref="gantt" :dataSource="data" id="GanttContainer"
      :taskFields="taskFields" :height="height" :editSettings="editSettings"
      :editDialogFields="editDialogFields" :addDialogFields=
      "addDialogFields" :toolbar= "toolbar" :actionBegin="actionBegin"
      :actionComplete="actionComplete" >

### Maintain zoom to fit in Vue Gantt component

In the Gantt control, While performing edit actions or dynamically change dataSource, the timeline gets refreshed. When zoomToFit toolbar item is clicked and perform editing actions or dynamically change dataSource, the timeline gets refreshed. So that, the timeline will not fit to the project any more.

### Maintain zoomToFit after edit actions

We can maintain zoomToFit after editing actions(cell edit,dialog edit,taskbar edit) by using [fitToProject](#) method in `actionComplete` and `taskbarEdited` event.

### APP.VUE

```

<template>
  <div>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
    :taskFields = "taskFields" :height = "height" :toolbar="toolbar"
    :editSettings= "editSettings" :actionComplete="actionComplete"
    :taskbarEdited="taskbarEdited"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Toolbar, Edit, Selection } from "@syncfusion/ej2-vue-gantt";
import { projectNewData } from './data-source.js';
Vue.use(GanttPlugin);
export default {
  data: function() {
    return{
      data: projectNewData,
      height: '450px',
      taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
      },
      toolbar: ['Edit','ZoomToFit'],
      editSettings: {
        allowEditing: true,

```

```

        allowTaskbarEditing: true
    },
    actionComplete: function(args) {
        if ((args.action === "CellEditing" || args.action ===
"DialogEditing") && args.requestType === "save") {
            var obj =
document.getElementById("GanttContainer").ej2_instances[0];
            obj.dataSource = projectNewData;
            obj.fitToProject();
        }
    },
    taskbarEdited: function(args) {
        if (args) {
            var obj =
document.getElementById("GanttContainer").ej2_instances[0];
            obj.dataSource = projectNewData;
            obj.fitToProject();
        }
    }
};
},
provide: {
    gantt: [Toolbar, Edit, Selection ]
}
};
</script>

```

{% previewsample "page.domainurl/code-snippet/gantt/how-to/maintainzoomtofit-cs1" %}

*Maintain zoomToFit after change dataSource dynamically*

We can maintain **zoomToFit** after change dataSource dynamically, by calling [fitToProject](#) method in dataBound event.

#### APP.VUE

```

<template>
  <div>
    <ejs-button id="changeData" cssClass="e-info" v-
on:click.native="changeData">Change Data</ejs-button>
    <br><br><br>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :toolbar="toolbar"
:dataBound="dataBound"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import { GanttPlugin, Toolbar } from "@syncfusion/ej2-vue-gantt";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { projectNewData, data } from './data-source.js';
Vue.use(GanttPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return{
      data: projectNewData,

```

```

        height: '450px',
        taskFields: {
            id: 'TaskID',
            name: 'TaskName',
            startDate: 'StartDate',
            duration: 'Duration',
            progress: 'Progress',
            dependency: 'Predecessor',
            child: 'subtasks'
        },
        toolbar: ['ZoomToFit'],
        dataBound: function(args) {
            var obj =
document.getElementById('GanttContainer').ej2_instances[0];
            obj.fitToProject();
        },
    };
},
methods: {
    changeData: function(e) {
        var obj =
document.getElementById('GanttContainer').ej2_instances[0];
        obj.dataSource = data;
    }
}

### Drag and drop from another in Vue Gantt component

In Gantt, it is possible to drag a record from another component and drop it in Gantt chart with updating the Gantt record. Here, dragging an item from **TreeView** component to Gantt and that item is updated as a resource for the Gantt record, we can achieve this, by using [nodeDragStop](#) event of [Link to the Video](#) control.

To learn about Gantt Chart Drag and Drop, you can check on this video:

### APP.VUE

```

<template>
  <div>
    <p><b>Gantt</b></p>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"

### New row position in Vue Gantt component

In Gantt, a new row can be added in one of the following positions: Top, Bottom, Above, Below and Child. This position can be specified through the `newRowPosition` property. We can make use of the `toolbarClick` event to create a context menu that specifies the position in which the new row is to be added when adding a record through toolbar click.

The following code snippets demonstrate how to achieve this.

#### APP.VUE

```
<template>
  <div>
    <ejs-contextmenu id='cmenu' :items='menuItems' :select="select"></ejs-
contextmenu>
    <ejs-gantt ref='gantt' id="GanttContainer" :dataSource="data"
:taskFields = "taskFields" :height = "height" :toolbar="toolbar"
:toolbarClick="toolbarClick" :editSettings= "editSettings"></ejs-gantt>
  </div>
</template>
<script>
import Vue from "vue";
import {
  GanttPlugin,
  Edit,
  Toolbar,
  Selection,
} from "@syncfusion/ej2-vue-gantt";
import { ContextMenuPlugin } from "@syncfusion/ej2-vue-navigations";
Vue.use(GanttPlugin);
Vue.use(ContextMenuPlugin);
export default {
  data: function () {
    return {
      menuItems: [
        {
          text: "Bottom",
        },
        {
          text: "Above",
        },
        {
          text: "Below",
        },
        {
          text: "Child",
        },
        {
          text: "Top",
        },
      ],
      data: [
        {
          TaskID: 1,
          TaskName: "Project Initiation",

## Grid

### Getting Started with the Vue Grid Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLILink to the Video](#) and integrating the Syncfusion Vue Grid component

To get start quickly with Vue Grid, you can check on this video:

Prerequisites

[System requirements for Syncfusion Vue UI components](#)

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```
`bash
```

```
npm install -g @vue/cli
```

```
vue create quickstart
```

```
cd quickstart
```

```
npm run serve
```

```
,
```

```
or
```

```
`bash
```

```
yarn global add @vue/cli
```

```
vue create quickstart
```

```
cd quickstart
```

```
yarn run serve
```

```
,
```

When creating a new project, choose the option **Default ([Vue 2] babel, eslint)** from the menu.

```
E:\samples>vue create quickstart

Vue CLI v5.0.8
? Please pick a preset:
  Default ([Vue 3] babel, eslint)
> Default ([Vue 2] babel, eslint)
  Manually select features
```

Once the `quickstart` project is set up with default settings, proceed to add Syncfusion components to the project.

#### Vue 3 Application

Select the option `Default ([Vue 3] babel, eslint)` from the menu.

```
E:\samples>vue create quickstart

Vue CLI v5.0.8
? Please pick a preset:
> Default ([Vue 3] babel, eslint)
  Default ([Vue 2] babel, eslint)
  Manually select features
```

#### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.npmjs.com). To use Vue components, install the required npm package.

This article uses the [Vue Grid component](#) as an example. Install the `@syncfusion/ej2-vue-grids` package by running the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-grids --save
```

```
`
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-grids
```

```
`
```

#### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the `Material` theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Grid component and its dependents were imported into the `<style>` section of `src/App.vue` file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

Grid components use other Syncfusion components as well, so CSS references for the dependent component must be added in order to use all grid functionalities. Use this same order to display the Syncfusion Grid component's predefined appearance.

### Add Syncfusion Vue component

Follow the below steps to add the Vue Grid component:

- 1\ First, import and register the Grid component in the `script` section of the `src/App.vue` file.

~/SRC/APP.VUE

```
<script>
import { GridComponent } from "@syncfusion/ej2-vue-grids";
export default {
  components: {
    'ejs-grid': GridComponent
  }
}
</script>
```

- 2\ In the `template` section, define the Grid component.

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-grid> </ejs-grid>
</div>
</template>
```

### Register the Syncfusion Vue component

A Syncfusion Vue component needs to be registered so that Vue knows where to locate its implementation when it is encountered in a template.

### Vue 3 Application

Import the Grid component along with the required child directives from the installed packages into the `<script>` section of the `src/App.vue` file. Register the Grid component along with the required child directives using following code.

```
`js
```

```
import { GridComponent, ColumnsDirective, ColumnDirective } from '@syncfusion/ej2-vue-grids';
// Component registration
export default {
  name: "App",
  components: {
    'ejs-grid' : GridComponent,
    'e-columns' : ColumnsDirective,
    'e-column' : ColumnDirective
  }
},
,
```

Now, the Grid and column directives are registered to use it in this application.

#### Defining Row Data

Data for the Grid component is bind by using [dataSource](#) property and value is defined in the vue component. It accepts either array of JavaScript object or **DataManager** instance.

```
,
<template>
<div id="app">
<ejs-grid :dataSource="data"> </ejs-grid>
</div>
</template>
<script>
import { GridComponent } from "@syncfusion/ej2-vue-grids";
export default {
  components: {
    'ejs-grid': GridComponent
  },
  data () {
    return {
      data: [
        { OrderID: 10248, CustomerID: 'VINET', Freight: 32.38 },
        { OrderID: 10249, CustomerID: 'TOMSP', Freight: 11.61 },
        { OrderID: 10250, CustomerID: 'HANAR', Freight: 65.83 },
        { OrderID: 10251, CustomerID: 'VICTE', Freight: 41.34 },
```

```

{ OrderID: 10252, CustomerID: 'SUPRD', Freight: 51.3 },
{ OrderID: 10253, CustomerID: 'HANAR', Freight: 58.17 },
{ OrderID: 10254, CustomerID: 'CHOPS', Freight: 22.98 },
{ OrderID: 10255, CustomerID: 'RICSU', Freight: 148.33 },
{ OrderID: 10256, CustomerID: 'WELLI', Freight: 13.97 }
]
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
`

```

### Defining Columns

The Grid has an option to define columns as directives. In these column directives, we have properties to customize columns. Let's check the properties used here:

- We have added [field](#) to map with a property name an array of JavaScript objects.
- We have added [headerText](#) to change the title of columns.
- We have used [textAlign](#) to change the alignment of columns. By default, columns will be left aligned. To change columns to right align, we need to define [textAlign](#) as **Right**.
- Also, we have used another useful property, [format](#). Using this, we can format number and date values to standard or custom formats.

Here, we have defined it for the conversion of numeric values to currency.

```

<ejs-grid :dataSource="data">
  <e-columns>
    <e-column field='OrderID' headerText='Order ID' textAlign='Right' width=90></e-column>
    <e-column field='CustomerID' headerText='Customer ID' width=120></e-column>
    <e-column field='Freight' headerText='Freight' textAlign='Right' format='C2' width=90></e-column>
  </e-columns>
</ejs-grid>
`

```

### Module injection

To create Vue Grid with additional features, inject the required modules. The following modules are used to extend Grid's basic functionality.

- **Page** - Inject this module to use paging feature.
- **Sort** - Inject this module to use sorting feature.
- **Filter** - Inject this module to use filtering feature.
- **Group** - Inject this module to use grouping feature.
- **Aggregate** - Inject this module to use aggregate feature.

Register the required array of modules under the key **grid** in the **provide** section.

Additional feature modules are available [here](#)

### Enable Paging

The paging feature enables users to view the Grid record in a paged view.

It can be enabled by setting [allowPaging](#) property to true. Also, need to inject the **Page** module in the **provide** section as follows.

If we didn't inject the **Page** module, then the pager will not be rendered in Grid. The pager can be customized using [pageSettings](#) property.

### ~/SRC/APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource="data" :allowPaging="true"
    :pageSettings='pageSettings'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
        format='C2' width=90></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import { GridComponent, ColumnDirective, ColumnsDirective, Page } from
"@syncfusion/ej2-vue-grids";
export default {
  components: {
    'ejs-grid': GridComponent,
    'e-column': ColumnDirective,
    'e-columns': ColumnsDirective
  },
  data() {
    return {
      data: [
        { OrderID: 10248, CustomerID: 'VINET', Freight: 32.38 },
        { OrderID: 10249, CustomerID: 'TOMSP', Freight: 11.61 },
        { OrderID: 10250, CustomerID: 'HANAR', Freight: 65.83 },
        { OrderID: 10251, CustomerID: 'VICTE', Freight: 41.34 },
```

```

        { OrderID: 10252, CustomerID: 'SUPRD', Freight: 51.3 },
        { OrderID: 10253, CustomerID: 'HANAR', Freight: 58.17 },
        { OrderID: 10254, CustomerID: 'CHOPS', Freight: 22.98 },
        { OrderID: 10255, CustomerID: 'RICSU', Freight: 148.33 },
        { OrderID: 10256, CustomerID: 'WELLI', Freight: 13.97 }
    ],
    pageSettings: { pageSize: 5 }
  };
},
provide: {
  grid: [Page]
}
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/getting-started/default-cs1" %}

### Enable Sorting

The sorting feature enables the user to order the records. It can be enabled by setting `[allowSorting]` (<https://ej2.syncfusion.com/vue/documentation/api/grid/#allowsorting>) property as true. Also, need to inject the **Sort** module in the **provide** section as follow. If we didn't inject the **Sort** module, then user not able to sort when click on headers. Sorting feature can be customized using [sortSettings](#) property.

### ~/SRC/APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource="data" :allowPaging="true"
    :allowSorting='true' :pageSettings='pageSettings'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
        format='C2' width=90></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import { GridComponent, ColumnDirective, ColumnsDirective, Page, Sort } from
"@syncfusion/ej2-vue-grids";

```

```

export default {
  components: {
    'ejs-grid': GridComponent,
    'e-column': ColumnDirective,
    'e-columns': ColumnsDirective
  },
  data() {
    return {
      data: [
        { OrderID: 10248, CustomerID: 'VINET', Freight: 32.38 },
        { OrderID: 10249, CustomerID: 'TOMSP', Freight: 11.61 },
        { OrderID: 10250, CustomerID: 'HANAR', Freight: 65.83 },
        { OrderID: 10251, CustomerID: 'VICTE', Freight: 41.34 },
        { OrderID: 10252, CustomerID: 'SUPRD', Freight: 51.3 },
        { OrderID: 10253, CustomerID: 'HANAR', Freight: 58.17 },
        { OrderID: 10254, CustomerID: 'CHOPS', Freight: 22.98 },
        { OrderID: 10255, CustomerID: 'RICSU', Freight: 148.33 },
        { OrderID: 10256, CustomerID: 'WELLI', Freight: 13.97 }
      ],
      pageSettings: { pageSize: 5 }
    };
  },
  provide: {
    grid: [Page, Sort]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/getting-started/default-cs2" %}

### Enable Filtering

The filtering feature enables the user to view the reduced amount of records based on filter criteria. It can be enabled by setting `[allowFiltering]`

https://ej2.syncfusion.com/vue/documentation/api/grid/#allowfiltering) property as true. Also, need to inject the **Filter** module in the **provide** section as follow. If we didn't inject the **Filter** module, then filter bar will not be rendered in Grid. Filtering feature can be customized using [filterSettings](#) property.

### ~/SRC/APP.VUE

```

<template>
  <div id="app">

```

```

    <ejs-grid :dataSource="data" :allowPaging="true"
:allowSorting='true' :allowFiltering='true' :pageSettings='pageSettings'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import { GridComponent, ColumnDirective, ColumnsDirective, Page, Sort,
Filter } from "@syncfusion/ej2-vue-grids";
export default {
  components: {
    'ejs-grid': GridComponent,
    'e-column': ColumnDirective,
    'e-columns': ColumnsDirective
  },
  data() {
    return {
      data: [
        { OrderID: 10248, CustomerID: 'VINET', Freight: 32.38 },
        { OrderID: 10249, CustomerID: 'TOMSP', Freight: 11.61 },
        { OrderID: 10250, CustomerID: 'HANAR', Freight: 65.83 },
        { OrderID: 10251, CustomerID: 'VICTE', Freight: 41.34 },
        { OrderID: 10252, CustomerID: 'SUPRD', Freight: 51.3 },
        { OrderID: 10253, CustomerID: 'HANAR', Freight: 58.17 },
        { OrderID: 10254, CustomerID: 'CHOPS', Freight: 22.98 },
        { OrderID: 10255, CustomerID: 'RICSU', Freight: 148.33 },
        { OrderID: 10256, CustomerID: 'WELLI', Freight: 13.97 }
      ],
      pageSettings: { pageSize: 5 }
    };
  },
  provide: {
    grid: [Page, Sort, Filter]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

```
{% previewsample "page.domainurl/code-snippet/grid/getting-started/default-cs3" %}
```

### Enable Grouping

The grouping feature enables users to view the Grid record in a grouped view. It can be enabled by setting `[allowGrouping]`(

<https://ej2.syncfusion.com/vue/documentation/api/grid/#allowgrouping>) property to true. Also, need to inject the **Group** module in the **provide** section as follow. If we didn't inject the **Group** module, then the group drop area will not be rendered in Grid. Grouping feature can be customized using [groupSettings](#) property.

### ~/SRC/APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource="data" :allowPaging="true"
:allowSorting='true' :allowFiltering='true' :allowGrouping='true'
:pageSettings='pageSettings'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import { GridComponent, ColumnDirective, ColumnsDirective, Page, Sort,
Filter, Group } from "@syncfusion/ej2-vue-grids";
export default {
  components: {
    'ejs-grid': GridComponent,
    'e-column': ColumnDirective,
    'e-columns': ColumnsDirective
  },
  data() {
    return {
      data: [
        { OrderID: 10248, CustomerID: 'VINET', Freight: 32.38 },
        { OrderID: 10249, CustomerID: 'TOMSP', Freight: 11.61 },
        { OrderID: 10250, CustomerID: 'HANAR', Freight: 65.83 },
        { OrderID: 10251, CustomerID: 'VICTE', Freight: 41.34 },
        { OrderID: 10252, CustomerID: 'SUPRD', Freight: 51.3 },
        { OrderID: 10253, CustomerID: 'HANAR', Freight: 58.17 },
        { OrderID: 10254, CustomerID: 'CHOPS', Freight: 22.98 },
        { OrderID: 10255, CustomerID: 'RICSU', Freight: 148.33 },
        { OrderID: 10256, CustomerID: 'WELLI', Freight: 13.97 }
      ],

### Enable Aggregate

The Aggregate feature enables users to view the aggregates of Grid records. It can be enabled by configured through **e-aggregates** directive. The **field** and **type** are the minimum properties required to represent an aggregate column. Also, need to inject the **Aggregate** module in the **provide** section as follow. If we didn't inject the **Aggregate** module, then the footer table will not be rendered in Grid. Check [aggregate](#) to know more about its configuration.

To avoid runtime-compilation overhead and CSP restrictions, install the template compiler using the following code:

```
`bash
```

```
npm i vue-template-compiler
```

```
,
```

Additionally, you need to set **runtimeCompiler** to true in the Vue.js CLI configuration, as shown below:

```
`bash
```

```
const { defineConfig } = require('@vue/cli-service')
```

```
module.exports = defineConfig({
```

```
  transpileDependencies: true,
```

```
  runtimeCompiler: true,
```

```
})
```

```
,
```

### ~/SRC/APP.VUE

```

{% raw %}
<template>
<div id="app">
<ejs-grid :dataSource="data" :allowPaging="true" :allowSorting='true'
:allowFiltering='true' :allowGrouping='true' :pageSettings='pageSettings' >
<e-columns>
<e-column field='OrderID' headerText='Order ID' textAlign='Right'
width=90></e-column>

```

```

<e-column field='CustomerID' headerText='Customer ID' width=120></e-column>
<e-column field='Freight' headerText='Freight' textAlign='Right' format='C2'
width=90></e-column>
</e-columns>
<e-aggregates>
<e-aggregate>
<e-columns>
<e-column type="Sum" field="Freight" format="C2"
:footerTemplate='footerSum'></e-column>
</e-columns>
</e-aggregate>
</e-aggregates>
</ejs-grid>
</div>
</template>

## Getting Started with the Vue Grid Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue Grid component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

### Prerequisites

[System requirements for Syncfusion Vue UI components](#)

### Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
npm create vite@latest
`
```

or

```
`bash
yarn create vite
`
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as **my-project** for this article.

```
`bash
? Project name: » my-project
`
```

2. Select **Vue** as the framework. It will create a Vue 3 project.

```
`bash
? Select a framework: » - Use arrow-keys. Return to submit.
Vanilla
```

Vue

React

Preact

Lit

Svelte

Others

,

3. Choose **JavaScript** as the framework variant to build this Vite project using JavaScript and Vue.

```
`bash
```

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

,

4. Upon completing the aforementioned steps to create the **my-project**, run the following command to install its dependencies:

```
`bash
```

```
cd my-project
```

```
npm install
```

,

or

```
`bash
```

```
cd my-project
```

```
yarn install
```

,

Now that **my-project** is ready to run with default settings, let's add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue Grid component](#) as an example. To use the Vue Grid component in the project, the `@syncfusion/ej2-vue-grids` package needs to be installed using the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-grids --save
```

```
,
```

```
or
```

```
`bash
```

```
yarn add @syncfusion/ej2-vue-grids
```

```
,
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, **Material** theme is applied using CSS styles, which are available in installed packages. The necessary **Material** CSS styles for the Grid component and its dependents were imported into the `<style>` section of **src/App.vue** file.

#### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

### Add Syncfusion Vue component

Follow the below steps to add the Vue Grid component using **Composition API** or **Options API**:

1.First, import and register the Grid component and its child directives in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { GridComponent as EjsGrid, ColumnsDirective as EColumns,
ColumnDirective as EColumn } from '@syncfusion/ej2-vue-grids';
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { GridComponent, ColumnsDirective, ColumnDirective } from
'@syncfusion/ej2-vue-grids';
```

```
//Component registration
export default {
  name: "App",
  components: {
    'ejs-grid': GridComponent,
    'e-columns': ColumnsDirective,
    'e-column': ColumnDirective
  }
}
</script>
```

2. In the **template** section, define the Grid component with the [dataSource](#) property and column definitions.

#### ~/SRC/APP.VUE

```
<template>
<ejs-grid :dataSource='data'>
<e-columns>
<e-column field='OrderID' width='100' textAlign="Right"></e-column>
<e-column field='CustomerID' width='100'></e-column>
<e-column field='EmployeeID' width='100' textAlign="Right"></e-column>
<e-column field='Freight' width='100' format="C2" textAlign="Right"></e-
column>
<e-column field='ShipCountry' width='100'></e-column>
</e-columns>
</ejs-grid>
</template>
```

3. Declare the values for the **dataSource** property in the **script** section.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const data = [
  {
    OrderID: 10248, CustomerID: 'VINET', EmployeeID: 5, ShipCountry: 'France',
    Freight: 32.38
  },
  {
    OrderID: 10249, CustomerID: 'TOMSP', EmployeeID: 6, ShipCountry: 'Germany',
    Freight: 11.61
  },
  {
    OrderID: 10250, CustomerID: 'HANAR', EmployeeID: 4, ShipCountry: 'Brazil',
    Freight: 65.83
  }
];
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
  return {
```

```

data:[
  {
    OrderID: 10248, CustomerID: 'VINET', EmployeeID: 5, ShipCountry: 'France',
    Freight: 32.38
  },
  {
    OrderID: 10249, CustomerID: 'TOMSP', EmployeeID: 6, ShipCountry: 'Germany',
    Freight: 11.61
  },
  {
    OrderID: 10250, CustomerID: 'HANAR', EmployeeID: 4, ShipCountry: 'Brazil',
    Freight: 65.83
  }
];
}
</script>

```

Here is the summarized code for the above steps in the **src/App.vue** file:

#### **COMPOSITION API (~ /SRC/APP.VUE)**

```

<template>
<ejs-grid :dataSource='data'>
<e-columns>
<e-column field='OrderID' width='100' textAlign="Right"></e-column>
<e-column field='CustomerID' width='100'></e-column>
<e-column field='EmployeeID' width='100' textAlign="Right"></e-column>
<e-column field='Freight' width='100' format="C2" textAlign="Right"></e-
column>
<e-column field='ShipCountry' width='100'></e-column>
</e-columns>
</ejs-grid>
</template>
<script setup>
import { GridComponent as EjsGrid, ColumnsDirective as EColumns,
ColumnDirective as EColumn } from '@syncfusion/ej2-vue-grids';
const data = [
  {
    OrderID: 10248, CustomerID: 'VINET', EmployeeID: 5, ShipCountry: 'France',
    Freight: 32.38
  },
  {
    OrderID: 10249, CustomerID: 'TOMSP', EmployeeID: 6, ShipCountry: 'Germany',
    Freight: 11.61
  },
  {
    OrderID: 10250, CustomerID: 'HANAR', EmployeeID: 4, ShipCountry: 'Brazil',
    Freight: 65.83
  }
];
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";

```

```
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

### OPTIONS API (~SRC/APP.VUE)

```
<template>
<ejs-grid :dataSource='data'>
<e-columns>
<e-column field='OrderID' width='100' textAlign="Right"></e-column>
<e-column field='CustomerID' width='100'></e-column>
<e-column field='EmployeeID' width='100' textAlign="Right"></e-column>
<e-column field='Freight' width='100' format="C2" textAlign="Right"></e-column>
<e-column field='ShipCountry' width='100'></e-column>
</e-columns>
</ejs-grid>
</template>
<script>
import { GridComponent, ColumnsDirective, ColumnDirective } from
'@syncfusion/ej2-vue-grids';
// Component registration
export default {
name: "App",
// Declaring component and its directives
components: {
'ejs-grid': GridComponent,
'e-columns': ColumnsDirective,
'e-column': ColumnDirective
},
// Bound properties declarations
data() {
return {
data:[
{
OrderID: 10248, CustomerID: 'VINET', EmployeeID: 5, ShipCountry: 'France',
Freight: 32.38
},
{
OrderID: 10249, CustomerID: 'TOMSP', EmployeeID: 6, ShipCountry: 'Germany',
Freight: 11.61
},
{
OrderID: 10250, CustomerID: 'HANAR', EmployeeID: 4, ShipCountry: 'Brazil',
Freight: 65.83
}
],
};
}
};
</script>
<style>
```

```
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
,
```

or

```
`bash
```

```
yarn run dev
```

```
,
```

The output will appear as follows:

OrderID	CustomerID	EmployeeID	Freight	ShipCountry
10248	VINET	5	\$32.38	France
10249	TOMSP	6	\$11.61	Germany
10250	HANAR	4	\$65.83	Brazil

**Sample:** [vue-3-grid-getting-started](#).

For migrating from Vue 2 to Vue 3, refer to the [migration](#) documentation.

- [Getting Started with Vue UI Components using Options API and TypeScript](#)

### Module in Vue Grid component

The following modules should be injected to extend grid's functionality.

The available grid modules are

Module	Description
--------	-------------

-----	-----
-------	-------

<a href="#">Page</a>	Inject this module to use paging feature.
----------------------	-------------------------------------------

| [Sort](#) | Inject this module to use sorting feature. |

| [Filter](#) | Inject this module to use filtering feature. |

| [Group](#) | Inject this module to use grouping feature |

| [Edit](#) | Inject this module is use editing feature. |

| [Aggregate](#) | Inject this module to use aggregate feature. |

| [ColumnChooser](#) | Inject this module to use column chooser feature. |

| [ColumnMenu](#) | Inject this module to use column menu feature. |

| [CommandColumn](#) | Inject this module to use command column feature. |

| [ContextMenu](#) | Inject this module to use context menu feature. |

| [DetailRow](#) | Inject this module to use detail template feature. |

| [ForeignKey](#) | Inject this module to use foreign key feature. |

| [Freeze](#) | Inject this module to use frozen rows and columns feature. |

| [Resize](#) | Inject this module to use resize feature. |

| [Reorder](#) | Inject this module to use reorder feature. |

| [RowDD](#) | Inject this module to use row drag and drop feature. |

| [Search](#) | Inject this module to use search feature and this is a default injected module. |

| [Selection](#) | Inject this module to use selection feature and this is a default injected module. |

| [Scroll](#) | Inject this module to use scrolling feature and this is a default injected module. |

| [Print](#) | Inject this module to use to use print feature and this is a default injected module. |

| [Toolbar](#) | Inject this module to use toolbar feature. |

| [VirtualScroll](#) | Inject this module to use virtual scroll feature. |

| [ExcelExport](#) | Inject this module to use excel export feature. |

| [PdfExport](#) | Inject this module to use PDF export feature. |

These modules should be injected into the `provide` section and use `grid` as a key of the object.

## Data Binding

### Data binding in Vue Grid component

The Grid uses `DataManager` which supports both RESTful JSON data services binding and local JavaScript object array binding. The `dataSource` property can be assigned either with the instance of [Link to the Video](#) or JavaScript object array collection. It supports two kinds of data binding methods:

- Local data
- Remote data

To learn about Grid data binding quickly, you can check on this video:

*Sending additional parameters to the server*

To add a custom parameter to the data request, use the `addParams` method of `Query` class. Assign the `Query` object with additional parameters to the grid `query` property.

**APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid :dataSource="data" :query='query'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
        <e-column field='OrderDate' headerText='Order Date'
textAlign='Right' format='yMd' type='date' width=120></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page } from "@syncfusion/ej2-vue-grids";
import { DataManager, ODataAdaptor, Query } from "@syncfusion/ej2-data";
Vue.use(GridPlugin);
export default {
  data() {
    let SERVICE_URI =
      "https://services.syncfusion.com/js/production/api/Orders";
    return {
      data: new DataManager({
        url: SERVICE_URI,
        adaptor: new ODataAdaptor()
      }),
      pageSettings: {pageSize: 7},
      query: new Query().addParams('ej2grid', 'true');
    };
  },
  provide: {
    grid: [Page]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/databind/remote-cs1" %}

The parameters added using the `query` property will be sent along with the data request for every grid action.

*Handling HTTP error*

During server interaction from the grid, some server-side exceptions may occur, and you can acquire those error messages or exception details in client-side using the [actionFailure](#) event.

The argument passed to the [actionFailure](#) Grid event contains the error details returned from the server.

,

```
<template>
<div id="app">
<ejs-grid :dataSource="data" :actionFailure='actionFailure'>
<e-columns>
<e-column field='OrderID' headerText='Order ID' textAlign='Right' width=90></e-column>
<e-column field='CustomerID' headerText='Customer ID' width=120></e-column>
<e-column field='Freight' headerText='Freight' textAlign='Right' format='C2' width=90></e-column>
<e-column field='OrderDate' headerText='Order Date' textAlign='Right' format='yMd' type='date'
width=120></e-column>
</e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { DataManager, ODataAdaptor } from "@syncfusion/ej2-data";
Vue.use(GridPlugin);
export default Vue.extend({
data() {
return {
data: new DataManager({
url: 'http://some.com/invalidUrl',
adaptor: new ODataAdaptor()
})
};
},
methods: {
actionFailure: function() {
```

```

alert('Server exception: 404 Not found');
}
}
});
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
`

```

The [actionFailure](#) event will be triggered not only for the server errors, but also when there is an exception while processing the grid actions.

#### *Binding with ajax*

You can use Grid [dataSource](#) property to bind the datasource to Grid from external ajax request. In the below code we have fetched the datasource from the server with the help of ajax request and provided that to [dataSource](#) property by using `onSuccess` event of the ajax.

```

<template>
<div id="app">
<ejs-button v-on:click.native="btnClick">Play</ejs-button>
<ejs-grid>
<e-columns>
<e-column field='OrderID' headerText='Order ID' textAlign='Right' width=120 ></e-column>
<e-column field='CustomerID' headerText='Customer ID' textAlign='Right' width=120 ></e-column>
<e-column field='EmployeeID' headerText='Employee ID' textAlign='Right' width=120 ></e-column>
<e-column field='ShipCountry' headerText='Ship Country' textAlign='Right' width=120 ></e-column>
</e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { Ajax } from '@syncfusion/ej2-base';

```

```

Vue.use(GridPlugin);
Vue.use(ButtonPlugin);
export default Vue.extend({
  data() {
    return {
      data: {}
    };
  },
  methods:{
    btnClick: function (args){
      var grid = document.getElementsByClassName("e-grid")[0].ej2_instances[0]; // Grid instance
      var ajax = new Ajax("https://ej2services.syncfusion.com/production/web-services/api/Orders", "GET");
      ajax.send();
      ajax.onSuccess = function (result) {
        grid.dataSource = JSON.parse(result);
      };
    }
  }
});
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

### Custom binding

It is possible to handle data processing externally and bind the result to the grid. This help you to provide your own custom data logic. Grid expects an object as the result of the custom logic and the emitted value should be an object with properties `result` and `count`.

In this context, we are going to use `Ajax` from our `@syncfusion/ej2-base` library for handling remote interaction, you can choose any HTTP client as per your choice.

```

<template>
<div id="app">
<ejs-grid :dataSource='data' :allowPaging='true' :pageSettings='pageOptions' :allowSorting='true'
:allowGrouping='true' :dataStateChange='dataStateChange'>

```

```
<e-columns>
<e-column field= "OrderID" headerText="Order ID" width="130" textAlign='Right' ></e-column>
<e-column field= "CustomerID" headerText="Customer Name" width="150"></e-column>
<e-column field= "ShipName" headerText="Ship Name" width="200"></e-column>
<e-column field= "ShipCity" headerText="Ship City" width="150"></e-column>
</e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, DataStateChangeEventArgs, Sorts, Sort, Group, Page, DataResult } from
"@syncfusion/ej2-vue-grids";
import { Ajax } from '@syncfusion/ej2-base';
Vue.use(GridPlugin);
export default Vue.extend({
  data() {
    return {
      data: {},
      pageOptions: { pageSize: 10, pageCount: 4 },
      orderService: new OrderService()
    };
  },
  mounted() {
    let state = { skip: 0, take: 10 };
    this.dataStateChange(state);
  },
  methods:{
    dataStateChange: function (state) {
      this.orderService.execute(state).then(( gridData ) => this.data = gridData );
    }
  },
  provide: {
```

```

grid: [Sort, Group, Page]
}
});
export class OrderService {
  public ajax: Ajax = new Ajax({
    type: 'GET', mode: true,
    onFailure: (e: Error) => { return false; }
  });
  private BASE_URL: string = 'https://services.syncfusion.com/js/production/api/Orders';
  public execute(state: DataStateChangeEventArgs): Promise<DataResult> {
    return this.getData(state);
  }
  private getData(state: DataStateChangeEventArgs): Promise<DataResult> {
    const pageQuery = `skip=${state.skip}&stop=${state.take}`;
    let sortQuery: string = '';
    if ((state.sorted || []).length) {
      sortQuery = `orderby= ` + (<any> state).sorted.map((obj: Sorts) => {
        return obj.direction === 'descending' ? `${obj.name} desc` : obj.name;
      }).reverse().join(',');
    }
    this.ajax.url =
      `${this.BASE_URL}?${pageQuery}${sortQuery}&$inlinecount=allpages&$format=json`;
    return this.ajax.send().then((response: any) => {
      let data: any = JSON.parse(response);
      return <DataResult> { result: data['d']['results'], count: parseInt(data['d']['count'], 10) };
    });
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
`

```

*Handling Grid actions*

For grid actions such as **paging**, **grouping**, **sorting** etc, the **dataStateChange** event will be invoked. You have to query and resolve data using **AJAX** in this event based on the state arguments.

```

<template>
<div id="app">
<ejs-grid :dataSource='data' :allowPaging='true' :pageSettings='pageOptions' :allowSorting='true'
:allowGrouping='true' :dataStateChange='dataStateChange'>
<e-columns>
<e-column field= "OrderID" headerText="Order ID" width="130" textAlign='Right' ></e-column>
<e-column field= "CustomerID" headerText="Customer Name" width="150"></e-column>
<e-column field= "ShipName" headerText="Ship Name" width="200"></e-column>
<e-column field= "ShipCity" headerText="Ship City" width="150"></e-column>
</e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";

import { GridPlugin, DataStateChangeEventArgs, Sorts, Sort, Group, Page, DataResult } from
"@syncfusion/ej2-vue-grids";

import { Ajax } from '@syncfusion/ej2-base';

Vue.use(GridPlugin);

export default Vue.extend({
data() {
return {
data: {},
pageOptions: { pageSize: 10, pageCount: 4 },
orderService: new OrderService()
};
},
mounted() {
let state = { skip: 0, take: 10 };
this.dataStateChange(state);

```

```

},
methods:{
  dataStateChange: function (state) {
    this.orderService.execute(state).then(( gridData ) => this.data = gridData );
  }
},
provide: {
  grid: [Sort, Group, Page]
}
});

export class OrderService {
  public ajax: Ajax = new Ajax({
    type: 'GET', mode: true,
    onFailure: (e: Error) => { return false; }
  });

  private BASE_URL: string = 'https://services.syncfusion.com/js/production/api/Orders';
  public execute(state: DataStateChangeEventArgs): Promise<DataResult> {
    return this.getData(state);
  }

  private getData(state: DataStateChangeEventArgs): Promise<DataResult> {
    const pageQuery = `&$skip=${state.skip}&$top=${state.take}`;
    let sortQuery: string = '';
    if ((state.sorted || []).length) {
      sortQuery = `&$orderby= ` + (state.sorted.map((obj: Sorts) => {
        return obj.direction === 'descending' ? `${obj.name} desc` : obj.name;
      })).reverse().join(',');
    }

    this.ajax.url =
      `${this.BASE_URL}?${pageQuery}${sortQuery}&$inlinecount=allpages&$format=json`;
    return this.ajax.send().then((response: any) => {
      let data: any = JSON.parse(response);
      return { result: data['d']['results'], count: parseInt(data['d']['count'], 10) };
    });
  }
}

```

```

}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
`

```

### Perform CRUD operations

The `dataSourceChanged` event will be triggered for updating the grid data. You can perform the save operation based on the event arguments and you need to call the `endEdit` method to indicate the completion of save operation.

```

<template>
<div id="app">
<ejs-grid :dataSource='data' :allowPaging='true' :pageSettings='pageOptions' :allowSorting='true'
:allowGrouping='true' :dataStateChange='dataStateChange' :editSettings='editSettings'
:toolbar='toolbar'>
<e-columns>
<e-column field= "OrderID" headerText="Order ID" :isPrimaryKey='true' width="130" textAlign='Right'
></e-column>
<e-column field= "CustomerID" headerText="Customer Name" width="150"></e-column>
<e-column field= "ShipName" headerText="Ship Name" width="200"></e-column>
<e-column field= "ShipCity" headerText="Ship City" width="150"></e-column>
</e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";

import { GridPlugin, DataStateChangeEventArgs, Sorts, Sort, Group, Page, DataResult, Toolbar, Edit }
from "@syncfusion/ej2-vue-grids";

import { OrderService } from "../order-service";

Vue.use(GridPlugin);

export default Vue.extend({
data() {

```

```
return {
  data: {},
  editSettings: { allowEditing: true, allowAdding: true, allowDeleting: true },
  toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
  pageOptions: { pageSize: 10, pageCount: 4 },
  orderService: new OrderService()
};
},
mounted() {
  let state = { skip: 0, take: 10 };
  this.dataStateChange(state);
},
methods:{
  dataStateChange: function (state) {
    this.orderService.execute(state).then(( gridData ) => this.data = gridData );
  },
  dataSourceChanged: function (state) {
    if (state.action === 'add') {
      this.orderService.addRecord(state).subscribe(() => state.endEdit());
    } else if (state.action === 'edit') {
      this.orderService.updateRecord(state).subscribe(() => state.endEdit());
    } else if (state.requestType === 'delete') {
      this.orderService.deleteRecord(state).subscribe(() => state.endEdit());
    }
  }
},
provide: {
  grid: [Sort, Group, Page, Edit, Toolbar]
}
});
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
```

```
</style>
```

```
,
```

### Calculate aggregates

The footer aggregate values should be calculated and send along with the `dataSource` property as follows. The aggregate property of the data source should contain the aggregate value assigned to the property named in the `field – type` format. For example, the `Sum` aggregate value for the `Freight` field should be assigned to the property named as `Freight - sum`.

```
,
```

```
{
  result: [{..}, {..}, {..}, ...],
  count: 830,
  aggregates: { 'Freight - sum' : 450,'EmployeeID - min': 1 }
}
```

```
,
```

The group footer and caption aggregate values will be calculated by the grid itself.

### Provide excel filter data source

The `dataStateChange` event will be triggered with appropriate arguments when the excel filter requests the filter choice data source. You need to resolve the excel filter data source using the `dataSource` resolver function from the state argument as follows.

```
,
```

```
<template>
<div id="app">
  <ejs-grid :dataSource='data' :allowPaging='true' :pageSettings='pageOptions' :allowSorting='true'
  :allowGrouping='true' :dataStateChange='dataStateChange' :filterSettings='filterOptions'>
    <e-columns>
      <e-column field= "OrderID" headerText="Order ID" width="130" textAlign='Right' ></e-column>
      <e-column field= "CustomerID" headerText="Customer Name" width="150"></e-column>
      <e-column field= "ShipName" headerText="Ship Name" width="200"></e-column>
      <e-column field= "ShipCity" headerText="Ship City" width="150"></e-column>
    </e-columns>
  </ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
```

```
import { GridPlugin, DataStateChangeEventArgs, Sorts, Sort, Group, Page, DataResult, Filter } from
"@syncfusion/ej2-vue-grids";
import { Ajax } from '@syncfusion/ej2-base';
Vue.use(GridPlugin);
export default Vue.extend({
  data() {
    return {
      data: {},
      filterOptions: { type: 'Excel' },
      pageOptions: { pageSize: 10, pageCount: 4 },
      orderService: new OrderService()
    };
  },
  mounted() {
    let state = { skip: 0, take: 10 };
    this.dataStateChange(state);
  },
  methods:{
    dataStateChange: function (state) {
      if (state.action.requestType === "filterchoicerequest" || state.action.requestType
        === "filtersearchbegin") {
        this.orderService.execute(state).then((e) => state.dataSource(e));
      } else {
        this.orderService.execute(state).then(( gridData ) => {this.grid.dataSource = gridData} );
      }
    },
  },
  provide: {
    grid: [Sort, Group, Page, Filter]
  }
});
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
```

</style>

You can find the code at our [GitHub repository](#)

- [How to bind SQL Server data in Vue DataGrid using SqlClient data provider](#)

### Local data in Vue Grid component

To bind local data to the grid, you can assign a JavaScript object array to the `dataSource` property. The local data source can also be provided as an instance of the `DataManager`.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource="data" height='315px' >
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
        <e-column field='OrderDate' headerText='Order Date'
textAlign='Right' format='yMd' type='date' width=120></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/databind/default-cs4" %}

By default, `DataManager` uses `JsonAdaptor` for local data-binding.

### *Refresh the data source*

You can add/delete the datasource records through an external button. To reflect the datasource changes in grid, you need to invoke the [refresh](#) method.

Please follow the below steps to refresh the grid after datasource change.

**Step 1:** Add/delete the datasource record by using the following code.

```
`ts
this.data.unshift(customData); // Add a new record.
this.data.splice(selectedRow, 1); // Delete a record.
`
```

**Step 2:** When applied the changes in dataSource then refresh Grid at own.

```
`ts
this.data = [...this.data]; // Refresh the Grid dataSource.
`
```

### APP.VUE

```
<template>
  <div id="app">
    <ejs-button @click.native='addAction'>Add</ejs-button>
    <ejs-button @click.native='deleteAction'>Delete</ejs-button>
    <ejs-grid ref='grid' :dataSource='data' height='280px' >
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight'
textAlign='Center' format='C2' width=80></e-column>
        <e-column field='OrderDate' headerText='Order Date' type='date'
format='yMd' width=120></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { data } from './datasource.js';
Vue.use(GridPlugin);
Vue.use(ButtonPlugin);
export default {
  data: () => {
    return {
      data: data,
    };
  },
  methods: {
    addAction: function() {
      let customData = { OrderID: 10247, CustomerID: "ASDFG", Freight: 40.4,
OrderDate: new Date(8367642e5) };
      this.data.unshift(customData);
      this.data = [...this.data];
    },
  },
}
```

```

deleteAction: function() {
  let selectedRow = this.$refs.grid.getSelectedRowIndex() [0];
  if (selectedRow !== undefined) {
    this.data.splice(selectedRow, 1);
  }
  else {
    alert("No records selected for delete operation");
  }
  this.data = [...this.data];
}
}
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/how-to/default-cs5" %}

### Remote data in Vue Grid component

To bind remote data to grid component, assign service data as an instance of **DataManager** to the [dataSource](#) property. To interact with remote data source, provide the endpoint url.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource="data">
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
        <e-column field='OrderDate' headerText='Order Date'
textAlign='Right' format='yMd' type='date' width=120></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { DataManager, ODataAdaptor } from "@syncfusion/ej2-data";
Vue.use(GridPlugin);
export default {
  data() {
    let SERVICE_URI =
      "https://services.syncfusion.com/js/production/api/Orders";
    return {
      data: new DataManager({
        url: SERVICE_URI,
        adaptor: new ODataAdaptor()
      })
    };
  }
};

```

```

    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/databind/remote-cs2" %}

By default, **DataManager** uses **ODataAdaptor** for remote data-binding.

#### *OData adaptor - Binding OData service*

**OData** is a standardized protocol for creating and consuming data. You can retrieve data from OData service using **DataManager**. You can refer to the following code example of remote data binding using OData service.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid :dataSource="data">
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
        <e-column field='OrderDate' headerText='Order Date'
textAlign='Right' format='yMd' type='date' width=120></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { DataManager, ODataAdaptor } from "@syncfusion/ej2-data";
Vue.use(GridPlugin);
export default {
  data() {
    let SERVICE_URI =
      "https://services.syncfusion.com/js/production/api/Orders";
    return {
      data: new DataManager({
        url: SERVICE_URI,
        adaptor: new ODataAdaptor(),
        crossDomain: true
      })
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

```
{% previewsample "page.domainurl/code-snippet/grid/databind/remote-cs3" %}
```

#### *OData v4 adaptor - Binding OData v4 service*

The ODataV4 is an improved version of OData protocols, and the **DataManager** can also retrieve and consume OData v4 services. For more details on OData v4 services, refer to the [odata documentation](#). To bind OData v4 service, use the **ODataV4Adaptor**.

#### **APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid :dataSource="data">
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
        <e-column field='OrderDate' headerText='Order Date'
textAlign='Right' format='yMd' type='date' width=120></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { DataManager, ODataV4Adaptor } from "@syncfusion/ej2-data";
Vue.use(GridPlugin);
export default {
  data() {
    let SERVICE_URI =
      "https://services.odata.org/V4/Northwind/Northwind.svc/Orders/";
    return {
      data: new DataManager({
        url: SERVICE_URI,
        adaptor: new ODataV4Adaptor(),
        crossDomain: true
      })
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/databind/remote-cs4" %}
```

#### *Web API Adaptor*

You can use **WebApiAdaptor** to bind grid with Web API created using OData endpoint.

```
<template>
<div id="app">
<ejs-grid :dataSource="data">
<e-columns>
<e-column field='OrderID' headerText='Order ID' textAlign='Right' width=90></e-column>
<e-column field='CustomerID' headerText='Customer ID' width=120></e-column>
<e-column field='Freight' headerText='Freight' textAlign='Right' format='C2' width=90></e-column>
<e-column field='OrderDate' headerText='Order Date' textAlign='Right' format='yMd' type='date'
width=120></e-column>
</e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { DataManager, WebApiAdaptor } from "@syncfusion/ej2-data";
Vue.use(GridPlugin);
export default Vue.extend({
  data() {
    return {
      data: new DataManager({
        url: 'https://services.syncfusion.com/vue/production/api/Orders',
        adaptor: new WebApiAdaptor(),
        crossDomain: true
      })
    };
  }
});
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

The response object should contain properties `Items` and `Count` whose values are a collection of entities and the total count of the entities respectively.

The sample response object should look like below.

```
{
  Items: [{..}, {..}, {..}, ...],
  Count: 830
}
```

#### *Remote save adaptor*

You may need to perform all Grid Actions in client-side except the CRUD operations, that should be interacted with server-side to persist data. It can be achieved in Grid by using `RemoteSaveAdaptor`.

Datasource must be set to `json` property and set `RemoteSaveAdaptor` to the `adaptor` property. CRUD operations can be mapped to server-side using `updateUrl`, `insertUrl`, `removeUrl`, `batchUrl`, `crudUrl` properties.

You can use the following code example to use `RemoteSaveAdaptor` in Grid.

```
<template>
<div id="app">
  <ejs-grid :dataSource="dataSource" :editSettings='editSettings' :toolbar='toolbar'>
    <e-columns>
      <e-column field='OrderID' headerText='Order ID' :isPrimaryKey='true' textAlign='Right' width=90></e-column>
      <e-column field='CustomerID' headerText='Customer ID' width=120></e-column>
      <e-column field='Freight' headerText='Freight' textAlign='Right' format='C2' width=90></e-column>
      <e-column field='OrderDate' headerText='Order Date' textAlign='Right' format='yMd' type='date' width=120></e-column>
    </e-columns>
  </ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
```

```

import { DataManager, RemoteSaveAdaptor } from "@syncfusion/ej2-data";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default Vue.extend({
  data() {
    return {
      dataSource: new DataManager({
        json: data,
        adaptor: new RemoteSaveAdaptor,
        insertUrl: '/Home/Insert',
        updateUrl: '/Home/Update',
        removeUrl: '/Home/Delete'
      }),
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting: true },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel']
    };
  },
  provide: {
    grid: [Edit, Toolbar]
  }
});
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

The following code example describes the CRUD operations handled at server-side.

```

public ActionResult Update(OrdersDetails value)
{
  ...
  return Json(value);
}

```

```

public ActionResult Insert(OrdersDetails value)
{
    ...
    return Json(value);
}

public ActionResult Delete(int key)
{
    ...
    return Json(data);
}

```

### Custom adaptor

You can create your own adaptor by extending the built-in adaptors. For the sake of demonstrating custom adaptor approach, we are going to see how to add a serial number for the records by overriding the built-in response processing using the `processResponse` method of the `ODataAdaptor`.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource="data">
      <e-columns>
        <e-column field='Sno' headerText='SNO' textAlign='Right'
width=150></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
        <e-column field='OrderDate' headerText='Order Date'
textAlign='Right' format='yMd' type='date' width=120></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { DataManager, ODataAdaptor } from "@syncfusion/ej2-data";
Vue.use(GridPlugin);
class SerialNoAdaptor extends ODataAdaptor {
  processResponse() {
    let i = 0;
    //calling base class processResponse function
    let original = super.processResponse.apply(this, arguments);
    //Adding serial number
    original.result.forEach((item) => item['Sno'] = ++i);
    return { result: original.result, count: original.count };
  }
}

```

```

export default {
  data() {
    let SERVICE_URI =
      "https://services.syncfusion.com/js/production/api/Orders";
    return {
      data: new DataManager({
        url: SERVICE_URI,
        adaptor: new SerialNoAdaptor()
      })
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/databind/remote-cs5" %}

### Offline mode

On remote data binding, all grid actions such as paging, sorting, editing, grouping, filtering, etc, will be processed on server-side. To avoid post back for every action, set the grid to load all data on initialization and make the actions process in client-side. To enable this behavior, use the **offline** property of **DataManager**.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource="data" :allowPaging="true"
    :pageSettings='pageSettings'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
        format='C2' width=90></e-column>
        <e-column field='OrderDate' headerText='Order Date'
        textAlign='Right' format='yMd' type='date' width=120></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page } from "@syncfusion/ej2-vue-grids";
import { DataManager, ODataAdaptor } from "@syncfusion/ej2-data";
Vue.use(GridPlugin);
export default {
  data() {
    let SERVICE_URI =
      "https://services.syncfusion.com/js/production/api/Orders";
    return {
      data: new DataManager({
        url: SERVICE_URI,

```

```

        adaptor: new ODataAdaptor(),
        offline: true
    }},
    pageSettings: {pageSize: 7}
};
},
provide: {
    grid: [Page]
}
});
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/databind/remote-cs6" %}

### How to change the data source or columns dynamically in Vue Grid component

The grid can be dynamically update the data source, columns, or both, using the [changeDataSource](#) method. However, it is important to note that during the changing process for the data source and columns, the grid's existing actions such as sorting, filtering, grouping, aggregation, and searching will be removed. The `changeDataSource` method has two optional arguments, the first argument being the data source, and the second argument being the columns. So, you need to pass the two required arguments to the `changeDataSource` method. Some of the uses for using the `changeDataSource` method are explained in the topic below.

#### 1. Change both data source and columns:

To modify both the existing columns and the data source, you need to pass the both arguments to the `changeDataSource` method. The following example demonstrates how to change both the data source and columns.

You can assign a JavaScript object array to the [dataSource](#) property to bind local data to the grid. The code below provides an example of how to create a data source for the grid.

```

`typescript
export let data: Object[] = [
{
    OrderID: 10248, CustomerID: 'VINET', Freight: 32.38,
    ShipCity: 'Reims'
},
{
    OrderID: 10249, CustomerID: 'TOMSP', Freight: 11.61,
    ShipCity: 'Münster'
},
{
    OrderID: 10250, CustomerID: 'HANAR', Freight: 61.34,

```

```
ShipCity: 'Rio de Janeiro'
```

```
});
```

```
,
```

The following code demonstrates how to create the [columns](#) for the grid, which are based on the provided grid data source.

```
`typescript
```

```
newcolumn: [
```

```
{ field: 'Freight', headerText: 'Employee ID', width: 120, textAlign: 'Right' },
```

```
{ field: 'ShipRegion', headerText: 'Ship City', width: 140 }
```

```
]
```

```
,
```

The following code demonstrates updating the data source and columns defined above using the `changeDataSource` method.

```
`typescript
```

```
this.$refs.gridInstance.changeDataSource(data, newColumn);
```

```
,
```

## 2. Modify only the existing columns:

To modify the existing columns in a grid, you can either add or remove columns or change the entire set of columns using the `changeDataSource` method. To use this method, you should set the first parameter to null and provide the new columns as the second parameter. However, please note that if a column field is not specified in the data source, its corresponding column values will be empty. The following example illustrates how to modify existing columns.

The following code demonstrates how to add new columns with existing grid columns ('newColumn') by using `changeDataSource` method.

```
`typescript
```

```
newcolumn: [
```

```
{ field: 'Freight', headerText: 'Employee ID', width: 120, textAlign: 'Right' },
```

```
{ field: 'ShipRegion', headerText: 'Ship City', width: 140 }
```

```
]
```

```
let column: any = this.newColumn.push(...this.newColumn1);
```

```
this.$refs.gridInstance.changeDataSource(null, column);
```

```
,
```

## 3. Modify only the data source:

You can change the entire data source in the grid using the `changeDataSource` method. To use this method, you should provide the data source as the first argument, and the second argument which is optional can be used to specify new columns for the grid. If you are not specifying the columns, the grid

will generate the columns automatically based on the data source. The following example demonstrates how to modify the data source.

You can assign a JavaScript object array to the `dataSource` property to bind local data to the grid. The code below provides an example of how to create a new data source for the grid.

```
`typescript
export let employeeData: Object[] = [
{
  FirstName: 'Nancy', City: 'Seattle', Region: 'WA',
  Country: 'USA'
},
{
  FirstName: 'Andrew', City: 'London', Region: null,
  Country: 'UK',
},
{
  FirstName: 'Janet', City: 'Kirkland', Region: 'WA',
  Country: 'USA'
}
];
`
```

The following code demonstrates, how to use the `changeDataSource` method to bind the new **employeeData** to the grid.

```
`typescript
this.$refs.gridInstance.changeDataSource(employeeData);
`
```

\* The Grid state persistence feature does not support the `changeDataSource` method.

\* In this document, the above sample uses the local data for `changeDataSource` method. For those using a remote data source, refer to the [FlexibleData](#) resource.

### Immutable mode in Vue Grid component

The immutable mode optimizes the Grid re-rendering performance by using the object reference and [deep compare](#) concept. When performing the Grid actions, it will only re-render the modified or newly added rows and prevent the re-rendering of the unchanged rows.

To enable this feature, you have to set the [enableImmutableMode](#) property as **true**.

This feature uses the primary key value for data comparison. So, you need to provide the [isPrimaryKey](#) column.

### **APP.VUE**

```

<template>
  <div id="app">
    <table>
      <tbody>
        <tr>
          <td>
            <span id="immutableDelete"></span>
          </td>
        </tr>
        <tr>
          <td>
            <span id="normalDelete"></span>
          </td>
        </tr>
        <tr>
          <td>

@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/immutable-mode-cs1" %}

### Limitations

The following features are not supported in the immutable mode:

- Frozen rows and columns
- Row Template
- Detail Template
- Hierarchy Grid
- Column reorder
- Virtual scroll
- Infinite scroll
- Grouping

### Performance tips for Vue DataGrid Component

This article is a comprehensive guide on improving the loading performance of the Vue DataGrid, especially when dealing with large datasets along with large number of columns. It provides valuable insights into the steps that need to be followed to bind a large data source without experiencing any performance degradations. By offering detailed explanations and actionable tips, this resource aims to empower readers with the knowledge and best practices necessary to optimize the performance of the Vue DataGrid during data binding, ensuring a smooth and efficient user experience.

#### How to improve loading performance by binding large dataset

As you all know, a grid is made up of rows and columns. For instance, when you bind 10 rows and 10 columns, it means 100 elements will be rendered in the DOM (Document Object Model). So, it is recommended to render only a limited number of rows and columns to guarantee the best loading performance for the component.

#### *Optimizing performance with paging*

To boost the performance efficiency of your application, especially when dealing with large datasets, it is advised to implement paging. [Paging](#) allows you to display grid data in segmented pages, facilitating easier navigation through substantial datasets. This feature proves particularly beneficial in enhancing the overall performance of your application. For more information on implementing paging, you can refer to the [documentation](#) section dedicated to this feature.

#### *Optimizing performance with row virtualization or infinite scrolling*

To enhance your application's efficiency, especially when dealing with substantial datasets, it is recommended to either using [virtualization](#) or [infinite scrolling](#). Implementing these techniques can significantly reduce the load on your application and elevate its overall performance.

1. **Virtualization:** The Virtual scrolling feature in the Vue Data Grid enables the efficient handling and display of large volumes of data without compromising performance. This approach optimizes the rendering process by loading only the visible rows within the Grid viewport, rather than rendering the entire dataset simultaneously. For more information on implementing row virtualization , you can refer to the [documentation](#) section dedicated to this feature.
2. **Infinite scrolling:** The Infinite Scrolling feature in the Vue Data Grid is a powerful tool for seamlessly handling extensive data sets without compromising grid performance. It operates on a "load-on-demand" concept, ensuring that data is fetched only when needed. In the default infinite scrolling mode, a new block of data is loaded each time the scrollbar reaches the end of the vertical scroller. For more information on implementing infinite scrolling , you can refer to the [documentation](#) section dedicated to this feature.

#### *Optimizing performance with column virtualization in large no of columns*

[Column virtualization](#) feature in the Vue Data Grid that allows you to optimize the rendering of columns by displaying only the columns that are currently within the viewport. It allows horizontal scrolling to view additional columns. This feature is particularly useful when dealing with grids that have a large number of columns, as it helps to improve the performance and reduce the initial loading time.

It is possible to enable both row and column virtualization. This feature allows for efficient handling of large datasets by dynamically loading only the visible rows and columns, optimizing performance and enhancing the overall responsiveness of the grid. For more information on implementing column virtualization , you can refer to the [documentation](#) section dedicated to this feature.

#### *How to overcome browser height limitation in virtual scrolling*

##### [Documentation link](#)

#### *How to improve loading performance by binding large data by showing custom text or element*

When integrating image or template elements into a column, it's recommended to utilize the [Column Template](#) feature rather than customizing the data through [rowDataBound](#) or [queryCellInfo](#) events. These events are triggered for each row and cell rendering, introducing delays in the component's rendering process. Moreover, rendering custom elements using these events may result in the persistence of rendered elements, potentially causing longer rendering times over time. By opting for the column template feature, you can efficiently meet this requirement without experiencing rendering delays and ensure a more streamlined rendering process.

#### *How to improve loading performance by referring individual script and CSS*

To improve the performance of Syncfusion Grid component during the initial render as well as certain actions, suggested you to download the specific component scripts using CRG (Custom Resource Generator) to speed up the project. By default, the ej2.min.js script file contains all the Syncfusion component scripts. So, it will take some time to load the scripts to the project. Using [CRG](#), you can select the components which you want to use, and the modules for those components, then you can download the scripts and CSS for the selected components and use them as per your need.

##### [CRG website link](#)

So to improve the performance of grid during the initial rendering, suggested you to refer individual script and CSS.

#### *How to update cell values without frequent server calls*

Efficiently update cell values without the need for frequent server calls, especially beneficial for live update scenarios. Even when the data is initially bound from the server, performing edit operations can

be done without triggering a database refresh. Utilize the [setCellValue](#) method to update the DataGrid without affecting the database and only refresh the UI.

#### How to optimize server-side data operations with adaptors

The Vue DataGrid provides support for various adaptors (OData, ODataV4, WebAPI, URL, etc.) to facilitate server-side data operations and CRUD functionalities. By leveraging these adaptors along with the **DataManager** component, you can seamlessly bind remote data sources to the grid and execute actions. During data operations like filtering, sorting, and paging, the corresponding action queries are generated as per the adaptor's requirements. It is crucial to handle these actions on the application end and return the processed data back to the grid. Refer to the documentation for comprehensive details. It's worth noting that for efficient data processing, the suggested order for returning processed data to the grid is as follows

- Filtering
- Sorting
- Aggregates
- Paging
- Grouping

#### How to avoid MaxJsonLength error while passing large amount of records

The Vue Grid component is client-server based. So, we send the data as JSON object between client and server. The reported issue occurs due to the serialization of the large-sized JSON object. We need to increase the maximum length for serializing the large-sized JSON object. You have to alter the [MaxJsonLength](#) property on your web.config file or in the place of deserialization.

##### **Solution: 1**

```
`csharp
<configuration>
<system.web.extensions>
<scripting>
<webServices>
<jsonSerialization maxJsonLength="50000000"/>
</webServices>
</scripting>
</system.web.extensions>
</configuration>
`
```

##### **Solution : 2**

```
`csharp
var serializer = new JavaScriptSerializer { MaxJsonLength = Int32.MaxValue };
`
```

### Microsoft excel limitation while exporting millions of records to excel file format

By default, Microsoft Excel supports only 1,048,576 records in an excel sheet. Hence it is not possible to export millions of records to excel. You can refer the [documentation](#) link for more details on Microsoft excel specifications and limits. So suggest to export the data in CSV (Comma-Separated Values) or other formats that can handle large datasets more efficiently than Excel.

## Columns

### Columns in Vue Grid component

In Syncfusion Vue Grid, Columns are fundamental elements that play a pivotal role in organizing and displaying data within your application. They serve as the building blocks for data presentation, allowing you to specify what data fields to show, how to format and style them, and how to enable various interactions within the grid.

### Column types

The Syncfusion Grid component allows you to specify the type of data that a column binds using the [columns.type](#) property. The `type` property is used to determine the appropriate [format](#), such as [number](#) or [date](#), for displaying the column data.

Grid supports the following column types:

- **string**: Represents a column that binds to string data. This is the default type if the `type` property is not defined.
- **number**: Represents a column that binds to numeric data. It supports formatting options for displaying numbers.
- **boolean**: Represents a column that binds to boolean data. It displays checkboxes for boolean values.
- **date**: Represents a column that binds to date data. It supports formatting options for displaying dates.
- **datetime**: Represents a column that binds to date and time data. It supports formatting options for displaying date and time values.
- **checkbox**: Represents a column that displays checkboxes.

Here is an example of how to specify column types in a grid using the types mentioned above.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource="data" height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' type='number' width=150></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
type='string' width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' type='number' width=150></e-column>
        <e-column field='OrderDate' headerText='Order Date'
textAlign='Right' format='yMd' type='date' width=120></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
```

```

<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  provide: {
    grid: []
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/column-type-cs1" %}

\* If the [type](#) is not defined, then it will be determined from the first record of the [dataSource](#).

\* In case if the first record of the [dataSource](#) is null/blank value for a column then it is necessary to define the [type](#) for that column. This is because the grid uses the column type to determine which filter dialog to display for that column.

#### Difference between boolean type and checkbox type column

1. Use the **boolean** column type when you want to bind boolean values from your datasource and/or edit boolean property values from your type.
2. Use the **checkbox** column type when you want to enable selection/deselection of the whole row.
3. When the grid column **type** is a **checkbox**, the selection type of the grid **selectionSettings** will be multiple. This is the default behavior.
4. If you have more than one column with the column type as a **checkbox**, the grid will automatically enable the other column's checkbox when selecting one column checkbox.

To learn more about how to render boolean values as checkboxes in a Syncfusion GridColumn, please refer to the [Render Boolean Values as Checkbox](#) section.

#### Column width

To adjust the column width in a Grid, you can use the [width](#) property within the [columns](#) property of the Grid configuration. This property enables you to define the column width in pixels or as a percentage. You can set the width to a specific value, like **100** for 100 pixels, or as a percentage value, such as **25%** for 25% of the available width.

1. Grid column width is calculated based on the sum of column widths. For example, a grid container with 4 columns and a width of 800 pixels will have columns with a default width of 200 pixels each.

2. If you specify widths for some columns but not others, the Grid will distribute the available width equally among the columns without explicit widths. For example, if you have 3 columns with widths of 100px, 200px, and no width specified for the third column, the third column will occupy the remaining width after accounting for the first two columns.
3. Columns with percentage widths are responsive and adjust their width based on the size of the grid container. For example, a column with a width of 50% will occupy 50% of the grid width and will adjust proportionally when the grid container is resized to a smaller size.
4. When you manually resize columns in Syncfusion Grid, a minimum width is set to ensure that the content within the cells remains readable. By default, the minimum width is set to 10 pixels if not explicitly specified for a column.
5. If the total width of all columns exceeds the width of the grid container, a horizontal scrollbar will automatically appear to allow horizontal scrolling within the grid.
6. When the columns is hide using the column chooser, the width of the hidden columns is removed from the total grid width, and the remaining columns will be resized to fill the available space.
7. If the parent element has a fixed width, the grid component will inherit that width and occupy the available space. However, if the parent element does not have a fixed width, the grid component will adjust its width dynamically based on the available space.

### Supported types for column width

Syncfusion Grid supports the following three types of column width:

#### 1. Auto

The column width is automatically calculated based on the content within the column cells. If the content exceeds the width of the column, it will be truncated with an ellipsis (...) at the end. You can set the width for columns as **auto** in your Grid configuration as shown below:

```
`html
```

```
<e-column field='OrderID' headerText='Order ID' textAlign='Right' width='auto'></e-column>
```

```
,
```

#### 2. Percentage

The column width is specified as a percentage value relative to the width of the grid container. For example, a column width of 25% will occupy 25% of the total grid width. You can set the width for columns as **percentage** in your Grid configuration as shown below:

```
`html
```

```
<e-column field='OrderID' headerText='Order ID' textAlign='Right' width='25%'></e-column>
```

```
,
```

#### 3. Pixel

The column width is specified as an absolute pixel value. For example, a column width of 100px will have a fixed width of 100 pixels regardless of the grid container size. You can set the width for columns as **pixel** in your Grid configuration as shown below:

```
`html
```

```
<e-column field='OrderID' headerText='Order ID' textAlign='Right' width='100'></e-column>
```

**APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource="data" height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width='auto'></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight'
textAlign='Right' format='C2' width='100px'></e-column>
        <e-column field='OrderDate' headerText='Order Date'
textAlign='Right' format='yMd' width='30%'></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  provide: {
    grid: []
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/column-width-cs1" %}

*Column formatting*

Column formatting is a powerful feature in Syncfusion Grid that allows you to customize the display of data in grid columns. You can apply different formatting options to columns based on your requirements, such as displaying numbers with specific formats, formatting dates according to a specific locale, and using templates to format column values.

You can use the [columns.format](#) property to specify the format for column values.

**APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' height='315'>
      <e-columns>

```

```

        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' format = 'C2'
width=80></e-column>
        <e-column field='OrderDate' headerText='Order Date'
format='yMd' textAlign='Right' width=80></e-column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  methods: {
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/column-format-cs1" %}

- \* The grid uses the [Internalization](#) library to format values based on the specified format and culture.
- \* By default, the [number](#) and [date](#) values are formatted in **en-US** locale. You can localize the currency and date in different locale as explained [here](#).
- \* The available format codes may vary depending on the data type of the column.
- \* You can also customize the formatting further by providing a custom function to the **format** property, instead of a format string.
- \* Make sure that the format string is valid and compatible with the data type of the column, to avoid unexpected results.

#### Number formatting

Number formatting allows you to customize the display of numeric values in grid columns. You can use standard numeric format strings or custom numeric format strings to specify the desired format. The [columns.format](#) property can be used to specify the number format for numeric columns. For example, you can use the following format strings to format numbers:

Format	Description	Remarks

| ----- | ----- | -----  
 ----- |

| N | Denotes numeric type. | The numeric format is followed by integer value as N2, N3. etc which denotes the number of precision to be allowed.

|

| C | Denotes currency type. | The currency format is followed by integer value as C2, C3. etc which denotes the number of precision to be allowed.

|

| P | Denotes percentage type | The percentage format expects the input value to be in the range of 0 to 1. For example the cell value **0.2** is formatted as **20%**. The percentage format is followed by integer value as P2, P3. etc which denotes the number of precision to be allowed. |

The following example code demonstrates the formatting of data for **Mark 1** and **Mark 2** using the '**N**' format, **Percentage of Marks** using the '**P**' format, and **Fees** using the '**C**' format.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' height='182px' allowPaging=true>
      <e-columns>
        <e-column field='RollNo' headerText='Roll No'></e-column>
        <e-column field='Mark1' headerText='Mark 1'></e-column>
        <e-column field='Mark2' headerText='Mark 2' format='N'></e-
column>
        <e-column field='Average' headerText='Average'
format='N2'></e-column>
        <e-column field='Percentage' headerText='Percentage of Marks'
format='P'></e-column>
        <e-column field='Fees' headerText='Fees' textAlign='Right'
format='C'></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  methods: {
  },
  provide: {
    grid: [Page]
  }
}
</script>
```

```
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/column/column-format-cs2" %}

To learn more about number formatting, you can refer to the [number](#) section.

### Date formatting

Date formatting in grid columns allows you to customize how date values are displayed. You can use standard date format strings, such as “d,” “D,” “MMM dd, yyyy,” and more, or create your own custom format strings. To specify the desired date format, you can use the [format](#) property of the Grid columns. For example, you can set `columns.format` as a string like “yMd” for a built-in date format.

Additionally, you can use custom format strings to format date values, and examples of custom formats and formatted date values are provided in the table below.

Format | Formatted value

{ type:'date', format:'dd/MM/yyyy' } | 04/07/1996

{ type:'date', format:'dd.MM.yyyy' } | 04.07.1996

{ type:'date', skeleton:'short' } | 7/4/96

{ type: 'dateTime', format: 'dd/MM/yyyy hh:mm a' } | 04/07/1996 12:00 AM

{ type: 'dateTime', format: 'MM/dd/yyyy hh:mm:ss a' } | 07/04/1996 12:00:00 AM

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' height='182px' allowPaging=true>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='Freight' headerText='Freight'
textAlign='Right' format='C2' width=90></e-column>
        <e-column field='OrderDate' :format='formatOptions'
headerText='Order Date' format='yMd' textAlign='Right' width=120></e-column>
        <e-column field='OrderDate' :format='shipFormat'
headerText='Ship Date' textAlign='Right' width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      formatOptions: { type: 'date', format: 'dd/MM/yyyy' },
      shipFormat: { type: 'dateTime', format: 'dd/MM/yyyy hh:mm a' }
    }
  }
}
```

```

    };
  },
  methods: {
  },
  provide: {
    grid: [Page]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/column-format-cs3" %}

To learn more about date formatting, you can refer to [Date formatting](#).

#### Format the date column based on localization

You can also format the date column based on the localization settings of the user's browser. You can use the [format](#) property of the Grid columns along with the [locale](#) property to specify the desired date format based on the locale.

In this example, the format property specifies the date format as "yyyy-MMM-dd", and the locale property specifies the locale as "de-DE" for German (Germany).

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' locale='de-DE' height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='Freight' headerText='Freight'
textAlign='Right' width=150></e-column>
        <e-column field='OrderDate' headerText='Order Date'
:format='dateFormatOptions' textAlign='Right' width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { L10n, loadCldr, setCulture, setCurrencyCode } from
"@syncfusion/ej2-base";
import * as currencies from './currencies.json';
import * as cagregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';
import * as timeZoneNames from './timeZoneNames.json';
import * as numberingSystems from './numberingSystems.json';
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';

```

```

setCulture('de-DE');
setCurrencyCode('EUR');
L10n.load({
  'de-DE': {
    'grid': {
      'EmptyRecord': 'Keine Aufzeichnungen angezeigt',
      'GroupDropArea': 'Ziehen Sie einen Spaltenkopf hier, um die
Gruppe ihre Spalte',
      'UnGroup': 'Klicken Sie hier, um die Gruppierung aufheben',
      'EmptyDataSourceError': 'DataSource darf bei der Erstauslastung
nicht leer sein, da Spalten aus der dataSource im AutoGenerate
Spaltenraster',
      'Item': 'Artikel',
      'Items': 'Artikel'
    },
    'pager': {
      'currentPageInfo': '{0} von {1} Seiten',
      'totalItemsInfo': '({0} Beiträge)',
      'firstPageTooltip': 'Zur ersten Seite',
      'lastPageTooltip': 'Zur letzten Seite',
      'nextPageTooltip': 'Zur nächsten Seite',
      'previousPageTooltip': 'Zurück zur letzten Seit',
      'nextPagerTooltip': 'Gehen Sie zu den nächsten Pager-Elementen',
      'previousPagerTooltip': 'Gehen Sie zu vorherigen Pager-
Elementen'
    }
  }
});
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      dateFormatOptions: {type: 'date', format: 'dd-MMM-yy'}
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/column-format-cs4" %}

#### Format template column value

In the Syncfusion Vue Grid, you have the ability to customize the display of data in a column through the use of template columns. Formatting template column values is essential for enhancing the visual representation of data in a web application. It allows the customization of the appearance of specific column data, such as dates and numbers, to improve readability and user understanding.

To illustrate how to format a template column value, consider the following example where the **OrderDate** column is formatted to display dates in the **'Jul 04, 1996'** format.

#### APP.VUE

```
<template>
```

```

<div id="app">
  <ejs-grid :dataSource='data' height='315px'>
    <e-columns>
      <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
      <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
      <e-column field='Freight' headerText='Freight'
textAlign='Right' width=150></e-column>
      <e-column field='OrderDate' headerText='Order Date'
:template='columnTemplate' textAlign='Right' width=150></e-column>
      <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
    </e-columns>
  </ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      columnTemplate: function () {
        return {
          template: Vue.component('columnTemplate', {
            template: `<div> {{formatDate(data.OrderDate)}}
</div>`,
            methods: {
              formatDate(date) {
                return new
Date(date).toLocaleDateString("en-US", { day: "2-digit", month: "short",
year: "numeric" });
            },
          },
        );
      },
    };
  },
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/column-format-cs5" %}

### Custom formatting

Syncfusion Grid allows you to customize the formatting of data in the grid columns. You can apply custom formats to numeric or date columns to display data in a specific way according to the

requirements. To apply custom formatting to grid columns in Syncfusion Grid, you can use the [format](#) property. Here's an example of how you can use custom formatting for numeric and date columns:

In the below example, the **numberFormatOptions** object is used as the **format** property for the **'Freight'** column to apply a custom numeric format with four decimal places. Similarly, the **dateFormatOptions** object is used as the **format** property for the **'OrderDate'** column to apply a custom date format displaying the date in the format of day-of-the-week, month abbreviation, day, and 2-digit year (e.g. Sun, May 8, '23).

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='Freight' headerText='Freight'
textAlign='Right' :format='numberFormatOptions' width=150></e-column>
        <e-column field='OrderDate' headerText='Order Date'
:format='dateFormatOptions' textAlign='Right' width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data:data,
      numberFormatOptions: {
        // Custom format for numeric columns
        format: '##.0000',
      },
      dateFormatOptions: {
        // Custom format for date columns
        type: 'Date',
        format: "EEE, MMM d, 'yyyy",
      }
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/column/column-format-cs6" %}
```

To learn more about custom formatting, you can refer to [Custom Date formatting](#) and [Custom Number formatting](#).

### *Align the text of content*

You can align the text in the content of a Grid column using the `textAlign` property. This property allows you to specify the alignment of the text within the cells of a particular column in the Grid. By default, the text is aligned to the left, but you can change the alignment by setting the value of the `textAlign` property to one of the following options:

*Left:* Aligns the text to the left (default). **Center:** Aligns the text to the center. *Right:* Aligns the text to the right. **Justify:** Align the text to the justify.

Here is an example of using the `textAlign` property to align the text of a Grid column:

### **APP.VUE**

```
<template>
<div id='app'>
  <div style='display: flex'>
    <label style='padding: 10px 10px 12px 0'> Align the text for
columns: </label>
    <ejs-dropdownlist ref='dropdown' id='dropdownlist' style='margin-
top:5px' index='0' width='150'
      :dataSource='alignmentData' :fields='fields'
      :change='change'></ejs-dropdownlist>
  </div>
  <ejs-grid ref='grid' id='grid' :dataSource='data' height='315'>
    <e-columns>
      <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
      <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
      <e-column field='Freight' headerText='Freight' format='C2'
width=80></e-column>
      <e-column field='OrderDate' headerText='Order Date' format='yMd'
textAlign='Right' width=80></e-column>
    </e-columns>
  </ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
import { data } from './datasource.js';
Vue.use(GridPlugin);
Vue.use(DropDownListPlugin);
export default {
  data() {
    return {
      data: data,
      fields: { text: 'text', value: 'value' },
      alignmentData: [
        { text: 'Left', value: 'Left' },
        { text: 'Right', value: 'Right' },
```

```

        { text: 'Center', value: 'Center' },
        { text: 'Justify', value: 'Justify' },
    ],
    };
},
methods: {
    change: function (args) {
        let grid = this.$refs.grid.$el.ej2_instances[0];
        grid.columns.forEach(col => {
            col.textAlign = args.value;
        });
        grid.refreshColumns();
    }
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/column-align-cs1" %}

\* The `textAlign` property only changes the alignment content not the column header. If you want to align both the column header and content, you can use the [headerTextAlign](#) property.

#### Render boolean value as checkbox

The Grid component allows you to render boolean values as checkboxes in columns. This can be achieved by using the [displayAsCheckBox](#) property, which is available in the [columns](#). This property is useful when you have a boolean column in your Grid and you want to display the values as checkboxes instead of the default text representation of **true** or **false**.

To enable the rendering of boolean values as checkboxes, you need to set the `displayAsCheckBox` property of the `columns` to **true**.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' height='315'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign=
        'Right' width=120 format= 'C2'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
        width=150></e-column>
        <e-column field='Verified' headerText='Verified'
        displayAsCheckBox='true' width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>

```

```
import Vue from "vue";
import { GridPlugin, Page } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
    };
  },
  provide: {
    grid: [Page]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs22" %}

\* The `displayAsCheckBox` property is only applicable to boolean values in Grid columns.

\* When `displayAsCheckBox` is set to **true**, the boolean values will be rendered as checkboxes in the Grid column, with checked state indicating **true** and unchecked state indicating **false**.

#### *How to prevent checkbox in the blank row*

To prevent the checkbox in the blank row of the Grid, even if the `displayAsCheckBox` property is set to true for that column, you can use the `rowDataBound` event and check for empty or null values in the row data. If all the values in the row are empty or null, you can set the inner HTML of the corresponding cell to an empty string to hide the checkbox.

Here is an example of how you can prevent a checkbox from being displayed in a blank row in a Grid:

#### **APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid id="grid" :dataSource="data" :rowDataBound='rowDataBound'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
        <e-column field='Verified' headerText='Verified'
displayAsCheckBox='true' width=120> </e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
```

```

Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  methods: {
    rowDataBound(args) {
      let grid = document.getElementById('grid').ej2_instances[0];
      let count = 0;
      let keys = Object.keys(args.data);
      for (let i = 0; i < keys.length; i++) {
        if (args.data[keys[i]] == null || args.data[keys[i]] == '' ||
args.data[keys[i]] == undefined) {
          count++;
        }
      }
      if (count == keys.length) {
        for (let i = 0; i < grid.columns.length; i++) {
          if (grid.columns[i].displayAsCheckBox) {
            args.row.children[i].innerHTML = '';
          }
        }
      }
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/blank-row-cs1" %}

### AutoFit columns

The Grid has a feature that allows it to automatically adjust column widths based on the maximum content width of each column when you double-click on the resizer symbol located in a specific column header. This feature ensures that all data in the grid rows is displayed without wrapping. To use this feature, you need to inject the **Resize** module in the provide section and enable the resizer symbol in the column header by setting the [allowResizing](#) property to true in the grid.

### Resizing a column to fit its content using autoFit method

The [autoFitColumns](#) method resizes the column to fit the widest cell's content without wrapping. You can autofit a specific column at initial rendering by invoking the `autoFitColumns` method in [dataBound](#) event.

To use the `autoFitColumns` method, inject the **Resize** module in the provide section.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource="data" :dataBound='dataBound'
height='315px'>
      <e-columns>

```

```

        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=150></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=150></e-column>
        <e-column field='OrderDate' headerText='Order Date'
textAlign='Right' format='yMd' type='date' width=120></e-column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Resize } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  methods: {
    dataBound: function() {
      this.$refs.grid.autoFitColumns(['OrderDate', 'CustomerID']);
    }
  },
  provide: {
    grid: [Resize]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs1" %}

You can autofit all the columns by invoking the `autoFitColumns` method without specifying column names.

#### AutoFit columns with empty space

The Autofit feature is utilized to display columns in a grid based on the defined width specified in the columns declaration. If the total width of the columns is less than the width of the grid, this means that white space will be displayed in the grid instead of the columns auto-adjusting to fill the entire grid width.

You can enable this feature by setting the `autoFit` property set to true. This feature ensures that the column width is rendered only as defined in the Grid column definition.

#### APP.VUE

```

<template>
  <div id="app">

```

```

    <ejs-grid ref='grid' :dataSource="data" :allowResizing='true'
height='400px' width='850px' :autoFit='true'>
    <e-columns>
        <e-column field='OrderID' headerText='Order ID' minWidth='100'
width='150' maxWidth='200' textAlign='Right'></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
minWidth='8' width='150'></e-column>
        <e-column field='Freight' headerText='Freight' minWidth='8'
width='120' format='C2' textAlign='Right'></e-column>
        <e-column field='ShipCity' headerText='Ship City' :allowResizing
= 'false' width='150' textAlign='Right'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
minWidth='8' width='150'></e-column>
    </e-columns>
    </ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Resize } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  provide: {
    grid: [Resize]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/autofit-cs1" %}

If any one of the column width is undefined, then the particular column will automatically adjust to fill the entire width of the grid table, even if you have enabled the `autoFit` property of grid.

#### AutoFit columns when changing column visibility using column chooser

In Syncfusion Grid, you can auto-fit columns when the column visibility is changed using the column chooser. This can be achieved by calling the `autoFitColumns` method in the `actionComplete` event. By using the `requestType` property in the event arguments, you can differentiate between different actions, and then call the `autoFitColumns` method when the request type is `columnState`.

Here's an example code snippet in Vue that demonstrates how to auto fit columns when changing column visibility using column chooser:

#### APP.VUE

```

<template>
  <div id="app">

```

```

<ejs-grid ref='grid' :dataSource="data" :allowResizing='true'
:toolbar='toolbarOptions' :showColumnChooser='true' height='400px'
width='600px' :autoFit='true' :actionComplete='actionComplete'>
  <e-columns>
    <e-column field='OrderID' headerText='Order ID' textAlign='Right'
width=100></e-column>
    <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
    <e-column field='ShipName' headerText='Ship Name' width=80></e-
column>
    <e-column field='ShipAddress' headerText='Ship Address'
width=120></e-column>
    <e-column field='ShipCity' headerText='Ship City' width=100></e-
column>
  </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Resize, ColumnChooser, Toolbar } from
"@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['ColumnChooser']
    };
  },
  methods:{
    actionComplete: function(args){
      if (args.requestType === 'columnstate') {
        let grid =this.$refs.grid.$el.ej2_instances[0];
        grid.autoFitColumns();
      }
    }
  },
  provide: {
    grid: [Resize, ColumnChooser, Toolbar]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/autofit-cs2" %}

### Locked columns

The Syncfusion Grid allows you to lock columns, which prevents them from being reordered and moves them to the first position. This functionality can be achieved by setting the [column.lockColumn](#) property to **true**, which locks the column and moves it to the first position in the grid.

Here's an example of how you can use the `lockColumn` property to lock a column in the Syncfusion Grid:

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource="data" :allowReordering='true'
:allowSelection='false' height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='ShipCity' width=90 :lockColumn='true'
:customAttributes="customAttributes"></e-column>
        <e-column field='ShipName' width=120></e-column>
        <e-column field='ShipCountry' width=120></e-column>
        <e-column field='ShipRegion' width=120></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Reorder } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      customAttributes : {class: 'customcss'}
    };
  },
  provide: {
    grid: [Reorder]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
.e-grid .e-rowcell.customcss{
  background-color: #ecedee;
}
.e-grid .e-headercell.customcss{
  background-color: #ecedee;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs24" %}

#### Show or hide columns

The Syncfusion Grid control allows you to show or hide columns dynamically by using property or methods available in the grid. This feature can be useful when you want to customize the visibility of columns in the Grid based on the requirements.

### Using property

You can show or hide columns in the Vue Grid using the [visible](#) property of each column. By setting the **visible** property to **true** or **false**, you can control whether the column should be visible or hidden in the grid. Here's an example of how to show or hide a column in the Vue Grid using the visible property:

In the below example, the **ShipCity** column is defined with **visible** property set to **false**, which will hide the column in the rendered grid.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource="data" height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
width=90></e-column>
        <e-column field='ShipCity' :visible=false headerText='Ship City'
width=120></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs23" %}

\* Hiding a column using the **visible** property only affects the UI representation of the grid. The data for the hidden column will still be available in the underlying data source, and can be accessed or modified programmatically.

\* When a column is hidden, its width is not included in the calculation of the total grid width.

\* To hide a column permanently, you can set its visible property to false in the column definition, or remove the column definition altogether.

### Using methods

You can also show or hide columns in the Vue Grid using the [showColumns](#) and [hideColumns](#) methods of the grid component. These methods allow you to show or hide columns based on either the `headerText` or the `field` of the column.

#### Based on header text

You can dynamically show or hide columns in the Grid based on the header text by invoking the `showColumns` or `hideColumns` methods. These methods take an array of column header texts as the first parameter, and the value `headerText` as the second parameter to specify that you are showing or hiding columns based on the header text.

Here's an example of how to show or hide a column based on the HeaderText in the Vue Grid:

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-button id='show' cssClass="e-info" v-on:click.native='show'> Show
  </ejs-button>
    <ejs-button id='hide' cssClass="e-info" v-on:click.native='hide'> Hide
  </ejs-button>
    <ejs-grid ref='grid' id='grid' :dataSource="data" height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
width=90></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=120></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
width=120></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { data } from './datasource.js';
Vue.use(GridPlugin);
Vue.use(ButtonPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  methods: {
    show: function () {
      let grid = this.$refs.grid.$el.ej2_instances[0];
      grid.showColumns('Customer ID', 'headerText');
    },
    hide: function () {
```

```

        let grid = this.$refs.grid.$el.ej2_instances[0];
        grid.hideColumns('Customer ID', 'headerText');
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs32" %}

### Based on field

You can dynamically show or hide columns in the Grid using external buttons based on the field by invoking the `showColumns` or `hideColumns` methods. These methods take an array of column fields as the first parameter, and the value `field` as the second parameter to specify that you are showing or hiding columns based on the field.

Here's an example of how to show or hide a column based on the field in the Vue Grid:

### APP.VUE

```

<template>
    <div id="app">
        <ejs-button id='show' cssClass="e-info" v-on:click.native='show'> Show
    </ejs-button>
        <ejs-button id='hide' cssClass="e-info" v-on:click.native='hide'> Hide
    </ejs-button>

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs33" %}

### Controlling grid actions

You can control various actions such as filtering, grouping, sorting, resizing, reordering, editing, and searching for specific columns in the Syncfusion Vue Grid using the following properties:

- [allowEditing](#): Enables or disables editing for a column.
- [allowFiltering](#): Enables or disables filtering for a column.
- [allowGrouping](#): Enables or disables grouping for a column.
- [allowSorting](#): Enables or disables sorting for a column.
- [allowReordering](#): Enables or disables reordering for a column.
- [allowResizing](#): Enables or disables resizing for a column.
- [allowSearching](#): Enables or disables searching for a column.

Here is an example code that demonstrates how to control grid actions for specific columns:

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowReordering="true"
    :editSettings='editSettings' :allowSorting="true" :allowFiltering="true"
    :allowGrouping="true" height="220px">
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=90 :allowReordering="false"></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        :allowEditing="false" width=120></e-column>
        <e-column field='Freight' headerText='Freight'
        textAlign='Right' format='C2' width=90 :allowFiltering="false"></e-column>
        <e-column field='OrderDate' headerText='Order Date'
        textAlign='Right' type='date' format='yMd' :allowGrouping="false" width=120
        :allowSorting="false"></e-column>
      </e-columns>
    </ejs-grid>
  </div>

```

```

</template>
<script>
import Vue from "vue";
import { GridPlugin, Sort, Group, Filter, Reorder, Edit } from
"@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
    };
  },
  provide: {
    grid: [Sort, Group, Filter, Reorder, Edit]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs25" %}

### *Customize column styles*

Customizing the grid column styles allows you to modify the appearance of columns in the Grid control to meet your design requirements. You can customize the font, background color, and other styles of the columns. To customize the columns styles in the grid, you can use grid event, css, property or method support.

For more information check on this [documentation](#).

### *Manipulating columns*

The Syncfusion Grid for Vue provides powerful features for manipulating columns in a grid. This section explains how to access columns, update column definitions, and add/remove columns using Syncfusion Grid properties, methods, and events.

### *Accessing columns*

To access columns in the Syncfusion Grid, you can use the following methods in the grid.

- [\*\*getColumns:\*\*](#)

This method returns the array of columns defined in the grid.

```
`ts
```

```
let columns = grid.getColumns();
```

```
,
```

- [\*\*getColumnByField:\*\*](#)

This method returns the column object that matches the specified field name.

```
`ts
```

```
let column = grid.getColumnByField('ProductName');
```

```
,
```

- [getColumnByUid:](#)

This method returns the column object that matches the specified UID.

```
`ts
```

```
let column = grid.getColumnByUid();
```

```
,
```

- [getVisibleColumns:](#)

This method returns the array of visible columns.

```
`ts
```

```
let visibleColumns = grid.getVisibleColumns();
```

```
,
```

- [getForeignKeyColumns:](#)

This method returns the array of foreignkey columns.

```
`ts
```

```
let foreignKeyColumns = grid.getForeignKeyColumns();
```

```
,
```

- [getColumnFieldNames](#)

This method returns an array of field names of all the columns in the Grid.

```
`ts
```

```
let fieldNames = grid.getColumnFieldNames()
```

```
,
```

For a complete list of column methods and properties, refer to this [section](#).

#### Updating column definitions

You can update the column definitions in the Grid using the [columns](#) property. You can modify the properties of the column objects in the columns array to update the columns dynamically. For example, you can change the headerText, width, visible, and other properties of a column to update its appearance and behavior in the grid and then call the [refreshColumns](#) method to apply the changes to the grid.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-button @click.native="updateColumns"> Update Columns </ejs-
button>
    <ejs-grid ref='grid' :dataSource='data' :height='280'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight'
textAlign='Right' format='C2' width=90></e-column>
        <e-column field='OrderDate' headerText='Order Date'
textAlign='Right' format='yMd' width=120 type='date'></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { data } from './datasource.js';
Vue.use(GridPlugin);
Vue.use(ButtonPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  methods: {
    updateColumns: function() {
      let grid = this.$refs.grid.$el.ej2_instances[0];
      grid.columns[0].textAlign = 'Center';
      grid.columns[0].width = '100';
      grid.columns[2].visible = false;
      grid.columns[1].customAttributes = { class: 'customcss' };
      // Applying changes to the grid
      grid.refreshColumns();
    },
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs26" %}

### [Adding/removing columns](#)

The Grid component allows you to dynamically add or remove columns to and from the grid using the [columns](#) property, which can be accessed through the instance of the Grid.

To add a new column to the Grid, you can directly **push** the new column object to the columns property. To remove a column from the Grid, you can use the **pop** method, which removes the last

element from the columns array of the Grid. Alternatively, you can use the splice method to remove a specific column from the columns array.

Here's an example of how you can add and remove a column from the grid:

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-button @click.native="AddColumns"> Add Columns </ejs-button>
    <ejs-button @click.native="DeleteColumns"> Delete Columns </ejs-button>
    <ejs-grid ref='grid' :dataSource='data' :height='280'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight'
textAlign='Right' format='C2' width=90></e-column>
        <e-column field='OrderDate' headerText='Order Date'
textAlign='Right' format='yMd' width=120 type='date'></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { data } from './datasource.js';
Vue.use(GridPlugin);
Vue.use(ButtonPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  methods: {
    AddColumns: function () {
      let grid = this.$refs.grid.$el.ej2_instances[0];
      var newColumns = [
        { field: 'ShipCity', headerText: 'Ship City', width: 120 },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 120 },
      ];
      newColumns.forEach((col) => {
        grid.columns.push(col);
      });
      grid.refreshColumns();
    },
    DeleteColumns: function () {
      let grid = this.$refs.grid.$el.ej2_instances[0];
      grid.columns.pop();
      grid.refreshColumns();
    }
  }
}
```

```

</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs34" %}

### How to refresh columns

You can use the [refreshColumns](#) method of the Syncfusion Grid to refresh the columns in the grid. This method can be used when you need to update the grid columns dynamically based on user actions or data changes.

```
`ts
```

```
grid.refreshColumns();
```

```
,
```

### Responsive columns

The Syncfusion Vue Grid provides a built-in feature to toggle the visibility of columns based on media queries using the [hideAtMedia](#) property of the column object. The `hideAtMedia` accepts valid [Media Queries](#).

In this example, we have a Grid that displays data with three columns: **Order ID**, **Customer ID**, and **Freight**. We have set the `hideAtMedia` property of the **OrderID** column to (min-width: 700px) which means that this column will be hidden when the browser screen width is less than or equal to 700px.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120 hideAtMedia='(min-width: 700px)'>
        </e-column> // column visibility hide when browser screen
width lessthan 700px;
        <e-column field='CustomerID' headerText='Customer ID'
width=140 hideAtMedia='(max-width: 700px)'>
        </e-column> // column Visibility show when browser screen
width 500px or less;
        <e-column field='Freight' headerText='Freight'
textAlign='Right' format='C' width=120
hideAtMedia='(min-width: 500px)'>
        </e-column> // column visibility hide when browser screen
width lessthan 500px;
        <e-column field='OrderDate' headerText='Order Date'
textAlign='Right' format='yMd' type='date' width=140>
        </e-column> // it always shown
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";

```

```
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs30" %}

Auto generated columns in Vue Grid component

The [columns](#) are automatically generated when [columns](#) declaration is empty or undefined while initializing the grid. All the columns in the [dataSource](#) are bound as grid columns.

#### **APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid :dataSource="data"> </ejs-grid>
  </div>
</template>
<script>
import Vue from 'vue';
import { GridPlugin } from '@syncfusion/ej2-vue-grids';
Vue.use(GridPlugin);
export default {
  data () {
    return {
      data: [
        { OrderID: 10248, CustomerID: 'VINET', EmployeeID: 5 },
        { OrderID: 10249, CustomerID: 'TOMSP', EmployeeID: 6 },
        { OrderID: 10250, CustomerID: 'HANAR', EmployeeID: 4 }
      ]
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/column/default-cs2" %}
```

When the columns are auto-generated then the column [type](#) will be determined from the first record of the [dataSource](#).

#### *How to set isPrimaryKey for auto generated columns when editing is enabled*

Primary key can be defined in the declaration of column object of the grid. When we didn't declare the columns, the grid will generate the columns automatically. For these auto generated columns, you can set `isPrimaryKey` column property as true by using the following ways,

If Primary key "column index" is known then refer the following code example

#### **APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource="data" :editSettings='editSettings'
    :dataBound='dataBound'> </ejs-grid>
  </div>
</template>
<script>
import Vue from 'vue';
import { GridPlugin, Edit } from '@syncfusion/ej2-vue-grids';
Vue.use(GridPlugin);
export default {
  data () {
    return {
      data: [
        { OrderID: 10248, CustomerID: 'VINET', EmployeeID: 5 },
        { OrderID: 10249, CustomerID: 'TOMSP', EmployeeID: 6 },
        { OrderID: 10250, CustomerID: 'HANAR', EmployeeID: 4 }],
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
    }
  },
  provide: {
    grid: [Edit]
  },
  methods: {
    dataBound: function() {
      this.$refs.grid.ej2Instances.columns[0].isPrimaryKey = true;
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/column/default-cs3" %}
```

If Primary key "column fieldname" is known then you can get the column by using `var column = grid.getColumnByField('OrderID')` and then set primary key by defining `column.isPrimaryKey = 'true'`

### Set column options to auto generated columns

You can set column options such as **format**, **width** to the auto generated columns by using **dataBound** event of the grid.

In the below example, **width** is set for **OrderID** column, **date** type is set for **OrderDate** column and **numeric** type is set for **Freight** column.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource="data" :dataBound='dataBound'> </ejs-
grid>
  </div>
</template>
<script>
import Vue from 'vue';
import { GridPlugin } from '@syncfusion/ej2-vue-grids';
Vue.use(GridPlugin);
export default {
  data () {
    return {
      data: [
        { OrderID: 10248, CustomerID: 'VINET', Freight: 32.3800, OrderDate:
"1996-07-02T00:00:00.000Z" },
        { OrderID: 10249, CustomerID: 'TOMSP', Freight: 32.3800, OrderDate:
"1996-07-19T00:00:00.000Z" },
        { OrderID: 10250, CustomerID: 'HANAR', Freight: 32.3800, OrderDate:
"1996-07-22T00:00:00.000Z" } ]
    },
    methods: {
      dataBound: function() {
        for (var i = 0; i < this.$refs.grid.ej2Instances.columns.length;
i++) {
          this.$refs.grid.ej2Instances.columns[0].width = 120;
          if(this.$refs.grid.ej2Instances.columns[i].field ===
"OrderDate"){
            this.$refs.grid.ej2Instances.columns[i].type="date";
          }
          if (this.$refs.grid.ej2Instances.columns[i].type === "date") {
            this.$refs.grid.ej2Instances.columns[i].format = { type:
"date", format: "dd/MM/yyyy" };
          }
          this.$refs.grid.ej2Instances.columns[2].format = "P2";
          this.$refs.grid.ej2Instances.refreshColumns();
        }
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs4" %}

### *How to auto-generate columns from complex column fields to flat columns*

By default, the auto-generated columns will create multiple column fields when grid has complex datasource. Hereby using [ValueAccessor](#) property, complex columns data are combined and generated in a single column.

In the below example, we set the **ValueAccessor** property to those columns whose field type is **Object**.

#### **APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid
      :dataSource="data"
      id="Grid"
      ref="grid"
      :pageSettings="pageSettings"
      :allowPaging="true"
      :editSettings="editSettings"
      :toolbar="toolbar"
      :dataBound="dataBound"
    ></ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Edit, Toolbar, Page } from "@syncfusion/ej2-vue-grids";
import { data } from "../datasource.js";
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      flag: true,
      editSettings: {
        allowEditing: true,
        allowAdding: true,
        allowDeleting: true
      },
      pageSettings: { pageSize: 5 },
      toolbar: ["Add", "Edit", "Delete", "Update", "Cancel"]
    };
  },
  methods: {
    dataBound: function() {
      if (this.flag) {
        this.flag = false;
        var cols = Object.keys(this.$refs.grid.getCurrentViewRecords()[0]);
        var length = cols.length;
        var col = [];
        for (var i = 0; i < length; i++) {
          var field = cols[i];
          var obj = {};
          obj["field"] = field;
          var mon = this.$refs.grid.getCurrentViewRecords()[i][field];
          var type = typeof mon;
          if (type === "object") {
            obj["valueAccessor"] = (field, data, column) => {
```

```

        return (
            data[field].Name +
            " , " +
            data[field].Unit +
            " , " +
            data[field].VSetMax
        );
    };
    }
    col.push(obj);
}
this.$refs.grid.setProperties({ columns: col });
}
},
provide: {
    grid: [Edit, Toolbar, Page]
}
};
</script>
<style>
@import "https://cdn.syncfusion.com/ej2/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/generate-cs1" %}

## Headers in Vue Grid component

### Header text

By default, column header title is displayed from column [field](#) value. To override the default header title, you have to define the [headerText](#) value.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource="data" height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
width=90></e-column>
        <e-column field='ShipCity' headerText='Ship City' width=120></e-
column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {

```

```

    return {
      data: data
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs28" %}

If both the [field](#) and [headerText](#) are not defined in the column, the column renders with “empty” header text.

#### Header template

Customize the header element using the [headerTemplate](#) property. In this demo, the custom element is rendered for both the CustomerID and OrderDate column headers.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref="grid" :dataSource="data" :allowPaging="true"
height="273px">
      <e-columns>
        <e-column field="OrderID" headerText="Order ID" width="120"
textAlign="Right"></e-column>
        <e-column field="CustomerID" headerText="Customer ID"
:headerTemplate="orderTemplate" width="150"></e-column>
        <e-column field="ShipCity" headerText="Ship City" width="150"></e-
column>
        <e-column field="OrderDate" headerText="Order Date" width="135"

#### *Change the orientation of header text*

You can change the orientation of the header text by using the [customAttributes](#) property.

To change the Orientation of Header Text, Ensure the following steps:

**Step 1:** Create a css class with orientation style for grid header cell.

`

```

.orientationcss .e-headercelldiv {
transform: rotate(90deg);
}

```

**Step 2:** Add the custom css class to particular column by using [customAttributes](#) property.

```
<e-column field='Freight' headerText='Freight' textAlign='Center' format='C2'
:customAttributes='customAttributes' width=80></e-column>
```

**Step 3:** Resize the header cell height by using the following code.

```
`ts
setHeaderHeight(args) {
let textWidth = document.querySelector(".orientationcss > div").scrollWidth;//Obtain the width of the
headerText content.
let headerCell = document.querySelectorAll(".e-headercell");
for(let i = 0; i < headerCell.length; i++) {
(headerCell.item(i)).style.height = textWidth + 'px'; //Assign the obtained textWidth as the height of the
headerCell.
}
}
```

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :created='setHeaderHeight'
height='240px' >
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight'
textAlign='Center' format='C2' :customAttributes='customAttributes'
width=80></e-column>
        <e-column field='ShipCity' headerText='Ship City'

### Column template in Vue Grid component

#### Render image in a column

The column [template](#) has options to display custom element instead of a field value in the column.

The `template` property should be a function which returns an object. The object should contain a Vue component which should be assigned to the `template` property. The grid will look for the template property and render it as new Vue instance.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid :dataSource="data" height=310>
            <e-columns>
                <e-column headerText='Employee Image' width='150'
                textAlign='Center' :template='cTemplate'></e-column>
                <e-column field='EmployeeID' headerText='Employee ID'
                width='125' textAlign='Right'></e-column>
                <e-column field='FirstName' headerText='Name'
                width='120'></e-column>
                <e-column field='Title' headerText='Title' width='170'></e-
                column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";

```

```

import { employeeData } from "../datasource.js";
Vue.use(GridPlugin);
export default {
  data: () => {
    return {
      data: employeeData,
      cTemplate: function () {
        return { template : Vue.component('columnTemplate',{
          template: `<div class="image">
            
          </div>`,
          data: function() {
            return {
              data: {}
            }
          },
          computed: {
            image: function() {
              return '../images/' + this.data.EmployeeID + '.png';
            },
            altImage: function() {
              return this.data.EmployeeID;
            }
          }
        })
      }
    }
  }
};
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
.image img {
  height: 55px;
  width: 55px;
  border-radius: 50px;
  box-shadow: inset 0 0 1px #e0e0e0, inset 0 0 14px rgba(0,0,0,0.2);
}
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/template-cs1" %}

*Render other components in a column*

You can render any component in a grid column using the [template](#) property.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' height='315px' >
      <e-columns>
        <e-column headerText='Order Status'
:template="dropdownTemplate" width=200></e-column>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>

```

```

        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight'
textAlign='Right' format='C2' width=90></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=120></e-column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
import { data } from './datasource.js';
Vue.use(GridPlugin);
Vue.use(DropDownListPlugin);
export default {
  data() {
    return {
      data: data,
      dropdownTemplate: function () {
        return {
          template: Vue.component('bindDropdown', {
            template: `<ejs-dropdownlist id='dropdownlist'
:dataSource='dropData'> </ejs-dropdownlist>`,
            data() {
              return {
                dropData: ['Order Placed', 'Processing', 'Delivered']
              }
            }
          })
        }
      })
    }
  }
};
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/how-to/dropdown-cs1" %}

### Using condition template

You can render the template elements based on condition.

In the following code, checkbox is rendered based on **Discontinued** field value.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource="data" height=310>
      <e-columns>
        <e-column headerText='Discontinued' width='150'
textAlign='Center' :template='cTemplate'></e-column>

```

```

        <e-column field='ProductID' headerText='Product ID'
width='125'></e-column>
        <e-column field='ProductName' headerText='Name'
width='120'></e-column>
        <e-column field='SupplierID' headerText='Supplier ID'
width='170'></e-column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { productData } from "../datasource.js";
Vue.use(GridPlugin);
export default {
  data: () => {
    return {
      data: productData,
      cTemplate: function () {
        return { template : Vue.component('columnTemplate',{
          template: `<div v-if=cData class="template_checkbox">
            <input type="checkbox" checked />
          </div>
          <div v-else class="template_checkbox">
            <input type="checkbox" />
          </div>`,
          data: function() {
            return {
              data: {}
            }
          },
          computed: {
            cData: function() {
              return this.data.Discontinued;
            }
          }
        })}
      }
    };
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/condition-template-cs1" %}

[How to get the row object by clicking on the template element](#)

You can get the row object without selecting the row and achieve it using the column template feature and the `getRowObjectFromUID` method of the Grid.

In the following sample, the button element is rendered in the Employee Data column. By clicking the button, you can get the row object using the `getRowObjectFromUID` method of the Grid and display it in the console.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref="grid" :dataSource="data" height=315 :recordClick =
    'recordClick'>
      <e-columns>
        <e-column headerText='Employee Data' width='150'
        textAlign='Right' :template='cTemplate' isPrimaryKey='true'></e-column>
        <e-column field='EmployeeID' headerText='Employee ID'
        width='130' textAlign='Right'></e-column>
        <e-column field='FirstName' headerText='Name'
        width='120'></e-column>
        <e-column field='Title' headerText='Title' width='170'></e-
        column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, RecordClickEventArgs } from "@syncfusion/ej2-vue-
grids";
import { employeeData } from "../datasource.js";
import { closest } from "@syncfusion/ej2-base";
Vue.use(GridPlugin);
export default {
  data: () => {
    return {
      data: employeeData,
      cTemplate: function () {
        return { template : Vue.component('columnTemplate',{
          template: `<div class="image">
            <button class="empData">Employee Data</button>
          </div>`
        }}}
      }
    };
  },
  methods: {
    recordClick(args) {
      if (args.target.classList.contains('empData')) {
        var rowObj =
        this.$refs.grid.ej2Instances.getRowObjectFromUID(closest(args.target, '.e-
        row').getAttribute('data-uid')
        );
        console.log(rowObj);
      }
    }
  },
}
```

```
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/column/template-cs2" %}

### Complex data binding in Vue Grid component

You can achieve complex data binding in the grid by using the dot(.) operator in the [column.field](#).

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :height='315'>
      <e-columns>
        <e-column field='EmployeeID' headerText='Employee ID'
textAlign='Right' width=120></e-column>
        <e-column field='Name.FirstName' headerText='First Name'
width=120></e-column>
        <e-column field='Name.LastName' headerText='Last Name'
width=120></e-column>
        <e-column field='Title' headerText='Title' width=150></e-
column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/column/complex-cs1" %}

### Foreign key column in Vue Grid component

Foreign key column can be enabled by using [column.dataSource](#), [column.foreignKeyField](#) and [column.foreignKeyValue](#) properties.

- [column.dataSource](#) - Defines the foreign data.
- [column.foreignKeyField](#) - Defines the mapping column name to the foreign data.
- [column.foreignKeyValue](#) - Defines the display field from the foreign data.

In the following example, **Employee Name** is a foreign column which shows **FirstName** column from foreign data.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' height='315'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
        <e-column field='EmployeeID' headerText='Employee Name'
width=120 foreignKeyValue='FirstName' :dataSource='employeeData'></e-column>
        <e-column field='Freight' headerText='Freight'
textAlign='Right' width=80></e-column>
        <e-column field='ShipCity' headerText='Ship City' width=130
></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, ForeignKey } from "@syncfusion/ej2-vue-grids";
import { data, employeeData } from '../datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      employeeData: employeeData
    };
  },
  provide: {
    grid: [ForeignKey]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/column/foreigncolumn-cs1" %}

\* For remote data, the sorting and grouping is done based on [column.foreignKeyField](#) instead of [column.foreignKeyValue](#).

\* If [column.foreignKeyField](#) is not defined, then the column uses [column.field](#).

*Use edit template in foreignkey column*

By default, foreign key column uses dropdown component for editing. You can render other than the dropdown by using the [column.edit](#) property.

The following example demonstrates the way of using edit template in foreign column.

In the following example, The **Employee Name** is a foreign key column and while editing, AutoComplete component is rendered instead of DropDownList.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' :editSettings='editoption'
:Toolbar='toolbar' height='270px' >
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
        <e-column field='EmployeeID' headerText='Employee Name'
:dataSource='employeeData' foreignKeyValue='FirstName' :edit='edit'
width=120></e-column>
        <e-column field='Freight' headerText='Freight'
textAlign='Center' format='C2' width=80></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=130></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { createElement } from '@syncfusion/ej2-base';
import { GridPlugin, Edit, Toolbar, ForeignKey } from "@syncfusion/ej2-vue-grids";
import { AutoComplete } from "@syncfusion/ej2-dropdowns";
import { DataManager, Query } from '@syncfusion/ej2-data';
import { data, fEmployeeData } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data: () => {
    return {
      data: data,
      employeeData: fEmployeeData,
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
      editoption: { allowEditing: true },
      edit: {
        create: () => { // to create input element
          return createElement('input');
        },
        read: () => { // return edited value to update data source
          let value = new DataManager(fEmployeeData).executeLocal(new
Query().where('FirstName', 'equal', this.autoComplete.value));
          return value.length && value[0]['EmployeeID']; // to convert
foreign key value to local value.
        },
        destroy: () => { // to destroy the custom component.
          this.autoComplete.destroy();
        },
        write: (args) => { // to show the value for date picker
          this.autoComplete = new AutoComplete({
            dataSource: fEmployeeData,
            fields: { value: args.column.foreignKeyValue },
            value: args.foreignKeyData[0][args.column.foreignKeyValue]
          });
        }
      }
    };
  }
};
```

```

        });
        this.autoComplete.appendTo(args.element);
    },
    },
    };
},
provide: {
    grid: [Edit, ForeignKey]
},
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/how-to/foreignKey-cs1" %}

#### *Customize filter UI in foreignkey column*

You can create your own filtering UI by using [column.filter](#) property. The following example demonstrates the way to create a custom filtering UI in the foreign column.

In the following example, The **Employee Name** is a foreign key column. DropDownList is rendered using Filter UI.

#### **APP.VUE**

```

<template>
    <div id="app">
        <ejs-grid ref='grid' :dataSource='data' :allowFiltering='true'
        :filterSettings='filteroption' height='270px' >
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
                textAlign='Right' width=100></e-column>
                <e-column field='EmployeeID' headerText='Employee Name'
                :dataSource='employeeData' foreignKeyValue='FirstName' :filter='filter'
                width=120></e-column>
                <e-column field='Freight' headerText='Freight'
                textAlign='Center' format='C2' width=80></e-column>
                <e-column field='ShipCity' headerText='Ship City'
                width=130></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>

#### [Perform aggregation in foreignkey column](#)

Default aggregations are not supported in a foreign key column. You can achieve aggregation for the foreign key column by using custom the aggregates. The following example demonstrates the way to achieve aggregation in foreign key column.

In the following example, The **Employee Name** is a foreign key column and the aggregation for the foreign column was calculated in customAggregateFn.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' :allowFiltering='true'
height='260px' >
      <e-columns>

```

```

        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
        <e-column field='EmployeeID' headerText='Employee Name'
:dataSource='employeeData' foreignKeyValue='FirstName' width=120></e-column>
        <e-column field='Freight' headerText='Freight'
textAlign='Center' format='C2' width=80></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=130></e-column>
    </e-columns>
    <e-aggregates>
        <e-aggregate>

### Enable multiple foreign key columns

Multiple foreign key columns with editing options are enabled for the Vue Grid component.

In the following example, **Customer Name** and **Ship City** are foreign key columns that display the **ContactName** and **City** columns from foreign data.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='orderDetails' :editSettings='editOptions'
    :toolbar='toolbarItems' height='315'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' :validationRules='orderidrules' :isPrimaryKey='true'
        width=100></e-column>
        <e-column field='CustomerID' headerText='Customer Name'
        width=120 foreignKeyValue='ContactName' foreignKeyField="CustomerID"
        :dataSource='customerData' :validationRules='orderidrules'></e-column>
        <e-column field='Freight' headerText='Freight'
        textAlign='Right' editType='numericedit' width=80 format='C2'></e-column>
        <e-column field='EmployeeID' headerText='Ship City'
        width=120 foreignKeyValue='City' foreignKeyField="EmployeeID"
        :dataSource='employeeData' :validationRules='orderidrules'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
        editType='dropdownedit' width=130></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Edit, Toolbar, ForeignKey } from "@syncfusion/ej2-vue-
grids";
import { orderDetails, customerData, employeeData } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      orderDetails: orderDetails,
      customerData: customerData,
      employeeData: employeeData,
      toolbarItems: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
      editOptions: { allowEditing: true, allowAdding: true, allowDeleting:
true },
      orderidrules: { required: true },
    };
  },
  provide: {

```

```

        grid: [Edit, Toolbar, ForeignKey]
    }
}
</script>

{% previewsample "page.domainurl/code-snippet/grid/column/foreigncolumn-cs2" %}

### Column reorder in Vue Grid component

Reordering can be done by drag and drop of a particular column header from one index to another index within the grid. To enable reordering, set the [allowReordering](#) to true.

To use Reordering, you need to inject **Reorder** module in the **provide** section.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid :dataSource="data" :allowReordering='true' height='315px'>
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
                textAlign='Right' width=90></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
                width=120></e-column>
                <e-column field='Freight' headerText='Freight' textAlign='Right'
                format='C2' width=90></e-column>
                <e-column field='OrderDate' headerText='Order Date'
                textAlign='Right' format='yMd' type='date' width=120></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Reorder } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
    data() {
        return {
            data: data
        };
    },
    provide: {
        grid: [Reorder]
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs11" %}

\* You can disable reordering a particular column by setting the [columns.allowReordering](#) to false.

\* In RTL mode, you can click and drag the left edge of the header cell to resize the column.

### Reorder single column

Grid have option to reorder Columns either by Interaction or by using the `reorderColumns` method. In the below sample, `ShipCity` column is reordered to last column position by using the method.

In the below sample, `Ship City` and `Ship Region` column is reordered to last column position.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-button id='reorderSingleCol' @click.native='reorder'>Reorder
    Ship City to Last</ejs-button>
    <ejs-grid ref='grid' :dataSource="data" :allowReordering='true'
    height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City' width=100></e-
        column>
        <e-column field='ShipRegion' headerText='Ship Region'
        width=80></e-column>
        <e-column field='ShipName' headerText='Ship Name' width=80></e-
        column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Reorder } from "@syncfusion/ej2-vue-grids";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { data } from './datasource.js';
Vue.use(GridPlugin);
Vue.use(ButtonPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  provide: {
    grid: [Reorder]
  },
  methods: {
    reorder: function() {
      this.$refs.grid.reorderColumns('ShipCity', 'ShipName');
    }
  }
}
</script>
<style>
```

```
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
#reorderSingleCol {
    text-transform: none;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs12" %}

### Reorder multiple columns

User can reorder a single column at a time by Interaction. Sometimes we need to have reorder multiple columns at the same time, It can be achieved through programmatically by using `reorderColumns` method.

In the below sample, `Ship City` and `Ship Region` column is reordered to last column position.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-button id='reorderMultipleCols' @click.native='reorder'>Reorder
    Ship City and Ship Region to Last</ejs-button>
    <ejs-grid ref='grid' :dataSource="data" :allowReordering='true'
    height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City' width=100></e-
        column>
        <e-column field='ShipRegion' headerText='Ship Region'
        width=80></e-column>
        <e-column field='ShipName' headerText='Ship Name' width=80></e-
        column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Reorder } from "@syncfusion/ej2-vue-grids";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { data } from './datasource.js';
Vue.use(GridPlugin);
Vue.use(ButtonPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  provide: {
    grid: [Reorder]
  },
  methods: {
    reorder: function() {
```

```

    this.$refs.grid.reorderColumns(['ShipCity', 'ShipRegion'], 'ShipName');
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
  #reorderMultipleCols {
    text-transform: none;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs13" %}

### Reorder events

During the reorder action, the grid component triggers the below three events.

1. The `columnDragStart` event triggers when column header element drag (move) starts.
2. The `columnDrag` event triggers when column header element is dragged (moved) continuously.
3. The `columnDrop` event triggers when a column header element is dropped on the target column.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource="data" :allowReordering='true'
      :columnDrag='columnDrag' :columnDrop='columnDrop'
      :columnDragStart='columnDragStart' height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
          textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
          width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City' width=100></e-
column>
        <e-column field='ShipRegion' headerText='Ship Region'
          width=80></e-column>
        <e-column field='ShipName' headerText='Ship Name' width=80></e-
column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Reorder } from "@syncfusion/ej2-vue-grids";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { data } from './datasource.js';
Vue.use(GridPlugin);
Vue.use(ButtonPlugin);
export default {
  data() {

```

```

    return {
      data: data
    };
  },
  provide: {
    grid: [Reorder]
  },
  methods: {
    columnDragStart: function() {
      alert('columnDragStart event is Triggered');
    },
    columnDrag: function() {
      alert('columnDrag event is Triggered');
    },
    columnDrop: function() {
      alert('columnDrop event is Triggered');
    }
  }
}
</script>
<style>

    text-transform: none;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs14" %}

### Column resizing in Vue Grid component

Grid component provides an intuitive user interface for resizing columns to fit their content. This feature allows users to easily adjust the width of the columns to improve readability and aesthetics of the data presented. To enable column resizing, set the [allowResizing](#) property of the grid to **true**.

Once column resizing is enabled, columns width can be resized by clicking and dragging at the right edge of the column header. While dragging the column, the width of the respective column will be resized immediately.

To use the column resize, inject **ResizeService** in the provider section of **AppModule**.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource="data" :allowResizing='true' height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City' width=100></e-
column>
        <e-column field='ShipName' headerText='Ship Name' width=80></e-
column>
        <e-column field='ShipCountry' headerText='Ship Country'
textAlign='Right' width=100></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>

```

```

        <e-column field='ShipAddress' headerText='Ship Address'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' width=80></e-
column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Resize } from "@syncfusion/ej2-vue-grids";
import { data } from '../datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  provide: {
    grid: [Resize]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/resize-column" %}

- \* You can disable Resizing for a particular column, by specifying [columns.allowResizing](#) to **false**.
- \* In RTL mode, you can click and drag the left edge of header cell to resize the column.
- \* The **width** property of the column can be set initially to define the default width of the column. However, when column resizing is enabled, you can override the default width by manually resizing the columns.

#### *Restrict the resizing based on minimum and maximum width*

The Grid component allows you to restrict the column width resizing between a minimum and maximum width. This can be useful when you want to ensure that your grid's columns stay within a certain range of sizes.

To enable this feature, you can define the [columns.minWidth](#) and [columns.maxWidth](#) properties of the columns directive for the respective column.

In the below code, **OrderID**, **Ship Name** and **Ship Country** columns are defined with minimum and maximum width. The **OrderID** column is set to have a minimum width of 100 pixels and a maximum width of 200 pixels. Similarly, the **ShipName** column is set to have a minimum width of 150 pixels and a maximum width of 300 pixels. The **ShipCountry** column is set to have a minimum width of 120 pixels and a maximum width of 280 pixels.

#### **APP.VUE**

```

<template>
  <div id="app">

```

```

        <ejs-grid :dataSource="data" :allowResizing='true' height='315px'>
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
textAlign='Right' minWidth= 100 width=150 maxWidth=250 ></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
                <e-column field='ShipCity' headerText='Ship City' width=100></e-
column>
                <e-column field='ShipName' headerText='Ship Name' minWidth= 150
width=200 maxWidth=300></e-column>
                <e-column field='ShipCountry' headerText='Ship Country'
textAlign='Right' minWidth= 120 width=150 maxWidth=280></e-column>
                <e-column field='ShipAddress' headerText='Ship Address'
width=120></e-column>
                <e-column field='Freight' headerText='Freight' width=80></e-
column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Resize } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
    data() {
        return {
            data: data
        };
    },
    provide: {
        grid: [Resize]
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/resize-min-max" %}

\* The [columns.minWidth](#) and [columns.maxWidth](#) properties will be considered only when the user resizes the column. When resizing the window, these properties will not be considered. This is because columns cannot be re-rendered when resizing the window.

\* When setting the `minWidth` and `maxWidth` properties, ensure that the values are appropriate for your data and layout requirements.

\* The specified `minWidth` and `maxWidth` values take precedence over any user-initiated resizing attempts that fall outside the defined range.

#### *Prevent resizing for particular column*

The Grid component provides the ability to prevent resizing for a particular column. This can be useful if you want to maintain a consistent column width or prevent users from changing the width of a column.

You can disable resizing for a particular column by setting the [allowResizing](#) property of the column to **false**. The following example demonstrates, how to disabled resize for **Customer ID** column.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource="data" :allowResizing='true' height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
:allowResizing="false" width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City' width=100></e-
column>
        <e-column field='Freight' headerText='Freight' width=80></e-
column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Resize } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  provide: {
    grid: [Resize]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/column/prevent-resize" %}

You can also prevent resizing by setting `args.cancel` to **true** in the [resizeStart](#) event.

#### Resizing modes

The Syncfusion Grid component provides a [ResizeSettingsModel](#) interface for configuring the resizing behavior of grid columns. The interface includes a property named [mode](#) which is of the type [ResizeMode](#). The [ResizeMode](#) is an enum that determines the available resizing modes for the grid columns. There are two resizing modes available for grid columns in Grid:

1. **Normal Mode**: This mode does not adjust the columns to fit the remaining space. When the sum of column width is less than the grid's width, empty space will be present to the right of the last column. When the sum of column width is greater than the grid's width, columns will overflow, and a horizontal scrollbar will appear.

2. **Auto Mode:** This mode automatically resizes the columns to fill the remaining space. When the sum of column width is less than the grid's width, the columns will be automatically expanded to fill the empty space. Conversely, when the sum of column width is greater than the grid's width, the columns will be automatically contracted to fit within the available space.

The following example demonstrates how to set the [resizeSettings.mode](#) property to **Normal** and **Auto** on changing the dropdown value using the [change](#) event of the DropDownList component.

#### APP.VUE

```
<template>

{% previewsample "page.domainurl/code-snippet/grid/column/resize-mode" %}

### *Resize stacked header column*

Grid component allows to resize stacked columns by clicking and dragging the right edge of the stacked column header. During the resizing action, the width of the child columns is resized at the same time. You can disable resize for any particular stacked column by setting [allowResizing](#) as **false** to its columns.

In this below code, we have disabled resize for **Ship City** column.

### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid :dataSource="data" :allowResizing='true'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID' width='100'
textAlign="Center" minWidth='10'></e-column>
        <e-column headerText='Order Details'
:columns='orderColumns'></e-column>
        <e-column headerText='Ship Details'
:columns='shipColumns'></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Resize } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      orderColumns: [
        {
          field: 'OrderDate',
          headerText: 'Order Date',
          type: 'date',
          format: 'yMd',
          width: 120,
          textAlign: 'Right',
          minWidth: 10
        },
        {
          field: 'Freight',

```

```

        headerText: 'Freight ($)',
        width: 100,
        format: 'C1',
        textAlign: 'Right',
        minWidth: 10
    },
    ],
    shipColumns: [
        {
            field: 'ShipCity',
            headerText: 'Ship City',
            width: 100,
            minWidth: 10,
            allowResizing: false
        },
        {
            field: 'ShipCountry',
            headerText: 'Ship Country',
            width: 120,
            minWidth: 10
        }
    ]
    };
},
provide: {
    grid: [Resize]
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/resize-stack-column" %}

When the [autoFit](#) property is set to **true**, the Grid will automatically adjust its column width based on the content inside them. In **normal** resize mode, if the [autoFit](#) property is set to **true**, the Grid will maintain any empty space that is left over after resizing the columns. However, in **auto** resize mode, the Grid will ignore any empty space.

#### Touch interaction

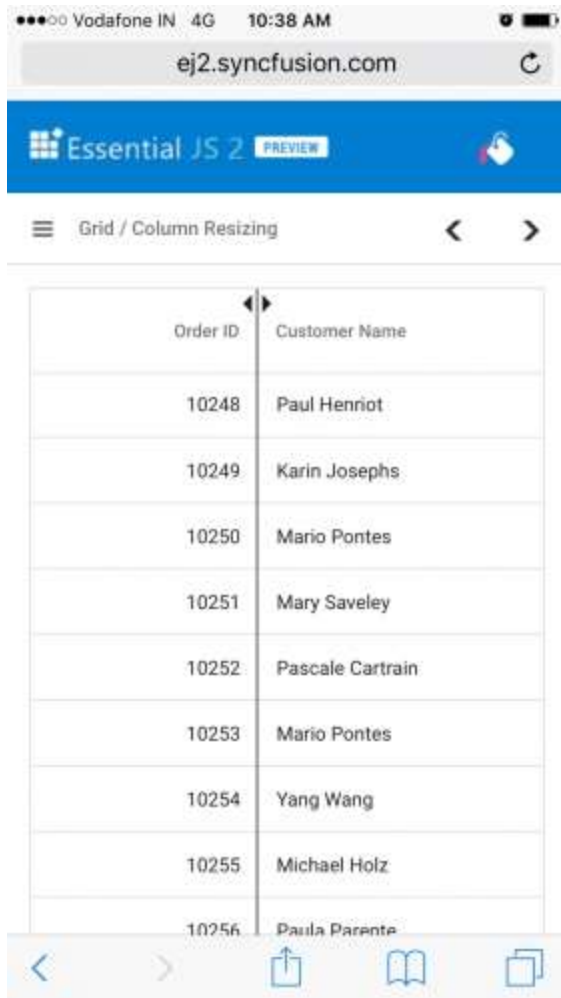

Grid component provides support for touch interactions to enable users to interact with the grid using their mobile devices. Users can resize columns in the grid by tapping and dragging the floating handler, and can also use the Column menu to autofit columns.

#### Resizing Columns on Touch Devices

To resize columns on a touch device:

1. Tap on the right edge of the header cell of the column that you want to resize. 2. A floating handler will appear over the right border of the column. 3. Tap and drag the floating handler to resize the column to the desired width.

The following screenshot represents the column resizing on the touch device.

Order ID	Customer Name
10248	Paul Henriot
10249	Karin Josephs
10250	Mario Pontes
10251	Mary Saveley
10252	Pascale Cartrain
10253	Mario Pontes
10254	Yang Wang
10255	Michael Holz
10256	Paula Parente

### Resizing column externally

Grid provides the ability to resize columns using an external button click. This can be achieved by changing the [width](#) property of the column and refreshing the grid using the [refreshColumns](#) method in the external button click function.

The following example demonstrates how to resize the columns in a grid. This is done by using the [change](#) event of the DropDownList component by change the [width](#) property of the selected column. This is accomplished using the [getColumnByField](#) on external button click. Then, the [refreshColumns](#) method is called on the grid component to update the displayed columns based on interaction.

### APP.VUE

```
<template>
  <div id="app">
    <div style="display: flex">
      <label style='padding: 10px 10px 15px 0'> Change the field:
    </label>
    <ejs-dropdownlist ref='dropdown' id='dropdownlist' style="margin-top:3px" index="0"

      <e-column field='Freight' headerText='Freight' width=80></e-
column>
      <e-column field='ShipCountry' headerText='Ship Country'
width=100></e-column>
    </e-columns>
  </ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Resize } from "@syncfusion/ej2-vue-grids";
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { TextBoxPlugin } from '@syncfusion/ej2-vue-inputs';
import { data } from './datasource.js';
Vue.use(GridPlugin);
Vue.use(DropDownListPlugin);
Vue.use(ButtonPlugin);
Vue.use(TextBoxPlugin);
export default {
  data() {
    return {
      data: data,
      ddlData : [
        { text: 'OrderID', value: 'OrderID' },
        { text: 'CustomerID', value: 'CustomerID' },
        { text: 'Freight', value: 'Freight' },
        { text: 'ShipCountry', value: 'ShipCountry' },
      ],
    };
  },
  methods: {
    onExternalResize: function() {
      this.$refs.grid.getColumnByField(this.$refs.dropdown.$el.value).width
= this.$refs.textbox.$el.value;
      this.$refs.grid.refreshColumns();
    }
  },
  provide: {
    grid: [Resize]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";

```

```
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/column/resize-externally" %}
```

The [refreshColumns](#) method is used to refresh the grid after the column widths are updated. Column resizing externally is useful when you want to provide a custom interface to the user for resizing columns.

### Resizing events

During the resizing action, the grid component triggers the below three events.

1.The [resizeStart](#) event triggers when column resize starts. This event can be used to perform actions when the user begins to resize a column. 2.The [resizing](#) event triggers when column header element is dragged (moved) continuously. This event is useful when you want to perform certain actions during the column resize process. 3.The [resizeStop](#) event triggers when column resize ends. This event can be used to perform actions after the column is resized.

The following is an example of using the resizing events, the [resizeStart](#) event is used to cancel the resizing of the **OrderID** column. The [resizeStop](#) event is used to apply custom CSS attributes to the resized column.

### APP.VUE

```
{% raw %}
<template>
<div id="app">
<div style="margin-left:180px"><p style="color:red;" id="message">{{ message
}}</p></div>
<ejs-grid ref='grid' :dataSource="data" :allowResizing='true' height='315px'
:resizeStart='resizeStart' :resizing='resizing' :resizeStop='resizeStop'>
<e-columns>
<e-column field='OrderID' headerText='Order ID' textAlign='Right'
width=100></e-column>
<e-column field='CustomerID' headerText='Customer ID' width=120></e-column>
<e-column field='ShipCity' headerText='Ship City' width=100></e-column>
<e-column field='ShipName' headerText='Ship Name' width=80></e-column>
<e-column field='ShipCountry' headerText='Ship Country' textAlign='Right'
width=100></e-column>
<e-column field='ShipAddress' headerText='Ship Address' width=120></e-
column>
<e-column field='Freight' headerText='Freight' width=80></e-column>
</e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Resize } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
data() {
return {
data: data
};
},

```

```

provide: {
  grid: [Resize]
},
methods: {
  resizeStart: function (args) {
    this.message = `resizeStart event triggered`;
    if (args.column.field === 'OrderID') {
      args.cancel = true;
    }
  },
  resizing: function (args) {
    this.message = `resizing event triggered`;
  },
  resizeStop: function (args) {
    this.message = `resizeStop event triggered`;
    const headerCell =
    this.$refs.grid.getColumnHeaderByField(args.column.field);
    headerCell.classList.add('customcss');
    const columnCells = this.$refs.grid.getContentTable()
    .querySelectorAll(`[data-colindex="${args.column.index}"]`);
    columnCells.forEach(cell => {
      cell.style.backgroundColor = 'rgb(43, 195, 226)';
    });
  }
}
</script>
<style>
.e-grid .customcss {
  background-color: rgb(43, 195, 226);
}
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
{% endraw %}

```

{% previewsample "page.domainurl/code-snippet/grid/column/resize-event" %}

The ResizeArgs object passed to the events contains information such as the current column width, new column width, column index, and the original event. The [resizing](#) event is triggered multiple times during a single resize operation, so be careful when performing heavy operations in this event.

### Column chooser in Vue Grid component

The column chooser has options to show or hide columns dynamically. It can be enabled by defining the [showColumnChooser](#) as true.

To use column chooser, inject **ColumnChooser** in the **provide** section.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource="data" :showColumnChooser='true'
    :toolbar='toolbarOptions' height='272px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID' width='120'
        textAlign="Right"></e-column>

```

```

        <e-column field='CustomerID' headerText='Customer Name'
width='150' :showInColumnChooser='false'></e-column>
        <e-column field='Freight' headerText='Freight' width='120'
format='C2' textAlign="Right"></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
:visible='true' width='150'></e-column>
        <e-column field='ShipCity' headerText='Ship City'
:visible='false' width='150'></e-column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, ColumnChooser, Toolbar } from "@syncfusion/ej2-vue-
grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['ColumnChooser']
    };
  },
  provide: {
    grid: [ColumnChooser, Toolbar]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs5" %}

You can hide the column names in column chooser by defining the

[columns.showInColumnChooser](#) as false.

*Open column chooser by external button*

The Column chooser can be displayed on a page through external button by invoking

the [openColumnChooser](#) method with X and Y axis positions.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-button @click.native="show">open Column Chooser </ejs-button>
    <ejs-grid ref='grid' :dataSource="data" :showColumnChooser='true'
height='272px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID' width='120'
textAlign="Right"></e-column>
        <e-column field='CustomerID' headerText='Customer Name'
width='150' :showInColumnChooser='false'></e-column>

```

```

        <e-column field='OrderDate' headerText='Order Date'

    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, ColumnChooser } from "@syncfusion/ej2-vue-grids";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { data } from './datasource.js';
Vue.use(GridPlugin);
Vue.use(ButtonPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  methods: {
    show: function() {
      this.$refs.grid.ej2Instances.columnChooserModule.openColumnChooser(200, 50);
      // give X and Y axis
    }
  },
  provide: {
    grid: [ColumnChooser]
  }
};
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs6" %}

### Column menu in Vue Grid component

The column menu has options to integrate features like sorting, grouping, filtering, column chooser, and autofit. It will show a menu with the integrated feature when users click on multiple icon of the column. To enable column menu, you need to define the [showColumnMenu](#) property as true.

To use the column menu, inject the `ColumnMenu` in the `provide` section.

The default items are displayed in following table.

Item	Description
----- -----	
SortAscending	Sort the current column in ascending order.

- | **SortDescending** | Sort the current column in descending order. |
- | **Group** | Group the current column. |
- | **Ungroup** | Ungroup the current column. |
- | **AutoFit** | Auto fit the current column. |
- | **AutoFitAll** | Auto fit all columns. |
- | **ColumnChooser** | Choose the column visibility. |
- | **Filter** | Show the filter option as given in **filterSettings.type** |

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource="data" id="gridcomp" :allowPaging='true'
:allowGrouping='true' :allowSorting='true' :showColumnMenu='true'
:groupSettings='groupOptions' :allowFiltering='true'
:filterSettings='filterSettings'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID' width='120'
textAlign='Right'></e-column>
        <e-column field='Freight' headerText='Freight' format='C2'
textAlign='Right' width='120'></e-column>
        <e-column field='ShippedDate' headerText='Shipped Date'
width='130' format='yMd' textAlign='Right' type='date'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
:visible='false' width='150'></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width='150'></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Group, Sort, Resize, ColumnMenu, Page } from
"@syncfusion/ej2-vue-grids";
import { data } from '../datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      groupOptions: { showGroupedColumn: true },
      filterSettings: { type: "CheckBox" }
    };
  },
  provide: {
    grid: [Group, Sort, Resize, ColumnMenu, Page]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";

```

```
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/column/default-cs7" %}
```

You can disable column menu for a particular column by defining the [columns.showColumnMenu](#) as false.

You can customize the default items by defining the [columnMenuItems](#) with required items.

#### Column menu events

During the resizing action, the grid component triggers the below two events.

1. The `columnMenuOpen` event triggers before the column menu opens.
2. The `columnMenuClick` event triggers when the user clicks the column menu of the grid.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource="data" id="gridcomp" :allowPaging='true'
:allowGrouping='true' :allowSorting='true' :showColumnMenu='true'
:groupSettings='groupOptions' :allowFiltering='true'
:filterSettings='filterSettings'
:columnMenuClick='columnMenuClick' :columnMenuOpen='columnMenuOpen'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID' width='120'
textAlign='Right'></e-column>
        <e-column field='Freight' headerText='Freight' format='C2'
textAlign='Right' width='120'></e-column>
        <e-column field='ShippedDate' headerText='Shipped Date'
width='130' format="yMd" textAlign='Right' type='date'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
:visible='false' width='150'></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width='150'></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Group, Sort, Resize, ColumnMenu, Page } from
"@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      groupOptions: { showGroupedColumn: true },
      filterSettings: { type: "CheckBox" }
    };
  },
  provide: {
    grid: [Group, Sort, Resize, ColumnMenu, Page]
```

```

    },
    methods: {
      columnMenuOpen: function(){
        alert('columnMenuOpen event is Triggered');
      },
      columnMenuClick: function(){
        alert('columnMenuClick event is Triggered');
      }
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs8" %}

#### Custom column menu item

Custom column menu items can be added by defining the [columnMenuItems](#) as collection of the [columnMenuItemModel](#). Actions for this customized items can be defined in the [columnMenuClick](#) event.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource="data" id="gridcomp"
:allowPaging='true' :allowSorting='true' :showColumnMenu='true'
:sortSettings='sortSettings' :columnMenuItems='columnMenuItems'
:columnMenuClick='columnMenuClick'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID' width='140'
textAlign="Right"></e-column>
        <e-column field='CustomerID' headerText='Customer Name'
:showInColumnChooser='false'></e-column>
        <e-column field='Freight' headerText='Freight' format='C2'
textAlign="Right"></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
:visible='false' width='150'></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width='150'></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Sort, ColumnMenu, Page } from "@syncfusion/ej2-vue-
grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      columnMenuItems: [{text:'Clear Sorting', id:'gridclearsorting'}],

```

```

        sortSettings: {columns:[{direction: "Ascending", field: "OrderID"}]}
    };
},
methods: {
    columnMenuClick: function(args) {
        if(args.item.id === 'gridclearsorting'){
            this.$refs.grid.clearSorting();
        }
    }
},
provide: {
    grid: [Sort, ColumnMenu, Page]
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs9" %}

#### *Customize menu items for particular columns*

Sometimes, you have a scenario that to hide an item from column menu for particular columns. In that case, you need to define the [columnMenuOpenEventArgs.hide](#) as true in the [columnMenuOpen](#) event.

The following sample, **Filter** item was hidden in column menu when opens for the **OrderID** column.

#### **APP.VUE**

```

<template>
    <div id="app">
        <ejs-grid ref='grid' :dataSource="data" id="gridcomp"
        :allowPaging='true' :allowSorting='true' :showColumnMenu='true'
        :filterSettings='filterSettings' :columnMenuOpen='columnMenuOpen'
        :allowFiltering='true' :allowGrouping='true'>

```

{% previewsample "page.domainurl/code-snippet/grid/column/default-cs10" %}

#### *Customize the icon of column menu*

You can customize the column menu icon by overriding the default grid class `.e-icons.e-columnmenu` with a custom property `content` as mentioned below,

```

.e-grid .e-columnheader .e-icons.e-columnmenu::before {
  content: "\e941";
}

```

In the below sample, grid is rendered with a customized column menu icon.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data':showColumnMenu='true'
height='315px' >
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' format='C2'
width=90></e-column>

```

```

        <e-column field='ShipName' headerText='Ship Name'
width=120></e-column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, ColumnMenu } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  provide: {
    grid: [ColumnMenu]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";

  content: "\e941";
}
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/how-to/default-cs1" %}

### Column spanning in Vue Grid component

The grid has option to span the adjacent cells. You need to define the [colSpan](#) attribute to span cells in the [QueryCellInfo](#) event.

In the following demo, Employee Davolio doing analysis from 9.00 AM to 10.00 AM, so that cells have spanned.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource="data" height='auto' width='auto'
gridLines='Both' :allowTextWrap='true' :queryCellInfo='queryCellInfoEvent'>
      <e-columns>
        <e-column field='EmployeeID' headerText='Employee ID'
width='150' textAlign='Right' isPrimaryKey={true}></e-column>
        <e-column field='EmployeeName' headerText='Employee Name'
width='200'></e-column>
        <e-column field='9:00' headerText='9:00 AM' width='120'></e-
column>
        <e-column field='9:30' headerText='9:30 AM' width='120'></e-
column>
        <e-column field='10:00' headerText='10:00 AM'
width='120'></e-column>

```

```

        <e-column field='10:30' headerText='10:30 AM'
width='120'></e-column>
        <e-column field='11:00' headerText='11:00 AM'

</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/spanning-cs1" %}

### Limitations

- Column spanning is not compatible with the following features:
  - Virtual scrolling
  - Infinite scrolling
  - Lazy load grouping

### Row

#### Row in Vue Grid component

It represents the record details that are fetched from the data source.

*Row customization**Using event*

You can customize the appearance of the Row by using the [rowDataBound](#) event. The [rowDataBound](#) event triggers for every row. In that event handler, you can get [RowDataBoundEventArgs](#) which contain details of the row.

**APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid :dataSource="data" :enableHover='false'
:allowSelection='false' height='315' :rowDataBound='rowDataBound'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
        <e-column field='OrderDate' headerText='Order Date'
textAlign='Right' format='yMd' type='date' width=120> </e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  methods: {
    rowDataBound: function(args) {
      if (args.data['Freight'] < 30) {
        args.row.classList.add('below-30');
      } else if (args.data['Freight'] < 80) {
        args.row.classList.add('below-80');
      } else {
        args.row.classList.add('above-80');
      }
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
.below-30 {
  background-color: orangered;
}
.below-80 {
  background-color: yellow;
}
```

```

    }
    .above-80 {
        background-color: greenyellow
    }
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/row/default-cs5" %}

Using CSS customize alternate rows

You can change the grid's alternative rows' background color by overriding the `.e-altrow` class.

```

.e-grid .e-altrow {
background-color: #fafafa;
}

```

Please refer the following example.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource="data">
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
        <e-column field='OrderDate' headerText='Order Date'
textAlign='Right' format='yMd' type='date' width=120> </e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
  .e-grid .e-altrow {
    background-color: #fafafa;
  }
</style>

```

```
}
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/row/default-cs6" %}

[Using CSS customize selected row](#)

The background color of the selected row can be changed by overriding the following CSS style.

```
.e-grid td.e-active {
background-color: #f9920b;
}
,
```

This is demonstrated in the following sample:

### **APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid :dataSource="data">
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
        <e-column field='OrderDate' headerText='Order Date'
textAlign='Right' format='yMd' type='date' width=120> </e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
  .e-grid td.e-active {
    background-color: #f9920b;
  }
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/row/default-cs7" %}
```

### [Adding a new row programmatically](#)

The Grid can add a new row between the existing rows using the [addRecord](#) method of the Grid.

This is demonstrated in the following sample:

#### **APP.VUE**

```
<template>
  <div id="app">
    <button id="add" @click="clickRow">Add Row</button>
    <br /><br />
    <ejs-grid ref="grid" :dataSource="data"
:editSettings='editSettings'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90 isPrimaryKey="true"></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
        <e-column field='ShipCity' headerText='Ship City' width=120>
</e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true }
    };
  },
  methods: {
    clickRow: function () {
      this.$refs.grid.ej2Instances.addRecord(
        { OrderID: 3232, CustomerID: 'ALKIT', Freight: 40, ShipCity:
'London'}, 2);
    }
  },
  provide: {
    grid: [Page, Edit]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/row/default-cs8" %}
```

When working with remote data, it is impossible to add a new row between the existing rows.

#### *How to get the row information when hovering over the cell*

It is possible to get the row information when hovering over the specific cell. This can be achieved by using the [rowDataBound](#) event and [getRowInfo](#) method of the Grid.

In the following sample, the `mouseover` event is bound to a grid row in the `rowDataBound` event, and when hovering over the specific cell, using the `getRowInfo` method, row information will be retrieved and displayed in the console.

#### **APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid id="grid" :dataSource="data" :editSettings='editSettings'
:rowDataBound='rowDataBound'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
        <e-column field='OrderDate' headerText='Order Date'
textAlign='Right' format='yMd' type='date' width=120> </e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
import { MouseEventArgs } from '@syncfusion/ej2-base';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true }
    };
  },
  methods: {
    rowDataBound(args) {
      let gridElement = document.getElementById('grid').ej2_instances[0];
      args.row.addEventListener('mouseover', function(e) {
        console.log(gridElement.getRowInfo(e.target))
      })
    }
  },
  provide: {
    grid: [Edit]
  }
}
```

```

</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/row/default-cs9" %}

- [How to pass data to DetailTemplate in Vue Grid](#)

### Row height in Vue Grid component

You can customize the row height of grid rows through the [rowHeight](#) property. The `rowHeight` property is used to change the row height of entire grid rows.

In the below example, the `rowHeight` is set as '60px'.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource="data" :enableHover='false'
    :allowSelection='false' height='295' rowHeight=60>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
        format='C2' width=90></e-column>
        <e-column field='OrderDate' headerText='Order Date'
        textAlign='Right' format='yMd' type='date' width=120> </e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);

</style>

```

{% previewsample "page.domainurl/code-snippet/grid/row/default-cs3" %}

### Customize row height for particular row

Grid row height for particular row can be customized using the [rowDataBound](#) event by setting the `rowHeight` in arguments for each row based on the requirement.

In the below example, the row height for the row with OrderID as '10249' is set as '90px' using the `rowDataBound` event.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource="data" height='315'
    :rowDataBound='rowDataBound'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
        format='C2' width=90></e-column>
        <e-column field='OrderDate' headerText='Order Date'
        textAlign='Right' format='yMd' type='date' width=120 > </e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  methods: {
    rowDataBound: (args) {
      if (args.data['OrderID'] === 10249) {
        args.rowHeight = 90;
      }
    }
  }
};
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/row/default-cs4" %}

In virtual scrolling mode, it is not applicable to set the `rowHeight` using the `rowDataBound` event.

### Row template in Vue Grid component

The [rowTemplate](#) has options to display custom `<tr>` element.

The `rowTemplate` property should be a function which returns an object. The object should contain a Vue component which should be assigned to the `template` property. The grid will look for the template property and render it as new Vue instance.

In `rowTemplate`, the Vue component `template` should be a `<tr>` element.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource="data" height=310 width='auto'
:rowTemplate='rowTemplate' >
      <e-columns>
        <e-column field='Employee Image' headerText='Employee Image'
width='150' textAlign='Center'></e-column>
        <e-column field='Employee Details' headerText='Employee Details'
width='300' textAlign='Left'></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";

#### Detail template in Vue Grid component

The [detailTemplate](#) provides an additional information about a data row which can show or hide by clicking on expand or collapse button. The [detailTemplate](#) property accepts the template for the detail row.

The [detailTemplate](#) property should be a function which returns an object. The object should contain a Vue component which should be assigned to the `template` property. The grid will look for the `template` property and render it as new Vue instance.

To use `detailTemplate`, inject the `DetailRow` in the `provide` section.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource="data" :detailTemplate = 'detailTemplate' >
      <e-columns>
        <e-column field='EmployeeID' headerText='Employee ID'
width='125' textAlign='Right'></e-column>
        <e-column field='FirstName' headerText='Name'
width='120'></e-column>
        <e-column field='Title' headerText='Title' width='170'></e-
column>

{% previewsample "page.domainurl/code-snippet/grid/column/template-cs4" %}

#### [Limitations for detail template](#)

Detail template is not supported with the following features:

- Frozen rows and columns
- Immutable mode
- Infinite scrolling
- Virtual scrolling
- Print
- Row template
- Row spanning
- Column spanning
- Lazy load grouping
- State persistence
- Hierarchy Grid

#### [Row drag and drop in Vue Grid component](#)

The Grid Row drag and drop allows you to drag grid rows and drop to another Grid or custom component. To enable Row drag and drop in the Grid, set the [allowRowDragAndDrop](#) to true. The target component on which the Grid rows to be dropped can be set by using [targetID](#).

To use Row Drag and Drop, you need to inject **RowDD** in the **provide** section.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid id='Grid' :dataSource='srcData' :allowPaging="true"
    :pageSettings="pageOptions" :allowSelection="true"
    :allowRowDragAndDrop="true"
      :selectionSettings="selectionOptions"
    :rowDropSettings="srcDropOptions" width="49%">
      <e-columns>
        <e-column field='OrderID' headerText='Order ID' width='120'
        textAlign='Right'></e-column>
        <e-column field='CustomerID' headerText='Customer Name'
        width='130'></e-column>
        <e-column field='Freight' headerText='Freight' width='120'
        format='C2' textAlign='Right'></e-column>

import { GridPlugin, RowDD, Selection, Page } from "@syncfusion/ej2-vue-
grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
    data() {
        return {
            srcData: data,
            pageSettings: { pageSize: 7 },
            destData: [],
            pageOptions: { pageSize: 7 },
            selectionOptions: { type: "Multiple" },
            srcDropOptions: { targetID: "DestGrid" },
            destDropOptions: { targetID: "Grid" }
        };
    },
    provide: {
        grid: [RowDD, Page, Selection]
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
    #Grid {
        float: left;
    }
    #DestGrid {
        float: right;
    }
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/row/default-cs1" %}

#### *Drag and drop rows without drag icon*

You can hide the drag and drop icon when performing a drag and drop operation within the grid. This can be achieved by setting the [targetID](#) of the [rowDropSettings](#) as the current Grid's ID.

By setting the [targetID](#), the Grid will render without a helper icon (for row drag). Now you can customize the drag and drop action. To control the drop action, you can bind the [rowDrop](#) event of the Grid. In the [rowDrop](#) event, you can prevent the default action(`args.cancel as true`) and reorder the rows using [reorderRows](#) method of the Grid.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' id='Grid' :dataSource='data'
      :selectionSettings="selectionOptions" :rowDropSettings="dropOptions"
      height='273px' :rowDrop="rowDrop" :allowSelection="true"
      :allowRowDragAndDrop="true">
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
          isPrimaryKey={true} textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
          width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign=
          'Right' width=120 format= 'C2'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
          width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, RowDD, Selection } from "@syncfusion/ej2-vue-grids";
import { data } from '../datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      selectionOptions: { type: "Multiple" },
      dropOptions: { targetID: "Grid" },
    };
  },
  methods: {
    rowDrop(args) {
      args.cancel = true;
      var value = [];
      for (var r = 0; r < args.rows.length; r++) {
        value.push(args.fromIndex + r);
      }
      this.$refs.grid.reorderRows(value, args.dropIndex);
    }
  },
  provide: {
    grid: [RowDD, Selection]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/row/default-cs2" %}
```

\* Selection feature must be enabled for row drag and drop.

\* Multiple rows can be selected by clicking and dragging inside the grid. For multiple row selection, the [type](#) property must be set to **Multiple**.

#### *Limitations of row drag and drop*

- Multiple rows can be drag and drop in the row selections basis.
- Single row is able to drag and drop in same grid without enable the row selection.
- Row drag and drop feature is not having built in support with sorting, filtering, hierarchy grid and grouping features of grid.

#### Row spanning in Vue Grid component

The grid has option to span row cells. To achieve this, You need to define the [rowSpan](#) attribute to span cells in the [QueryCellInfo](#) event.

In the following demo, **Davolio** cell is spanned to two rows in the **EmployeeName** column.

Also Grid supports the spanning of rows and columns for same cells. **Lunch Break** cell is spanned to two rows and three columns in the **1:00** column.

#### **APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid :dataSource="data" height='300' width='auto'
    gridLines='Both' :allowTextWrap='true' :queryCellInfo='queryCellInfoEvent'>

</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/spanning-cs2" %}

To disable the spanning for particular grid page, we need to use `requestType` from [QueryCellInfo](#) event argument.

### Limitations

- Row spanning is not compatible with the following features:
  1. Virtual scrolling
  2. Infinite scrolling
  3. Lazy load grouping
  4. Row drag and drop

## Cell

### Editing

#### Edit in Vue Grid component

The Grid component has options to dynamically insert, delete and update records. Editing feature requires a primary key column for CRUD operations. To define the primary key, set [columns.isPrimaryKey](#) to **true** in particular column.

You can start the edit action either by double clicking the particular row or by selecting the required row and click on **Edit** button in the toolbar. Similarly, you can add a new record to grid either by clicking on **Add** button in the toolbar or on an external button which is bound to invoke the [addRecord](#) method of the grid, **Save** and **Cancel** while in edit mode is possible using respective toolbar icon in grid.

Deletion of the record is possible by selecting the required row and click on **Delete** button in the toolbar.

To use CRUD, inject the [Edit](#) module in the [Link to the Video](#) section.

To get start quickly with Edit Options, you can check on this video:

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :editSettings='editSettings'
height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' :isPrimaryKey='true' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign=
'Right' width=120 format= 'C2'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from '../datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true }
    };
  },
  provide: {
    grid: [Page, Edit]
  }
}
</script>
<style>
```

```
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs20" %}

\* If [columns.isIdentity](#) is enabled, then it will be considered as a read-only column when editing and adding a record.

\* You can disable editing for a particular column, by specifying [columns.allowEditing](#) to **false**.

#### *Toolbar with edit option*

The grid toolbar has the [built-in items](#) to execute Editing actions. You can define this by using the [toolbar](#) property.

#### **APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :editSettings='editSettings'
height='270' :toolbar='toolbar'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' :isPrimaryKey='true' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign=
'Right' width=120 format= 'C2'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel']
    };
  },
  provide: {
    grid: [Page, Edit, Toolbar]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs21" %}
```

### *Disable editing for particular column*

You can disable editing for particular columns by using the [columns.allowEditing](#).

In the following demo, editing is disabled for the **CustomerID** column.

### **APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :editSettings='editSettings'
:toolbar='toolbar' height='273px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' :isPrimaryKey='true' :validationRules='orderIDRules'
width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
:allowEditing='false' :validationRules='customerIDRules' width=120></e-
column>
        <e-column field='Freight' headerText='Freight' textAlign=
'Right' editType= 'numericedit' width=120 format= 'C2'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
editType= 'dropdownedit' width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from '../datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Normal' },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
      orderIDRules: { required: true },
      customerIDRules: { required: true, minLength: 3 }
    };
  },
  provide: {
    grid: [Page, Edit, Toolbar]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs22" %}
```

*Disable editing for a particular row or cell*

You can disable the editing for a particular row by using the [actionBegin](#) event of Grid based on `requestType` as `beginEdit`.

In the below demo, the rows which are having the value for `ShipCountry` column as "France" is prevented from editing.

**APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :editSettings='editSettings'
:toolbar='toolbar' height='273px' :actionBegin = 'actionBegin'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' :isPrimaryKey='true' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign=
'Right' editType= 'numericedit' width=120 format= 'C2'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
editType= 'dropdownedit' width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true },
      toolbar: ['Edit', 'Update', 'Cancel']
    };
  },
  methods: {
    actionBegin(args) {
      if (args.requestType === 'beginEdit') {
        if (args.rowData.ShipCountry == "France") {
          args.cancel = true;
        }
      }
    }
  },
  provide: {
    grid: [Page, Edit, Toolbar]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs23" %}
```

For batch mode of editing, you can use [cellEdit](#) event of Grid. In the below demo, the cells which are having the value as "France" is prevented from editing.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :editSettings='editSettings'
:toolbar='toolbar' height='273px' :cellEdit = 'cellEdit'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' :isPrimaryKey='true' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign=
'Right' editType= 'numericedit' width=120 format= 'C2'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
editType= 'dropdownedit' width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true, mode: 'Batch' },
      toolbar: ['Edit', 'Update', 'Cancel']
    };
  },
  methods: {
    cellEdit(args) {
      if (args.value == "France") {
        args.cancel = true;
      }
    }
  },
  provide: {
    grid: [Page, Edit, Toolbar]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs24" %}
```

*Editing template column*

You can edit template column value by defining **field** for that particular column.

In the below demo, the **ShipCountry** column is rendered with the template.

**APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :editSettings='editSettings'
:toolbar='toolbar' height='280px' >
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
:isPrimaryKey='true' textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight'
textAlign='Center' format='C2' editType='numericedit' width=80></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
:template='editTemplate' editType='dropdownedit' width=120></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data: () => {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
      editTemplate: function () {
        return {
          template: Vue.component('editOption', {
            template: '<a href="#">{{data.ShipCountry}}</a>',
            data() { return { data: { data: {} } }; }
          })
        }
      },
    };
  },
  provide: {
    grid: [Edit, Toolbar]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/how-to/default-cs8" %}

*Troubleshoot editing works only for first row*

The Editing functionalities can be performed based upon the primary key value of the selected row. If **primaryKey** is not defined in the grid, then edit or delete action takes place the first row.

*How to make a Grid column always editable*

Make the Grid column always editable using the column template feature of the Grid.

In the following example, the textbox is rendered in the Freight column using a column template. The keyup event for the Grid is bound using the [created](#) event of the Grid, and the edited changes are saved in the data source using the [updateRow](#) method of the Grid.

**APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid ref="grid" :dataSource='data' height='315px' :created =
'created'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' :isPrimaryKey='true' width=120></e-column>
        <e-column field='OrderDate' headerText='Order Date'
width=130 textAlign='Right' format='yMd'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
width=120></e-column>
        <e-column field='Freight' headerText='Receipt Amount'
width=120 :template='cTemplate'></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, parentsUntil } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      cTemplate: function () {
        return { template : Vue.component('columnTemplate',{
          template: `<div class="image">
            <input :id='id' :value='value' class='custemp'
type='text' style='width: 100%' />
          </div>`,
          data: function() {
            return {
              data: {}
            }
          },
          computed: {
            id: function() {
              return this.data.OrderID;
            },
            value: function() {
              return this.data.Freight;
            }
          }
        });
      }
    };
  }
};
```

```

    }
    }
  }
};
},
methods: {
  created(args) {
    this.$refs.grid.ej2Instances.element.addEventListener('keyup',
function (e) { // Bind the keyup event for the grid.
  if (e.target.classList.contains('custemp')) { // Based on this
condition, you can find whether the target is an input element or not.
    var row = parentsUntil(e.target, 'e-row');
    var rowIndex = row.rowIndex; // Get the row index.
    var uid = row.getAttribute('data-uid');
    var grid = document.getElementsByClassName('e-
grid')[0].ej2_instances[0];
    var rowData = grid.getRowObjectFromUID(uid).data; // Get the
row data.
    rowData.Freight = e.target.value; // Update the new value
for the corresponding column.
    grid.updateRow(rowIndex, rowData); // Update the modified
value in the row data.
  }
});
}
},
}
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

Edit types in Vue Grid component

[Customize editors using params](#)

The [columns.editType](#) is used to define the editor component for any particular column. You can set the [columns.editType](#) based on data type of the column.

- [NumericTextBox](#) component for integers, double, and decimal data types.
- [TextBox](#) component for string data type.
- [DropDownList](#) component to show all unique values related to that field.

- [Checkbox](#) component for boolean type.
- [DatePicker](#) component for date type.

Also, you can customize model of the [columns.editType](#) component through the [columns.edit.params](#).

The following table describes cell edit type component and their corresponding edit params of the column.

Component | Example

[NumericTextBox](#) | params: { decimals: 2, value: 5 }

[TextBox](#) | -

[DropDownList](#) | params: { value: 'Germany' }

[DatePicker](#) | params: { value: new Date() }

[Checkbox](#) | params: { checked: true }

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :editSettings='editSettings'
:toolbar='toolbar' height='273px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' :isPrimaryKey='true' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign=
'Right' editType= 'numericedit' :edit='numericParams' width=120 format=
'C2'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
editType= 'dropdownedit' :edit='ddParams' width=150></e-column>
        <e-column field='ShippedDate' headerText='Shipped Date'
editType= 'datepickeredit' :edit='dpParams' width=150></e-column>
        <e-column field='Verified' headerText='Verified' editType=
'booleanedit' :edit='boolParams' width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
      numericParams: { params: { decimals: 2, value: 5 } },
      ddParams: { params: { value: 'Germany' } },
    }
  }
}
```

```

        dpParams: { params: {value: new Date() } },
        boolParams: { params: {checked: true } }
    };
},
provide: {
    grid: [Page, Edit, Toolbar]
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs12" %}

If edit type is not defined in the column, then it will be considered as the **stringedit** type (Textbox component).

#### Restrict to type decimal points in a NumericTextBox while editing the numeric column

By default, the number of decimal places will be restricted to two in the NumericTextBox while editing the numeric column. We can restrict to type the decimal points in a NumericTextBox by using the **validateDecimalOnType** and **decimals** properties of NumericTextBox.

In the below demo, while editing the row we have restricted to type the decimal point value in the NumericTextBox of **Freight** column.

#### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid :dataSource='data' :editSettings='editSettings'
        :toolbar='toolbar' height='265px' >
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
                :isPrimaryKey='true' textAlign='Right' width=100></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
                width=120></e-column>
                <e-column field='Freight' headerText='Freight'
                textAlign='Center' editType='numericedit' :edit='numericParams'
                width=80></e-column>
                <e-column field='ShipCity' headerText='Ship City'
                editType='dropdownedit' width=120></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
    data: () => {
        return {
            data: data,

```

```

        editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
        toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
        numericParams: { params: {
            validateDecimalOnType: true,
            decimals: 0,
            format: "N" }
        },
    };
},
provide: {
    grid: [Edit, Toolbar]
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/how-to/default-cs6" %}

[Provide custom data source and enabling filtering to DropDownList](#)

You can provide data source to the DropDownList by using the `columns.edit.params` property.

While setting new data source using edit params, you must specify a new `query` property too for the DropDownList as follows,

```

`ts
countryParams: {
  params: {
    allowFiltering: true,
    dataSource: country,
    fields: {text:"countryName",value:"countryName"},
    query: new Query(),
    actionComplete: () => false
  }
};
`

```

You can also enable filtering for the DropDownList by passing the `allowFiltering` as `true` to the edit params.

In the below demo, DropDownList is rendered with custom Datasource for the `ShipCountry` column and enabled filtering to search DropDownList items.

#### APP.VUE

```

<template>
  <div id="app">

```

```

    <ejs-grid ref='grid' :dataSource='data' :editSettings='editSettings'
:toolbar='toolbar' height='273px' >
        <e-columns>
            <e-column field='OrderID' headerText='Order ID'
:isPrimaryKey='true' textAlign='Right' width=100></e-column>
            <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
            <e-column field='ShipCountry' headerText='ShipCountry'
editType='dropdownedit' :edit='countryParams' width=150></e-column>
        </e-columns>
    </ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { createElement } from '@syncfusion/ej2-base';
import { GridPlugin, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { DropDownList } from "@syncfusion/ej2-dropdowns";
import { Query } from '@syncfusion/ej2-data';
import { cascadeData } from './datasource.js';
let country= [
    { countryName: 'United States', countryId: '1' },
    { countryName: 'Australia', countryId: '2' },
    { countryName: 'India', countryId: '3' }
];
Vue.use(GridPlugin);
export default {
    data: () => {
        return {
            data: cascadeData,
            toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
            editSettings: { allowEditing: true, allowAdding: true,
allowDeleting: true },
            countryParams: {
                params: {
                    allowFiltering: true,
                    dataSource: country,
                    fields: {text:"countryName",value:"countryName"},
                    query: new Query(),
                    actionComplete: () => false
                }
            }
        };
    },
    provide: {
        grid: [Edit, Toolbar]
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/how-to/default-cs7" %}

### Custom editors using template

The cell edit template is used to add a custom component for a particular column by invoking the following functions:

- **create** - It is used to create the element at the time of initialization.
- **write** - It is used to create custom component or assign default value at the time of editing.
- **read** - It is used to read the value from the component at the time of save.
- **destroy** - It is used to destroy the component.

### Render TimePicker component while editing

Use the cell edit template feature of the Grid to render the TimePicker component in the Grid edit form. In the below sample, we have rendered TimePicker component in the **OrderDate** column.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' :allowPaging='true'
    :editSettings='editSettings' :pageSettings='pageSettings' :toolbar='toolbar'
    height='175px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        type='number' textAlign='Right' :isPrimaryKey='true'
        :validationRules='orderIDRules' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        type='string' width=120>
        </e-column>
        <e-column field='Freight' headerText='Freight' type='number'
        textAlign='Right' editType='numericedit' format='C2' width=120></e-column>
        <e-column field='OrderDate' headerText='Order Date'
        type='date' textAlign='Right' format="hh:mm" :edit='dpParams' width=120></e-
        column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { TimePicker } from "@syncfusion/ej2-calendars";
import { enableRipple } from "@syncfusion/ej2-base";
import { purchaseData } from '../datasource.js';
Vue.use(GridPlugin);
let ddElem;
let timeObject;
function createOrderDateFn() {
  ddElem = document.createElement('input');
  return ddElem;
}
function destroyOrderDateFn() {
  timeObject.destroy();
}
function readOrderDateFn() {
  return timeObject.value;
}
</script>
```

```
function writeOrderDateFn(args) {
  enableRipple(true);
  timeObject = new TimePicker({
    value: args.rowData[args.column.field],
    step: 60,
  });
  timeObject.appendTo(ddElem);
}
export default {
  data() {
    return {
      data: purchaseData,
      pageSettings: { pageSizes: true, pageSize: 5 },
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
      dpParams: {
        create: createOrderDateFn,
        destroy: destroyOrderDateFn,
        read: readOrderDateFn,
        write: writeOrderDateFn,
      },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
      orderIDRules: { required: true },
    };
  },
  provide: {
    grid: [Page, Edit, Toolbar],
  },
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs13" %}

#### Render AutoComplete component while editing

Use the cell edit template feature of the Grid to render the AutoComplete component in the Grid edit form. In the below sample, we have rendered AutoComplete component in the **CustomerID** column.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' :allowPaging='true'
:editSettings='editSettings' :pageSettings='pageSettings' :toolbar='toolbar'
height='175px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
type='number' textAlign='Right' :isPrimaryKey='true'
:validationRules='orderIDRules' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
type='string' :edit='dpParams' width=140></e-column>
        <e-column field='Freight' headerText='Freight' type='number'
textAlign='Right' editType='numericedit' format='C2' width=120></e-column>
```

```

        <e-column field='OrderDate' headerText='Order Date'
type='date' editType='datepickeredit' textAlign='Right' format='yMd'
width=150></e-column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { AutoComplete } from "@syncfusion/ej2-dropdowns";
import { purchaseData } from './datasource.js';
Vue.use(GridPlugin);
let inpuEle;
let autoCompleteIns;
let autoCompleteData = [
    { CustomerID: 'VINET', Id: '1' },
    { CustomerID: 'TOMSP', Id: '2' },
    { CustomerID: 'HANAR', Id: '3' },
    { CustomerID: 'VICTE', Id: '4' },
    { CustomerID: 'SUPRD', Id: '5' },
];
function createCustomerIDFn() {
    inpuEle = document.createElement('input');
    return inpuEle;
}
function destroyCustomerIDFn() {
    autoCompleteIns.destroy();
}
function readCustomerIDFn() {
    return autoCompleteIns.value;
}
function writeCustomerIDFn(args) {
    autoCompleteIns = new AutoComplete({
        allowCustom: true,
        value: args.rowData[args.column.field],
        dataSource: autoCompleteData,
        fields: { value: "CustomerID", text: "CustomerID" },
    });
    autoCompleteIns.appendTo(inpuEle);
}
export default {
    data() {
        return {
            data: purchaseData,
            pageSettings: { pageSizes: true, pageSize: 5 },
            editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
            daParams: {
                create: createCustomerIDFn,
                destroy: destroyCustomerIDFn,
                read: readCustomerIDFn,
                write: writeCustomerIDFn,
            },
            toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
            orderIDRules: { required: true },
        };
    }
};

```

```

    },
    provide: {
      grid: [Page, Edit, Toolbar],
    },
  };
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs14" %}

[Render MultiSelect DropDown component while editing](#)

Use the cell edit template feature of the Grid to render the MultiSelect DropDown component in the Grid edit form. In the below sample, we have rendered MultiSelect DropDown component in the **ShipCity** column.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' :allowPaging='true'
    :editSettings='editSettings' :pageSettings='pageSettings' :toolbar='toolbar'
    height='175px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        type='number' textAlign='Right' :isPrimaryKey='true'
        :validationRules='orderIDRules' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        type='string' width=120></e-column>
        <e-column field='Freight' headerText='Freight' type='number'
        textAlign='Right' editType='numericedit' format='C2' width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City'
        type='string' :edit='dsParams' width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { MultiSelect } from "@syncfusion/ej2-dropdowns";
import { purchaseData } from './datasource.js';
Vue.use(GridPlugin);
let ddElem;
let multiSelectObj;
let multiSelectDatasource = [
  { ShipCity: 'Reims', Id: '1' },
  { ShipCity: 'Münster', Id: '2' },

      grid: [Page, Edit, Toolbar],
    },
  };
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs15" %}

#### Render MaskedTextBox component while editing

Use the cell edit template feature of the Grid to render the MaskedTextBox component in the Grid edit form. In the following sample, the MaskedTextBox component is rendered in the Mask column.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' :allowPaging='true'
:editSettings='editSettings' :toolbar='toolbar'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
type='number' textAlign='Right' :isPrimaryKey='true' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
type='string' width=120>
          </e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
type='string' width=120>
          </e-column>
        <e-column field='Mask' headerText='Mask' :edit='params'
width=140>
          </e-column>
        </e-columns>
      </ejs-grid>
    </div>
  </template>
  <script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { MaskedTextBox } from '@syncfusion/ej2-inputs';
import { employeeData } from './datasource.js';
Vue.use(GridPlugin);
let element;
let maskObj;
function create() {
  element = document.createElement('input');
  return element;
}
function destroy() {
  maskObj.destroy();
}
function read() {
  return maskObj.value;
}
function write(args) {
  maskObj = new MaskedTextBox({
    mask: "0-0-0-0",
    value: args.rowData.Mask
  });
  maskObj.appendTo(element);
}
export default {
  data() {
    return {
      data: employeeData,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
      params: {
        create: create,
        destroy: destroy,
        read: read,
        write: write,
      },
    },
  },

```

```

        toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel']
    };
},
provide: {
    grid: [Page, Edit, Toolbar],
},
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs16" %}

#### Render RichTextEditor component while editing

Use the cell edit template feature of the Grid to render the RichTextEditor component in the Grid edit form. In the below sample, we have rendered RichTextEditor component in the **ShipAddress** column, so we use [allowTextWrap](#) property to true.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' :allowPaging='true'
    :allowTextWrap='true' :editSettings='editSettings'
    :pageSettings='pageSettings' :toolbar='toolbar' height='175px'
    :created='created'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        type='number' textAlign='Right' :isPrimaryKey='true'
        :validationRules='orderIDRules' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        type='string' width=140>
        </e-column>
        <e-column field='Freight' headerText='Freight' type='number'
        textAlign='Right' editType='numericedit' format='C2' width=120></e-column>
        <e-column field='ShipAddress' headerText='Ship Address'
        type='string' :edit='ddParams' :valueAccessor='valueAccessor'
        :disableHtmlEncode='disableHtmlEncode' width=180>
        </e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { purchaseData } from './datasource.js';
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";

### Render multiple columns in DropDownList component while editing

Use the cell edit template feature of the Grid to render the DropDownList component in the Grid edit form.

The DropDownList has been provided with several options to customize each list item, group title, selected value, header, and footer element. By default, list items can be rendered as a single column in the DropDownList component. Instead of this, multiple columns can be rendered. This can be achieved by using the [headerTemplate](#) and [itemTemplate](#) properties of the DropDownList component.

This is demonstrated in the following sample.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' :allowPaging='true'
      :editSettings='editSettings' :toolbar='toolbar'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
          type='number' textAlign='Right' :isPrimaryKey='true' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
          type='string' width=120></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
          type='string' :edit='params' width=300></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { Query } from "@syncfusion/ej2-data";
import { DropDownList } from "@syncfusion/ej2-dropdowns";
import { data } from './datasource.js';
Vue.use(GridPlugin);
let element;
let dropdownobj;
function create() {
  element = document.createElement('input');
  return element;
}
function destroy() {
  dropdownobj.destroy();
}
function read() {
  return dropdownobj.value;
}
function write(args) {
  dropdownobj = new DropDownList({
    dataSource:data,
    value: args.rowData[args.column.field],
    query: new Query().select(['EmployeeID', 'ShipCountry']).take(10),
    fields: { text: 'ShipCountry', value: 'ShipCountry' },
    placeholder: 'Select a Country',
  });
}
```

```

        headerTemplate:
'<table><tr><th>EmployeeID</th><th>ShipCountry</th></tr></table>',
        itemTemplate: '<div class="e-grid"><table class="e-
table"><tbody><tr><td class="e-rowcell">${EmployeeID}</td><td class="e-
rowcell">${ShipCountry}</td></tr> </tbody></table></div>'
    });
    dropdownobj.appendTo(element);
}
export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
      params: {
        create: create,
        destroy: destroy,
        read: read,
        write: write,
      },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel']
    };
  },
  provide: {
    grid: [Page, Edit, Toolbar],
  },
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";

### Using template

The cell editor for a particular column can be specified using a Vue Component. The [column.editTemplate](#) property used to define the corresponding column editor.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :editSettings='editSettings'
:toolbar='toolbar' height='273px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' :isPrimaryKey='true' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign=
'Right' editType= 'numericedit' width=120 format= 'C2'></e-column>
        <e-column field='OrderDate' headerText='Order Date'
type='date' format= 'yMd' width=150 :editTemplate='editTemplate'></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(GridPlugin);
Vue.use(DatePickerPlugin);
export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Normal' },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel']
    };
  },
  methods: {
    editTemplate: function() {
      return {template: Vue.component('datePicker', {
        template: `<ejs-datepicker id="OrderDate" placeholder="Order
Date" v-model="data.OrderDate" floatLabelType='Never'></ejs-datepicker>`,
        data() {
          return {data:{}}
        }
      })}
    }
  },
},
```

```

    provide: {
      grid: [Page, Edit, Toolbar]
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs19" %}

### In line editing in Vue Grid component

In Normal edit mode, when you start editing the currently selected record is changed to edit state. You can change the cell values and save edited data to the data source. To enable Normal edit, set the [editSettings.mode](#) as **Normal**.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :editSettings='editSettings'
:toolbar='toolbar' height='273px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' :isPrimaryKey='true' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign=
'Right' editType= 'numericedit' width=120 format= 'C2'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
editType= 'dropdownedit' width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Normal' },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel']
    };
  },
  provide: {
    grid: [Page, Edit, Toolbar]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";

```

```
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs26" %}
```

**Normal** edit mode is default mode of editing.

*Automatically update the column based on another column edited value*

You can update the column value based on another column edited value by using the Cell Edit Template feature.

In the below demo, we have update the **TotalCost** column value based on the **UnitPrice** and **UnitInStock** column value while editing.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid id="grid" :dataSource="data" :editSettings="editSettings"
    :toolbar="toolbar" height="273px">
      <e-columns>
        <e-column field="ProductID" headerText="Product ID"
        textAlign="Right" :isPrimaryKey="true" width="100"></e-column>
        <e-column field="ProductName" headerText="Product Name"
        width="120"></e-column>
        <e-column field="UnitPrice" headerText="Unit Price"
        editType="numericedit" :edit="priceParams"
        width="150" format="C2" textAlign="Right" ></e-column>
        <e-column field="UnitsInStock" headerText="Units In Stock"
        editType="numericedit"
        :edit="stockParams" width="150" textAlign="Right"></e-column>
        <e-column field="TotalCost" headerText="Total Cost" width="150"
        :allowEditing="false" format="C2" textAlign="Right" ></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { NumericTextBox } from "@syncfusion/ej2-inputs";
import { productData } from "../datasource.js";
let priceElem, stockElem, priceObj, stockObj;
Vue.use(GridPlugin);
export default {
  data: () => {
    return {
      data: productData,
      toolbar: ["Add", "Edit", "Delete", "Update", "Cancel"],
      editSettings: {
        allowEditing: true,
        allowAdding: true,
        allowDeleting: true,
      },
      priceParams: {
        create: () => {
          priceElem = document.createElement("input");
```

```

        return priceElem;
    },
    read: () => {
        return priceObj.value;
    },

```

### Cancel edit based on condition

You can prevent the CRUD operations of the Grid by using condition in the [actionBegin](#) event with requestType as `beginEdit` for editing, `add` for adding and `delete` for deleting actions.

In the below demo, we prevent the CRUD operation based on the `Role` column value. If the Role Column is `Employee`, we are unable to edit/delete that row.

### APP.VUE

```
<template>
  <div id="app">
    <button v-on:click="btnClick">Grid is Addable</button>
    <ejs-grid :dataSource='data' :editSettings='editSettings'
:toolbar='toolbar' :actionBegin="actionBegin" height='240px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' :isPrimaryKey='true' width=100></e-column>
        <e-column field='Role' headerText='Role' width=120></e-
column>
        <e-column field='Freight' headerText='Freight' textAlign=
'Right' editType= 'numericedit' width=120 format= 'C2'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
editType= 'dropdownedit' width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { employeeData } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: employeeData,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Normal' },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
      isAddable: true
    };
  },
  methods: {
    actionBegin: function (args) {
      if (args.requestType === "beginEdit") {
        if (args.rowData["Role"].toLowerCase() === "employee") {
          args.cancel = true;
        }
      }
      if (args.requestType === "delete") {
        if (args.data[0]["Role"].toLowerCase() === "employee") {
          args.cancel = true;
        }
      }
    }
  }
}

#### *Perform CRUD action programmatically*

Grid methods can be used to perform CRUD operations programmatically. The [addRecord](#), [deleteRecord](#), and [startEdit](#) methods are used to perform CRUD operations in the following demo.

- To add a new record to the Grid, use the [addRecord](#) method. In this method, you can pass the data parameter to add a new record to the Grid, and the index parameter to add a record at a specific index. If you call this method with no parameters, it will create an empty row in the Grid.
- To change the selected row to the edit state, use the [startEdit](#) method.
- If you need to update the row data in the Grid's datasource, you can use the [updateRow](#) method. In this method, you need to pass the index value of the row to be updated along with the updated data.
- If you need to update the particular cell in the row, you can use the [setCellValue](#) method. In this method, you need to pass the primary key value of the data source, field name, and new value for the particular cell.
- To remove a selected row from the Grid, use the [deleteRecord](#) method. For both edit and delete operations, you must select a row first.

Note: In both normal and dialog editing modes, these methods can be used.

#### **APP.VUE**

{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs31" %}

### Adding a new row at the bottom of the Grid

By default, a new row will be added at the top of the grid. You can change it by setting [editSettings.newRowPosition](#) as **Bottom**.

**APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :editSettings='editSettings'
height='270' :toolbar='toolbar'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' :isPrimaryKey='true' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign=
'Right' width=120 format= 'C2'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, newRowPosition: 'Bottom' },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel']
    };
  },
  provide: {
    grid: [Page, Edit, Toolbar]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs32" %}

Add newRowPosition is supported for **Normal** and **Batch** editing modes.

*Move the focus to a particular cell instead of first cell while editing a row*

The [recordDoubleClick](#) event allows you to move the focus to the corresponding cell (the cell that you double-clicked to edit a row) instead of the first cell in edit form. With the help of this event, you can focus the double-clicked column in inline edit mode.

**APP.VUE**

```

<template>
  <div id="app">

```

```

<ejs-grid ref="grid" :dataSource="data" :editSettings="editSettings"

### Dialog editing in Vue Grid component

In Dialog edit mode, when you start editing the currently selected row data will be shown on a dialog. You can change the cell values and save edited data to the data source. To enable Dialog edit, set the [editSettings.mode](#) as **Dialog**.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :editSettings='editSettings'
:toolbar='toolbar' height='273px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' :isPrimaryKey='true' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign=
'Right' editType= 'numericedit' width=120 format= 'C2'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
editType= 'dropdownedit' width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Dialog' },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel']
    };
  },
  provide: {

```

```

    grid: [Page, Edit, Toolbar]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs8" %}

### Customize edit dialog

You can customize the appearance of the edit dialog in the [actionComplete](#) event based on `requestType` as `beginEdit` or `add`.

In the following example, the dialog's properties like header text, showCloseIcon, height have been changed while editing and adding the records.

Also the locale text for the `Save` and `Cancel` buttons has been changed by overriding the default locale strings.

You can refer the Grid [Default text](#) list for more localization.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :editSettings='editSettings'
    :toolbar='toolbar' height='273px' :actionComplete = 'actionComplete'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' :isPrimaryKey='true' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign=
        'Right' editType= 'numericedit' width=120 format= 'C2'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
        editType= 'dropdownedit' width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { L10n } from '@syncfusion/ej2-base';
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
L10n.load({
  'en-US': {
    'grid': {
      'SaveButton': 'Submit',
      'CancelButton': 'Discard'
    }
  }
});
export default {
  data() {

```

```

    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Dialog' },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel']
    };
  },
  methods: {
    actionComplete(args) {
      if ((args.requestType === 'beginEdit' || args.requestType ===
'add')) {
        let dialog = args.dialog;
        dialog.showCloseIcon = false;
        dialog.height = 400;
        // change the header of the dialog
        dialog.header = args.requestType === 'beginEdit' ? 'Edit Record
of ' + args.rowData['CustomerID'] : 'New Customer';
      }
    }
  },
  provide: {
    grid: [Page, Edit, Toolbar]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs9" %}

The Grid add or edit dialog element has the max-height property, which is calculated based on the available window height. So, in the normal window (1920 x 1080), it is possible to set the dialog's height up to 658px.

#### Show or hide columns in dialog editing

The Grid has the option to show hidden columns or hide visible columns while editing in the dialog edit mode by using the [actionBegin](#) event of the Grid.

In the `actionBegin` event, when the `requestType` is `beginEdit` or `add`, the column will be shown or hidden using the `column.visible` property. When the `requestType` is `save`, the properties will be reset to their original state.

In the following example, the `CustomerID` column is rendered as a hidden column, and the `ShipCountry` column is rendered as a visible column. In the edit mode, the `CustomerID` column will be changed to a visible state and the `ShipCountry` column will be changed to a hidden state.

#### APP.VUE

### Customize Add/Edit Dialog footer

In dialog edit mode, a dialog will show up when editing the currently selected row or adding a new row. By default, you can save or cancel the edited changes by clicking the Save or Cancel button in the dialog's footer. Along with these buttons, it is possible to add a custom button in the footer section using the [actionComplete](#) event of the Grid.

In the following sample, using the `dialog` argument of the `actionComplete` event, the action for the custom button can be customized.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :editSettings='editSettings'
:toolbar='toolbar' height='273px' :actionComplete = 'actionComplete'>

## Template editing in Vue Grid component

### *Inline or dialog template editing*

The dialog/inline template editing provides an option to customize the default behavior of dialog editing. Using the dialog template, you can render your own editors by defining the [editSettings.mode](#) as [Link to the Video](#) and [editSetting.template](#) as Vue component.

In some cases, you need to add the new field editors in the dialog which are not present in the column model. In that situation, the dialog template will help you to customize the default edit dialog.

To get start quickly with Dialog/Inline template edit Option, you can check on this video:

In the following sample, grid enabled with dialog template editing.

The Dialog/Inline template form editors should have **name** attribute.

#### Template context

The template should be a Vue Component. You can access the row information inside the Component and you can bind the attribute or value based on this row information.

The following properties will be available at the time of template execution.

Property Name	Usage
isAdd	A Boolean property; it defines whether the current row should be a new record or not.

In the following code example, the **OrderID** textbox has been disabled by using the **isAdd** property.

,

// The disabled attributes will be added based on the isAdd property.

```
<input id="OrderID" name="OrderID" v-model='data.OrderID' type="text" :disabled="!data.isAdd">
```

,

#### Get value from editor

You can read, format, and update the current editor value in the [actionBegin](#) event at the time of setting **requestType** to **save**.

In the following code example, the **Freight** value has been formatted and updated.

```
`ts
```

```
actionBegin(args) {
```

```
if (args.requestType === 'save') {
```

```
// cast string to integer value.
```

```
args.data['Freight'] = parseFloat(args.form.querySelector("#Freight").value);
```

```
}
```

```
},
```

```
,
```

*Set focus to editor*

By default, the first input element in the dialog will be focused while opening the dialog. If the first input element is in disabled or hidden state, focus the valid input element in the [actionComplete](#) event based on **requestType** as **beginEdit**.

```
`ts
actionComplete(args) {
  if ((args.requestType === 'beginEdit' || args.requestType === 'add')) {
    // Set initail Focus
    if (args.requestType === 'beginEdit') {
      (args.form.elements.namedItem('CustomerID')).focus();
    }
  }
}
```

*Adding validation rules for custom editors*

If you have used additional fields that are not present in the column model, then add the validation rules to the [actionComplete](#) event.

```
`ts
actionComplete(args) {
  if ((args.requestType === 'beginEdit' || args.requestType === 'add')) {
    // Add Validation Rules
    args.form.ej2_instances[0].addRules('Freight', {max: 500});
  }
}
```

*Batch editing in Vue Grid component*

In Batch edit mode, when you double-click on the grid cell, then the target cell changed to edit state. You can bulk save (added, changed and deleted data in the single request) to data source by click on the toolbar's **Update** button or by externally invoking the [batchSave](#) method. To enable Batch edit, set the [editSettings.mode](#) as **Batch**.

**APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :editSettings='editSettings'
    :toolbar='toolbar' height='273px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' :isPrimaryKey='true' width=100></e-column>
```

```

        <e-column field='CustomerID' headerText='Customer ID'
width=120 allowEditing='false'></e-column>
        <e-column field='Freight' headerText='Freight' textAlign=
'Right' editType= 'numericedit' width=120 format= 'C2'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
editType= 'dropdownedit' width=150></e-column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Batch' },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel']
    };
  },
  provide: {
    grid: [Page, Edit, Toolbar]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs1" %}

If a column's [allowEditing](#) property is set to false, then the focus can be skipped in that non-editable column by clicking the tab or shift-tab key while in batch edit mode.

*Automatically update the column based on another column edited value in batch mode*

You can update the column value based on another column edited value in Batch mode by using the Cell Edit Template feature.

In the below demo, we have update the **TotalCost** column value based on the **UnitPrice** and **UnitInStock** column value while editing.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid id="Grid1" :dataSource="data" :editSettings="editSettings"
:toolbar="toolbar" height="273px" :cellEdit="cellEdit">
      <e-columns>
        <e-column field="ProductID" headerText="Product ID"
textAlign="Right" :isPrimaryKey="true" width="100"></e-column>
        <e-column field="ProductName" headerText="Product Name"
width="120"></e-column>

```

```

        <e-column field="UnitPrice" headerText="Unit Price"
editType="numericedit" :edit="priceParams"
        width="150" format="C2" textAlign="Right" ></e-column>
        <e-column field="UnitsInStock" headerText="Units In Stock"
editType="numericedit"
        :edit="stockParams" width="150" textAlign="Right"></e-column>
        <e-column field="TotalCost" headerText="Total Cost" width="150"
format="C2" textAlign="Right" ></e-column>
    </e-columns>
</ejs-grid>
</div>
</template>

```

#### Cancel edit based on condition in batch mode

You can prevent the CRUD operations of the Batch edit Grid by using condition in the [cellEdit](#), [beforeBatchAdd](#) and [beforeBatchDelete](#) events for Edit, Add and Delete actions respectively.

In the below demo, we prevent the CRUD operation based on the **Role** column value. If the Role Column is **Employee**, we are unable to edit/delete that row.

#### APP.VUE

```

<template>
  <div id="app">

```

```

        <button v-on:click="btnClick">Grid is Addable</button>
        <ejs-grid :dataSource='data' :editSettings='editSettings'
:toolbar='toolbar' :cellEdit="cellEdit" :beforeBatchAdd="beforeBatchAdd"
:beforeBatchDelete="beforeBatchDelete" height='240px'>
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'

</style>

```

{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs4" %}

\* [editSettings.showConfirmDialog](#) requires the [editSettings.mode](#) to be **Batch**

\* If [editSettings.showConfirmDialog](#) set to **false**, then confirmation dialog does not display in batch editing.

#### *How to make editing in single click and arrow keys*

When using batch mode, the TAB key allows you to edit or move to the next cell or row from the current record by default. Using the grid's load event, the same functionality can also be achieved by pressing the arrow keys. Additionally, the `editCell` method of the grid allows for cells to be made editable with a single click.

In the following sample, the [load](#) event of the Grid will be used to bind the keydown event handler. When any arrow key is pressed, the `editCell` method of the Grid will be used to identify the next or previous cell (td) and set it to be editable. Additionally, it is possible to enable editing of a cell with a single click by utilizing the `editCell` method within the [created](#) event of the Grid.

#### **APP.VUE**

### Command column editing in Vue Grid component

The command column provides an option to add CRUD action buttons in a column. This can be defined by the [column.commands](#) property.

To use command column, inject the **CommandColumn** module in the **provide** section.

The available built-in command buttons are:

Command Button	Actions
Edit	Edit the current row.
Delete	Delete the current row.
Save	Update the edited row.
Cancel	Cancel the edited state.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :editSettings='editSettings'
height='310px'>

{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs7" %}

## Validation in Vue Grid component

### Column validation

Column validation allows you to validate the edited or added row data and it display errors for invalid fields before saving data. Grid uses **Form Validator** component for column validation. You can set validation rules by defining the [columns.validationRules](#).

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :editSettings='editSettings'
    :toolbar='toolbar' height='273'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' :isPrimaryKey='true' :validationRules='orderIDRules'
        width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        :validationRules='customerIDRules' width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign=
        'Right' editType= 'numericedit' width=120 format= 'C2'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
        editType= 'dropdownedit' width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);

```

```

export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Normal' },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
      orderIDRules: { required: true },
      customerIDRules: { required: true, minLength: 3 }
    };
  },
  provide: {
    grid: [Page, Edit, Toolbar]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs34" %}

#### Custom validation

You can define your own custom validation rules for the specific columns by using **Form Validator custom rules**.

In the below demo, custom validation applied for **CustomerID** column.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :editSettings='editSettings'
:toolbar='toolbar' height='273'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' :isPrimaryKey='true' :validationRules='orderIDRules'
width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
:validationRules='customerIDRules' width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign=
'Right' editType= 'numericedit' width=120 format= 'C2'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
editType= 'dropdownedit' width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,

```

```

        editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Normal' },
        toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
        orderIDRules: { required: true },
        customerIDRules: { required: true, minLength: [(args) => {return
args['value'].length >= 5;}, 'Need atleast 5 letters'] }
    };
},
    provide: {
        grid: [Page, Edit, Toolbar]
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs35" %}

#### Custom validation based on dropdown change

You can apply validation rules and messages to a column based on another column value in edit mode. You can achieve this requirement by using the custom validation feature of Grid.

In the following sample, dropdownlist edit type is used for the **Role** and **Salary** columns. Here, you can apply the custom validation in the **Salary** column based on the value selected in the **Role** column.

#### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid ref="grid" :dataSource="data" :editSettings="editSettings"
:toolbar="toolbar" :load="load">
            <e-columns>
                <e-column field="EmployeeID" headerText="Employee ID"
textAlign="Right" :isPrimaryKey="true" width="120"></e-column>
                <e-column field="Role" headerText="Role"
editType="dropdownedit" :edit="roleParams"
width="160"></e-column>
                <e-column field="Salary" headerText="Salary"
textAlign="Right" editType="dropdownedit"
width="160" :edit="salaryParams"></e-column>
                <e-column field="Address" headerText="Address"
width="150"></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { employeeDetails } from '../datasource.js';
import { Query } from '@syncfusion/ej2-data';
Vue.use(GridPlugin);
window.role = "";
let jobRole = [
    { role: "TeamLead", destId: "0" },

```

```

    { role: "Manager", destId: "1" },
    { role: "Engineer", destId: "2" },
    { role: "Sales", destId: "3" },
    { role: "Support", destId: "4" },
];
let salaryDetails = [
    { salary: "11000", destId: "1" },
    { salary: "13500", destId: "2" },
    { salary: "16500", destId: "2" },
    { salary: "18500", destId: "1" },
    { salary: "21500", destId: "2" },
    { salary: "23000", destId: "2" },
];
export default {
    data() {

{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs36" %}

Persisting data in server in Vue Grid component

Edited data can be persisted in the database using the RESTful web services.

All the CRUD operations in the grid are done through [DataManager](#). The [DataManager](#) has an option to bind all the CRUD related data in server-side.

For your information, the ODataAdaptor persists data in the server as per OData protocol.

In the below section, we have explained how to get the edited data details on the server-side using the [UrlAdaptor](#).

#### *Using URL adaptor*

You can use the [UrlAdaptor](#) of [DataManager](#) when binding data source from remote data. In the initial load of grid, data are fetched from remote data and bound to the grid using **url** property of [DataManager](#). You can map The CRUD operation in grid can be mapped to server-side Controller actions using the properties **insertUrl**, **removeUrl**, **updateUrl**, **crudUrl** and [Link to the Video](#).

To learn about Server side CRUD operation with UrlAdaptor, you can check on this video:

The following code example describes the above behavior.

```
<template>
<div id="app">
<ejs-grid :dataSource='data' :editSettings='editSettings' :toolbar='toolbar' height='273px'>
<e-columns>
<e-column field='OrderID' headerText='Order ID' textAlign='Right' :isPrimaryKey='true'
:validationRules='orderIDRules' width=100></e-column>
<e-column field='CustomerID' headerText='Customer ID' :validationRules='customerIDRules'
width=120></e-column>
<e-column field='Freight' headerText='Freight' textAlign= 'Right' editType= 'numericedit' width=120
format= 'C2'></e-column>
<e-column field='ShipCountry' headerText='Ship Country' editType= 'dropdownedit' width=150></e-
column>
</e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
Vue.use(GridPlugin);
export default Vue.extend({
data() {
```

```

return {
  data: new DataManager({
    url: "Home/DataSource",
    updateUrl: "Home/Update",
    insertUrl: "Home/Insert",
    removeUrl: "Home/Delete",
    adaptor: new UrlAdaptor
  }),
  editSettings: { allowEditing: true, allowAdding: true, allowDeleting: true, mode: 'Normal' },
  toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
  orderIDRules: { required: true },
  customerIDRules: { required: true, minLength: 3 }
};
},
provide: {
  grid: [Page, Edit, Toolbar]
}
});
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
`

```

Also, when using the [UrlAdaptor](#), you need to return the data as JSON from the controller action and the JSON object must contain a property as **result** with dataSource as its value and one more property **count** with the dataSource total records count as its value.

The following code example describes the above behavior.

```

`ts
public ActionResult DataSource(DataManager dm)
{
  var DataSource = OrderRepository.GetAllRecords();
  DataResult result = new DataResult();
  result.result = DataSource.Skip(dm.Skip).Take(dm.Take).ToList();
  result.count = result.result.Count;
}

```

```

return Json(result, JsonRequestBehavior.AllowGet);
}
public class DataResult
{
    public List<EditableOrder> result { get; set; }
    public int count { get; set; }
}

```

#### Insert record

Using the **insertUrl** property, you can specify the controller action mapping URL to perform insert operation on the server-side.

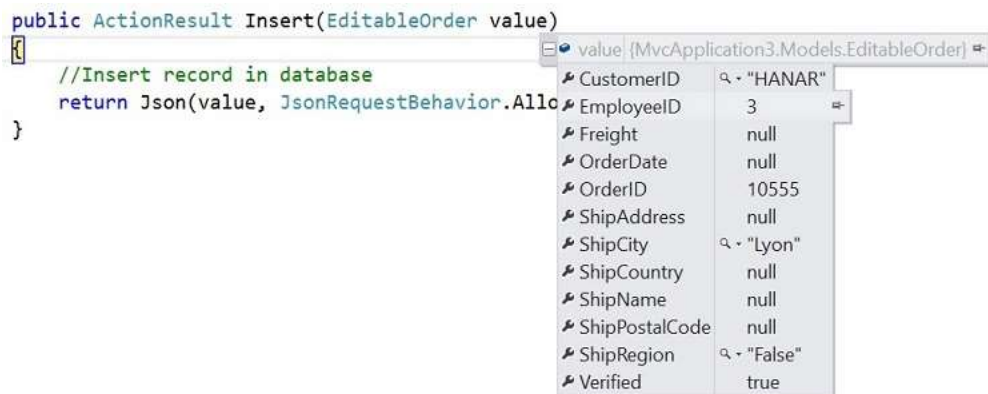

The following code example describes the above behavior.

```

`ts
public ActionResult Insert(EditableOrder value)
{
    //Insert record in database
}

```

The newly added record details are bound to the **value** parameter. Please refer to the following screenshot.

#### Update record

Using the **updateUrl** property, the controller action mapping URL can be specified to perform save/update operation on the server-side.

The following code example describes the previous behavior.

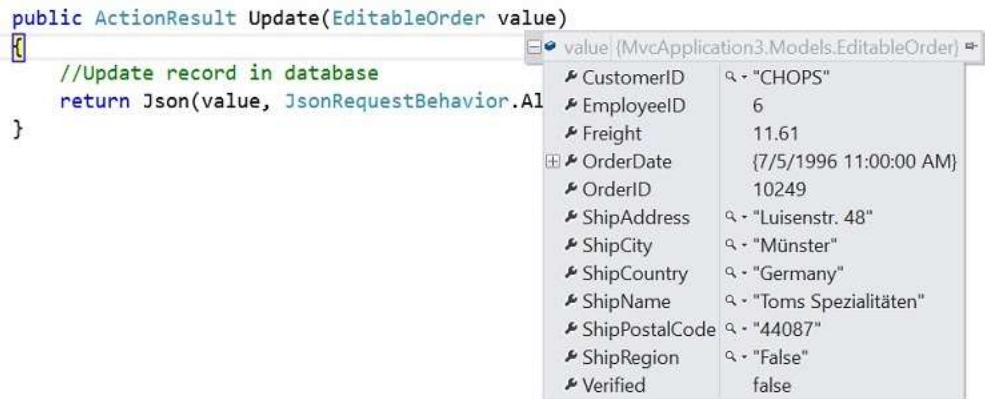

```

`ts
public ActionResult Update(EditableOrder value)
{

```

```
//Update record in database
}
,
```

The updated record details are bound to the **value** parameter. Please refer to the following screenshot.

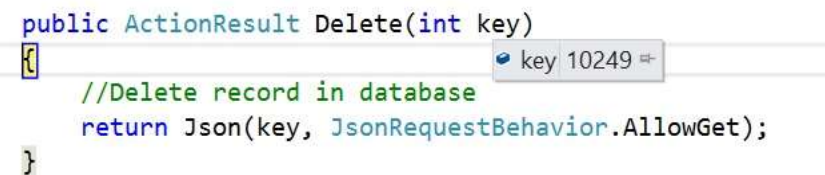

#### Delete record

Using the **removeUrl** property, the controller action mapping URL can be specified to perform delete operation on the server-side.

The following code example describes the previous behavior.

```
`ts
public ActionResult Delete(int key)
{
    //Delete record in database
}
,
```

The deleted record primary key value is bound to the **key** parameter. Please refer to the following screenshot.

#### CRUD URL

Using the **crudUrl** property, the controller action mapping URL can be specified to perform all the CRUD operation at server-side using a single method instead of specifying separate controller action method for CRUD (insert, update and delete) operations.

The action parameter of **crudUrl** is used to get the corresponding CRUD action.

The following code example describes the above behavior.

```

<template>
<div id="app">
<ejs-grid :dataSource='data' :editSettings='editSettings' :toolbar='toolbar' height='273px'>
<e-columns>
<e-column field='OrderID' headerText='Order ID' textAlign='Right' :isPrimaryKey='true'
:validationRules='orderIDRules' width=100></e-column>
<e-column field='CustomerID' headerText='Customer ID' :validationRules='customerIDRules'
width=120></e-column>
<e-column field='Freight' headerText='Freight' textAlign= 'Right' editType= 'numericedit' width=120
format= 'C2'></e-column>
<e-column field='ShipCountry' headerText='Ship Country' editType= 'dropdownedit' width=150></e-
column>
</e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
Vue.use(GridPlugin);
export default Vue.extend({
data() {
return {
data: new DataManager({
url: "Home/DataSource",
crudUrl: "Home/CrudUpdate",
adaptor: new UrlAdaptor
}),
editSettings: { allowEditing: true, allowAdding: true, allowDeleting: true, mode: 'Normal' },
toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
orderIDRules: { required: true },
customerIDRules: { required: true, minLength: 3 }
}
}
}

```

```
};  
},  
provide: {  
  grid: [Page, Edit, Toolbar]  
}  
});  
</script>  
<style>  
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";  
</style>  
,  
  
`ts  
public ActionResult CrudUpdate(EditableOrder value, string action)  
{  
  if(action == "update"){  
    //Update record in database  
  }  
  else if (action == "insert")  
  {  
    //Insert record in database  
  }  
  else  
  {  
    //Delete record in database  
  }  
}  
,
```

Please refer to the following screenshot to know about the action parameter.

```

public ActionResult CrudUpdate(EditableOrder value, string action)
{
    if(action == "update"){
        //Update record in database
    }
    else if (action == "insert")
    {
        //Insert record in database
    }
    else
    {
        //Delete record in database
    }
    return Json(value, JsonRequestBehavior.AllowGet);
}

```

If you specify **insertUrl** along with **crudUrl**, then while adding **insertUrl** only will be invoked.

#### Batch URL

The **batchUrl** property supports only for batch editing mode. You can specify the controller action mapping URL to perform batch operation on the server-side.

The following code example describes the above behavior.

```

<template>
<div id="app">
<ejs-grid :dataSource='data' :editSettings='editSettings' :toolbar='toolbar' height='273px'>
<e-columns>
<e-column field='OrderID' headerText='Order ID' textAlign='Right' :isPrimaryKey='true'
:validationRules='orderIDRules' width=100></e-column>
<e-column field='CustomerID' headerText='Customer ID' :validationRules='customerIDRules'
width=120></e-column>
<e-column field='Freight' headerText='Freight' textAlign= 'Right' editType= 'numericedit' width=120
format= 'C2'></e-column>
<e-column field='ShipCountry' headerText='Ship Country' editType= 'dropdownedit' width=150></e-
column>
</e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';

```

```

Vue.use(GridPlugin);
export default Vue.extend({
  data() {
    return {
      data: new DataManager({
        url: "Home/DataSource",
        batchUrl: "Home/BatchUpdate",
        adaptor: new UrlAdaptor
      });
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting: true, mode: 'Batch' },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
      orderIDRules: { required: true },
      customerIDRules: { required: true, minLength: 3 }
    };
  },
  provide: {
    grid: [Page, Edit, Toolbar]
  }
});
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
`ts
public ActionResult BatchUpdate(string action, List<EditableOrder> added, List<EditableOrder> changed,
List<EditableOrder> deleted, int? key)
{
  //Save the batch changes in database
}
`

```

```
public ActionResult BatchUpdate(string action, List<EditableOrder> added, List<EditableOrder> changed, List<EditableOrder> deleted, int? key)
{
    //Save the batch changes in database
    return Json(changed, JsonRequestBehavior.AllowGet);
}
```

## Sorting in Vue Grid component

The Grid component has support to sort data bound columns in **ascending** or **descending** order. This can be achieved by setting [allowSorting](#) property as true.

To dynamically sort a particular column, click on its column header. The order switch between **Ascending** and **Descending** each time you click a column header for sorting.

To use Sorting, you need to inject [Sort](#) module in the **provide** section.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowSorting='true' height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Sort } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  provide: {
    grid: [Sort]
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-grids/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/sort/default-cs1" %}
```

\* Grid column sorted in **Ascending** order. If you click on an already sorted column, then toggles the sort direction.

\* You can apply and clear sorting by invoking [sortColumn](#) and [clearSorting](#) methods.

\* To disable Sorting for a particular column, by specifying [columns.allowSorting](#) to false.

### Initial Sort

By default, the Grid records are not sorted at initial rendering. To apply sort at initial rendering, set the [field](#) and [direction](#) in **sortSettings.columns**.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowSorting='true'
    :sortSettings='sortOptions' height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
        width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
        width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Sort } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      sortOptions: { columns: [{ field: 'OrderID', direction: 'Ascending' },
      { field: 'ShipCity', direction: 'Descending' }] }
    };
  },
  provide: {
    grid: [Sort]
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-grids/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/sort/default-cs2" %}
```

### Multi-column sorting

You can sort more than one column in a Grid. To sort multiple columns, press and hold the **CTRL** key and click the column header. The sorting order will be displayed in the header while performing multi-column sorting.

To clear sorting for a particular column, press the "Shift + mouse left click".

The [allowSorting](#) must be true while enabling multi-column sort.

Set [allowMultiSorting](#) property as **false** to disable multi-column sorting.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowSorting='true'
:allowMultiSorting='true' height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Sort } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  provide: {
    grid: [Sort]
  }
}

vue-grids/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/sort/default-cs3" %}
```

### Sort order

By default, the sorting order will be as **ascending** -> **descending** -> **none**.

When first click a column header it sorts the column in ascending. Again click the same column header, it will sort the column in descending. A repetitive third click on the same column header will clear the sorting.

### Sort foreign key column based on Text

For local data in Grid, sorting will be performed based on the [foreignKeyValue](#).

For remote data in Grid, sorting will be performed based on the [foreignKeyField](#), we need to handle the sorting operation at the server side.

The following code example describes the handling of sorting operation at the server side.

```
<template>
<div id="app">
<ejs-grid :dataSource='data' height='315' :allowSorting='true'>
<e-columns>
<e-column field='OrderID' headerText='Order ID' textAlign='Right' width=100></e-column>
<e-column field='EmployeeID' headerText='Employee Name' width=120 foreignKeyValue='FirstName'
:dataSource='employeeData'></e-column>
<e-column field='Freight' headerText='Freight' textAlign='Right' width=80></e-column>
<e-column field='ShipCity' headerText='Ship City' width=130 ></e-column>
</e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, ForeignKey, Sort } from "@syncfusion/ej2-vue-grids";
import { DataManager, ODataV4Adaptor } from "@syncfusion/ej2-data";
import { data, employeeData } from './datasource.js';
Vue.use(GridPlugin);
export default {
data() {
return {
data: new DataManager({
url:'/OData/Items',
```

```

adaptor: new ODataV4Adaptor
}},
employeeData: new DataManager({
url:'/OData/Brands',
adaptor: new ODataV4Adaptor
})
};
},
provide: {
grid: [ForeignKey, Sort]
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
`

```

The following code example describes the handling of sorting operation at server side.

```

public class ItemsController : ODataController
{
[EnableQuery]
public IQueryable<Item> Get()
{
List<Item> GridData =
JsonConvert.DeserializeObject<Item[]>(Properties.Resources.ItemsJson).AsQueryable().ToList();

List<Brand> empData =
JsonConvert.DeserializeObject<Brand[]>(Properties.Resources.BrandsJson).AsQueryable().ToList();

var queryString = HttpContext.Current.Request.QueryString;
var allUrlKeyValues = ControllerContext.Request.GetQueryNameValuePairs();
string key = allUrlKeyValues.LastOrDefault(x => x.Key == "$orderby").Value;
if (key != null)
{
if (key == "EmployeeID") {

```

```

GridData = SortFor(key); //Only for foreignKey Column ascending
}
else if(key == "EmployeeID desc") {
GridData = SortFor(key); //Only for foreignKey Column descending
}
}
var count = GridData.Count();
var data = GridData.AsQueryable();
return data;
}
public List<Item> SortFor(String Sorted)
{
List<Item> GridData =
JsonConvert.DeserializeObject<Item[]>(Properties.Resources.ItemsJson).AsQueryable().ToList();
List<Brand> empData =
JsonConvert.DeserializeObject<Brand[]>(Properties.Resources.BrandsJson).AsQueryable().ToList();
if (Sorted == "EmployeeID") //check whether ascending or descending
empData = empData.OrderBy(e => e.FirstName).ToList();
else if(Sorted == "EmployeeID desc")
empData = empData.OrderByDescending(e => e.FirstName).ToList();
List<Item> or = new List<Item>();
for (int i = 0; i < empData.Count(); i++) {
//Select the Field matching records
IEnumerable<Item> list = GridData.Where(pred => pred.EmployeeID ==
empData[i].EmployeeID).ToList();
or.AddRange(list);
}
return or;
}
}
`

```

### Sorting Events

During the sort action, the Grid component triggers two events. [actionBegin](#) event triggers before the sort action start and [actionComplete](#) event triggers after the sort action complete. Using these events you can perform any actions.

**APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :actionComplete='actionHandler'
    :actionBegin='actionHandler' :allowSorting='true' height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
        width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
        width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Sort } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  methods: {
    actionHandler: function(args) {
      alert(args.requestType + ' ' + args.type); // custom Action
    }
  },
  provide: {
    grid: [Sort]
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/sort/default-cs4" %}

[args.requestType](#) is current action name. For example in sorting, the [args.requestType](#) value is **sorting**.

**Sort Comparer**

You can customize the default sort action for a column by defining [column.sortComparer](#) property. The sort comparer function has the same functionality like [Array.sort](#) sort comparer.

In the following example, custom sort comparer function was defined in **Customer ID** column.

**APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowSorting='true' height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' :sortComparer='sortComparer'
headerText='Customer ID' width=150></e-column>
        <e-column field='Freight' headerText='Freight' width=100
format='C2'></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Sort } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  methods: {
    sortComparer: function(reference, comparer) {
      if (reference < comparer) {
        return -1;
      }
      if (reference > comparer) {
        return 1;
      }
      return 0;
    }
  },
  provide: {
    grid: [Sort]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/sort/default-cs5" %}

### Touch Interaction

When you tap Grid header on touchscreen devices, then the selected column header is sorted. Also, it

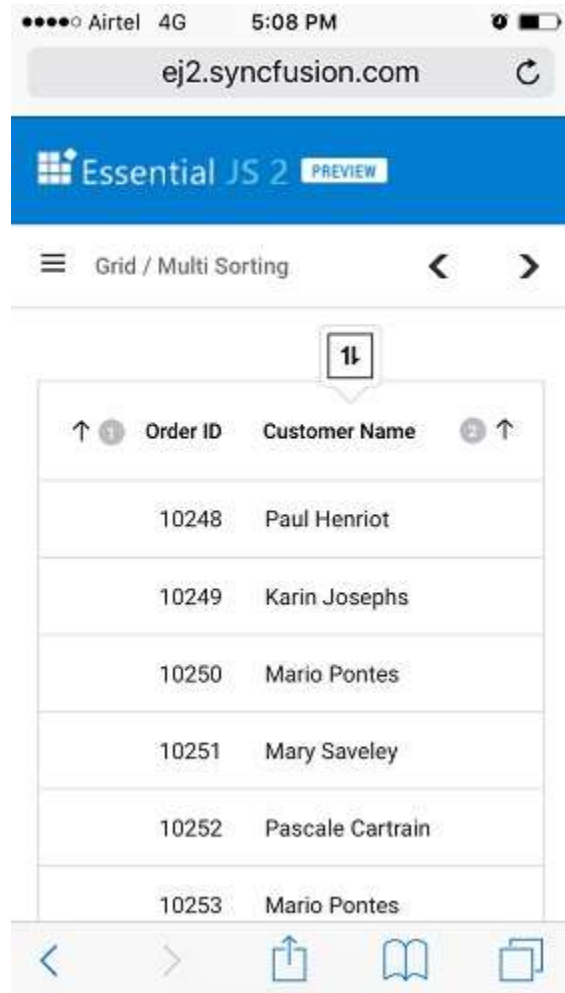

will show a popup for multi-column sorting.

To sort multiple columns, tap the popup and then tap the desired Grid headers.

The [allowMultiSorting](#) and [allowSorting](#) should be **true** then only the popup will be shown.

The following screenshot represents a Grid touch sorting in the device.

## Grouping

### Grouping in Vue Grid component

The Grid has options to group records by dragging and dropping the column header to the group drop area. When grouping is applied, grid records are organized into a hierarchical structure to facilitate easier expansion and collapse of records.

To enable Grouping in the grid, set the [allowGrouping](#) to true. Grouping options can be configured in [groupSettings](#).

To use Grouping, you need to inject [Group](#) module in the [Link to the Video](#) section.

To get start quickly with Grouping Options, you can check on this video:

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowGrouping='true' height='267px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Group } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  provide: {
    grid: [Group]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/group/default-cs2" %}

\* You can group and ungroup columns by using the [groupColumn](#) and [ungroupColumn](#) methods.

\* To disable grouping for a particular column, set the [columns.allowGrouping](#) to false.

#### Initial group

To apply group at initial rendering, set the column field name in the [groupSettings.columns](#).

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowGrouping='true'
:groupSettings='groupOptions' height='267px'>
      <e-columns>
```

```

        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Group } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      groupOptions: { columns: ['CustomerID', 'ShipCity'] }
    };
  },
  provide: {
    grid: [Group]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/group/default-cs3" %}

#### Hide drop area

To avoid ungrouping or further grouping of a column after initial column grouping, define the [groupSettings.showDropArea](#) as false.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowGrouping='true'
:groupSettings='groupOptions' height='267px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>

```

```

    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Group } from "@syncfusion/ej2-vue-grids";
import { data } from '../datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      groupOptions: { showDropArea: false, columns: ['CustomerID',
'ShipCity'] }
    };
  },
  provide: {
    grid: [Group]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/group/default-cs4" %}

#### Group with paging

On grouping columns with paging feature, the aggregated information and total items are displayed based on the current page. The grid does not consider aggregated information and total items from other pages. To get additional details (aggregated information and total items) from other pages, set the [groupSettings.disablePageWiseAggregates](#) to true.

If remote data is bound to grid dataSource, two requests will be sent when performing grouping action; one for getting the grouped data and another for getting aggregate details and total items count.

#### Group by format

By default, columns will be grouped by the data or value present for the particular row. To group numeric or datetime column based on the mentioned format, you have to enable the [enableGroupByFormat](#) property of the corresponding grid columns.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowGrouping='true'
:groupSettings='groupOptions' height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='OrderDate' headerText='Order Date'
format='yMMM' :enableGroupByFormat='true' width=150 type='date'></e-column>
        <e-column field='Freight' headerText='Freight' format='C2'
:enableGroupByFormat='true' width=150></e-column>
      </e-columns>
    </div>
  </template>

```

```

        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Group } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      groupOptions: { columns: ['OrderDate', 'Freight'] }
    };
  },
  provide: {
    grid: [Group]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/group/default-cs5" %}

### Grouping events

During the group action, the grid component triggers two events. The [actionBegin](#) event triggers before the group action starts and the [actionComplete](#) event triggers after the group action is completed. Using these events you can perform any action.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowGrouping='true'
      :actionComplete='actionHandler' :actionBegin='actionHandler' height='260px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
          textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
          width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
          width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
          width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Group } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {

```

```

data() {
  return {
    data: data
  };
},
methods: {
  actionHandler: function(args) {
    alert(args.requestType + ' ' + args.type); // custom Action
  }
},
provide: {
  grid: [Group]
}
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/group/default-cs6" %}

[args.requestType](#) is current action name. For example in grouping, the [args.requestType](#) value is **grouping**.

#### *Collapse by external button*

To collapse the selected grouped row from an external button by using the [expandCollapse](#) method.

### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-button id='collapse' cssClass='e-flat'
    @click.native='collapse'>Collapse</ejs-button>
    <ejs-grid ref='grid' :dataSource='data' :allowGrouping='true'
    :groupSettings='groupSettings' height='240px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
        width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
        width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Group } from "@syncfusion/ej2-vue-grids";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { data } from './datasource.js';
Vue.use(GridPlugin);
Vue.use(ButtonPlugin);
export default {

```

```

data() {
  return {
    data: data,
    groupSettings: { columns: ['CustomerID'] }
  };
},
methods: {
  collapse: function() {
    if (this.$refs.grid.getSelectedRowIndex().length) {
      let currentTr =
this.$refs.grid.getRows()[this.$refs.grid.getSelectedRowIndex()[0]];
      while (currentTr.classList && currentTr.classList.length) {
        currentTr = currentTr.previousSibling;
      }
      let collapseElement = currentTr.querySelector('.e-
recordplusexpand');

this.$refs.grid.ej2Instances.groupModule.expandCollapseRows(collapseElement)
; // pass the collapse row element.
    }
  },
  provide: {
    grid: [Group]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/group/default-cs7" %}

#### Sort grouped columns in descending order during initial grouping

By default, grouped columns are sorted in ascending order. To sort grouped columns in descending order during initial grouping, you can set the [field](#) and [direction](#) in the `sortSettings.columns` property.

The `CustomerID` column will be sorted in descending order when the grid is initially grouped, as shown in the following example.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowGrouping='true'
:allowSorting='true' :sortSettings='sortOptions'
:groupSettings='groupSettings' height='267px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </div>
  </template>

```

```

        </e-columns>
      </ejs-grid>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Group, Sort } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      sortOptions: { columns: [{ field: 'CustomerID', direction:
'Descending' }] },
      groupSettings: { columns: ['CustomerID'] }
    };
  },
  provide: {
    grid: [Group, Sort]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/group/default-cs1" %}

### Reordering on grouped columns in Vue Grid component

Grid provides an option to interchange the position of the Grouped Columns by dragging and dropping the grouped headercells in the droparea. So, any new column entering into the droparea can also be dropped in any position.

To enable this feature, you have to set the [groupSettings.allowReordering](#) property as **true**.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' :allowGrouping='true'
:groupSettings='groupSettings' height='240px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";

```

```

import { GridPlugin, Group } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      groupSettings: { columns: ['CustomerID'], allowReordering: true }
    };
  },
  methods: { },
  provide: {
    grid: [Group]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/group/default-cs9" %}

### Lazy load grouping in Vue Grid component

The lazy load grouping allows you to load grouped records to the Grid through the on-demand concept. So, you can use this feature to load a huge amount of grouped data to the Grid without any performance degradation.

When you enable this feature, the Grid will render only the initial level caption rows in the collapsed state at grouping. The child rows of each caption will be fetched from the server and render in the Grid when you expand the caption row. The fetching child records count will be implicitly determined by the content area occupying rows count. So, if the child records exceed the count, then the Grid will request the server again to fetch the next block of child records on scrolling.

The caption row expand/collapse state will be persisted on paging and Grid pages count will be determined based on the caption rows count instead of the child rows.

To enable this feature, you have to set the [groupSettings.enableLazyLoading](#) property as **true**.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource="data" :allowPaging='true'
    :allowGrouping='true' :groupSettings='groupSettings'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID' textAlign=
        'Right' width='120'></e-column>
        <e-column field='ProductName' headerText='Product Name'
        width='160'></e-column>
        <e-column field='ProductID' headerText='Product ID'
        textAlign= 'Right' width='120'></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width='120'></e-column>
        <e-column field='CustomerName' headerText='Customer Name'
        width='160'></e-column>
      </e-columns>
    </div>
  </template>

```

```

        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Group, LazyLoadGroup } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
    data() {
        return {
            data: data,
            groupSettings: { enableLazyLoading: true, columns: ['ProductName', 'CustomerName'] }
        };
    },
    methods: { },
    provide: {
        grid: [Page, Group, LazyLoadGroup]
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/group/lazy-load-group-cs1" %}

#### Handling the lazy load grouping at server-side

You can use the [UrlAdaptor](#) of **DataManager** when binding the remote data. Along with the default server request, this feature will additionally send the below details to handle the lazy load grouping. In the server end, these details are bound with the **ISLazyLoad** and **OnDemandGroupInfo** parameters in the **DataManagerRequest** model. Please refer to the below table and screenshots.

Property Name | Description

**isLazyLoad** | To differentiate the default grouping and lazy load grouping

**onDemandGroupInfo** | Have the details of expanded caption row grouping **level**, **skip**, **take** and **filter** query of the child records

```

.....} if (dm.IsLazyLoad)
.....{
.....    dm.IsLazyLoad = true;
.....    groupedData = operation.PerformGrouping<Customers>(DataSource, dm); // Lazy-load grouping
.....    if (dm.OnDemandGroupInfo != null && dm.Group.Count() == dm.OnDemandGroupInfo.Level)
.....    {
.....        count = groupedData.Cast<Customers>().Count();
.....    }
.....    else
.....    {
.....        count = groupedData.Cast<Group>().Count();
.....    }
.....    groupedData = operation.PerformSkip(groupedData, dm.OnDemandGroupInfo == null ? dm.Skip : dm.OnDemandGroupInfo.Skip);
.....    groupedData = operation.PerformTake(groupedData, dm.OnDemandGroupInfo == null ? dm.Take : dm.OnDemandGroupInfo.Take);
.....}
.....return dm.RequiresCounts ? Json(new { result = groupedData == null ? DataSource : groupedData, count = count }) : Json(DataSource);

```

```

if (dm.IsLazyLoad)
{
    groupedData = operation.PerformGrouping<Customers>(DataSource, dm); // Lazy load grouping
    if (dm.OnDemandGroupInfo != null && dm.Group.Count() == dm.OnDemandGroupInfo.Level)
    {
        dm.OnDemandGroupInfo = {Syncfusion.EJ2.Base.OnDemandGroupInfo}
        count = groupedData.Count();
    }
    else
    {
        count = groupedData.Count();
    }
    groupedData = operation.PerformSkip(groupedData, dm.OnDemandGroupInfo == null ? dm.Skip : dm.OnDemandGroupInfo.Skip);
    groupedData = operation.PerformTake(groupedData, dm.OnDemandGroupInfo == null ? dm.Take : dm.OnDemandGroupInfo.Take);
}
return dm.RequiresCounts ? Json(new { result = groupedData == null ? DataSource : groupedData, count = count }) : Json(DataSource);
}

```

The following code example describes the lazy load grouping handled at the server-side with other the grid actions.

```
`ts
```

```

public IActionResult UrlDatasource([FromBody] DataManagerRequest dm)
{
    IEnumerable groupedData = null;
    IEnumerable<Customers> DataSource = customers;
    DataOperations operation = new DataOperations();
    if (dm.Search != null && dm.Search.Count > 0)
    {
        DataSource = operation.PerformSearching(DataSource, dm.Search); //Search
    }
    if (dm.Sorted != null && dm.Sorted.Count > 0) //Sorting
    {
        DataSource = operation.PerformSorting(DataSource, dm.Sorted);
    }
    if (dm.Where != null && dm.Where.Count > 0) //Filtering
    {
        DataSource = operation.PerformFiltering(DataSource, dm.Where, dm.Where[0].Operator);
    }
    int count = DataSource.Cast<Customers>().Count();
    if (dm.IsLazyLoad == false && dm.Skip != 0)
    {
        DataSource = operation.PerformSkip(DataSource, dm.Skip); // Paging
    }
    if (dm.IsLazyLoad == false && dm.Take != 0)
    {
        DataSource = operation.PerformTake(DataSource, dm.Take);
    }
}

```

```

}
if (dm.IsLazyLoad)
{
groupedData = operation.PerformGrouping<Customers>(DataSource, dm); // Lazy load grouping
if (dm.OnDemandGroupInfo != null && dm.Group.Count() == dm.OnDemandGroupInfo.Level)
{
count = groupedData.Cast<Customers>().Count();
}
else
{
count = groupedData.Cast<Group>().Count();
}

groupedData = operation.PerformSkip(groupedData, dm.OnDemandGroupInfo == null ? dm.Skip :
dm.OnDemandGroupInfo.Skip);

groupedData = operation.PerformTake(groupedData, dm.OnDemandGroupInfo == null ? dm.Take :
dm.OnDemandGroupInfo.Take);
}

return dm.RequiresCounts ? Json(new { result = groupedData == null ? DataSource : groupedData, count
= count }) : Json(DataSource);
}
,

```

#### *Lazy load grouping with infinite scrolling*

Infinite scrolling loads a huge amount of data without degrading the Grid's performance. By default, infinite scrolling is enabled only for the expanded grouped rows when lazy loading is enabled. Now, the Grid has an option to allow infinite scrolling for group caption rows. This is achieved by setting the [enableInfiniteScrolling](#) property as true when lazy loading is enabled in the grouped records.

This is demonstrated in the following sample:

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource="data" :allowGrouping='true'
:enableInfiniteScrolling='true' :groupSettings='groupSettings'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID' textAlign=
'Right' width='120'></e-column>
        <e-column field='ProductName' headerText='Product Name'
width='160'></e-column>
        <e-column field='ProductID' headerText='Product ID'
textAlign= 'Right' width='120'></e-column>

```

```

        <e-column field='CustomerID' headerText='Customer ID'
width='120'></e-column>
        <e-column field='CustomerName' headerText='Customer Name'
width='160'></e-column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Group, LazyLoadGroup, InfiniteScroll } from
"@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      groupSettings: { enableLazyLoading: true, columns: ['ProductName',
'CustomerName'] }
    };
  },
  methods: { },
  provide: {
    grid: [Group, LazyLoadGroup, InfiniteScroll]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/group/lazy-load-group-cs2" %}

The Grid also supports the lazy load grouping with [virtualization](#)(virtual scrolling).

#### *Limitations for lazy load grouping*

- Due to the element height limitation in browsers, the maximum number of records loaded by the grid is limited due to the browser capability.
- DataManager's [UrlAdaptor](#) and [JsonAdaptor](#) only have the built-in lazy load grouping support.
- Lazy load grouping is not compatible batch editing, row template etc.
- Programmatic selection is not supported.

## Filtering

### Filtering in Vue Grid component

Filtering allows you to view particular records based on filter criteria. To enable filtering in the Grid, set the [allowFiltering](#) to true. Filtering options can be configured through [filterSettings](#). To use filter, inject [Filter](#) module in the [Link to the Video](#) section.

To get start quickly with Filtering Options, you can check on this video:

<!-- The Grid supports three types of filter, they are

- Filter bar
- Excel
- Checkbox -->

**APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowFiltering='true' height='273px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=100></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=100></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Filter } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js'
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  provide: {
    grid: [Filter]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/filter/default-cs8" %}

\* You can apply and clear filtering, by using [filterByColumn](#) and [clearFiltering](#) methods.

\* To disable Filtering for a particular column, by specifying [columns.allowFiltering](#) to false.

*Initial filter*

To apply the filter at initial rendering, set the filter [predicate](#) object in [filterSettings.columns](#).

**APP.VUE**

```

<template>
  <div id="app">

```

```

    <ejs-grid :dataSource='data' :allowFiltering='true'
:filterSettings='filterOptions' height='273px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=100></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=100></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Filter } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js'
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      filterOptions: {
        columns: [{ field: 'ShipCity', matchCase: false, operator:
'startswith', predicate: 'and', value: 'reims' },
        { field: 'ShipName', matchCase: false, operator: 'startswith',
predicate: 'and', value: 'Vins et alcools Chevalier' }]
      }
    };
  },
  provide: {
    grid: [Filter]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/filter/default-cs9" %}

### Filter operators

The filter operator for a column can be defined in [filterSettings.columns.operator](#) property.

The available operators and its supported data types are,

Operator | Description | Supported Types

a\*b | Everything that starts with "a" and ends with "b".

a\* | Everything that starts with "a".

\*b | Everything that ends with "b".

a | Everything that has an "a" in it.

*ab\** | Everything that has an "a" in it, followed by anything, followed by a "b", followed by anything.

Search			Columns	
Order ID	Shipped Date	Ship Country		
10250	7/12/1996	Brazil		
10251	7/15/1996	France		
10252	7/11/1996	Belgium		
10253	7/16/1996	Brazil		
10254	7/23/1996	Switzerland		
10255	7/15/1996	Switzerland		
10256	7/17/1996	Brazil		
10257	7/22/1996	Venezuela		
10258	7/23/1996	Austria		

#### LIKE filtering

The **LIKE** filter can process single search patterns using the "%" symbol, retrieving values matching the specified patterns. The following Grid features support LIKE filtering on string-type columns:

- Filter Menu
- Filter Bar with the [filterSettings.showFilterBarOperator](#) property enabled on the Grid [filterSettings](#).
- Custom Filter of Excel filter type.

#### For example:

Operator | Description

%ab% | Returns all the value that are contains "ab" character.

ab% | Returns all the value that are ends with "ab" character.

%ab | Returns all the value that are starts with "ab" character.

Order ID	Shipped Date	Ship Country
10250	7/12/1996	Brazil
10251	7/15/1996	France
10252	7/11/1996	Belgium
10253	7/16/1996	Brazil
10254	7/23/1996	Switzerland
10255	7/15/1996	Switzerland
10256	7/17/1996	Brazil
10257	7/22/1996	Venezuela
10258	7/23/1996	Austria

By default, the [filterSettings.columns.operator](#) value is **equal**.

#### *Diacritics filter*

By default, grid ignores diacritic characters while filtering. To include diacritic characters, set the [filterSettings.ignoreAccent](#) as **true**.

In the following sample, type **mun** in **Ship City** column to filter diacritic characters.

#### **APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowFiltering='true'
:filterSettings='filterOptions' height='273px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=100></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=100></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
```

```

<script>
import Vue from "vue";
import { GridPlugin, Filter } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js'
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      filterOptions: {
        ignoreAccent: true
      }
    };
  },
  provide: {
    grid: [Filter]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/filter/default-cs10" %}

[See Also](#)

- [Hide sorting options on Excel filter Dialog](#)

### Filter bar in Vue Grid component

By defining the [allowFiltering](#) to true, then filter bar row will be rendered next to header which allows you to filter data. You can filter the records with different expressions depending upon the column type.

#### Filter bar Expressions:

You can enter the following filter expressions(operators) manually in the filter bar.

Expression	Example	Description	Column Type
=	=value	equal	Number
!=	!=value	notequal	Number
>	>value	greaterthan	Number
<	<value	lessthan	Number
= >=	>=value	greaterthanorequal	Number
<= <=	<=value	lessthanorequal	Number
/	/value	startswith	String
%	%value	endswith	String
N/A	N/A	Always <b>equal</b> operator will be used for Date filter	Date
N/A	N/A	Always <b>equal</b> operator will be used for Boolean filter	Boolean

**APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowFiltering='true' height='273px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=100></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=100></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Filter } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js'
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  provide: {
    grid: [Filter]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/filter/default-cs2" %}

*Filter bar template with custom component*

The [filterBarTemplate](#) is used to add a custom component for a particular column and this contains the following functions.

- **create** – It is used for creating custom components.
- **write** - It is used to wire events for custom components.

In the following sample dropdown is used as custom component in EmployeeID column.

**APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' :allowFiltering='true'
height='273px'>
      <e-columns>

```

```

        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
        <e-column field='EmployeeID' headerText='Employee ID'
width=120 :filterBarTemplate='templateOptions'></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=100></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=100></e-column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>

### Filter menu in Vue Grid component

You can enable filter menu by setting the [filterSettings.type](#) as **Menu**. The filter menu UI will be rendered based on its column type, which allows you to filter data. You can filter the records with different operators.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowFiltering='true'
    :filterSettings='filterOptions' height='273px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City'
        width=100></e-column>
        <e-column field='ShipName' headerText='Ship Name'
        width=100></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Filter } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js'
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      filterOptions: {
        type: 'Menu'
      }
    };
  },
  provide: {
    grid: [Filter]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/filter/default-cs4" %}
```

\* [allowFiltering](#) must be set as true to enable filter menu.

\* Setting [columns.allowFiltering](#) as false will prevent filter menu rendering for a particular column.

#### *Custom component in filter menu*

The [column.filter.ui](#) is used to add custom filter components to a particular column. To implement custom filter ui, define the following functions:

- **create:** Creates custom component.
- **write:** Wire events for custom component.
- **read:** Read the filter value from custom component.

In the following sample, dropdown is used as custom component in the OrderID column.

#### **APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowFiltering='true'
:filterSettings='filterOptions' height='273px'>
      <e-columns>
        <e-column field='OrderID' :filter= 'filter'
headerText='Order ID' textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=100></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=100></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";

</style>

```

{% previewsample "page.domainurl/code-snippet/grid/filter/default-cs5" %}

### [Customizing filter menu operators list](#)

You can customize the default filter operator list by defining the [filterSettings.operators](#) property. The available options are:

- **stringOperator** - defines customized string operator list.
- **numberOperator** - defines customized number operator list.
- **dateOperator** - defines customized date operator list.
- **booleanOperator** - defines customized boolean operator list.

In the following sample, we have customized string filter operators.

### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' allowFiltering='true'
:filterSettings='filterOptions' height='273px' >
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>

```

```

        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=100></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=100></e-column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Filter } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data: () => {
    return {
      data: data,
      filterOptions: {
        type: 'Menu',
        operators: {
          stringOperator: [
            { value: 'startsWith', text: 'starts with' },
            { value: 'endsWith', text: 'ends with' },
            { value: 'contains', text: 'contains' }
          ]
        }
      }
    };
  },
  provide: {
    grid: [Filter],
  },
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/how-to/default-cs10" %}

#### Enable different filter for a column

You can use both **Menu** and **Checkbox** filter in a same Grid. To do so, set the [column.filter.type](#) as **Menu** or **Checkbox**.

In the following sample menu filter is enabled by default and checkbox filter is enabled for the CustomerID column using the [column.filter.type](#).

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowFiltering='true'
:filterSettings='filterOptions' height='273px'>
      <e-columns>

```

```

        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' :filter='filter'
headerText='Customer ID' width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=100></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=100></e-column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Filter } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js'
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      filterOptions: {
        type: 'Menu'
      },
      filter: {
        type : 'CheckBox'
      }
    };
  },
  provide: {
    grid: [Filter]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/filter/default-cs6" %}

#### *Filter by multiple keywords using filter menu*

By default, the filtering action is performed based on the single keyword filter value from the built-in component of the filter menu dialog. Now data grid has an option to perform filtering actions based on multiple keywords instead of a single keyword alone. For this, set [filterSettings.type](#) as `Menu`.

In the following sample, filtering action with multiple keywords can be done by rendering the `MultiSelect` component as custom component in the OrderID column filter menu dialog.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' :allowFiltering='true'
:filterSettings='filterSettings' height='273px'>
      <e-columns>

```

```

        <e-column field='OrderID' :filter= 'filter'
headerText='Order ID' textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=100></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=100></e-column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Filter } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
import { MultiSelect, CheckBoxSelection } from "@syncfusion/ej2-dropdowns";
import { DataManager } from "@syncfusion/ej2-data";
import { createElement } from "@syncfusion/ej2-base";
import { MultiSelectPlugin } from "@syncfusion/ej2-vue-dropdowns";
MultiSelect.Inject(CheckBoxSelection);
Vue.use(MultiSelectPlugin);
Vue.use(GridPlugin);
export default {
    data() {
        let dropInstance = null;
        return {
            data: data,
            filterSettings: {
                type: 'Menu'
            },
            filter: {
                ui: {
                    create: function (args) {
                        let db = new DataManager(data);
                        let flValInput = createElement('input', { className:
'flm-input' });
                        args.target.appendChild(flValInput);
                        dropInstance = new MultiSelect({
                            dataSource: new DataManager(data),
                            fields: { text: 'OrderID', value: 'OrderID' },
                            placeholder: 'Select a value',
                            popupHeight: '200px',
                            allowFiltering: true,
                            mode: "CheckBox",
                        });
                        dropInstance.appendTo(flValInput);
                    },
                    write: function (args) {
                        var grid =
document.getElementById("Grid").ej2_instances[0];
                        var filteredValue = [];
                        grid.filterSettings.columns.map((item) => {
                            if (item.field === "OrderID" && item.value) {
                                filteredValue.push(item.value);
                            }
                        });
                    }
                }
            }
        };
    }
};

```

```

        if (filteredValue.length > 0) {
            dropInstance.value = filteredValue;
        }
    },
    read: function (args) {
        var grid =
document.getElementById("Grid").ej2_instances[0];
        grid.removeFilteredColsByField(args.column.field);
        args.fltrObj.filterByColumn(
            args.column.field,
            "contains",
            dropInstance.value
        );
    }
}
};
},
provide: {
    grid: [Filter, CheckBoxSelection]
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

```
{% previewsample "page.domainurl/code-snippet/grid/filter/default-cs7" %}
```

#### [Add current selection to filter checkbox](#)

By default, the CheckBox filter can only filter the selected items. If filtering is done multiple times on the same column, the previously filtered values in the column will be cleared. Now, it is possible to retain those previous values by using the **Add current selection to filter** checkbox. This checkbox is displayed when data is searched in the search bar of the CheckBox filter.

The following image describes the above mentioned behavior.

Order ID	Customer Name	Order Date	Freight
10248		4/1/1996 10:10 AM	\$32.38
10249		5/1/1996 12:20 PM	\$11.61
10250		3/1/1996 08:40 AM	\$65.83

### Excel like filter in Vue Grid component

You can enable Excel like filter by defining. [filterSettings.type](#) as Excel. The excel menu contains an option such as Sorting, Clear filter, Sub menu for advanced filtering.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref="Grid" :dataSource="data" :allowFiltering="true"
    :filterSettings="filterOptions" height="273px">
      <e-columns>
        <e-column field="OrderID" headerText="ID" width="80"
isPrimaryKey="true"></e-column>
        <e-column field="CustomerID" headerText="CustomerID" width="90"></e-
column>
        <e-column field="OrderDate" headerText="OrderDate" width="120"
format="yMd"></e-column>
        <e-column field="ShipName" headerText="ShipName" width="120"></e-
column>
        <e-column field="ShipCity" headerText="ShipCity" width="120"></e-
column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
```

```

import { GridPlugin, Filter } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js'
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      filterOptions: { type: "Excel" },
    };
  },
  methods: {
  },
  provide: {
    grid: [Filter],
  },
};
</script>
<style>
@import "https://cdn.syncfusion.com/ej2/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/filter/default-cs1" %}

\* By default, while opening the excel/checkbox filter in the Grid, the filter dialog will get and display the distinct data from the first 1000 records bound to the Grid to optimize performance. The remaining records will be returned as a result of the search option of the filter dialog.

\* However, we can increase the excel/checkbox filter count by modifying the `filterChoiceCount` argument value(as per our need) in the `actionBegin` event when the `requestType` is `filterchoicerequest` or `filtersearchbegin`. This is demonstrated in the below code snippet,

```

`ts
methods: {
  actionBegin(args) {
    if (args.requestType === "filterchoicerequest" || args.requestType === "filtersearchbegin" ) {
      args.filterChoiceCount = 3000;
    }
  },
},
,
`

```

#### *Render checkbox list data in on-demand for excel/checkbox filtering*

The Excel/Checkbox filter type of Grid has a restriction where only the first 1000 unique sorted items are accessible to view in the filter dialog checkbox list content by scrolling. This limitation is in place to avoid any rendering delays when opening the filter dialog. However, the searching and filtering processes consider all unique items in that particular column.

The Excel/Checkbox filter in the Grid provides an option to load large data sets on-demand during scrolling to improve scrolling limitation functionality. This is achieved by setting the

[filterSettings.enableInfiniteScrolling](#) property to **true**. This feature proves especially beneficial for managing extensive datasets, enhancing data loading performance in the checkbox list, and allowing interactive checkbox selection with persistence for the selection based on filtering criteria.

The Excel/Checkbox filter retrieves distinct data in ascending order, governed by its [filterSettings.itemsCount](#) property, with a default value of **50**. As the checkbox list data scroller reaches its end, the next dataset is fetched and displayed, with the notable advantage that this process only requests new checkbox list data without redundantly fetching the existing loaded dataset.

#### Customize the items count for initial rendering

Based on the items count value, the Excel/Checkbox filter gets unique data and displayed in Excel/Checkbox filter content dialog. You can customize the count of on-demand data rendering for Excel/Checkbox filter by adjusting the [filterSettings.itemsCount](#) property. The default value is **50**.

`ts

```
grid.filterSettings = { enableInfiniteScrolling = true, itemsCount = 40 };
```

,

It is recommended to keep the itemsCount below **300**. Higher values will result in unwanted whitespace because of DOM maintenance performance degradation.

#### Customize the loading animation effect

A loading effect is presented to signify that loading is in progress when the checkbox list data scroller reaches the end, and there is a delay in receiving the data response from the server. The loading effect during on-demand data retrieval for Excel/Checkbox filter can be customized using the [filterSettings.loadingIndicator](#) property. The default value is **Shimmer**.

`ts

```
grid.filterSettings = { enableInfiniteScrolling = true, loadingIndicator = 'Spinner' };
```

,

In the provided example, On-Demand Excel filter has been enabled for the Vue Grid

#### APP.VUE

```

- [How to perform filter by using Wildcard and LIKE operator filter](#)

## Searching in Vue Grid component

You can search records in a Grid, by using the [search](#) method with search key as a parameter. This also provides an option to integrate search text box in grid's toolbar by adding **Search** item to the [toolbar](#).

To use searching, you need to inject [Search](#) module in the **provide** section.

The clear icon is shown in the Data Grid search text box when it is focused on search text or after typing the single character in the search text box. A single click of the clear icon clears the text in the search box as well as the search results in the Data Grid.

## APP.VUE

```

<template>
  <div id="app">

```

```

        <ejs-grid :dataSource='data' :toolbar='toolbarOptions'
height='272px'>
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
                <e-column field='ShipCity' headerText='Ship City'
width=100></e-column>
                <e-column field='ShipName' headerText='Ship Name'
width=100></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Search } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js'
Vue.use(GridPlugin);
export default {
    data() {
        return {
            data: data,
            toolbarOptions: ['Search']
        };
    },
    provide: {
        grid: [Toolbar, Search]
    }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/search/default-cs3" %}

### Initial search

To apply search at initial rendering, set the fields, operator, key, and ignoreCase in the [searchSettings](#).

### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid :dataSource='data' :searchSettings='searchOptions'
:toolbar='toolbarOptions' height='272px'>
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
                <e-column field='ShipCity' headerText='Ship City'
width=100></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>

```

```

        <e-column field='ShipName' headerText='Ship Name'
width=100></e-column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Search } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js'
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['Search'],
      searchOptions: { fields: ['CustomerID'], operator: 'contains', key:
'Ha', ignoreCase: true }
    };
  },
  provide: {
    grid: [Toolbar, Search]
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/search/default-cs4" %}

By default, grid searches all the bound column values. To customize this behavior define the [searchSettings.fields](#) property.

### Search operators

The search operator can be defined in [searchSettings.operator](#) property to configure specified searching.

The following operators are supported in searching:

#### Operator | Description

startsWith | Checks whether a value begins with the specified value.

endsWith | Checks whether a value ends with specified value.

contains | Checks whether a value contains with specified value.

equal | Checks whether a value equal to specified value.

notEqual | Checks whether a value not equal to specified value.

### Search by external button

To search grid records from an external button, invoke the [search](#) method.

### **APP.VUE**

```

<template>
  <div id="app">
    <div class="e-float-input" style="width: 200px; display: inline-block;">
      <input type="text" class="searchtext"/>
      <span class="e-float-line"></span>
      <label class="e-float-text">Search text</label>
    </div>
    <ejs-button id='search' @click.native='search'>Search</ejs-button>
    <ejs-grid ref='grid' :dataSource='data' height='262px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=100></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=100></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Search } from "@syncfusion/ej2-vue-grids";
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { data } from './datasource.js'
Vue.use(GridPlugin);
Vue.use(ButtonPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  methods: {
    search: function() {
      let searchText =
document.getElementsByClassName('searchtext')[0].value;
      this.$refs.grid.search(searchText);
    }
  },
  provide: {
    grid: [Search]
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/search/default-cs5" %}

### Search Specific Columns

By default, grid searches all visible columns. You can search specific columns by defining the specific column's field names in the [searchSettings.fields](#) property.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :searchSettings='searchOptions'
:toolbar='toolbarOptions' height='272px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=100></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=100></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Search } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js'
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['Search'],
      searchOptions: {fields: ['CustomerID', 'ShipCity']}
    };
  },
  provide: {
    grid: [Toolbar, Search]
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/search/default-cs6" %}

### Clear search by external button

To clear the searched grid records from the external button, set [searchSettings.key](#) property as **empty** string.

#### APP.VUE

```
<template>
```

```

    <div id="app">
      <ejs-button id='clear' @click.native='clear'>Clear Search</ejs-
button>
      <ejs-grid ref='grid' :dataSource='data'
:searchSettings='searchOptions' :toolbar='toolbarOptions' height='262px'>
        <e-columns>
          <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
          <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
          <e-column field='ShipCity' headerText='Ship City'
width=100></e-column>
          <e-column field='ShipName' headerText='Ship Name'
width=100></e-column>
        </e-columns>
      </ejs-grid>
    </div>
  </template>
  <script>
import Vue from "vue";
import { GridPlugin, Toolbar, Search } from "@syncfusion/ej2-vue-grids";
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { data } from './datasource.js'
Vue.use(GridPlugin);
Vue.use(ButtonPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['Search'],
      searchOptions: { fields: ['CustomerID'], operator: 'contains', key:
'Ha', ignoreCase: true }
    };
  },
  methods: {
    clear: function() {
      this.$refs.grid.ej2Instances.searchSettings.key = "";
    }
  },
  provide: {
    grid: [Search,Toolbar]
  }
}
  </script>
  <style>
    @import
    "https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-grids/styles/material.css";
  </style>

```

{% previewsample "page.domainurl/code-snippet/grid/search/default-cs7" %}

### Search on each key stroke

You can search the Grid data on each key stroke by binding the `keyup` event for the search input element inside the `created` event. Inside the `keyup` handler you can search the Grid by invoking the `search` method of the Grid component.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' id='grid' :dataSource='data'
:toolbar='toolbarOptions' height='262px' :created='created'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=100></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=100></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Search } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js'
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['Search'],
    };
  },
  methods: {
    created: function() {
      document.getElementById(this.$refs.grid.$el.id +
"_searchbar").addEventListener('keyup', () => {
        this.$refs.grid.search((event.target as HTMLInputElement).value)
      });
    }
  },
  provide: {
    grid: [Search, Toolbar]
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-grids/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/search/default-cs8" %}
```

### Perform search operation in Grid using multiple keywords

You can perform a searching operation in the Grid using multiple keywords. This can be achieved by the [actionBegin](#) event of the Grid.

In the following sample, we have performed the searching with multiple keywords by using the query property of grid when the requestType is searching in the [actionBegin](#) event.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data'
      :searchSettings="searchOptions" :toolbar="toolbarOptions" height='273px'
      :actionBegin = 'actionBegin' :actionComplete = 'actionComplete'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
          textAlign='Right' :isPrimaryKey='true' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
          width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign=
          'Right' editType= 'numericedit' width=120 format= 'C2'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
          editType= 'dropdownedit' width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Search } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
import { Predicate, Query } from "@syncfusion/ej2-data";
Vue.use(GridPlugin);
export default {
  data() {
    return {
      values: "",
      key: "",
      refresh: false,
      removeQuery: false,
      valueAssign: false,
      data: data,
      toolbarOptions: ["Search"],
      searchOptions: {
        fields: ["OrderID", "CustomerID", "ShipCity", "ShipName"],
        key: "",
      },
    };
  },
  methods: {
    actionBegin(args) {
      if (args.requestType === "searching") {
        const keys = args.searchString.split(",");
        var flag = true;
        var predicate;
```

```

        if (keys.length > 1) {
            if (this.$refs.grid.ej2Instances.searchSettings.key !== "") {
                this.values = args.searchString;
                keys.forEach((key) => {
                    this.$refs.grid.ej2Instances.getColumns().forEach((col) => {
                        if (flag) {
                            predicate = new Predicate(col.field, "contains", key,
true);
                            flag = false;
                        } else {
                            var predic = new Predicate(col.field, "contains", key,
true);

## Paging in Vue Grid component

Paging provides an option to display Grid data in page segments. To enable paging, set the [allowPaging](#) to true. When paging is enabled, pager component renders at the bottom of the grid. Paging options can be configured through the [pageSettings](#).

In the below sample, [pageSize](#) is calculated based on the grid height by using the [load](#) event.

To use Paging, you need to inject [Page](#) module in the **provide** section.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource="data" :allowPaging="true"
    :pageSettings='pageSettings' height=323 :load='load'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
        format='C2' width=90></e-column>
        <e-column field='ShipCity' headerText='Ship City' width=150></e-
        column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page } from "@syncfusion/ej2-vue-grids";
import { data } from "../datasource.js";
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      pageSettings: { pageSize: 5 }
    };
  },
  methods: {
    load: function() {
      let rowHeight = this.$refs.grid.ej2Instances.getRowHeight(); //height
of the each row
      let gridHeight = this.$refs.grid.height; //grid height
      let pageSize = this.$refs.grid.pageSettings.pageSize; //initial page
size
      let pageResize = (gridHeight - (pageSize * rowHeight)) / rowHeight;
//new page size is obtained here
      this.$refs.grid.pageSettings = {pageSize: pageSize +
      Math.round(pageResize)};
    }
  }
}
```

```

    },
    provide: {
      grid: [Page]
    }
  }
</script>
<style>
  @import
  "https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
  vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/page/default-cs1" %}

You can achieve better performance by using grid paging to fetch only a pre-defined number of records from the data source.

### Template

You can use custom elements inside the pager instead of default elements. The custom elements can be defined by using [pagerTemplate](#). Inside this template, you can access the [currentPage](#), [pageSize](#), [pageCount](#), [totalPage](#) and [totalRecordCount](#) values.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref="grid" :dataSource="data" :allowPaging="true"
    :pageSettings='pageSettings' :pagerTemplate='pagerTemp'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
        format='C2' width=90></e-column>
        <e-column field='ShipCity' headerText='Ship City' width=150></e-
        column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page } from "@syncfusion/ej2-vue-grids";
import { NumericTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
import { data } from "../datasource.js";
Vue.use(GridPlugin);
Vue.use(NumericTextBoxPlugin);
export default {
  data() {
    return {
      data: data,
      pageSettings: { pageSize: 5 },
      pagerTemp: function() {
        return {
          template: Vue.component("pagerTemplate", {

```

```

template: `<div class="e-pagertemplate">
  <div class="col-lg-12 control-section">
    <div class="content-wrapper">
      <ejs-numericinput width="100"
: value="value" : change="change"></ejs-numericinput>
    </div>
  </div>
  <div id="totalPages" class="e-pagertemplatemessage"
    style="margin-top: 5px; margin-left: 30px; border:
none; display: inline-block ">
    <span class="e-
pagenomsg">{{this.$data.data.currentPage}} of {{this.$data.data.totalPages}}
pages
    <span class="e-recordscount">{{this.$data.data.totalRecordsCount}}
items</span>
  </div>
</div>`,
computed: {
  value: function() {
    return this.$data.data.currentPage;
  },
  methods: {
    change: function(args) {
      let grid: any = this.$el.closest(".e-
grid").ej2_instances[0];
      grid.goToPage(args.value);
    }
  }
})
};
}
};
},
provide: {
  grid: [Page]
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
.e-pagertemplate {
  display: inline-block;
  overflow: hidden;
}
.control-section {
  margin-left: 20px;
  width: 25%;
}
.content-wrapper {
  width: 25%;
  margin: 0 auto;
  min-width: 185px;
}
.e-float-input.e-numeric.e-input-group {
  margin-top: 12px;
  display: inline-flex;

```

```
width: 180px;
}

  .e-pager .content-wrapper {
    display: inline-block
  }
}
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/page/template-cs1" %}

### Pager with Page Size Dropdown

The pager Dropdown allows you to change the number of records in the Grid dynamically. It can be enabled by defining the [pageSettings.pageSizes](#) property as true.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource="data" :allowPaging="true"
:pageSettings='pageSettings'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
        <e-column field='ShipCity' headerText='Ship City' width=150></e-
column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page } from "@syncfusion/ej2-vue-grids";
import { data } from "../datasource.js";
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      pageSettings: { pageSizes: true, pageSize: 9 }
    };
  },
  provide: {
    grid: [Page]
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-grids/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/page/default-cs2" %}
```

### How to render Pager at the Top of the Grid

By default, Pager will be rendered at the bottom of the Grid. You can also render the Pager at the top of the Grid by using the [dataBound](#) event.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource="data" :allowPaging="true"
:pageSettings='pageSettings' :toolbar='toolbar' :dataBound='dataBound'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
        <e-column field='ShipCity' headerText='Ship City' width=150></e-
column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar } from "@syncfusion/ej2-vue-grids";
import { data } from "../datasource.js";
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      initialGridLoad: true,
      pageSettings: { pageSizes: true, pageSize: 9 },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel']
    };
  },
  methods: {
    dataBound: function() {
      if (this.initialGridLoad) {
        this.initialGridLoad = false;
        let pager = document.getElementsByClassName('e-gridpager');
        let topElement;
        console.log('allowGroping n toolbar', this.$refs.grid);
        if (this.$refs.grid.allowGrouping || this.$refs.grid.toolbar) {
          topElement = this.$refs.grid.allowGrouping ?
document.getElementsByClassName('e-groupdroparea') :
document.getElementsByClassName('e-toolbar');
        } else {
          topElement = document.getElementsByClassName('e-gridheader');
        }
        console.log('insetBefore', this.$refs.grid.$el);
        this.$refs.grid.$el.insertBefore(pager[0], topElement[0]);
      }
    }
  }
}
```

```

    },
    provide: {
      grid: [Page, Toolbar]
    }
  }
</script>
<style>
  @import
  "https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
  vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/page/default-cs3" %}

During the paging action, the pager component triggers the below three events.

- \* The [created](#) event triggers when Pager is created.
- \* The [click](#) event triggers when the numeric items in the pager is clicked.
- \* The [dropDownChanged](#) event triggers when pageSize DropDownList value is selected.

See Also

- [Group with Paging](#)

### Scrolling in Vue Grid component

The scrollbar will be displayed in the grid when content exceeds the element [width](#) or [height](#). The vertical and horizontal scrollbars will be displayed based on the following criteria:

- The vertical scrollbar appears when the total height of rows present in the grid exceeds its element height.
- The horizontal scrollbar appears when the sum of columns width exceeds the grid element width.
- The [height](#) and [width](#) are used to set the grid height and width, respectively.

The default value for [height](#) and [width](#) is **auto**.

Set width and height

To specify the [width](#) and [height](#) of scroller in pixel, set the pixel value as number.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource="data">
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
        width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>

```

```

        <e-column field='ShipCountry' headerText='Ship Country'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
    </e-columns>

```

{% previewsample "page.domainurl/code-snippet/grid/scroll/default-cs4" %}

### Responsive with parent container

Specify the [width](#) and [height](#) as **100%** to make the grid element fill its parent container. Setting the [height](#) to **100%** requires the grid parent element to have explicit height.

### APP.VUE

```

<template>
  <div id="app">
    <p class="e-text"> The parent container can be resizable by dragging
the bottom-right corner.</p>
    <div id='container' class='e-resizable'>
      <ejs-grid :dataSource='data' height='100%' width='100%'>
        <e-columns>
          <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
          <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
          <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
          <e-column field='ShipCountry' headerText='Ship Country'
width=150></e-column>
          <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
        </e-columns>
      </ejs-grid>
    </div>
  </div>
</template>
<script>

```

```

import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from "../datasource.js";
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
  .e-resizable {
    resize: both;
    overflow: auto;
    border: 1px solid red;
    padding: 10px;
    height: 300px;
    min-height: 250px;
    min-width: 250px;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/scroll/default-cs5" %}

### Sticky Header

You can make the Grid column headers remain fixed while scrolling by using the [enableStickyHeader](#) property.

In the below demo, the Grid headers will be sticky while scrolling the Grid's parent div element.

### APP.VUE

```

<template>
  <div id="app">
    <div style='height:350px;'>
      <ejs-grid ref='grid' :dataSource='data' enableStickyHeader=true>
        <e-columns>
          <e-column field='OrderID' headerText='Order ID'
            textAlign='Right' width=100></e-column>
          <e-column field='CustomerID' headerText='Customer ID'
            width=120></e-column>
          <e-column field='ShipCity' headerText='Ship City'
            width=100></e-column>
          <e-column field='ShipName' headerText='Ship Name'
            width=100></e-column>
        </e-columns>
      </ejs-grid>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";

```

```
import { data } from './datasource.js'
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/search/default-cs1" %}

### Scroll To Selected Row

You can scroll the grid content to the selected row position by using the [rowSelected](#) event.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-numerictextbox ref='numeric' format='N' min='0' placeholder='Enter
index to select a row' width=200 :showSpinButton='false'
:change='onchange'></ejs-numerictextbox>
    <ejs-grid ref='grid' :dataSource='data' height='280' width='100%'
:rowSelected='rowSelected'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { NumericTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
import { data } from './datasource.js';
Vue.use(GridPlugin);
Vue.use(NumericTextBoxPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
}
```

```

methods: {
  onchange: function() {
    this.$refs.grid.selectRow(parseInt(this.$refs.numeric.getText(), 10));
  }
  rowSelected: function (args) {
    let rowHeight =
this.$refs.grid.getRows()[this.$refs.grid.getSelectedRowIndex()[0]].scroll
Height;
    this.$refs.grid.getContent().children[0].scrollTop = rowHeight *
this.$refs.grid.getSelectedRowIndex()[0];
  }
}
}
</script>
<style>
  @import
  "https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/scroll/selectrow-cs1" %}

Hide the scrollbar when the content is not overflown

You can hide the scrollbar of Grid content by using the [hideScroll](#) method when the content doesn't overflow its parent element.

In the following sample, we have invoked the [hideScroll](#) method inside the [dataBound](#) event.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' height='312px'
: dataBound='dataBound'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=100></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=100></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js'
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data.slice(0, 2),

```

```

    };
  },
  methods: {
    dataBound: function() {
      this.$refs.grid.hideScroll();
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/search/default-cs2" %}

### Frozen in Vue Grid component

Frozen rows and columns provides an option to make rows and columns always visible in the top and left side of the grid while scrolling.

In this demo, the [frozenColumns](#) is set as '2' and the [frozenRows](#) is set as '3'. Hence, the left two columns and top three rows are frozen.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' height=315 :frozenColumns='2'
    :frozenRows='3' :allowSelection='false' :enableHover='false' width='600'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=150></e-column>
        <e-column field='OrderDate' headerText='Order Date'
        width=130 format='yMd' textAlign='Right' type='date'></e-column>
        <e-column field='ShipName' headerText='Ship Name'
        width=150></e-column>
        <e-column field='ShipAddress' headerText='Ship Address'
        width=170></e-column>
        <e-column field='ShipCity' headerText='Ship City'
        width=150></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
        width=150></e-column>
        <e-column field='ShipRegion' headerText='Ship Region'
        width=150></e-column>
        <e-column field='ShipPostalCode' headerText='Ship Postal
        Code' width=150></e-column>
        <e-column field='Freight' headerText='Freight'
        width=120></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Freeze } from "@syncfusion/ej2-vue-grids";

```

```
import { data } from "../datasource.js";
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  provide: {
    grid: [Freeze]
  }
}
</script>
<style>
  @import
  "https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/scroll/default-cs1" %}

- \* The **height** and **width** must be set while giving frozen rows and columns.
- \* Frozen rows and columns should not be set outside the grid view port.
- \* Frozen Grid will support row and column virtualization feature, which helps to improve the Grid performance while loading a large dataset.

### Frozen Grid Limitations

The following features are not supported in frozen rows and columns:

- Detail Template
- Hierarchy Grid

### Freeze Direction

You can freeze the Grid columns on the left or right side by using the [column.freeze](#) property and the remaining columns will be movable. The grid will automatically move the columns to the left or right position based on the [column.freeze](#) value.

Types of the [column.freeze](#) directions:

- **Left:** Allows you to freeze the columns at the left.
- **Right:** Allows you to freeze the columns at the right.
- **Fixed:** Allows you to lock the column at a fixed position by ensuring its visibility during horizontal scroll.

In this demo, the **ShipCountry** column is frozen at the left and the **CustomerID** column is frozen at the right side of the content table.

### APP.VUE

```
<template>
  <div id="app">
```

```

        <ejs-grid :dataSource='data' height=315 :frozenRows='2'
:enableHover='false'>
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
                <e-column field='Freight' headerText='Freight'
width=120></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
width=150 freeze='Right'></e-column>
                <e-column field='OrderDate' headerText='Order Date'
width=130 format='yMd' textAlign='Right' type='date'></e-column>
                <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
                <e-column field='ShipAddress' headerText='Ship Address'
width=170></e-column>
                <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
                <e-column field='ShipCountry' headerText='Ship Country'
width=150 freeze='Left'></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Freeze } from "@syncfusion/ej2-vue-grids";
import { data } from "../datasource.js";
Vue.use(GridPlugin);
export default {
    data() {
        return {
            data: data
        };
    },
    provide: {
        grid: [Freeze]
    }
}
</script>
<style>
    @import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/scroll/default-cs2" %}

Freeze Direction is not compatible with the [isFrozen](#) and [frozenColumns](#) properties.

### Deprecated Methods

Deprecated Methods | [Previous](#) | [Current](#) | [Suggested Alternative Methods](#) | [Example for achieving the same results](#)

**getMovableRows()** | In the previous architecture of frozen grid, three separate tables were created for the left, right, and movable contents. When calling this method, it would return only the movable table rows (tr's). | In the current architecture, the frozen left, right, and movable sections are applied within a

single table. When calling this method, it will return all table rows (tr's) of the entire table. However, in this approach, we have introduced the `e-unfreeze` class for movable cells. This allows us to selectively retrieve the movable rows using the `e-unfreeze` class selector. | `getRows()` | `gridInstance.getMovableRows()[0].querySelectorAll('.e-unfreeze')` // Deprecated <br><br> (or) <br><br> `gridInstance.getRows()[0].querySelectorAll('.e-unfreeze')` // Alternative method

`getFrozenRightRows()` | In the previous architecture, this method would return only the table rows (tr's) from the freeze right table. | In the current architecture, the frozen left, right, and movable sections are applied within a single table. When calling this method, it will return all the rows (tr's) of the entire table. In this new approach, we have introduced the `e-rightfreeze` class for right freeze cells. As a result, you can now selectively retrieve the right freeze rows using the `e-rightfreeze` class selector. | `getRows()` | `gridInstance.getFrozenRightRows()[0].querySelectorAll('.e-rightfreeze')` // Deprecated <br><br> (or) <br><br> `gridInstance.getRows()[0].querySelectorAll('.e-rightfreeze')` // Alternative method

`getMovableRowByIndex()` <br> `getFrozenRowByIndex()` <br> `getFrozenRightRowByIndex()` | In the previous architecture, you could select rows by using separate methods for each table section. Like, <br> `getMovableRowByIndex` - select a movable row <br> `getFrozenRowByIndex` - select a freeze row <br> `getFrozenRightRowByIndex` - select a right freeze row. | In the current architecture, the `getMovableRowByIndex`, `getFrozenRightRowByIndex` and `getFrozenRowByIndex` methods all return the same table row (tr) based on the given index. Additionally, class names for table cells (td's) have been separated as follows: <br> Left-Freeze : `e-leftfreeze` <br> Movable : `e-unfreeze` <br> Right-Freeze : `e-rightfreeze`.<br>This separation of class names makes it easier to target and customize the cells within the particular row. | `getRowByIndex()` | **To get the left freeze cells:** <br> `gridInstance.getRowByIndex(1).querySelectorAll('.e-leftfreeze')` <br><br> **To get the movable cells:** <br> `gridInstance.getRowByIndex(1).querySelectorAll('.e-unfreeze')` <br><br> **To get the right freeze cells:** <br> `gridInstance.getRowByIndex(1).querySelectorAll('.e-rightfreeze')`

`getMovableCellFromIndex()` <br> `getFrozenRightCellFromIndex()` | `getMovableCellFromIndex()` - select a particular cell in the movable table. <br> `getFrozenRightCellFromIndex()` - select a particular cell in the right freeze table. | In the new approach, you can select a particular cell by using both the `getFrozenRightCellFromIndex` and `getMovableCellFromIndex` methods. | `getCellFromIndex()` | `gridInstance.getCellFromIndex(1,1)`

`getMovableDataRows()` <br> `getFrozenRightDataRows()` <br> `getFrozenDataRows()` | These methods returns the viewport data rows for the freeze, movable, and right tables separately. | In the new approach, when calling the `getMovableDataRows`, `getFrozenRightDataRows`, and `getFrozenDataRows` methods, returns the entire viewport data rows. You can then select specific cells within these rows using the following selectors <br> Left-Freeze : `e-leftfreeze` <br> Movable : `e-unfreeze` <br> \* Right-Freeze : `e-rightfreeze`. | `getDataRows()` | **To get the movable data cells:** <br> `gridInstance.getDataRows()[0].querySelectorAll('.e-unfreeze')` <br><br> **To get the right freeze data cells:** <br> `gridInstance.getDataRows()[0].querySelectorAll('.e-rightfreeze')` <br><br> **To get the left freeze data cells:** <br> `gridInstance.getDataRows()[0].querySelectorAll('.e-leftfreeze')`

`getMovableColumnHeaderByIndex()` <br> `getFrozenRightColumnHeaderByIndex()` <br> `getFrozenLeftColumnHeaderByIndex()` | In the previous architecture, these methods selects the movable, right freeze, and left freeze headers from the table separately. | In the new approach, when calling the `getMovableColumnHeaderByIndex`, `getFrozenRightColumnHeaderByIndex`, and

`getFrozenLeftColumnHeaderByIndex` methods, you will still receive the same results as before. | `getColumnHeaderByIndex()` | `gridInstance.getColumnHeaderByIndex(1)`

When a validation message is displayed in the frozen part (Left, Right, Fixed) of the table, scrolling is prevented until the validation message is cleared.

### Virtual scroll in Vue Grid component

Grid allows you to load large amount of data without performance degradation.

To use virtualization, you need to inject `VirtualScroll` module in the `provide` section.

#### Row Virtualization

Row virtualization allows you to load and render rows only in content viewport. It is an alternative way of paging in which the data will load while scrolling vertically.

To setup the row virtualization, you need to define [enableVirtualization](#) as true and content height by [height](#) property.

The number of records displayed in the Grid is determined implicitly by height of content area. Also you have an option to define visible number of records by [pageSettings.pageSize](#) property. The loaded data will be cached and reused when it is needed for next time.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' height=300 :enableVirtualization=true
:pageSettings='options' :editSettings='editSettings' :toolbar='toolbar'>

{% previewsample "page.domainurl/code-snippet/grid/virtualscroll/default-cs5" %}

Column's [width](#) is required for column virtualization. If column's width is not defined then Grid will consider its value as 200px.

### Virtualization with Grouping

Both the row and column virtualization can be used along with grouping. At initial rendering, the virtual height of scrollbar will be set based on the total number of records and after grouping, it will be refreshed based on the grouped state(expand/collapse). While collapse the group caption row in current viewport then the next view page grouped records are shown.

The collapsed/expanded state will persist only for local dataSource while scrolling.

### Limitations for virtual scrolling

- While using column virtual scrolling, column width should be in pixel. Percentage values are not accepted.
- Due to the element height limitation in browsers, the maximum number of records loaded by the Grid is limited by the browser capability.
- The cell selection is not supported for both row and column virtual scrolling.
- Virtual scrolling is not compatible with batch editing, detail template, rowspan, colspan and hierarchy features.
- Group expand and collapse state will not be persisted.
- Since data is virtualized in grid, the aggregated information and total group items are displayed based on the current view items.

To get these information regardless of the view items, refer to the

[Group with Page](#) topic.

- The page size provided must be two times larger than the number of visible rows in the grid.

If the page size is failed to meet this condition then the size will be determined by grid.

- The height of the grid content is calculated using the row height and total number of records in the data source and hence features which changes row height such as text wrapping are not supported. If you want to increase the row height to accommodate the content then you can specify the [rowHeight](#) as below to ensure all the table rows are in same height.

```
<ejs-grid :dataSource='data' rowHeight=50>
```

```
</ejs-grid>
```

- Programmatic selection using [selectRows](#) method is not supported in virtual scrolling.

#### Browser height limitation in virtual scrolling and solution

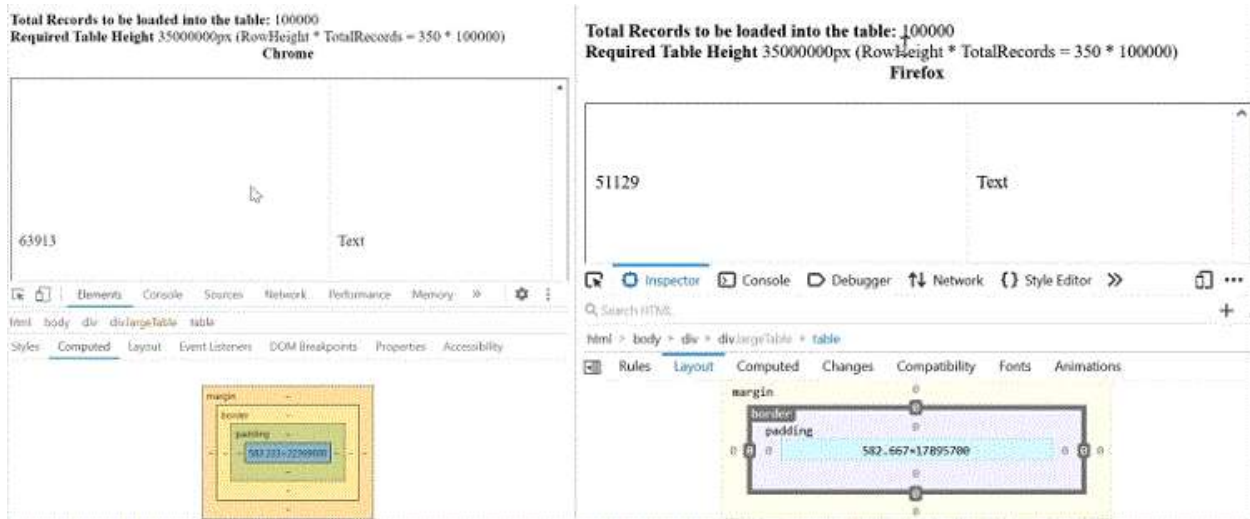

You can load millions of records in the Grid by using virtual scrolling, where the grid loads and renders rows on-demand while scrolling vertically. As a result, Grid lightens the browser's load by minimizing the DOM elements and rendering elements visible in the viewport. The height of the grid is calculated using the Total Records Count \* [Row Height](#) property.

The browser has some maximum pixel height limitations for the scroll bar element. The content placed above the maximum height can't be scrolled if the element height is greater than the browser's maximum height limit. The browser height limit affects the virtual scrolling of the grid. When a large number of records are bound to the Grid, it can only display the records until the maximum height limit of the browser. Once the browser's height limit is reached while scrolling, the user won't be able to scroll further to view the remaining records.

For example, if the row height is set as 30px and the total record count is 1000000(1 million), then the height of the grid element will be 30,000,000 pixels. In this case, the browser's maximum height limit for a div is about 22,369,600 (The maximum pixel height limitation differs for different browsers). The records above the maximum height limit of the browser can't be scrolled.

This height limitation is not related to the Grid component. It fully depends on the default behavior of the browser. The same issue is reproduced in the normal HTML table too.

The following image illustrates the height limitation issue of a normal HTML table in different browsers (Chrome and Firefox).

Grid component also faced the same issue as mentioned in the below image.

The Grid has an option to overcome this limitation of the browser in the following ways.

#### [Solution 1: Using external buttons](#)

You can prevent the height limitation problem in the browser when scrolling through millions of records by loading the segment of data through different strategy.

In the following sample, Grid is rendered with a large number of records(nearly 2 million). Here, you can scroll 0.5 million records at a time in Grid. Once you reach the last page of 0.5 million records, the **Load Next Set** button will be shown at the bottom of the Grid. By clicking that button, you can view the next set of 0.5 million records in Grid. Also, the **Load Previous Set** button will be shown at the top of the Grid to load the previous set of 0.5 million records.

Let's see the step by step procedure for how we can overcome the limitation in the Syncfusion Grid component.

1. Create a custom adaptor by extending `UrlAdaptor` and binding it to the grid `dataSource` property. In the `processQuery` method of the custom adaptor, we handled the `Skip` query based on the current page set to perform the data operation with whole records on the server.

```

`ts
class CustomUrlAdaptor extends UrlAdaptor {
  processQuery(args) {
    if (arguments[1].queries) {
      for (var i = 0; i < arguments[1].queries.length; i++) {
        if (arguments[1].queries[i].fn === 'onPage') {
          // pageSet - defines the number of segments that we are going to split the 2million records. In this
          // example we have considered 0.5 million records for each set so the pageSet is 1, 2, 3 and 4.
          // maxRecordsPerPageSet – In this example we define the value as 0.5 million.
          // gridPageSize – the pageSize that we have defined in the Grid pageSettings->pageSize property
          // customize the pageIndex based on the current pageSet (It send the skip query including the previous
          // pageSet ) so that the other operations performed for total 2millions records instead of 0.5 million alone.
          arguments[1].queries[i].e.pageIndex = (((pageSet - 1) * maxRecordsPerPageSet) / gridPageSize) +
            arguments[1].queries[i].e.pageIndex;
        }
      }
    }
    let original = super.processQuery.apply(this, arguments);
    return original;
  }
}

data: new DataManager({
  adaptor: new CustomUrlAdaptor(),
  url: "Home/UrlDatasource"
})
`

```

## 2. Render the grid by define the following features.

```

`ts
<ejs-grid :dataSource="data" :enableVirtualization='true' height='360' :pageSettings='pageSettings'
:beforeDataBound='beforeDataBound'>
  <e-columns>
    <e-column field='OrderID' headerText='Order ID' textAlign='Right' width=90></e-column>
    .....
    .....
  </e-columns>
</ejs-grid>

```

```
</e-columns>
```

```
</ejs-grid>
```

```
,
```

3. In the `beforeDataBound` event, we set the `args.count` as 0.5 million to perform scrolling with 0.5 million records and all the data operations are performed with whole records which is handled using the custom adaptor. And also particular segment records count is less than 0.5 million means it will directly assigned the original segmented count instead of 0.5 million.

```
`ts
```

```
beforeDataBound(args) {
```

```
// storing the total records count which means 2 million records count
```

```
totalRecords = args.count;
```

```
// change the count with respect to maxRecordsPerPageSet (maxRecordsPerPageSet = 500000)
```

```
args.count = args.count - ((pageSet - 1) * maxRecordsPerPageSet) > maxRecordsPerPageSet
```

```
?maxRecordsPerPageSet : args.count - ((pageSet - 1) * maxRecordsPerPageSet);
```

```
}
```

```
,
```

4. Render “Load Next Set” button and “Load Previous Set” button at bottom and top of the grid component.

```
`ts
```

```
<ejs-button cssClass='e-info prevbtn' :onClick='prevBtnClick'>Load Previous Set...</ejs-button>
```

```
<ejs-grid :dataSource='data' :enableVirtualization='true' height='360' :pageSettings='pageSettings'
:beforeDataBound='beforeDataBound'>
```

```
<e-columns>
```

```
<e-column field='OrderID' headerText='Order ID' textAlign='Right' width=90></e-column>
```

```
.....
```

```
.....
```

```
</e-columns>
```

```
</ejs-grid>
```

```
<ejs-button cssClass='e-info nxtbtn' :onClick='nxtBtnClick'>Load Next Set...</ejs-button>
```

```
,
```

5. While click on the **Load Next Set** / **Load Previous Set** button corresponding page data set is loaded to view remaining records of total 2 millions records after doing some simple calculation.

```
`ts
```

```
// Triggered when clicking the Previous/ Next button.
prevNxtBtnClick(args) {
  if (this.grid.element.querySelector('.e-content') && this.grid.element.querySelector('.e-content').getAttribute('aria-busy') === 'false') {
    // Increase/decrease the pageSet based on the target element.
    pageSet = args.target.classList.contains('prevbtn') ? --pageSet : ++pageSet;
    this.rerenderGrid(); // Re-render the Grid component.
  }
}
,
```

You can view the hosted link for this sample [here](#).

LOAD PREVIOUS SET...

Order ID	Customer ID	Freight	Country	Status
1	Alfki	\$12.30	Denmark	Active
2	Anatr	\$3.30	Brazil	Inactive
3	Anton	\$4.30	Germany	Active
4	Blomp	\$5.30	Austria	Inactive
5	Bolid	\$6.30	Switzerland	Active
6	Hanar	\$12.30	France	Active
7	Thomas	\$3.30	Itali	Inactive
8	Jack	\$4.30	Austria	Active
9	Alfki	\$5.30	USA	Inactive
10	Hanar	\$6.30	Belgium	Active

LOAD NEXT SET...

If you perform grid actions such as filtering, sorting, etc., after scrolling through the 0.5 million data, the Grid performs those data actions with the whole records, not just the current loaded 0.5 million data.

#### *Solution 2: Using RowHeight property*

You can reduce the [row height](#) using the [rowHeight](#) property of the Grid. It will reduce the overall height to accommodate more rows. But this approach optimizes the limitation, but if the height limit is reached after reducing row height also, you have to opt for the previous solution or use paging.

In the following image, you can see how many records will be scrollable when setting rowHeight to "36px" and "30px".

**RowHeight = 36px**

Order ID	Customer ID	Freight	Country	Status
1	Alfki	\$12.30	Denmark	Active
2	Anatr	\$3.30	Brazil	Inactive
3	Anton	\$4.30	Germany	Active
4	Blomp	\$5.30	Austria	Inactive
5	Bolid	\$6.30	Switzerland	Active
6	Hanar	\$12.30	France	Active
7	Thomas	\$3.30	Itali	Inactive
8	Jack	\$4.30	Austria	Active

**RowHeight = 30px**

Order ID	Customer ID	Freight	Country	Status
1	Alfki	\$12.30	Denmark	Active
2	Anatr	\$3.30	Brazil	Inactive
3	Anton	\$4.30	Germany	Active
4	Blomp	\$5.30	Austria	Inactive
5	Bolid	\$6.30	Switzerland	Active
6	Hanar	\$12.30	France	Active
7	Thomas	\$3.30	Itali	Inactive
8	Jack	\$4.30	Austria	Active
9	Alfki	\$5.30	USA	Inactive
10	Hanar	\$6.30	Belgium	Active

### *Solution 3: Using paging instead of virtual scrolling*

Similar to virtual scrolling, the [paging](#) feature also loads the data in an on-demand concept. Pagination is also compatible with all the other features (Grouping, Editing, etc.) in Grid. So, use the paging feature instead of virtual scrolling to view a large number of records in the Grid without any kind of performance degradation or browser height limitation.

### Infinite scroll in Vue Grid component

Infinite scrolling is used to load a huge amount of data without degrading the Grid performance. This feature works like the lazy loading concept, which means the buffer data is loaded only when the scrollbar reaches the end of the scroller.

To enable Infinite scrolling, set `enableInfiniteScrolling` property as true.

In this feature, Grid will not make a new data request when you visit the same page again.

### **APP.VUE**

```
<template>
  <div id="app">
```

```

    <ejs-grid :dataSource='data' height=300
:enableInfiniteScrolling='true' :pageSettings='options'>
      <e-columns>
        <e-column field='TaskID' headerText='Task ID'
textAlign='Right' width=70></e-column>
        <e-column field='Engineer' width=100></e-column>
        <e-column field='Designation' width=100></e-column>
        <e-column field='Estimation' textAlign='Right'
width=100></e-column>
        <e-column field='Status' width=100></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, InfiniteScroll } from "@syncfusion/ej2-vue-grids";
Vue.use(GridPlugin);
let names = ['TOM', 'Hawk', 'Jon', 'Chandler', 'Monica', 'Rachel', 'Phoebe',
'Gunter', 'Ross', 'Geller', 'Joey', 'Bing', 'Tribbiani', 'Janice', 'Bong',
'Perk', 'Green', 'Ken', 'Adams'];
let hours = [1, 2, 3, 4, 5, 6, 7, 8, 9, 10];
let designation = ['Manager', 'Engineer 1', 'Engineer 2', 'Developer',
'Tester'];
let status = ['Completed', 'Open', 'In Progress', 'Review', 'Testing']
let data = (count) => {
  let result = [];
  for (let i = 0; i < count; i++) {
    result.push({
      TaskID: i + 1,
      Engineer: names[Math.round(Math.random() * names.length)] ||
names[0],
      Designation: designation[Math.round(Math.random() *
designation.length)] || designation[0],
      Estimation: hours[Math.round(Math.random() * hours.length)] ||
hours[0],
      Status: status[Math.round(Math.random() * status.length)] ||
status[0]
    });
  }
  return result;
};
export default {
  data() {
    return {
      data: data(1000),
      options: { pageSize: 50 }
    };
  },
  provide: {
    grid: [InfiniteScroll]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

```
{% previewsample "page.domainurl/code-snippet/grid/virtualscroll/default-cs1" %}
```

### InitialBlocks

You can define the initial loading pages count by using `infiniteScrollSettings.initialBlocks` property. By default, this feature loads three pages in initial rendering.

In the below demo, we have changed this property value to load five page records instead of three.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' height=300
:enableInfiniteScrolling='true' :pageSettings='options'
:infiniteScrollSettings='infiniteOptions'>
      <e-columns>
        <e-column field='TaskID' headerText='Task ID'
textAlign='Right' width=70></e-column>
        <e-column field='Engineer' width=100></e-column>
        <e-column field='Designation' width=100></e-column>
        <e-column field='Estimation' textAlign='Right'
width=100></e-column>
        <e-column field='Status' width=100></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, InfiniteScroll } from "@syncfusion/ej2-vue-grids";
Vue.use(GridPlugin);
let names = ['TOM', 'Hawk', 'Jon', 'Chandler', 'Monica', 'Rachel', 'Phoebe',
'Gunter', 'Ross', 'Geller', 'Joey', 'Bing', 'Tribbiani', 'Janice', 'Bong',
'Perk', 'Green', 'Ken', 'Adams'];
let hours = [1, 2, 3, 4, 5, 6, 7, 8, 9, 10];
let designation = ['Manager', 'Engineer 1', 'Engineer 2', 'Developer',
'Tester'];
let status = ['Completed', 'Open', 'In Progress', 'Review', 'Testing']
let data = (count) => {
  let result = [];
  for (let i = 0; i < count; i++) {
    result.push({
      TaskID: i + 1,
      Engineer: names[Math.round(Math.random() * names.length)] ||
names[0],
      Designation: designation[Math.round(Math.random() *
designation.length)] || designation[0],
      Estimation: hours[Math.round(Math.random() * hours.length)] ||
hours[0],
      Status: status[Math.round(Math.random() * status.length)] ||
status[0]
    });
  }
  return result;
};
```

```

export default {
  data() {
    return {
      data: data(1000),
      options: { pageSize: 50 },
      infiniteOptions: { initialBlocks: 5 }
    };
  },
  provide: {
    grid: [InfiniteScroll]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/virtualscroll/default-cs2" %}

### Cache Mode

Cache is used to store the loaded rows object in the Grid instance which can be reused for creating the row elements whenever you scroll to already visited page. Also, this mode maintains row elements based on the `infiniteScrollSettings.maxBlocks` count value, once this limit exceeds then it will remove row elements from DOM for new rows.

To enable the cache mode in Infinite scrolling, set `infiniteScrollSettings.enableCache` property as true.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' height=300
:enableInfiniteScrolling='true' :pageSettings='options'
:infiniteScrollSettings='infiniteOptions'>
      <e-columns>
        <e-column field='TaskID' headerText='Task ID'
textAlign='Right' width=70></e-column>
        <e-column field='Engineer' width=100></e-column>
        <e-column field='Designation' width=100></e-column>
        <e-column field='Estimation' textAlign='Right'
width=100></e-column>
        <e-column field='Status' width=100></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, InfiniteScroll } from "@syncfusion/ej2-vue-grids";
Vue.use(GridPlugin);
let names = ['TOM', 'Hawk', 'Jon', 'Chandler', 'Monica', 'Rachel', 'Phoebe',
'Gunter', 'Ross', 'Geller', 'Joey', 'Bing', 'Tribbiani', 'Janice', 'Bong',
'Perk', 'Green', 'Ken', 'Adams'];
let hours = [1, 2, 3, 4, 5, 6, 7, 8, 9, 10];
let designation = ['Manager', 'Engineer 1', 'Engineer 2', 'Developer',
'Tester'];

```

```

let status = ['Completed', 'Open', 'In Progress', 'Review', 'Testing']
let data = (count) => {
  let result = [];
  for (let i = 0; i < count; i++) {
    result.push({
      TaskID: i + 1,
      Engineer: names[Math.round(Math.random() * names.length)] ||
names[0],
      Designation: designation[Math.round(Math.random() *
designation.length)] || designation[0],
      Estimation: hours[Math.round(Math.random() * hours.length)] ||
hours[0],
      Status: status[Math.round(Math.random() * status.length)] ||
status[0]
    });
  }
  return result;
};
export default {
  data() {
    return {
      data: data(1000),
      options: { pageSize: 50 },
      infiniteOptions: { enableCache: true }
    };
  },
  provide: {
    grid: [InfiniteScroll]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/virtualscroll/default-cs3" %}

### Limitations for Infinite Scrolling

- Due to the element height limitation in browsers, the maximum number of records loaded by the grid is limited due to the browser capability.
- Initial loading rows total height must be greater than the viewport height.
- Cell selection will not be persisted in cache mode.
- Infinite scrolling is not compatible with batch editing, detail template and hierarchy features.
- The group records cannot be collapsed in cache mode.
- The aggregated information and total group items are displayed based on the current view items. To get these information regardless of the view items, refer to the [Group with Page](#) topic.
- Programmatic selection using the [selectRows](#) and [selectRow](#) method is not supported in infinite scrolling.

## Selection

### Selection in Vue Grid component

Selection provides an option to highlight a row or cell or column. Selection can be done through simple Mouse down or Arrow keys. To disable selection in the Grid, set the [allowSelection](#) to false.

The grid supports two types of selection that can be set by using the [selectionSettings.type](#). They are:

- **Single** - The **Single** value is set by default. Allows you to select only a single row or cell or column.
- [Link to the Video](#) - Allows you to select multiple rows or cells or columns. To perform the multi-selection, press and hold CTRL key and click the desired rows or cells or columns. To select range of rows or cells or columns, press and hold the SHIFT key and click the rows or cells or columns.

To get start quickly with Selection Options, you can check on this video:

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :selectionSettings='selectionOptions'
height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      selectionOptions: { type: 'Multiple' }
    };
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/select/default-cs13" %}

*Selection mode*

Grid supports three types of selection mode which can be set by using [selectionSettings.mode](#). They are:

- **Row** - The **row** value is set by default. Allows you to select rows only.
- **Cell** - Allows you to select cells only.
- **Both** - Allows you to select rows and cells at the same time.

**APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :selectionSettings='selectionOptions'
height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>

```

{% previewsample "page.domainurl/code-snippet/grid/select/default-cs14" %}

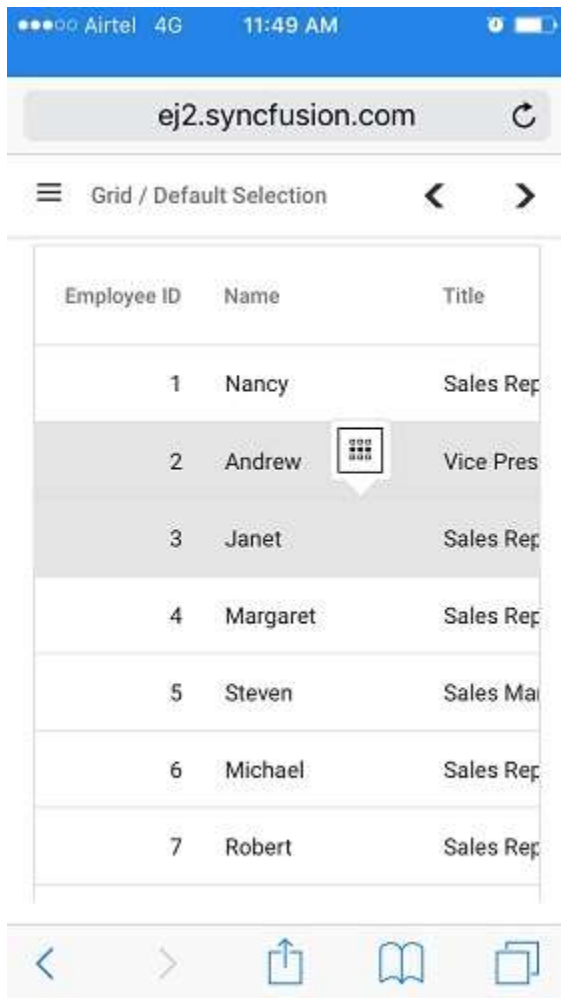

*Touch interaction*

When you tap Grid row on touch screen devices, then the tapped row is selected. Also, it will show a

popup  for multi-row-selection. To select multiple rows or cells, tap the popup  and then tap the desired rows or cells.

For multi-selection, It requires the selection [type](#) to be **Multiple**.

The following screenshot represents a Grid touch selection in the device.

{% previewsample "page.domainurl/code-snippet/grid/select/default-cs7" %}

#### [Get selected row indexes](#)

You can get the selected row indexes by using the [getSelectedRowIndexes](#) method.

#### **APP.VUE**

```

<template>
    <div id="app">
        <ejs-grid ref='grid' :dataSource='data' height='315px'
:rowSelected='rowSelected'>
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
                <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
                <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
    data() {

```

```

    return {
      data: data
    };
  },
  methods: {
    rowSelected: function(args) {
      let selectedrowindex = this.$refs.grid.getSelectedRowIndex(); //
Get the selected row indexes.
      alert(selectedrowindex); // To alert the selected row indexes.
      let selectedrecords = this.$refs.grid.getSelectedRecords(); // Get
the selected records.
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/select/default-cs8" %}

#### *Simple multiple row selection*

You can select multiple rows by clicking on rows one by one. This will not deselect the previously selected rows. To deselect the previously selected row, you can click on the selected row. You can enable this behavior by using [selectionSettings.enableSimpleMultiRowSelection](#) property.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :selectionSettings='selectionOptions'
height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      selectionOptions: { type: 'Multiple', enableSimpleMultiRowSelection:
true }
    }
  }
}

```

```

    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/select/default-cs9" %}

### *Toggle selection*

The Toggle selection allows to perform selection and unselection of the particular row or cell or column. To enable toggle selection, set [enableToggle](#) property of the selectionSettings as true. If you click on the selected row or cell or column then it will be unselected and vice versa.

### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :selectionSettings='selectionOptions'
height='315px'>
      <e-columns>
        <e-column type='checkbox' width='50'></e-column>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from '../datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      selectionOptions: { enableToggle: true }
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/select/default-cs10" %}

If multi selection is enabled, then first click on any selected row (without pressing Ctrl key), it will clear the multi selection and in second click on the same row, it will be unselected.

#### *Clear selection programmatically*

You can clear the Grid selection programmatically by using the [clearSelection](#) method.

In the demo below, we initially selected the third row using [selectedRowIndex](#). You can clear this selection by calling the [clearSelection](#) method in the button click event.

#### **APP.VUE**

```
<template>
  <div id="app">
    <ejs-button id='clear' cssClass='e-flat' @click.native='clear'>Clear
    Selection</ejs-button>
    <ejs-grid ref='grid' :dataSource='data' :allowPaging='true'
    :allowSelection='true' :pageSettings='pageSettings' :selectedRowIndex='2'
    :selectionSettings='selectionOptions'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        :isPrimaryKey='true' textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=120></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
        width=130></e-column>
        <e-column field='Freight' headerText='Freight' format='C2'
        width=100></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Selection } from "@syncfusion/ej2-vue-grids";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { cdata } from './datasource.js';
Vue.use(GridPlugin);
Vue.use(ButtonPlugin);
export default {
  data() {
    return {
      data: cdata,
      selectionOptions: { type: 'Multiple' },
      pageSettings: { pageSize: 5 }
    };
  },
  methods: {
    clear: function (args) {
      var gridObj = this.$refs.grid.ej2Instances;
      gridObj.clearSelection();
    }
  },
  provide: {
    grid: [Page, Selection]
  }
}
</script>
```

```
<style>
@import
"https://ej2.syncfusion.com/vue/documentation./node_modules/@syncfusion/ej2-
vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/select/default-cs11" %}

*Get selected records on various pages*

Enabling the `selectionSettings.persistSelection` property will persist the selection in all Grid operations.

So the selection will be maintained on every page even after navigating to another page.

You can get the selected records using the [getSelectedRecords](#) method.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-button id='select' cssClass='e-flat'
    @click.native='select'>Selected Records</ejs-button>
    <ejs-grid ref='grid' :dataSource='data' :allowPaging='true'
    :pageSettings='pageSettings' :selectedRowIndex='2'
    :selectionSettings='selectionOptions'>
      <e-columns>
        <e-column type='checkbox' headerText='Check Box'
width=50></e-column>
        <e-column field='OrderID' headerText='Order ID'
:isPrimaryKey='true' textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
width=130></e-column>
        <e-column field='Freight' headerText='Freight' format='C2'
width=100></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Selection } from "@syncfusion/ej2-vue-grids";
import { ButtonPlugin, CheckBoxPlugin } from "@syncfusion/ej2-vue-buttons";
import { cdata } from './datasource.js';
Vue.use(GridPlugin);
Vue.use(ButtonPlugin, CheckBoxPlugin);
export default {
  data() {
    return {
      data: cdata,
      selectionOptions: { persistSelection: true },
      pageSettings: { pageSize: 5 }
    };
  },
  methods: {
    select: function (args) {
      var gridObj = this.$refs.grid.ej2Instances;
```

```

        let selectedrecords = gridObj.getSelectedRecords(); // get the
selected records.
        let selectedRecordsCount = selectedrecords.length;
        alert(selectedRecordsCount); // to alert the selected records count.
    }
},
provide: {
    grid: [Page, Selection]
}
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation./node_modules/@syncfusion/ej2-
vue-grids/styles/material.css";
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/select/default-cs12" %}

To persist the grid selection, it is necessary to define any one of the columns as a primary key using the `columns.isPrimaryKey` property.

#### Cell selection in Vue Grid component

Cell Selection can be done through simple Mouse down or Arrow keys(up, down, left and right).

Grid supports two types of cell selection mode which can be set by using

[selectionSettings.cellSelectionMode](#). They are:

- **Flow** - The **Flow** value is set by default. Select range of cells between the start index and end index which includes in between cells of rows.
- **Box** - Select range of cells within the start and end column indexes which includes in between cells of rows within the range.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :selectionSettings='selectionOptions'
height='315px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>

```

```
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      selectionOptions: { cellSelectionMode: 'Box', type: 'Multiple', mode:
'Cell' }
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/select/default-cs1" %}

Cell Selection requires the [selectionSettings.mode](#) to be **Cell** or **Both** and [type](#) should be **Multiple**.

#### *Toggle selection*

The Toggle selection allows to perform selection and unselection of the particular row or cell or column. To enable toggle selection, set [enableToggle](#) property of the selectionSettings as true. If you click on the selected row or cell or column then it will be unselected and vice versa.

#### **APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :selectionSettings='selectionOptions'
height='315px'>
      <e-columns>
        <e-column type='checkbox' width='50'></e-column>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
```

```

        selectionOptions: { enableToggle: true }
    };
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/select/default-cs2" %}

If multi selection is enabled, then first click on any selected row (without pressing Ctrl key), it will clear the multi selection and in second click on the same row, it will be unselected.

### Column selection in Vue Grid component

Column selection can be done through simple mouse down or arrow keys.

You can enable column selection by setting the [selectionSettings.allowColumnSelection](#) property as true.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid :dataSource='data' :selectionSettings='selectionOptions'
height='315px'>
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
                <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
                <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
    data() {
        return {
            data: data,
            selectionOptions: { allowColumnSelection: true, type: 'Multiple' }
        };
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

```
{% previewsample "page.domainurl/code-snippet/grid/select/default-cs6" %}
```

### Check box selection in Vue Grid component

Checkbox Selection provides an option to select multiple Grid records with help of checkbox in each row.

To render checkbox in each grid row, you need to use checkbox column with type as **CheckBox** using column [type](#) property.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' height='315px'>
      <e-columns>
        <e-column type='checkbox' width='50'></e-column>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/select/default-cs3" %}
```

By default selection is allowed by clicking a grid row or checkbox in that row. To allow Selection only through checkbox, you can set [selectionSettings.checkboxOnly](#) property to true.

Selection can be persisted on all the operations using [selectionSettings.persistSelection](#) property. For persisting selection on the Grid, any one of the column should be defined as a primary key using [columns.isPrimaryKey](#) property.

*Checkbox selection mode*

In checkbox selection, selection can also be done by clicking on rows. This selection provides two types of Checkbox Selection mode which can be set by using the following API, [selectionSettings.checkboxMode](#). The modes are;

- **Default:** This is the default value of the checkboxMode. In this mode, user can select multiple rows by clicking rows one by one.
- **ResetOnRowClick:** In ResetOnRowClick mode, when user clicks on a row it will reset previously selected row. Also you can perform multiple-selection in this mode by press and hold CTRL key and click the desired rows. To select range of rows, press and hold the SHIFT key and click the rows.

**APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :selectionSettings='selectionOptions'
height='315px'>
      <e-columns>
        <e-column type='checkbox' width='50'></e-column>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";

```

{% previewsample "page.domainurl/code-snippet/grid/select/default-cs4" %}

### Prevent specific rows from being selected in checkbox selection

You can prevent specific rows from being selected in the checkbox selection mode by hiding the checkboxes using the [rowDataBound](#) event. You achieve this by setting the [isSelectable](#) argument as false in the [rowDataBound](#) event based on certain conditions as per the needs of the application.

In the following sample, the selection of specific rows has been prevented based on the [isSelectable](#) argument in the [rowDataBound](#) event.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowPaging="true"
      :allowFiltering='true' :allowSelection="true"
      :selectionSettings='selectionOptions' :editSettings='editSettings'
      :pageSettings='pageSettings' :toolbar='toolbar'
      :filterSettings='filterOptions' :rowDataBound='rowDataBound' height='185px'>
      <e-columns>
        <e-column type='checkbox' width='120'></e-column>

## Aggregates

### Aggregates in Vue Grid component

Aggregate values are displayed in the footer, group footer and group caption of Grid. It can be configured through `e-aggregates` directive. The [field](#) and [type](#) are the minimum properties required to represent an aggregate column.

To use aggregate feature, you need to inject the `Aggregate` module into the `provide` section.

By default, the aggregate value can be displayed in footer, group and caption cells, to show the aggregate value in any of these cells, use the [footerTemplate](#), [groupFooterTemplate](#) and [Link to the Video](#) properties.

To get start quickly with Aggregate Options, you can check on this video:

### Built-in aggregate types

Aggregate type must be specified in [type](#) property to configure an aggregate column.

The built-in aggregates are,

- Sum
- Average
- Min
- Max
- Count
- TrueCount
- FalseCount

\* Multiple aggregates can be used for an aggregate column by setting the [type](#) property with an array of aggregate type.

\* Multiple types for a column is supported only when one of the aggregate templates is used.

### Footer aggregate in Vue Grid component

Footer aggregate value is calculated from all the rows and it can be displayed in footer cells. Use [footerTemplate](#) to render the aggregate value in footer cells.

### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' height='210px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='Freight' width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
      <e-aggregates>
        <e-aggregate>
          <e-columns>
            <e-column type="Sum" field="Freight"
:footerTemplate='footerSum'></e-column>
          </e-columns>
        </e-aggregate>
        <e-aggregate>
          <e-columns>
            <e-column type="Max" field="Freight"
:footerTemplate='footerMax'></e-column>
          </e-columns>
        </e-aggregate>
      </e-aggregates>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Aggregate } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      footerSum: function () {
        return { template : Vue.component('sumTemplate', {
          template: `<span>Sum: {{data.Sum}}</span>`,
          data () {return { data: {}}};
        })
      },
      footerMax: function () {
        return { template : Vue.component('maxTemplate', {
          template: `<span>Max: {{data.Max}}</span>`,
          data () {return { data: {}}};
        })
      }
    }
  },
  provide: {
    grid: [Aggregate]
  }
};

```

```

}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/aggregates/default-cs2" %}

The aggregate values must be accessed inside the template using their corresponding [type](#) name.

#### *How to format aggregate value*

You can format the aggregate value result by using the [format](#) property.

### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' height='210px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='Freight' width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
      <e-aggregates>
        <e-aggregate>
          <e-columns>
            <e-column type="Sum" field="Freight" format="C2"
:footerTemplate='footerSum'></e-column>
          </e-columns>
        </e-aggregate>
        <e-aggregate>
          <e-columns>
            <e-column type="Max" field="Freight" format="C2"
:footerTemplate='footerMax'></e-column>
          </e-columns>
        </e-aggregate>
      </e-aggregates>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Aggregate } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      footerSum: function () {
        return { template : Vue.component('sumTemplate', {
          template: `<span>Sum: {{data.Sum}}</span>`,
          data () {return { data: {}}};

```

```

        })
      }
    },
    footerMax: function () {
      return { template : Vue.component('maxTemplate', {
        template: `<span>Max: {{data.Max}}</span>`,
        data () {return { data: {}}};
      })
    }
  }
};
},
provide: {
  grid: [Aggregate]
}
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/aggregates/default-cs3" %}

#### *How to place aggregates on top of the Grid*

By default, the aggregated values are placed at the bottom of the footer section. It is possible to place the aggregated values at the top of the header. This is achieved by using the [dataBound](#) event, [getHeaderContent](#), and [getFooterContent](#) methods of the Grid.

In the following sample, the footer element is appended to the header element using the [getHeaderContent](#) and [getFooterContent](#) methods in the [dataBound](#) event.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' height='210px'
    :dataBound="dataBound">
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=150></e-column>
        <e-column field='Freight' width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
        width=150></e-column>
      </e-columns>
      <e-aggregates>
        <e-aggregate>
          <e-columns>
            <e-column type="Sum" field="Freight"
            :footerTemplate='footerSum'></e-column>
          </e-columns>

### Group and caption aggregate in Vue Grid component

Group and caption aggregate values are calculated from the current group items. If

[groupFooterTemplate](#) is provided then the aggregate values can be displayed in the group footer cells

and if [groupCaptionTemplate](#) is provided then aggregate values can be displayed in the group caption cells.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' height='290px' :allowGrouping="true"
    :groupSettings="groupOptions">
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=150></e-column>
        <e-column field='OrderDate' headerText='Order Date'
        format='yMd' width=120 type='date'></e-column>

        <e-column field='ShipCountry' headerText='Ship Country'
        width=150></e-column>
      </e-columns>
      <e-aggregates>
        <e-aggregate>
          <e-columns>
            <e-column type="Sum" field="Freight" format="C2"
            :groupFooterTemplate = 'footerSum'></e-column>
          </e-columns>
        </e-aggregate>
        <e-aggregate>
          <e-columns>
            <e-column type="Average" field="Freight" format="C2"
            :groupCaptionTemplate = 'footerAvg'></e-column>
          </e-columns>
        </e-aggregate>
      </e-aggregates>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Group, Aggregate } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      groupOptions: {showDropArea: false, columns: ['ShipCountry'] },
      footerSum: function () {
        return { template : Vue.component('sumTemplate', {
          template: `<span>Sum: {{data.Sum}}</span>`,
          data () {return { data: {}}};
        })
      },
      footerAvg: function () {
        return { template : Vue.component('maxTemplate', {
          template: `<span>Average: {{data.Average}}</span>`,
```

```

        data () {return { data: {} };}
    })
}
};
},
provide : {
    grid: [Group, Aggregate]
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/aggregates/default-cs5" %}

\* Use the template reference property name as `groupFooterTemplate` to specify the group footer template and as `groupCaptionTemplate` to specify the group caption template.

\* The aggregate values must be accessed inside the template using their corresponding [type](#) name.

#### Custom aggregate in Vue Grid component

Sometimes you can have a scenario to calculate aggregate value using your own aggregate function, we can achieve this behavior using the custom aggregate option. To use custom aggregation, specify the [type](#) as `Custom` and provide the custom aggregate function in the [customAggregate](#) property.

The custom aggregate function will be invoked with different arguments for Total and Group aggregations.

- **Total aggregation** - the custom aggregate function will be called with whole data and the current [AggregateColumn](#) object.
- **Group aggregation** - it will be called with current group details and the [AggregateColumn](#) object.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' height='268px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='Freight' format='C2' width=150></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
width=150></e-column>
      </e-columns>
      <e-aggregates>
        <e-aggregate>
          <e-columns>
            <e-column columnName="ShipCountry" type="Custom"
:customAggregate="customAggregateFn" :footerTemplate='footerTemp'></e-
column>
          </e-columns>
        </e-aggregate>
      </e-aggregates>
    </ejs-grid>
  </div>
</template>

```

```

        </e-aggregate>
    </e-aggregates>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Aggregate } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
    data() {
        return {
            data: data,
            footerTemp: function () {
                return { template : Vue.component('footerTemplate', {
                    template: `<span>Brazil Count: {{data.Custom}}</span>`,
                    data () {return { data: {}}};
                })
            }
        };
    },
    methods: {
        customAggregateFn : function (data) {
            return data.result.filter((item) => item.ShipCountry ===
'Brazil').length;
        },
        provide: {
            grid: [Aggregate]
        }
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/aggregates/default-cs1" %}

To access the custom aggregate value inside template, use the key as **Custom**.

### Reactive aggregate in Vue Grid component

#### [Auto update aggregate value in batch editing](#)

When using batch editing, the aggregate values will be refreshed on every cell save. The footer, group footer, and group caption aggregate values will be refreshed.

Adding a new record to the grouped grid will not refresh the aggregate values.

### **APP.VUE**

```

<template>
    <div id="app">
        <ejs-grid :dataSource='data' height='290px' allowPaging='true'
allowGrouping='true' :groupSettings='groupOptions' :toolbar='toolbarOptions'
:editSettings='editSettings'>

```

```

#### *Refresh aggregate values in inline editing*

By default, reactive aggregate update is not supported by inline and dialog edit modes as it is not feasible to anticipate the value change event for every editor. But, you can refresh the aggregates manually in the inline edit mode using the refresh method of aggregate module.

In the following code, the input event for the Freight column editor has been registered and the aggregate value has been refreshed manually.

#### **APP.VUE**

```

<template>
    <div id="app">
        <ejs-grid ref='grid' :dataSource='data' height='290px'
        allowPaging='true' :toolbar='toolbarOptions' :editSettings='editSettings'

## Print in Vue Grid component

To print the Grid, use the [Print](#) method from grid instance. The print option can be displayed on the [toolbar](#) by adding the **Print** toolbar item.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' :toolbar='toolbarOptions'
height='272px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['Print']
    };
  },
  provide: {
    grid: [Toolbar]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/grid/print/default-cs2" %}

### Page Setup

Some of the print options cannot be configured through JavaScript code. So, you have to customize the layout, paper size, and margin options using the browser page setup dialog. Please refer to the following links to know more about the browser page setup:

- [Chrome](#)
- [Firefox](#)
- [Safari](#)

- [IE](#)

### Print by external button

To print the grid from an external button, invoke the [print](#) method.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-button id='print' @click.native='print'>Print</ejs-button>
    <ejs-grid ref='grid' :dataSource='data' height='280px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { data } from './datasource.js';
Vue.use(GridPlugin);
Vue.use(ButtonPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  methods: {
    print: function() {
      this.$refs.grid.print();
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/print/default-cs3" %}
```

### Print visible Page

By default, the grid prints all the pages. To print the current page alone, set the [printMode](#) to `CurrentPage`.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' printMode='CurrentPage'
:allowPaging='true' :pageSettings='pageOptions' :toolbar='toolbarOptions'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['Print'],
      pageOptions: { pageSize: 6 }
    };
  },
  provide: {
    grid: [Page, Toolbar]
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/print/default-cs4" %}

### Print the hierarchy grid

By default, the grid will be print the master and expanded child grids alone. you can change the print option by using the [hierarchyPrintMode](#) property. The available options are,

- |          |                                                   |  |
|----------|---------------------------------------------------|--|
| Mode     | Behavior                                          |  |
| -----    | -----                                             |  |
| Expanded | Prints the master grid with expanded child grids. |  |
| All      | Prints the master grid with all the child grids.  |  |
| None     | Prints the master grid alone.                     |  |

**APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='parentData' :childGrid='childGrid'
:toolbar='["Print"]' hierarchyPrintMode='All'>
      <e-columns>
        <e-column field='EmployeeID' headerText='Employee ID'
textAlign='Right' width=120></e-column>
        <e-column field='FirstName' headerText='FirstName'
width=150></e-column>
        <e-column field='LastName' headerText='Last Name'
width=150></e-column>
        <e-column field='City' headerText='City' width=150></e-
column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, DetailRow, Toolbar, Page, printGridInit,
getPrintGridModel } from "@syncfusion/ej2-vue-grids";
import { data, employeeData } from './datasource.js';
import { extend } from '@syncfusion/ej2-base';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      parentData: employeeData,
      childGrid: {
        dataSource: data,
        queryString: 'EmployeeID',
        columns: [
          { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
          { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
          { field: 'ShipCity', headerText: 'Ship City', width: 150 },
          { field: 'ShipName', headerText: 'Ship Name', width: 150 }
        ]
      }
    },
    provide: {
      grid: [DetailRow, Toolbar]
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/hierarchy-grid/default-cs10" %}

### Print the master detail grid

The Grid has the option to visualize details of a record in another Grid in a master and detailed manner. By default, Grid will print the master grid alone. Instead of this, it is possible to print both the master and detail grids by using the [beforePrint](#) event of the Grid.

In the following sample, the detail grid is added to the `element` argument of the `beforePrint` event, resulting in both the master and detail grids being printed on the page.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource="data" :selectedRowIndex="1" :toolbar="toolbar"
    :rowSelected="rowSelected" :beforePrint="beforePrint">
      <e-columns>
        <e-column field="ContactName" headerText="Customer Name"
width="150"></e-column>
        <e-column field="CompanyName" headerText="Company Name"
width="150"></e-column>
        <e-column field="Address" headerText="Address" width="150"></e-
column>
        <e-column field="Country" headerText="Country" width="130"></e-
column>
      </e-columns>
    </ejs-grid>
    <div class="e-statustext">Showing orders of Customer: <b
id="key"></b></div>
    <ejs-grid ref="grid" :allowSelection="false">
      <e-columns>
        <e-column field="OrderID" headerText="Order ID" width="100"
textAlign="Right"></e-column>
        <e-column field="Freight" headerText="Freight" format="C2"
width="100" type="number"></e-column>
        <e-column field="ShipName" headerText="Ship Name"
width="200"></e-column>
        <e-column field="ShipCountry" headerText="Ship Country"
width="150"></e-column>
        <e-column field="ShipAddress" headerText="Ship Address"
width="200"></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Print } from "@syncfusion/ej2-vue-grids";
import { customerData, data } from "../datasource.js";
Vue.use(GridPlugin);
export default {
  data() {
    var names = ["AROUT", "BERGS", "BLONP", "CHOPS", "ERNSH"];
    return {
      toolbar: ["Print"],
      data: customerData.filter(function (e) {
        return names.indexOf(e.CustomerID) !== -1;
      })
    };
  }
};
```

```

    },
    methods: {
      rowSelected: function (args) {
        let selectedRecord = args.data;
        this.$refs.grid.ej2Instances.dataSource = data.filter((record)
=> record.CustomerName === selectedRecord.ContactName).slice(0, 5);
        document.getElementById("key").innerHTML =
selectedRecord.ContactName;
      },
      beforePrint: function (args) {
        let customEle = document.createElement("div");
        customEle.innerHTML =
document.getElementsByClassName("e-statustext")[0].innerHTML +
this.$refs.grid.ej2Instances.element.innerHTML;
        customEle.appendChild(document.createElement("br"));
        args.element.append(customEle);
      },
    },
  },
  provide: {
    grid: [Toolbar, Print],
  }
};
</script>
<style>

```

{% previewsample "page.domainurl/code-snippet/grid/print/mastergrid-cs2" %}

### Print large number of columns

By default, the browser uses A4 as page size option to print pages and to adapt the size of the page the browser print preview will auto-hide the overflowed contents. Hence grid with large number of columns will cut off to adapt the print page.

To show large number of columns when printing, adjust the scale option from print option panel based on your content size.

### Show or Hide columns while Printing

You can show a hidden column or hide a visible column while printing the grid using [toolbarClick](#) and [printComplete](#) events.

In the `toolbarClick` event, based on `args.item.id` as `grid_print`. We can show or hide columns by setting `column.visible` property to `true` or `false` respectively.

In the `printComplete` event, We have reversed the state back to the previous state.

In the below example, we have `CustomerID` as a hidden column in the grid. While printing, we have changed `CustomerID` to visible column and `ShipCity` as hidden column.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' :allowPaging="true"
    :pageSettings='pageSettings' :toolbar='toolbarOptions'
    :toolbarClick='toolbarClick' :printComplete='printComplete' height='272px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        :visible='false' width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
        width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
        width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Page } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      pageSettings: { pageSizes: true, pageSize: 6 },
      toolbarOptions: ['Print']
    };
  },
  methods: {
    toolbarClick: function() {
      for (var i = 0; i < this.$refs.grid.getColumns().length; i++) {
        if (this.$refs.grid.getColumns()[i].field == "CustomerID") {
          this.$refs.grid.getColumns()[i].visible = true;
        }
        else if (this.$refs.grid.getColumns()[i].field == "ShipCity") {
          this.$refs.grid.getColumns()[i].visible = false;
        }
      }
    },
    printComplete: function() {
```

```

        for (var i = 0; i < this.$refs.grid.getColumns().length; i++) {
            if (this.$refs.grid.getColumns()[i].field == "CustomerID") {
                this.$refs.grid.getColumns()[i].visible = false;
            }
            else if (this.$refs.grid.getColumns()[i].field == "ShipCity") {
                this.$refs.grid.getColumns()[i].visible = true;
            }
        }
    },
    provide: {
        grid: [Toolbar, Page]
    }
}

</style>

```

{% previewsample "page.domainurl/code-snippet/grid/print/default-cs5" %}

### Limitations of Printing Large Data

When grid contains large number of data, printing all the data at once is not a best option for the browser performance. Because to render all the DOM elements in one page will produce performance issues in the browser. It leads to browser slow down or browser hang. Grid have option to handle large number of data by Virtualization. However while printing, it is not possible to use virtualization for rows and columns.

If printing of all the data is still needed, we suggest to Export the grid to **Excel** or **CSV** or **Pdf** and then print it from another non-web based application.

### Adaptive in Vue Grid component

The Grid user interface (UI) was redesigned to provide an optimal viewing experience and improve usability on small screens. This interface will render the filter, sort, column chooser, column menu(supports only when the **rowRenderingMode** as Horizontal) and edit dialogs adaptively and have an option to render the grid row elements in the vertical direction.

### Render adaptive dialogs

When we enable the [enableAdaptiveUI](#) property, the grid will render the filter, sort, and edit dialogs in full screen for a better user experience. This behavior is demonstrated in the below demo.

### APP.VUE

```

<template>
    <div id="app">
        <div class="e-adaptive-demo e-bigger">

{% previewsample "page.domainurl/code-snippet/grid/adaptive-cs2" %}

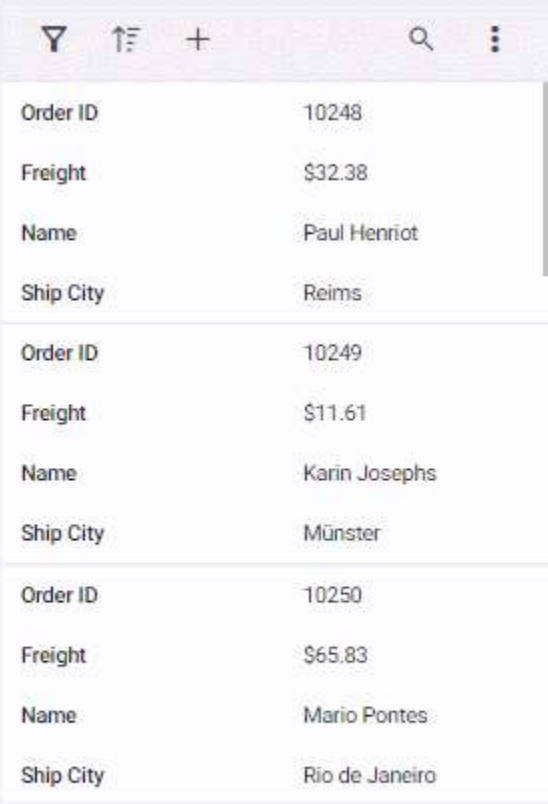

[enableAdaptiveUI](#) property must be enabled for vertical row rendering.

*Supported features by vertical row rendering*

The following features are only supported in vertical row rendering:

- Paging, including Page size dropdown
- Sorting
- Filtering

- Selection
- Dialog Editing
- Aggregate
- Infinite scroll
- Toolbar - Options like **Add**, **Filter**, **Sort**, **Edit**, **Delete**, **Search**, and **Toolbar template** are available when their respective features are enabled. The toolbar dynamically includes a three-dotted icon, containing additional features like **ColumnChooser**, **Print**, **PdfExport**, **ExcelExport**, or **CsvExport**, once these features are enabled. Please refer to the following snapshot.

The Column Menu feature, which includes grouping, sorting, autofit, filter, and column chooser, is exclusively supported for the Grid in **Horizontal** [rowRenderingMode](#).

### Hierarchy grid in Vue Grid component

The Grid allows display of table data in a hierarchical structure to visualize relations between parent and child records. This feature is enabled by defining the [childGrid](#) and [childGrid.queryString](#).

The [childGrid](#) describes the options of grid and the [childGrid.queryString](#) describes the relation between parent and child grids.

To use hierarchical binding, inject the **DetailRow** in the **provide** section.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='parentData' height='315px'
    :childGrid='childGrid'>
      <e-columns>
        <e-column field='EmployeeID' headerText='Employee ID'
        textAlign='Right' width=120></e-column>
        <e-column field='FirstName' headerText='FirstName'
        width=150></e-column>
        <e-column field='LastName' headerText='Last Name'
        width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
```

```

{% previewsample "page.domainurl/code-snippet/grid/hierarchy-grid/default-cs3" %}

### Expand child grid initially

You can expand a particular child grid at initial rendering by invoking the [expand](#) method in the [dataBound](#) event.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='parentData' height='265px'
    :childGrid='childGrid' :dataBound='onDataBound'>
      <e-columns>
        <e-column field='EmployeeID' headerText='Employee ID'
        textAlign='Right' width=120></e-column>
        <e-column field='FirstName' headerText='First Name'
        width=150></e-column>
        <e-column field='LastName' headerText='Last Name'
        width=150></e-column>
        <e-column field='City' headerText='City' width=150></e-
        column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, DetailRow } from "@syncfusion/ej2-vue-grids";
import { data, employeeData } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      parentData: employeeData,
      childGrid: {
        dataSource: data,
        queryString: 'EmployeeID',
        columns: [
          { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
          { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
          { field: 'ShipCity', headerText: 'Ship City', width: 150 },
          { field: 'ShipName', headerText: 'Ship Name', width: 150 }
        ]
      }
    }
  },
  methods: {
    onDataBound: function() {
      this.$refs.grid.ej2Instances.detailRowModule.expand(2); // initially
2nd child Grid will expand.
    }
  },
  provide: {
    grid: [DetailRow]
  }
}
```

```

</script>
<style>
  @import
  "https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
  vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/hierarchy-grid/default-cs4" %}

### Dynamically load child grid data

You can dynamically load child grid dataSource by using the [detailDataBound](#) event. This [detailDataBound](#) event triggers when the child grid is expanded for the first time.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='parentData' height='265px'
    :childGrid='childGrid' :detailDataBound='onDetailDataBound'>
      <e-columns>
        <e-column field='EmployeeID' headerText='Employee ID'
        textAlign='Right' width=120></e-column>
        <e-column field='FirstName' headerText='FirstName'
        width=150></e-column>
        <e-column field='LastName' headerText='Last Name'
        width=150></e-column>
        <e-column field='City' headerText='City' width=150></e-
        column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, DetailRow } from "@syncfusion/ej2-vue-grids";
import { data, employeeData } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      parentData: employeeData,
      childGrid: {
        queryString: 'EmployeeID',
        columns: [
          { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
          { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
          { field: 'ShipCity', headerText: 'Ship City', width: 150 },
          { field: 'ShipName', headerText: 'Ship Name', width: 150 }
        ]
      }
    }
  },
  methods: {
    onDetailDataBound(args) {

```

```

        args.detailElement.querySelector('.e-grid').ej2_instances[0].dataSource = data; // assign data source for child grid.
    },
    provide: {
        grid: [DetailRow]
    }
}
</script>
<style>

</style>

```

{% previewsample "page.domainurl/code-snippet/grid/hierarchy-grid/default-cs5" %}

### Bind hierarchy grid with different field

By default, Parent and child grid relation will be maintained by [queryString](#) property. We should use the same field name to map both parent and child grid. To achieve parent and child relation with different fields, we need to change the mapping value in the child grid [load](#) event.

In the below sample, we have bound the child and parent grid with different fields. Parent grid field name as **EmployeeID** and the child grid field name as **ID**. We need to define the mapping value of **parentKeyFieldValue** from the parent row data in the child grid [load](#) event.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid ref='grid' :dataSource='parentData' height='265px' :childGrid='childGrid'>
            <e-columns>
                <e-column field='EmployeeID' headerText='Employee ID'
                textAlign='Right' width=120></e-column>
                <e-column field='FirstName' headerText='First Name'
                width=150></e-column>
                <e-column field='LastName' headerText='Last Name'
                width=150></e-column>
                <e-column field='City' headerText='City' width=150></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, DetailRow } from "@syncfusion/ej2-vue-grids";
import { data, employeeData, childdata } from './datasource.js';
Vue.use(GridPlugin);
export default {
    data() {
        return {
            parentData: employeeData,
            childGrid: {

```

```

        dataSource: childdata,
        queryString: 'ID',
        columns: [
            { field: 'ID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
            { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
            { field: 'ShipCity', headerText: 'Ship City', width: 150 },
            { field: 'ShipName', headerText: 'Ship Name', width: 150 }
        ],
        load: function () {
            this.parentDetails.parentKeyFieldValue =
this.parentDetails.parentRowData['EmployeeID'];
        }
    },
    provide: {
        grid: [DetailRow]
    }
}
</script>
<style>
    @import
    "https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/hierarchy-grid/default-cs6" %}

### Adding Record in ChildGrid

Parent and child grid are related by [queryString](#) field value. To maintain this relation in newly added record, You need to set value for [\[queryString\]](#)(

<https://ej2.syncfusion.com/vue/documentation/api/grid/#querystring>) field in the added data by the [actionBegin](#) event.

In the below demo, **EmployeeID** field relates the parent and child grids. To add a new record in child grid, We have to set the **EmployeeID** field with parent record's [queryString](#) field value in the [actionBegin](#) event.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid ref='grid' :dataSource='parentData' height='265px'
:childGrid='childGrid'>
            <e-columns>
                <e-column field='EmployeeID' headerText='Employee ID'
textAlign='Right' width=120></e-column>
                <e-column field='FirstName' headerText='FirstName'
width=150></e-column>
                <e-column field='LastName' headerText='Last Name'
width=150></e-column>
                <e-column field='City' headerText='City' width=150></e-
column>
            </e-columns>
        </ejs-grid>
    </div>
</template>

```

```

    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, DetailRow, Edit, Toolbar } from "@syncfusion/ej2-vue-grids";
import { data, employeeData } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      parentData: employeeData,
      childGrid: {
        dataSource: data,
        queryString: 'EmployeeID',
        toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
        editSettings: { allowEditing: true, allowAdding: true,
allowDeleting: true },
        columns: [
          { field: 'OrderID', headerText: 'Order ID', isPrimaryKey:true,
textAlign: 'Right', width: 120 },
          { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', allowEditing:false, width: 120 },
          { field: 'ShipCity', headerText: 'Ship City', width: 150 },
          { field: 'ShipName', headerText: 'Ship Name', width: 150 }
        ],
        actionBegin: function(args) {
          if (args.requestType === "add") {
            // `parentKeyFieldValue` refers to the queryString field value of
the parent record.
            args.data.EmployeeID = this.parentDetails.parentKeyFieldValue;
          }
        }
      }
    },
    provide: {
      grid: [DetailRow, Edit, Toolbar]
    }
  }
}
</script>
<style>

vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/hierarchy-grid/default-cs7" %}

### Dynamically bind data to child grid based on parent row Data

By default, the [childGrid.queryString](#) describes the relationship between parent and child grids and visualizes the data in a hierarchical structure. Instead of the `queryString` property, we can dynamically bind the datasource to the `childGrid` based on the parent row data using the [detailDataBound](#) event of the grid.

While expanding the child Grid, the `detailDataBound` event will be triggered. In this event, based on the EmployeeID column value of parent row data, filter the equally matched data from the `childGrid` datasource using the `DataManager` plugin and bind the filtered data as a datasource to the `childGrid`. This can be demonstrated by the following sample.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='parentData' height='265px'
      :childGrid='childGrid' :detailDataBound='onDetailDataBound'>
      <e-columns>
        <e-column field='EmployeeID' headerText='Employee ID'
          textAlign='Right' width=120></e-column>
        <e-column field='FirstName' headerText='FirstName'
          width=150></e-column>
        <e-column field='LastName' headerText='Last Name'
          width=150></e-column>
        <e-column field='City' headerText='City' width=150></e-
column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, DetailRow } from "@syncfusion/ej2-vue-grids";
import { data, employeeData } from './datasource.js';
import { DataManager, Query } from '@syncfusion/ej2-data';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      parentData: employeeData,
      childGrid: {
        columns: [
          { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
          { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
          { field: 'ShipCity', headerText: 'Ship City', width: 150 },
          { field: 'ShipName', headerText: 'Ship Name', width: 150 }
        ]
      }
    }
  },
  methods: {
    onDetailDataBound(args) {
      var orderData = data;
      var empIdValue =
args.childGrid.parentDetails.parentRowData.EmployeeID;
      var matchedData = new DataManager(data).executeLocal(
        new Query().where("EmployeeID", "equal", empIdValue, true)
      );
      args.childGrid.query = new Query();
      args.childGrid.dataSource = matchedData;
    }
  }
}
```

```

    },
    provide: {
      grid: [DetailRow]
    }
  }

## State Persistence

### State persistence in Vue Grid component

State persistence refers to the Grid's state maintained in the browser's [localStorage](#) even if the browser is refreshed or if you move to the next page within the browser. State persistence stores grid's model object in the local storage when the [enablePersistence](#) is defined as true.

#### Restore initial Grid state

When the [enablePersistence](#) property is set to **true**, the Grid will keep its state even if the page is reloaded. In some cases, you may be required to retain the Grid in its initial state. The Grid will not retain its initial state now since the [enablePersistence](#) property has been enabled.

You can achieve this by destroying the grid after disabling the [enablePersistence](#) property and clearing the local storage data, as shown in the sample below.

### APP.VUE

```

<template>
  <div id="app">
    <button id="restore" @click="clickRestore">Restore to initial
    state</button>
    <br /><br />
    <ejs-grid ref="grid" :dataSource='data' :enablePersistence='true'
    :allowPaging='true' :allowFiltering='true' height='230px' id="Grid">
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
        width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
        width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Filter } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {

```

```

    return {
      data: data
    };
  },
  methods: {
    clickRestore: function () {
      this.$refs.grid.ej2Instances.enablePersistence = false;
      window.localStorage.setItem("gridGrid", "");
      this.$refs.grid.ej2Instances.destroy();
      location.reload();
    }
  },
  provide: {
    grid: [Page, Filter]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/sort/default-cs8" %}

#### *Maintaining custom query in state persistence*

Grid does not maintain the query params after page load event when [enablePersistence](#) is set to true. This is because the Grid refreshes its query params for every page load. You can maintain the custom query params by resetting the `addParams` method in the [actionBegin](#) event.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid ref="grid" :dataSource='data' :allowSorting='true'
      :enablePersistence='true' :allowPaging='true' :allowFiltering='true'
      height='210px' :actionBegin='actionHandler'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
          textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
          width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
          width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
          width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Sort, Page, Filter } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {

```

```

        data: data
      };
    },
    methods: {
      actionHandler: function () {
        this.$refs.grid.ej2Instances.query.addParams('$filter', 'EmployeeID eq 1');
      }
    }
  },
  provide: {
    grid: [Sort, Page, Filter]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/sort/default-cs9" %}

#### Add a new column in persisted columns list

The Grid columns can be persisted when the [enablePersistence](#) property is set to true. If you want to add the new columns with the existing persist state, you can use the Grid inbuilt method such as `column.push` and call the [refreshColumns\(\)](#) method for UI changes. Please refer to the following sample for more information.

#### APP.VUE

```

<template>
  <div id="app">
    <button id="add" @click="clickAdd">Add Columns</button>
    <br /><br />
    <ejs-grid ref="grid" :dataSource='data' :enablePersistence='true'
    :allowPaging='true' height='230px' id="Grid">
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
        width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
        width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    }
  }
}

```

```

    };
  },
  methods: {
    clickAdd: function () {
      let obj = { field: "Freight", headerText: 'Freight', width: 120 }
      this.$refs.grid.ej2Instances.columns.push(obj as any); //you can add
the columns by using the Grid columns method
      this.$refs.grid.ej2Instances.refreshColumns();
    }
  },
  provide: {
    grid: [Page]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/sort/default-cs10" %}

[See Also](#)

- [How to override Grid persistence in Vue Grid](#)

Get or set local storage value in Vue Grid component

If the [enablePersistence](#) property set as true, The Grid property value is saved in the `window.localStorage` for reference. You can get/set the `localStorage` value by using the `getItem/setItem` method in `window.localStorage`.

`ts

//get the Grid model.

let value = window.localStorage.getItem('gridGrid'); //"gridGrid" is component name + component id.

let model = JSON.parse(model);

,

`ts

//set the Grid model.

window.localStorage.setItem('gridGrid', JSON.stringify(model)); //"gridGrid" is component name + component id.

,

Prevent to persist in Vue Grid component

[Prevent columns from persisting](#)

When the [enablePersistence](#) property is set to true, the Grid properties such as [Grouping](#), [Paging](#), [Filtering](#), [Sorting](#), and [Columns](#) will persist. You can use the `addOnPersist` method to prevent these Grid properties from persisting.

The following example demonstrates how to prevent Grid columns from persisting. In the [dataBound](#) event of the Grid, you can override the `addOnPersist` method and remove the columns from the key list given for persistence.

**Note:** When the [enablePersistence](#) property is set to true, the Grid properties such as column template, column formatter, header text, and value accessor will not persist.

#### APP.VUE

```
<template>
  <div id="app">
    <button id="add" @click="clickAdd">Add Columns</button>
    <button id="remove" @click="clickRemove">Remove Columns</button>
    <br /><br />
    <ejs-grid ref="grid" :dataSource='data' :enablePersistence='true'
:allowPaging='true' height='230px' id="Grid" :dataBound='dataBound'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);

### Add to persist in Vue Grid component

#### *Persist the column template, header template and header Text*

By default, the Grid properties such as column template, header text, header template, column formatter, and value accessor will not persist when [enablePersistence](#) is set to true. Because the column template and header text can be customized at the application level.

If you wish to restore all these column properties, then you can achieve it by cloning the grid's columns property using JavaScript Object's assign method and storing this along with the persist data manually. While restoring the settings, this column object must be assigned to the grid's columns property to restore the column settings as demonstrated in the following sample.

### **APP.VUE**

```

<template>
  <div id="app">
    <button id="restore" @click="clickRestore">Restore</button>
    <br /><br />
    <ejs-grid ref="grid" :dataSource='data' :enablePersistence='true'
:allowPaging='true' height='230px' id="Grid">
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150 :headerTemplate="hTemplate"></e-column>
        <e-column field='ShipName' headerText='Ship Name' width=150
:template='cTemplate"></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script id="template" type="text/x-template">
  <a rel='nofollow'
href=https://en.wikipedia.org/wiki/${ShipName}><span class="e-icons e-
column"></span></a>
</script>

  <script id="customertemplate" type="text/x-template">
    <span class="e-icons e-header" ></span>
    Customer ID
  </script>
<script>
import Vue from "vue";

```

```

import { GridPlugin, Page } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
var headTemplate = Vue.component("header", {
  template: '<span class="e-icons e-header">CustomerID</span>',
  data() {
    return {
      data: {}
    };
  }
});
var columnTemplate = Vue.component("column", {
  template: '<a rel="nofollow" href="https://en.wikipedia.org/wiki/${ShipName}"><span class="e-icons e-column"></span></a>',
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data() {
    return {
      data: data,
      hTemplate: function (e) {
        return {
          template: headTemplate
        };
      },
      cTemplate: function (e) {
        return {
          template: columnTemplate
        };
      }
    };
  },
  methods: {
    clickRestore: function () {
      let savedProperties =
JSON.parse(this.$refs.grid.ej2Instances.getPersistData());
      let gridColumnsState = Object.assign([],
this.$refs.grid.ej2Instances.getColumns());
      savedProperties.columns.forEach((col: {
        field: any;
        headerText: any;
        template: any;
        headerTemplate: any;
      }) => {
        let headerText = gridColumnsState.find((colColumnsState) =>
colColumnsState.field === col.field)['headerText'];
        let colTemplate = gridColumnsState.find((colColumnsState) =>
colColumnsState.field === col.field)['template'];
        let headerTemplate = gridColumnsState.find((colColumnsState) =>
colColumnsState.field === col.field)['headerTemplate'];
        col.headerText = 'Text Changed';
        col.template = colTemplate;
      });
    }
  }
};

```

```

        col.headerTemplate = headerTemplate; //likewise you can restore
        required column properties as per your wants.
    }
    );
    console.log(savedProperties);
    this.$refs.grid.ej2Instances.setProperties(savedProperties);
}
},
provide: {
    grid: [Page]
}
}
</script>

## Tool Bar

### Tool bar in Vue Grid component

The Grid provides Toolbar support to handle grid actions. The [toolbar](#) property accepts either the collection of built-in toolbar items and `ItemModel` objects for custom toolbar items or HTML element ID for toolbar template.

To use Toolbar, you need to inject `Toolbar` module in the `provide` section.

### Enable or disable toolbar items

You can enable/disable toolbar items by using the `enableItems` method.

## APP.VUE

```

<template>
    <div id="app">
        <ejs-button id='enable' cssClass='e-flat'
        @click.native='enable'>Enable</ejs-button>
        <ejs-button id='disable' cssClass='e-flat'
        @click.native='disable'>Disable</ejs-button>
        <ejs-grid id='Grid' ref='grid' :dataSource='data' height='200px'
        :allowGrouping='true' :groupSettings='groupOptions' :toolbar='toolbar'
        :toolbarClick='clickHandler'>
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
                textAlign='Right' width=120></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
                width=150></e-column>
                <e-column field='ShipCity' headerText='Ship City'
                width=150></e-column>
            </e-columns>
        </ejs-grid>
    </div>

```

```

        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Group } from "@syncfusion/ej2-vue-grids";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { data } from './datasource.js';
Vue.use(GridPlugin);
Vue.use(ButtonPlugin);
export default {
  data() {
    return {
      data: data,
      toolbar: ['Expand', 'Collapse'],
      groupOptions: { columns: ['CustomerID'] }
    };
  },
  methods: {
    clickHandler: function(args) {
      if (args.item.id === 'Grid_Collapse') { // Grid_Collapse is control
        id + '_' + toolbar value.
        this.$refs.grid.ej2Instances.groupModule.collapseAll();
      }
      if (args.item.id === "Grid_Expand") {
        this.$refs.grid.ej2Instances.groupModule.expandAll();
      }
    },
    enable: function() {
      this.$refs.grid.ej2Instances.toolbarModule.enableItems(['Grid_Collapse', 'Grid_Expand'], true); // Enable toolbar items.
    },
    disable: function() {
      this.$refs.grid.ej2Instances.toolbarModule.enableItems(['Grid_Collapse', 'Grid_Expand'], false); // Disable toolbar items.
    }
  },
  provide: {
    grid: [Toolbar]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/toolbar/default-cs6" %}

[Add toolbar at the bottom of Grid](#)

You can add the Grid toolbar component at the bottom of Grid using the ['created'](#) event.

**APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' :toolbar='toolbar'
:created='created' height='175px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
type='number' textAlign='Right' :isPrimaryKey='true'
:validationRules='orderIDRules' width='120'></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
type='string' width='140'>
          </e-column>
        <e-column field='Freight' headerText='Freight' type='number'
textAlign='Right' format='C2' width='120'></e-column>
        <e-column field='OrderDate' headerText='OrderDate'
type='date' textAlign='Right' format='yMd' width='140'></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar } from "@syncfusion/ej2-vue-grids";
import { tbdata } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: tbdata.slice(0, 8),
      toolbar: ['Print', 'Search'],
      orderIDRules: { required: true },
    };
  },
  methods: {
    created: function () {
      let toolbar = this.$refs.grid.ej2Instances.element.querySelector(".e-
toolbar");
      this.$refs.grid.ej2Instances.element.appendChild(toolbar);
    }
  },
  provide: {
    grid: [Toolbar]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/toolbar/default-cs7" %}

Tool bar items in Vue Grid component

#### *Built-in toolbar items*

Built-in Toolbar Items execute standard actions of the Grid and it can be added by defining [toolbar](#) as a collection of built-in items. It renders the button with icon and text.

The following table shows Built-in toolbar items and its action.

Built-in Toolbar Items	Actions
----- -----	
Add	Add a new record.
Edit	Edit the selected record.
Update	Update edited record.
Delete	Delete the selected record.
Cancel	Cancel the edit state.
Search	Search the records by given key.
Print	Print the Grid.
ColumnChooser	Choose the column's visibility.
PdfExport	Exports grid to PDF document.
ExcelExport	Exports grid to Excel document.
CsvExport	Exports grid to CSV document.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' height='270px' :toolbar='toolbar'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {

```

```

    return {
      data: data,
      toolbar: ['Print', 'Search']
    };
  },
  provide: {
    grid: [Toolbar]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/toolbar/default-cs1" %}

The [toolbar](#) has options to define both built-in and custom toolbar items.

#### Show only icons in built-in toolbar items

By default, the built-in toolbar items render as buttons with an icon and text. It is possible to hide the text and show only the icon using the following CSS style.

```

,
.e-toolbar .e-tbar-btn-text, .e-toolbar .e-toolbar-items .e-toolbar-item .e-tbar-btn-text {
display: none;
}
,

```

This is demonstrated in the following sample:

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :editSettings='editSettings'
height='270px' :toolbar='toolbar'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120 isPrimaryKey="true"></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from '../datasource.js';
Vue.use(GridPlugin);

```

```

export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel']
    };
  },
  provide: {
    grid: [Edit, Toolbar]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
.e-toolbar .e-tbar-btn-text, .e-toolbar .e-toolbar-items .e-toolbar-item
.e-tbar-btn-text {
  display: none;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/toolbar/default-cs2" %}

#### Custom toolbar items

Custom toolbar items can be added by defining [toolbar](#) as a collection of `ItemModel` Actions for this customized toolbar items are defined in the [toolbarClick](#) event.

By default, Custom toolbar items are in position `Left`. You can change the position by using the `align` property. In the below sample, we have applied position `Right` for the `Collapse All` toolbar item.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' height='200px'
:allowGrouping='true' :groupSettings='groupOptions' :toolbar='toolbar'
:toolbarClick='clickHandler'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Group } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);

```

```

export default {
  data() {
    return {
      data: data,
      toolbar: [{ text: 'Expand All', tooltipText: 'Expand All', prefixIcon:
'e-expand', id: 'expandall' }, { text: 'Collapse All', tooltipText:
'collection All', prefixIcon: 'e-collapse', id: 'collapseall' },
align: 'Right' ]},
      groupOptions: { columns: ['CustomerID'] }
    };
  },
  methods: {
    clickHandler: function(args) {
      if (args.item.id === 'expandall') {
        this.$refs.grid.ej2Instances.groupModule.expandAll();
      }
      if (args.item.id === "collapseall") {
        this.$refs.grid.ej2Instances.groupModule.collapseAll();
      }
    }
  },
  provide: {
    grid: [Toolbar, Group]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/toolbar/default-cs3" %}

\* The [toolbar](#) has options to define both built-in and custom toolbar items.

\* If a toolbar item does not match with built-in items, it will be treated as custom toolbar item.

#### *Both built-in and custom items in toolbar*

Grid have an option to use both built-in and custom toolbar items at same time.

In the below example, Add, Edit, Delete, Update, Cancel are built-in toolbar items and Click is custom toolbar item.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' height='200px'
:editSettings='editSettings' :toolbar='toolbar'
:toolbarClick='clickHandler'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
      </e-columns>
    </div>
  </template>

```

```

        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel', 'Print',
'Search', { text: 'Click', tooltipText: 'Click', prefixIcon: 'e-expand', id:
'Click' }]
    };
  },
  methods: {
    clickHandler: function(args) {
      if (args.item.id === 'Click') {
        alert("Custom Toolbar Click...");
      }
    }
  },
  provide: {
    grid: [Toolbar, Edit]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
.e-expand::before {
  content: '\e5b8';
}
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/toolbar/default-cs4" %}

#### Custom toolbar component in a specific position

By default, Custom toolbar items are in the Left position. You can change the position by using the [align](#) property. In the following sample, we have applied the Right position for the Collapse All toolbar item, Left for the Expand All toolbar item, and Center for the Search toolbar item.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' height='200px'
:allowGrouping='true' :groupSettings='groupOptions' :toolbar='toolbar'
:toolbarClick='clickHandler'>
      <e-columns>

```

```

        <e-column field='EmployeeID' headerText='Employee ID'

### Custom tool bar in Vue Grid component

Custom Toolbar is used to customize the whole toolbar. It can be added by defining **toolbarTemplate**. Actions for this toolbar template items are defined in the **clicked** event in toolbar.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' id='Grid' :dataSource='data'
:allowGrouping='true' :groupSettings='groupOptions'
:toolbarTemplate='toolbar'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
type='number' textAlign='Right' isPrimaryKey='true' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
type='string' width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
type='string' width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
type='string' width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Group } from "@syncfusion/ej2-vue-grids";
import { ToolbarPlugin } from "@syncfusion/ej2-vue-navigations";
import { cdata } from './datasource.js';
Vue.use(GridPlugin);
Vue.use(ToolbarPlugin);
export default {
  data() {
    return {
      data: cdata,
      groupOptions: { columns: ['CustomerID'] },
      toolbar: function () {
        return {
          template: Vue.component('custom-toolbar', {
            template: `<ejs-toolbar :clicked='clickHandler'>
              <e-items>
                <e-item id='collapse' prefixIcon='e-
collapse'></e-item>
              </e-items>
            </ejs-toolbar>`,
            data: function () {
              return {};
            },
            methods: {
              clickHandler(args) {
                let target = args.originalEvent.target.closest('button');
                //find clicked button
                var gridInstance =
document.getElementById("Grid").ej2_instances[0];
```

```

        if (target.id === 'collapse') {
            //collapse all expanded grouped row
            gridInstance.groupModule.collapseAll();
        }
    }
}
}))
};
}
};
},
provide: {
    grid: [Toolbar, Group]
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
.e-icons.e-collapse::before {
    content: "\e834";
}
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/toolbar/custom-cs1" %}

## Pdf Export

### Pdf export in Vue Grid component

PDF export allows exporting Grid data to PDF document. You need to use the [pdfExport](#) method for exporting. To enable PDF export in the grid, set the [allowPdfExport](#) as true.

To use PDF export, inject **PdfExport** module in the **provide** section.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid ref='grid' id='Grid' :dataSource='data'
        :toolbar='toolbarOptions' height='272px' :allowPdfExport='true'
        :toolbarClick='toolbarClick'>
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
                textAlign='Right' width=120></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
                width=150></e-column>
                <e-column field='ShipCity' headerText='Ship City'
                width=150></e-column>
                <e-column field='ShipName' headerText='Ship Name'
                width=150></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, PdfExport } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';

```

```

Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['PdfExport']
    };
  },
  methods: {
    toolbarClick(args) {
      if (args.item.id === 'Grid_pdfexport') { // 'Grid_pdfexport' -> Grid
        component id + _ + toolbar item name
        this.$refs.grid.pdfExport();
      }
    }
  },
  provide: {
    grid: [Toolbar, PdfExport]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/pdf/default-cs14" %}

#### Show spinner while exporting

You can show/ hide spinner component while exporting the grid using `showSpinner/ hideSpinner` methods. You can use `toolbarClick` event to show spinner before exporting and hide a spinner in the `pdfExportComplete` or `excelExportComplete` event after the exporting.

In the `toolbarClick` event, based on the parameter `args.item.id` as `Gridpdfexport` or `Gridexcelexport` we can call the `showSpinner` method from grid instance.

In the `pdfExportComplete` or `excelExportComplete` event, We can call the `hideSpinner` method.

In the below demo, we have rendered the default spinner component when exporting the grid.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='grid' id='Grid' :dataSource='data'
      :toolbar='toolbarOptions' height='272px' :allowPdfExport='true'
      :allowExcelExport='true' :excelExportComplete='excelExportComplete'
      :pdfExportComplete='pdfExportComplete' :toolbarClick='toolbarClick'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
          textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
          :visible='false' width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
          width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
          width=150></e-column>
      </e-columns>
    </div>
  </div>

```

```

        </e-columns>
      </ejs-grid>
    </div>
  </template>

#### Custom data source

PDF export provides an option to define datasource dynamically before exporting. To export data dynamically, define the **dataSource** in [pdfExportProperties](#).

#### APP.VUE

```

<template>
  <div id="app">

```

```

    <ejs-grid ref='grid' id='Grid' :dataSource='data'
:toolbar='toolbarOptions' height='272px' :allowPaging='true'
:allowPdfExport='true' :toolbarClick='toolbarClick'>
        <e-columns>
            <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
            <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
            <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
            <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
        </e-columns>
    </ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, PdfExport } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['PdfExport']
    };
  },
  methods: {
    toolbarClick(args) {
      if (args.item.id === 'Grid_pdfexport') { // 'Grid_pdfexport' -> Grid
        component id + _ + toolbar item name
        let pdfExportProperties = {
          dataSource: data,
        };
        this.$refs.grid.pdfExport(pdfExportProperties);
      }
    }
  },
  provide: {

</style>

```

{% previewsample "page.domainurl/code-snippet/grid/pdf/default-cs16" %}

#### [Passing additional parameters to the server when exporting](#)

You can pass the additional parameter in the **query** property by invoking **addParams** method. In the **toolbarClick** event, you can define params as key and value pair so it will receive at the server side when exporting.

In the below example, we have passed `recordcount` as `12` using `addParams` method.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' id='Grid' :dataSource='data'
:toolbar='toolbarOptions' height='272px' :allowPdfExport='true'
:allowExcelExport='true' :excelExportComplete='excelExportComplete'
:pdfExportComplete='pdfExportComplete' :toolbarClick='toolbarClick'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'

[See Also](#)

- [Exporting Grid in Cordova application](#)

### Export multiple grids in Vue Grid component

The PDF export provides an option to export multiple grids to the same or different pages of a PDF file. Each grid is identified by its unique ID. You can specify which grid to export by listing their IDs in the `exportGrids` property.

#### Same page

PDF exporting provides support for exporting multiple grids on the same page. To export the grids on the same page, define `multipleExport.type` as **AppendToPage** in `exportProperties`. It also has an option to provide blank space between the grids. This blank space can be defined by using `multipleExport.blankSpace` property.

### APP.VUE

```

<template>
    <div id="app">
        <p><b>First Grid:</b></p>
        <ejs-grid ref='grid1' id='FirstGrid' :dataSource='fData'
        :toolbar='toolbarOptions' :exportGrids='exportGrids' :allowPdfExport='true'
        :toolbarClick='toolbarClick'>
            <e-columns>

{% previewsample "page.domainurl/code-snippet/grid/how-to/export-filtered-data-cs3" %}

### [Export filtered data only](#)

You can export the filtered data by defining the resulted data in `exportProperties.dataSource` before export.

In the below Pdf exporting demo, We have gotten the filtered data by applying filter query to the grid data and then defines the resulted data in `exportProperties.dataSource` and pass it to `pdfExport` method.

### **APP.VUE**

```

<template>
    <div id="app">
        <ejs-grid ref='grid' :dataSource='data' :toolbar='toolbarOptions'

</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/pdf/default-cs8" %}
```

### Show or hide columns

You can show a hidden column or hide a visible column while exporting the grid using [toolbarClick](#) and [pdfExportComplete](#) events.

In the [toolbarClick](#) event, based on **args.item.id** as **Grid\_pdfexport**. We can show or hide columns by setting [column.visible](#) property to **true** or **false** respectively.

In the pdfExportComplete event, We have reversed the state back to the previous state.

In the below example, we have **CustomerID** as a hidden column in the grid. While exporting, we have changed **CustomerID** to visible column and **ShipCity** as hidden column.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' id='Grid' :dataSource='data'
:toolbar='toolbarOptions' height='272px' :allowPdfExport='true'
:pdfExportComplete='pdfExportComplete'
:toolbarClick='toolbarClick'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
:visible='false' width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, PdfExport } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['PdfExport']
    };
  },
  methods: {
    toolbarClick(args) {
      if (args.item.id === 'Grid_pdfexport') {
        this.$refs.grid.getColumns()[1].visible = true;
        this.$refs.grid.getColumns()[3].visible = false;
        this.$refs.grid.pdfExport();
      }
    },
    pdfExportComplete(args) {
      this.$refs.grid.getColumns()[1].visible = false;
      this.$refs.grid.getColumns()[3].visible = true;
    }
  }
}
```

```

    }
  },
  provide: {
    grid: [Toolbar, PdfExport]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/pdf/default-cs9" %}

#### [Change page orientation](#)

Page orientation can be changed Landscape(Default Portrait) for the exported document using the [pdfExportProperties](#).

### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid ref='grid' id='Grid' :dataSource='data'
:toolbar='toolbarOptions' height='272px' :allowPaging='true'
:allowPdfExport='true' :toolbarClick='toolbarClick'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, PdfExport } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['PdfExport']
    };
  },
  methods: {
    toolbarClick(args) {
      if (args.item.id === 'Grid_pdfexport') { // 'Grid_pdfexport' -> Grid
        component id + _ + toolbar item name
        let pdfExportProperties = {
          pageOrientation: 'Landscape',
        };
      }
    }
  }
}

```

```

        this.$refs.grid.pdfExport(pdfExportProperties);
    }
},
provide: {
    grid: [Toolbar, PdfExport]
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/pdf/default-cs10" %}

### [Change page size](#)

Page size can be customized for the exported document using the [pdfExportProperties](#). Supported page sizes are:

- Letter
- Note
- Legal
- A0
- A1
- A2
- A3
- A5
- A6
- A7
- A8
- A9
- B0
- B1
- B2
- B3
- B4
- B5
- Archa
- Archb
- Archc
- Archd
- Arche
- Flsa
- HalfLetter
- Letter11x17
- Ledger

### **APP.VUE**

```
<template>
```

```

<div id="app">
  <ejs-grid ref='grid' id='Grid' :dataSource='data'
:toolbar='toolbarOptions' height='272px' :allowPaging='true'
:allowPdfExport='true' :toolbarClick='toolbarClick'>
    <e-columns>
      <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
      <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
      <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
      <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
    </e-columns>
  </ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, PdfExport } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['PdfExport']
    };
  },
  methods: {
    toolbarClick(args) {
      if (args.item.id === 'Grid_pdfexport') { // 'Grid_pdfexport' -> Grid
component id + _ + toolbar item name
        let pdfExportProperties = {
          pageSize: 'Letter'
        };
        this.$refs.grid.pdfExport(pdfExportProperties);
      }
    }
  },
  provide: {
    grid: [Toolbar, PdfExport]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/pdf/default-cs11" %}

### Define file name

You can assign the file name for the exported document by defining [fileName](#) property of [PdfExportProperties](#) in the `toolbarClick` event.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='grid' id='Grid' :dataSource='data'
:allowPaging='true' :allowPdfExport='true' :toolbar='toolbarOptions'
:toolbarClick='toolbarClick' height='258px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' type='number' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
type='string' width=140></e-column>
        <e-column field='Freight' headerText='Freight'
textAlign='Right' format='C2' width=120></e-column>
        <e-column field='OrderDate' headerText='Order Date'
textAlign='Right' type='date' format='yMd' width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Page, PdfExport } from "@syncfusion/ej2-vue-
grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ["PdfExport"],
      pageSettings: { pageSize: 7 }
    };
  },
  methods: {
    toolbarClick(args) {
      if (args["item"].id === "Grid_pdfexport") {
        let exportProperties = {
          fileName: "new.pdf"
        };
        this.$refs.grid.pdfExport(exportProperties);
      }
    }
  },
  provide: {
    grid: [Toolbar, Page, PdfExport]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/pdf/default-cs12" %}

*Font customization**Default fonts*

By default, grid uses **Helvetica** font in the exported document. You can change the default font by using [pdfExportProperties.theme](#) property. The available default fonts are,

- Helvetica
- TimesRoman
- Courier
- Symbol
- ZapfDingbats

The code example for changing default font,

```
`ts
import { PdfStandardFont, PdfFontFamily, PdfFontStyle } from '@syncfusion/ej2-pdf-export';
...
let pdfExportProperties = {
  theme: {
    header: {font: new PdfStandardFont(PdfFontFamily.TimesRoman, 11, PdfFontStyle.Bold)},
    caption: { font: new PdfStandardFont(PdfFontFamily.TimesRoman, 9) },
    record: { font: new PdfStandardFont(PdfFontFamily.TimesRoman, 10) }
  }
};
`
```

*Add custom font*

You can change the default font of Grid header, content and caption cells in the exported document by using [pdfExportProperties.theme](#) property.

In the following example, we have used Algeria font to export the grid.

**APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid ref='grid' id='Grid' :dataSource='data'
      :toolbar='toolbarOptions' height='272px' :allowPaging='true'
      :allowPdfExport='true' :toolbarClick='toolbarClick'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
          textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
          width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
          width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
          width=150></e-column>
      </e-columns>
    </div>
  </template>
```

```

        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, PdfExport } from "@syncfusion/ej2-vue-grids";
import { data, adventProFont } from '../datasource.js';
import { PdfTrueTypeFont } from '@syncfusion/ej2-pdf-export';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['PdfExport']
    };
  },
  methods: {
    toolbarClick(args) {
      if (args.item.id === 'Grid_pdfexport') { // 'Grid_pdfexport' -> Grid
        component id + _ + toolbar item name
        let pdfExportProperties = {
          theme: {
            header: { font: new PdfTrueTypeFont(adventProFont, 12)
            },
            caption: { font: new PdfTrueTypeFont(adventProFont, 10)
            },
            record: { font: new PdfTrueTypeFont(adventProFont, 9) }
          }
        };
        this.$refs.grid.pdfExport(pdfExportProperties);
      }
    },
  },
  provide: {
    grid: [Toolbar, PdfExport]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/pdf/default-cs13" %}

**PdfTrueTypeFont** accepts base 64 format of the Custom Font.

#### [Export grid as blob](#)

The Grid offers an option to export the data as a **Blob** instead of downloading it as a file in the browser. To export the grid as a Blob, set the **isBlob** parameter to **true** in the [pdfExport](#) method. The grid returns the promise of a blob in the [pdfExportComplete](#) event.

The following example demonstrates how to obtain the blob data of the exported grid by executing the promise in the **pdfExportComplete** event.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid ref='grid' id='Grid' :dataSource='data'
:toolbar='toolbarOptions' height='220px' :allowPaging='true'
:allowPdfExport='true' :toolbarClick='toolbarClick'
:pdfExportComplete='pdfExportComplete">
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, PdfExport, Page } from "@syncfusion/ej2-vue-
grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['PdfExport']
    };
  },
  methods: {
    toolbarClick(args) {
      if (args.item.id === 'Grid_pdfexport') {
        // pass fourth parameter as true to get the blob data of exported
grid
        this.$refs.grid.pdfExport(null, null, null, true);
      }
    },
    pdfExportComplete(args) {
      // execute the promise to get the blob data
      args.promise.then((e) => {
        console.log(e.blobData);
      });
    },
  },
  provide: {
    grid: [Toolbar, PdfExport, Page]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

```
{% previewsample "page.domainurl/code-snippet/grid/pdf/export-grid-as-blob-cs1" %}
```

## Pdf cell style customization in Vue Grid component

### Conditional cell formatting

Grid cells in the exported PDF can be customized or formatted using [pdfQueryCellInfo](#) event. In this event, we can format the grid cells of exported PDF document based on the column cell value.

In the below sample, we have set the background color for **Freight** column in the exported document by **args.cell** and **backgroundColor** property.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' id='Grid' :dataSource='data'
:toolbar='toolbarOptions' height='272px' :allowPdfExport='true'
:queryCellInfo='queryCellInfo'
:pdfQueryCellInfo='pdfQueryCellInfo' :toolbarClick='toolbarClick'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='Freight' headerText='Freight'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, PdfExport } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['PdfExport']
    };
  },
  methods: {
    toolbarClick(args) {
      if (args.item.id === 'Grid_pdfexport') {
        this.$refs.grid.pdfExport();
      }
    },
    pdfQueryCellInfo(args) {
      if (args.column.field === 'Freight') {
        if (args.value < 30) {
          args.style = { backgroundColor: '#99ffcc' };
        }
        else if (args.value < 60) {
          args.style = { backgroundColor: '#ffffb3' };
        }
      }
    }
  }
}
```

```

        else {
            args.style = {backgroundColor: '#ff704d'};
        }
    },
    queryCellInfo(args) {
        if(args.column.field == 'Freight') {
            if(args.data['Freight'] < 30) {
                args.cell.bgColor = '#99ffcc';
            }
            else if(args.data['Freight'] < 60) {
                args.cell.bgColor = '#ffffb3';
            }
            else {
                args.cell.bgColor = '#ff704d';
            }
        }
    }
},
provide: {
    grid: [Toolbar, PdfExport]
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/pdf/default-cs5" %}

### Theme

PDF export provides an option to include theme for exported PDF document.

To apply theme in exported PDF, define the [Link to the Video](#) in [pdfExportProperties](#).

### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid ref='grid' id='Grid' :dataSource='data'
        :toolbar='toolbarOptions' height='272px' :allowPaging='true'
        :allowPdfExport='true' :toolbarClick='toolbarClick'>
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
                textAlign='Right' width=120></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
                width=150></e-column>
                <e-column field='ShipCity' headerText='Ship City'
                width=150></e-column>
                <e-column field='ShipName' headerText='Ship Name'
                width=150></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
    import Vue from "vue";

```

```

import { GridPlugin, Toolbar, PdfExport } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['PdfExport']
    };
  },
  methods: {
    toolbarClick(args) {
      if (args.item.id === 'Grid_pdfexport') { // 'Grid_pdfexport' -> Grid
        component id + _ + toolbar item name
        let pdfExportProperties = {
          theme: {
            header: {
              fontColor: '#64FA50', fontName: 'Calibri', fontSize:
17, bold: true, border: { color: '#64FA50', lineStyle: 'Thin' }
            },
            record: {
              fontColor: '#64FA50', fontName: 'Calibri', fontSize:
17, bold: true
            },
            caption: {
              fontColor: '#64FA50', fontName: 'Calibri', fontSize:
17, bold: true
            }
          }
        };
        this.$refs.grid.pdfExport(pdfExportProperties);
      }
    },
    provide: {
      grid: [Toolbar, PdfExport]
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/pdf/default-cs6" %}

By default, material theme is applied to exported PDF document.

#### Adding header and footer in Vue Grid component

PDF export provides an option to customize mapping of grid to exported PDF document.

To get start quickly with PDF export Options, you can check on this video:

You can customize text, page number, line, page size and changing orientation in header and footer.

#### Write a text in header and footer

You can add text either in Header or Footer of exported PDF document using [pdfExportProperties](#).

```
`ts
let pdfExportProperties = {
  header: {
    fromTop: 0,
    height: 130,
    contents: [
      {
        type: 'Text',
        value: "Northwind Traders",
        position: { x: 0, y: 50 },
        style: { textBrushColor: '#000000', fontSize: 13 }
      },
    ]
  }
}
```

#### *Draw a line in header and footer*

you can add line either in Header or Footer of the exported PDF document.

Supported line styles:

- Dash
- Dot
- DashDot
- DashDotDot
- Solid

```
`ts
let pdfExportProperties = {
  header: {
    fromTop: 0,
    height: 130,
    contents: [
      {
        type: 'Line',
        style: { penColor: '#000080', penSize: 2, dashStyle: 'Solid' },
        points: { x1: 0, y1: 4, x2: 685, y2: 4 }
      }
    ]
  }
}
```

```
}
]
}
}
`ts
```

#### *Add page number in header and footer*

you can add page number either in Header or Footer of exported PDF document.

Supported page number types:

- LowerLatin - a, b, c,
- UpperLatin - A, B, C,
- LowerRoman - i, ii, iii,
- UpperRoman - I, II, III,
- Number - 1,2,3.

```
`ts
let pdfExportProperties = {
header: {
fromTop: 0,
height: 130,
contents: [
{
type: 'PageNumber',
pageNumberType: 'Number',
format: 'Page {$current} of {$total}', //optional
position: { x: 0, y: 25 },
style: { textBrushColor: '#ffff80', fontSize: 15, hAlign: 'Center' }
}
]
}
}
`ts
```

#### *Insert an image in header and footer*

Image (Base64 string with .jpeg format) can be added in the exported document in header/footer using the [pdfExportProperties](#).

```
`ts
let pdfExportProperties = {
```

```

header: {
  fromTop: 0,
  height: 130,
  contents: [
    {
      type: 'Image',
      src: image,
      position: { x: 435, y: 10 },
      size: { height: 100, width: 250 },
    }
  ]
}
,

```

The below code illustrates the pdf export customization.

#### **APP.VUE**

```

<template>

[Repeat column header on every page](#)

By default, column header will be placed on the first page of the pdf document but you can display column header on every page using **repeatHeader** property of **pdfGrid**.

In the below sample, we have enabled **repeatHeader** property in [pdfHeaderQueryCellInfo](#) event to show the header on every page.

**APP.VUE**

```

### Exporting hierarchy grid in Vue Grid component

The grid have an option to export the hierarchy grid to pdf document. By default, grid will exports the master grid with expanded child grids alone. you can change the exporting option by using the **PdfExportProperties.hierarchyExportMode** property. The available options are,

- | Mode | Behavior |
- |-----|-----|
- | Expanded | Exports the master grid with expanded child grids. |
- | All | Exports the master grid with all the child grids. |
- | None | Exports the master grid alone. |

### APP.VUE

### Exporting grid with templates in Vue Grid control

The grid offers the option to export the column, detail, and caption templates to a PDF document. The template contains images, hyperlinks, and customized text.

#### Exporting with column template

The PDF export functionality allows you to export Grid columns that include images, hyperlinks, and custom text to a PDF document.

In the following sample, the hyperlinks and images are exported to PDF using [hyperlink](#) and [image](#) properties in the [pdfQueryCellInfo](#) event.

PDF Export supports base64 string to export the images.

### APP.VUE

```

<template>
  <ejs-grid id="ColumnTemplateGrid" ref="grid" :dataSource="data"
  :allowPdfExport="true"
  :toolbar="toolbar" :toolbarClick="toolbarClick"
  :pdfQueryCellInfo="pdfQueryCellInfo" height=315>
    <e-columns>
      <e-column headerText="Employee Image" textAlign="Center"
      :template="imageTemplate" width="150"></e-column>
      <e-column field="EmployeeID" headerText="Employee ID"
      width="125"></e-column>

          data: function() {
            return {
              data: {}
            }
          },
        })},
      },
      mailTemplate: function () {
        return { template : Vue.component('mailTemplate',{
          template: `<div class="link">
            <a
:href="'mailto:'+data.EmailID">{{data.EmailID}}</a></div>
            </div>`,
          data: function() {
            return {
              data: {}
            }
          },
        })},
      },
    };
  },
  methods: {
    toolbarClick: function (args) {
      if (args.item.id === 'ColumnTemplateGrid_pdfexport') {
        this.$refs.grid.pdfExport();
      }
    },
    pdfQueryCellInfo: function(args) {
      if (args.column.headerText === 'Employee Image') {
        args.image = {
          base64: args.data.EmployeeImage,
          height: 50,
          width: 50,
        };
      }
      if (args.column.headerText === 'Email ID') {
        args.hyperLink = {
          target: 'mailto:' + args.data.EmailID,
          displayText: args.data.EmailID,
        };
      }
    }
  }
}

```

```

    },
    provide: {
      grid: [PdfExport, Toolbar],
    },
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
  .image img {
    height: 55px;
    width: 55px;
    border-radius: 50px;
    box-shadow: inset 0 0 1px #e0e0e0, inset 0 0 14px rgba(0,0,0,0.2);
  }
</style>

```

```
{% previewsample "page.domainurl/code-snippet/grid/pdf/column-template-export-cs1" %}
```

PDF Export		
Employee Image	Name	Email ID
	Nancy	nancy@domain.com
	Andrew	andrew@domain.com
	Janet	janet@domain.com
	Margaret	margaret@domain.com

#### Exporting with detail template

By default, the grid will export the parent grid with expanded detail rows alone. Change the exporting option by using the `PdfExportProperties.hierarchyExportMode` property. The available options are:

Mode	Behavior	
-----	-----	

| Expanded | Exports the parent grid with expanded detail rows. |

| All | Exports the parent grid with all the detail rows. |

| None | Exports the parent grid alone. |

The detail rows in the exported PDF can be customized or formatted using the [exportDetailTemplate](#) event. In this event, the detail rows of the PDF document are formatted in accordance with their parent row details.

In the following sample, the detail row content is formatted by specifying the [columnCount](#), [columnHeader](#), and [rows](#) properties using its [parentRow](#) details. This allows for the creation of detail rows in the PDF document. Additionally, custom styles can be applied to specific cells using the [style](#) property.

If [columnCount](#) is not provided, the columns in the detail row of the PDF grid will be generated based on the count of the [columnHeader](#)/[rows](#) first row's [cells](#).

When using [rowSpan](#), it is essential to provide the cell's [index](#) for proper functionality.

#### Exporting with caption template

The PDF export feature enables exporting of Grid with a caption template to an PDF document.

In the following sample, the customized caption text is exported to PDF using [captionText](#) property in the [exportGroupCaption](#) event.

#### APP.VUE

```

<template>
  <ejs-grid id="CaptionTemplateGrid" ref="grid" :dataSource="data"
:allowGrouping="true" :groupSettings="groupOptions"
  :allowPdfExport="true" :toolbar="toolbar" :toolbarClick="toolbarClick"
:exportGroupCaption="exportGroupCaption" height=315>
    <e-columns>
      <e-column field="EmployeeID" headerText="Employee ID"
width="120"></e-column>
      <e-column field="FirstName" headerText="Name" width="120"></e-
column>
      <e-column field="City" headerText="City"></e-column>
      <e-column field="Title" headerText="Title" width="170"></e-
column>
    </e-columns>
  </ejs-grid>
</template>
<script>
import Vue from 'vue';

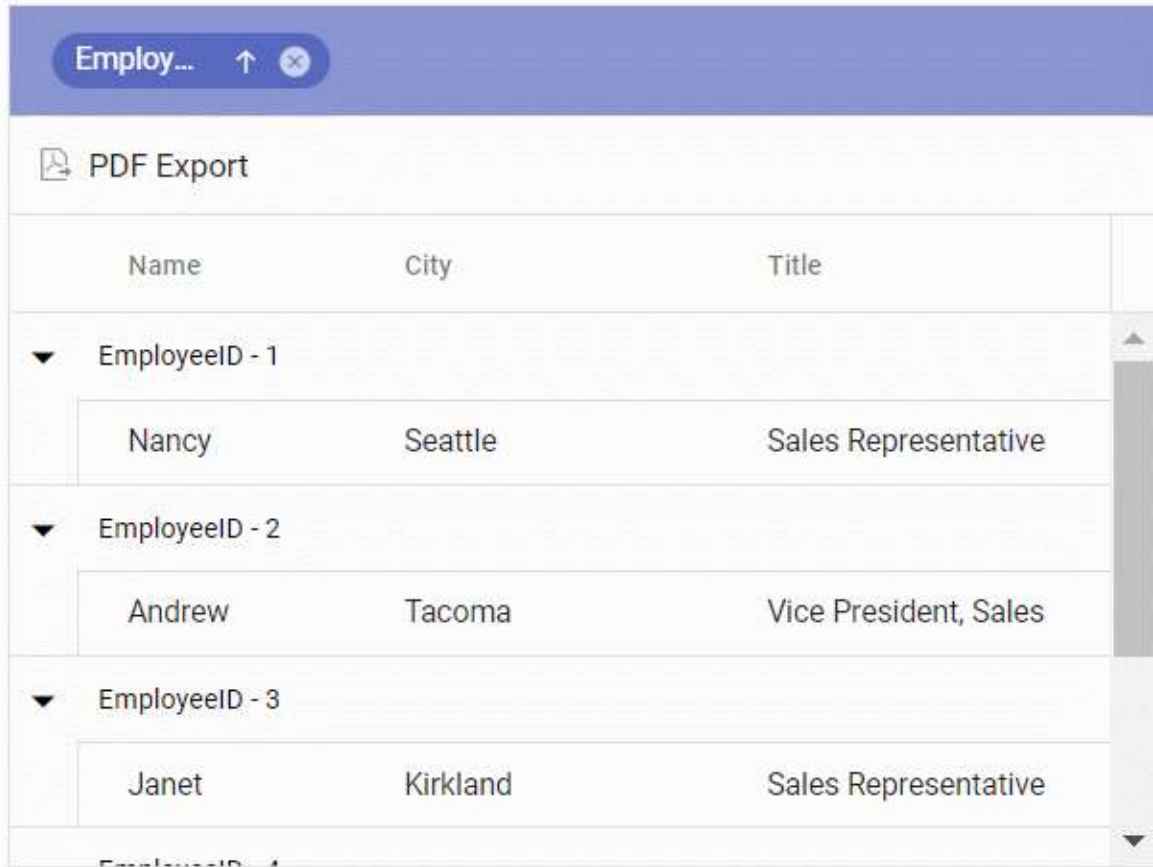

```

```

import { GridPlugin, Group, PdfExport, Toolbar } from '@syncfusion/ej2-vue-grids';
import { employeeData } from '../datasource.js';
Vue.use(GridPlugin);
export default {
  data: () => {
    return {
      data: employeeData,
      toolbar: ['PdfExport'],
      groupOptions: {
        columns: ['EmployeeID'],
        captionTemplate: '${field} - ${key}'
      }
    };
  },
  methods: {
    toolbarClick: function (args) {
      if (args.item.id === 'CaptionTemplateGrid_pdfexport') {
        this.$refs.grid.pdfExport();
      }
    },
    exportGroupCaption: function(args) {
      args.captionText = args.data.field + ' - ' + args.data.key;
    }
  },
  provide: {
    grid: [Group, PdfExport, Toolbar],
  },
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/pdf/caption-template-export-cs1" %}

The screenshot shows a web application interface. At the top, there is a blue header bar with a button labeled "Employ..." and two small icons (an upward arrow and a close 'x' icon). Below the header, there is a white bar with a PDF icon and the text "PDF Export". The main content area is a grid with three columns: "Name", "City", and "Title". The grid contains three rows of data, each preceded by a dropdown arrow and a label: "EmployeeID - 1", "EmployeeID - 2", and "EmployeeID - 3". The data rows are: Nancy (Seattle, Sales Representative), Andrew (Tacoma, Vice President, Sales), and Janet (Kirkland, Sales Representative). A vertical scrollbar is visible on the right side of the grid.

	Name	City	Title
▼ EmployeeID - 1	Nancy	Seattle	Sales Representative
▼ EmployeeID - 2	Andrew	Tacoma	Vice President, Sales
▼ EmployeeID - 3	Janet	Kirkland	Sales Representative

### Exporting grid in server in Vue Grid component

The Grid have an option to export the data to PDF in server side using Grid server export library.

#### Server dependencies

The Server side export functionality is shipped in the Syncfusion.EJ2.GridExport package, which is available in Essential Studio and [nuget.org](https://nuget.org). The following list of dependencies is required for Grid server side PDF exporting action.

- Syncfusion.EJ2
- Syncfusion.EJ2.GridExport

#### Server configuration

The following code snippet shows server configuration using ASP.NET Core Controller Action.

To Export the Grid in server side, You need to call the [serverPdfExport](#) method for passing the Grid properties to server exporting action.

```
`ts
public ActionResult PdfExport([FromForm] string gridModel)
{
    GridPdfExport exp = new GridPdfExport();
    Grid gridProperty = ConvertGridObject(gridModel);
```

```

return exp.PdfExport<OrdersDetails>(gridProperty, OrdersDetails.GetAllRecords());
}

private Grid ConvertGridObject(string gridProperty)
{
    Grid GridModel = (Grid)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty, typeof(Grid));
    GridColumnModel cols =
    (GridColumnModel)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
    typeof(GridColumnModel));
    GridModel.Columns = cols.columns;
    return GridModel;
}

public class GridColumnModel
{
    public List<GridColumn> columns { get; set; }
}
`
`

<template>
<div id="app">
<ejs-grid ref='grid' id='Grid' :dataSource='data' :toolbar='toolbarOptions' height='272px'
:toolbarClick='toolbarClick'>
<e-columns>
<e-column field='OrderID' headerText='Order ID' textAlign='Right' width=120></e-column>
<e-column field='CustomerID' headerText='Customer ID' width=150></e-column>
<e-column field='ShipCity' headerText='Ship City' width=150></e-column>
<e-column field='ShipName' headerText='Ship Name' width=150></e-column>
</e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';

```

```

Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['PdfExport']
    };
  },
  methods: {
    toolbarClick: function(args) {
      if (args.item.id === 'Gridpdfexport') { // 'Gridpdfexport' -> Grid component id + _ + toolbar item name
        this.$refs.grid.serverPdfExport('Home/PdfExport');
      }
    }
  },
  provide: {
    grid: [Toolbar]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

Note: Refer to the GitHub sample for quick implementation and testing from [here](#).

#### *Export grid as memory stream*

The Grid offers an option to export the data as a memory stream instead of downloading it as a file in the browser. To obtain the memory stream of the exported grid, set the `AsMemoryStream` parameter to **true** in the [PdfExport](#) method.

The following code demonstrates how to get the memory stream of exported grid.

```

`ts
public object PdfExport(string gridModel)
{
  GridPdfExport exp = new GridPdfExport();

```

```

Grid gridProperty = ConvertGridObject(gridModel);
// pass third parameter as true to get the Memory Stream of exported grid data
return (MemoryStream)exp.PdfExport<OrdersDetails>(gridProperty, OrdersDetails.GetAllRecords(),
true);
}
`

```

#### *Merge grid's memory stream*

The [Essential PDF](#) library is used to merge multiple memory streams into a single stream. To learn more about the merge option, please refer to this [documentation](#).

You can merge a memory stream, a file stream, and a local file with the Grid's memory stream in the following ways:

#### *Merging with an existing memory stream*

If you already have a memory stream, you can directly use it to merge with the Grid's memory stream.

In the following code, the [Merge](#) method of the [PdfDocumentBase](#) class is used to merge the grid's memory stream with an existing memory stream.

```

`ts
using Syncfusion.Pdf;

public MemoryStream ms1; // defines existing memory stream
public object PdfExport(string gridModel)
{
    GridPdfExport exp = new GridPdfExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    // get the memory stream of exported grid data
    MemoryStream ms2 = (MemoryStream)exp.PdfExport<OrdersDetails>(gridProperty,
OrdersDetails.GetAllRecords(), true);
    //Creates a PDF document.
    PdfDocument finalDoc = new PdfDocument();
    //Creates a PDF stream for merging. ms1 and ms2 represents the existing stream and grid's stream.
    Stream[] streams = { ms1, ms2 };
    //Merges PDFDocument.
    PdfDocumentBase.Merge(finalDoc, streams);
    //Save the document into stream.
    MemoryStream ms3 = new MemoryStream();
    finalDoc.Save(ms3);
    ms3.Position = 0;
}
`

```

```
//Close the document.
finalDoc.Close(true);
//Dispose the streams.
ms1.Dispose();
ms2.Dispose();
return ms3;
}
`ts
```

#### Merging with an existing file stream

If you already have a file stream, you can directly use it to merge with the Grid's memory stream. In the following code, the existing file stream is merged with the Grid's memory stream.

```
`ts
using Syncfusion.Pdf;

public FileStream fs1; // defines existing file stream
public ActionResult PdfExport(string gridModel)
{
    GridPdfExport exp = new GridPdfExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    MemoryStream ms1 = (MemoryStream)exp.PdfExport<OrdersDetails>(gridProperty,
    OrdersDetails.GetAllRecords(), true);
    PdfDocument finalDoc = new PdfDocument();
    //fs1 and ms1 represents the existing stream and grid's stream.
    Stream[] streams = { fs1, ms1 };
    PdfDocumentBase.Merge(finalDoc, streams);
    MemoryStream ms3 = new MemoryStream();
    finalDoc.Save(ms3);
    ms3.Position = 0;
    return ms3;
}
`ts
```

#### Merging with a local file

To merge a local file with the Grid's memory stream, you need to convert it into a file stream before merging. In the following code, the existing local file is merged with the Grid's memory stream.

```
`ts
using Syncfusion.Pdf;
```

```
// get the file stream of local file
public FileStream fs1 = new FileStream("D:/PdfDoc.pdf", FileMode.Open, FileAccess.Read); //
PdfDoc.pdf is a local file which is located in local disk D.

public ActionResult PdfExport(string gridModel)
{
    GridPdfExport exp = new GridPdfExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    MemoryStream ms1 = (MemoryStream)exp.PdfExport<OrdersDetails>(gridProperty,
    OrdersDetails.GetAllRecords(), true);
    PdfDocument finalDoc = new PdfDocument();
    //fs1 and ms1 represents the local file's stream and grid's stream.
    Stream[] streams = { fs1, ms1 };
    PdfDocumentBase.Merge(finalDoc, streams);
    MemoryStream ms3 = new MemoryStream();
    finalDoc.Save(ms3);
    ms3.Position = 0;
    return ms3;
}
,
```

#### Downloading the merged memory stream

You can download the merged memory stream by converting it into a `FileStreamResult`. In the following code, the merged memory stream is downloaded to the browser.

```
`ts
using Syncfusion.Pdf;

public ActionResult PdfExport(string gridModel)
{
    PdfDocument finalDoc = new PdfDocument();
    //ms1 and ms2 represents the streams needs to merge.
    Stream[] streams = { ms1, ms2 };
    PdfDocumentBase.Merge(finalDoc, streams);
    MemoryStream ms3 = new MemoryStream();
    finalDoc.Save(ms3);
    ms3.Position = 0;
    // Save the MemoryStream into FileStreamResult
```

```

FileStreamResult fileStreamResult = new FileStreamResult(ms3, "application/pdf");
fileStreamResult.FileNameDownload = "Export.pdf";
//Close the document.
finalDoc.Close(true);
//Dispose the streams.
ms1.Dispose();
ms2.Dispose();
// return the file
return fileStreamResult;
}

```

*Rotate a header text to a certain degree in the exported grid on the server side*

The Grid has support to customize the column header styles such as changing text orientation, the font color, and so on in the exported PDF file. To achieve this requirement, define the `BeginCellLayout` event of the `PdfExportProperties` with an event handler to perform the required action.

The `PdfHeaderQueryCellInfoEvent` will be triggered when creating a column header for the pdf document to be exported. Collect the column header details in this event and handle the custom in the `BeginCellLayout` event handler.

In the following demo, the `DrawString` method from the `Graphics` is used to rotate the header text of the column header inside the `BeginCellLayout` event handler.

A PDF exporting is not supported to rotate the column header on the client side.

```
`ts
```

```

public ActionResult PdfExport(string gridModel)
{
    GridPdfExport exp = new GridPdfExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    gridProperty.ServerPdfHeaderQueryCellInfo = PdfHeaderQueryCellInfo;
    PdfGrid grid = new PdfGrid();
    PdfExportProperties pdfExportProperties = new PdfExportProperties();
    pdfExportProperties.IsRepeatHeader = true;
    pdfExportProperties.BeginCellLayout = new PdfGridBeginCellLayoutEventHandler(BeginCellEvent);
    gridProperty.ServerPdfQueryCellInfo = PdfQueryCellInfo;
    IEnumerable data = Utils.DataTableToJson(dt);
    var result = exp.PdfExport<dynamic>(gridProperty, data, pdfExportProperties);
    return result;
}

```

```

}

public void BeginCellEvent(object sender, PdfGridBeginCellLayoutEventArgs args)
{
    PdfGrid grid = (PdfGrid)sender;
    var brush = new PdfSolidBrush(new PdfColor(Color.DimGray));
    args.Graphics.Save();
    args.Graphics.TranslateTransform(args.Bounds.X + 50, args.Bounds.Height + 40); // give the value for
    bounds x and Y by the user
    args.Graphics.RotateTransform(-60); // give the rotate degree value by the user
    // Draw the text at particular bounds.
    args.Graphics.DrawString(headerValues[args.CellIndex], new PdfStandardFont(PdfFontFamily.Helvetica,
    10), brush, new PointF(0, 0));
    if (args.IsHeaderRow)
    {
        grid.Headers[0].Cells[args.CellIndex].Value = string.Empty;
    }
    args.Graphics.Restore();
}

private void PdfHeaderQueryCellInfo(object pdf)
{
    ServerPdfHeaderQueryCellInfoEventArgs name = (ServerPdfHeaderQueryCellInfoEventArgs)pdf;
    PdfGrid grid = new PdfGrid();
    headerValues.Add(name.Column.HeaderText);
    var longestString = headerValues.Where(s => s.Length == headerValues.Max(m => m.Length)).First();
    PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 6);
    SizeF size = font.MeasureString(longestString);
    name.Headers[0].Height = size.Width * 2;
}

```

### Limitations

- The export feature for detail and caption templates is not supported in server-side exporting.
- Multiple grids exporting feature is not supported with server side exporting.

## Excel Export

### Excel exporting in Vue Grid component

The excel export allows exporting Grid data to Excel document. You need to use the

[excelExport](#) method for exporting. To enable Excel export in the grid, set the [allowExcelExport](#) as true.

To use excel export, inject **ExcelExport** module in the **provide** section.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' id='Grid' :dataSource='data'
:toolbar='toolbarOptions' height='272px' :allowExcelExport='true'
:toolbarClick='toolbarClick'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, ExcelExport } from "@syncfusion/ej2-vue-
grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['ExcelExport']
    };
  },
  methods: {
    toolbarClick: function(args) {
      if (args.item.id === 'Grid_excelexport') { // 'Grid_excelexport' ->
Grid component id + _ + toolbar item name
        this.$refs.grid.excelExport();
      }
    }
  },
  provide: {
    grid: [Toolbar, ExcelExport]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/excel/default-cs10" %}
```

### Show spinner while exporting

You can show/ hide spinner component while exporting the grid using `showSpinner/ hideSpinner` methods. You can use `toolbarClick` event to show spinner before exporting and hide a spinner in the `pdfExportComplete` or `excelExportComplete` event after the exporting.

In the `toolbarClick` event, based on the parameter `args.item.id` as `Gridpdfexport` or `Gridexcelexport` we can call the `showSpinner` method from grid instance.

In the `pdfExportComplete` or `excelExportComplete` event, We can call the `hideSpinner` method.

In the below demo, we have rendered the default spinner component when exporting the grid.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' id='Grid' :dataSource='data'
    :toolbar='toolbarOptions' height='272px' :allowPdfExport='true'
    :allowExcelExport='true' :excelExportComplete='excelExportComplete'
    :pdfExportComplete='pdfExportComplete' :toolbarClick='toolbarClick'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        :visible='false' width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
        width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
        width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, PdfExport, ExcelExport } from
"@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['PdfExport', 'ExcelExport']
    };
  },
  methods: {
    toolbarClick(args) {
      if (args.item.id === 'Grid_pdfexport') {
        this.$refs.grid.showSpinner();
        this.$refs.grid.pdfExport();
      }
      else if (args.item.id === 'Grid_excelexport') {
```

```

        this.$refs.grid.showSpinner();
        this.$refs.grid.excelExport();
    }
}
pdfExportComplete(args) {
    this.$refs.grid.hideSpinner();
}
excelExportComplete(args) {
    this.$refs.grid.hideSpinner();
}
},
provide: {
    grid: [Toolbar, PdfExport, ExcelExport]
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/pdf/default-cs1" %}

#### Custom data source

The excel export provides an option to define datasource dynamically before exporting. To export data dynamically, define the **dataSource** in [excelExportProperties](#).

#### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid ref='grid' id='Grid' :dataSource='data'
        :toolbar='toolbarOptions' height='270px' :allowPaging='true'
        :allowExcelExport='true' :toolbarClick='toolbarClick'>
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
                textAlign='Right' width=120></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
                width=150></e-column>
                <e-column field='ShipCity' headerText='Ship City'
                width=150></e-column>
                <e-column field='ShipName' headerText='Ship Name'
                width=150></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, ExcelExport } from "@syncfusion/ej2-vue-grids";
import { data } from '../datasource.js';
Vue.use(GridPlugin);
export default {
    data() {
        return {
            data: data,

```

```

        toolbarOptions: ['ExcelExport']
    };
},
methods: {
    toolbarClick: function(args) {
        if (args.item.id === 'Grid_excelexport') { // 'Grid_excelexport' ->
Grid component id + _ + toolbar item name
            let excelExportProperties = {
                dataSource: data
            };
            this.$refs.grid.excelExport(excelExportProperties);
        }
    },
    provide: {
        grid: [Toolbar, ExcelExport]
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/excel/default-cs11" %}

#### Passing additional parameters to the server when exporting

You can pass the additional parameter in the `query` property by invoking `addParams` method. In the `toolbarClick` event, you can define params as key and value pair so it will receive at the server side when exporting.

In the below example, we have passed `recordcount` as `12` using `addParams` method.

#### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid ref='grid' id='Grid' :dataSource='data'
:toolbar='toolbarOptions' height='272px' :allowPdfExport='true'
:allowExcelExport='true' :excelExportComplete='excelExportComplete'
:pdfExportComplete='pdfExportComplete' :toolbarClick='toolbarClick'>
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
:visible='false' width=150></e-column>
                <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
                <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";

```

```

import { GridPlugin, Toolbar, PdfExport, ExcelExport } from
"@syncfusion/ej2-vue-grids";
import { Query } from "@syncfusion/ej2-data";
import { data } from '../datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['PdfExport', 'ExcelExport'],
      queryClone: ""
    };
  },
  methods: {
    toolbarClick(args) {
      if (args.item.id === 'Grid_pdfexport') {
        debugger
        this.queryClone = this.$refs.grid.query;
        this.$refs.grid.query = new Query().addParams("recordcount",
"12")

        this.$refs.grid.pdfExport();
      }
      else if (args.item.id === 'Grid_excelexport') {
        this.queryClone = this.$refs.grid.query;
        this.$refs.grid.query = new Query().addParams("recordcount",
"12")

        this.$refs.grid.excelExport();
      }
    }
    pdfExportComplete(args) {

- [Exporting Grid in Cordova application](#)

### Export multiple grids in Vue Grid component

The Excel export provides an option to export multiple grid data in the same or different sheets of an Excel file. Each grid is identified by its unique ID. You can specify which grids to export by listing their IDs in the `exportGrids` property.

#### Same sheet

Excel exporting provides support for exporting multiple grids on the same sheet. To export the grids in the same sheet, define `multipleExport.type` as `AppendToSheet` in `excelExportProperties`. It also has an option to provide blank rows between the grids. These blank rows count can be defined by using the `multipleExport.blankRows` property.

#### APP.VUE

```
<template>
  <div id="app">
    <p><b>First Grid:</b></p>
    <ejs-grid ref='grid1' id='FirstGrid' :dataSource='fData'
:toolbar='toolbarOptions' :allowExcelExport='true'
:exportGrids='exportGrids' :toolbarClick='toolbarClick'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
    <p><b>Second Grid:</b></p>
    <ejs-grid ref='grid2' id='SecondGrid' :dataSource='sData'
:allowExcelExport='true'>
      <e-columns>
        <e-column field='EmployeeID' headerText='Employee ID'
textAlign='Right' width=120></e-column>
        <e-column field='FirstName' headerText='FirstName'
width=150></e-column>
        <e-column field='LastName' headerText='Last Name'
width=150></e-column>
        <e-column field='City' headerText='City' width=150></e-
column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, ExcelExport } from "@syncfusion/ej2-vue-
grids";
import { data, employeeData } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      fData: data.slice(0, 5),
```

```

        sData: employeeData.slice(0, 5),
        toolbarOptions: ['ExcelExport'],
        exportGrids: ['FirstGrid', 'SecondGrid'],
    };
},
methods: {
    toolbarClick: function (args) {
        if (args.item.id === 'FirstGrid_excelexport') { //
            'Grid_excelexport' -> Grid component id + _ + toolbar item name
            let appendExcelExportProperties = {
                multipleExport: { type: 'AppendToSheet', blankRows: 2 }
            };
            this.$refs.grid1.excelExport(appendExcelExportProperties, true);
        }
    },
    provide: {
        grid: [Toolbar, ExcelExport]
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/excel/multiple-cs1" %}

By default, [multipleExport.blankRows](#) value is 5.

#### New sheet

Excel export functionality enables the exporting of multiple grids onto separate sheets (each grid in new sheet of excel) within the Excel file. To achieve this, you can specify [multipleExport.type](#) as [Link to the Video](#) in `exportProperties`.

#### APP.VUE

```

<template>
    <div id="app">
        <p><b>First Grid:</b></p>
        <ejs-grid ref='grid1' id='FirstGrid' :dataSource='fData'

### Excel export options in Vue Grid component

The excel export provides an option to customize mapping of the grid to excel document.

To get start quickly with Excel export Options, you can check on this video:

[Export current page](#)

The excel export provides an option to export the current page into excel. To export current page, define [exportType](#) to **CurrentPage**.

**APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid ref='grid' id='Grid' :dataSource='data'
:toolbar='toolbarOptions' height='220px' :allowPaging='true'
:allowExcelExport='true' :toolbarClick='toolbarClick'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, ExcelExport, Page } from "@syncfusion/ej2-vue-
grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      toolbarOptions: ['ExcelExport']
    };
  },
  methods: {
    toolbarClick: function(args) {
      if (args.item.id === 'Grid_excelexport') { // 'Grid_excelexport' ->
Grid component id + _ + toolbar item name
        let excelExportProperties = {
          exportType: 'CurrentPage'
        };
        this.$refs.grid.excelExport(excelExportProperties);
      }
    },
  },
  provide: {
    grid: [Toolbar, ExcelExport, Page]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

```
{% previewsample "page.domainurl/code-snippet/grid/excel/default-cs4" %}
```

### *Export the selected records only*

You can export the selected records data by passing it to `exportProperties.dataSource` property in the `toolbarClick` event.

In the below exporting demo, We can get the selected records using `getSelectedRecords` method and pass the selected data to `PdfExport` or `excelExport` property.

### **APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' :toolbar='toolbarOptions'
      :allowPaging='true' :allowFiltering='true' :allowPdfExport='true'
      :allowExcelExport='true' :pageSettings='pageSettings'
      :toolbarClick='toolbarClick' :selectionSettings='selectionOption'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
          textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
          width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
          width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, PdfExport, Filter, Page, ExcelExport } from
"@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
import { DataManager } from "@syncfusion/ej2-data";
Vue.use(GridPlugin);
export default {
  data: () => {
    return {
      data: data,
      toolbarOptions: ['PdfExport', 'ExcelExport'],
      pageSettings: { pageSize: 5, pageCount: 5 },
      selectionOption: { type: 'Multiple' }
    };
  },
  methods: {
    toolbarClick(args: ClickEventArgs) {
      if (args['item'].id.indexOf("pdfexport") !== -1) {
        let selectedRecords =
this.$refs.grid.getSelectedRecords();
        let exportProperties = {
          dataSource: selectedRecords
        };
        this.$refs.grid.pdfExport(exportProperties);
      }
      else if (args['item'].id.indexOf("excelexport") !== -1) {
        let selectedRecords =
this.$refs.grid.getSelectedRecords();
```

```

        let exportProperties = {
            dataSource: selectedRecords
        };
        this.$refs.grid.excelExport(exportProperties);
    },
    },
    provide: {
        grid: [Toolbar, PdfExport, Filter, Page, ExcelExport]
    },

</style>

```

{% previewsample "page.domainurl/code-snippet/grid/how-to/export-filtered-data-cs1" %}

### Export hidden columns

The excel export provides an option to export hidden columns of grid by defining [includeHiddenColumn](#) as **true**.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid ref='grid' id='Grid' :dataSource='data'
        :toolbar='toolbarOptions' height='270px' :allowPaging='true'
        :allowExcelExport='true' :toolbarClick='toolbarClick'>
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
                textAlign='Right' width=120></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
                width=150></e-column>
                <e-column field='ShipCity' headerText='Ship City' width=150
                :visible='false'></e-column>
                <e-column field='ShipName' headerText='Ship Name'
                width=150></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, ExcelExport } from "@syncfusion/ej2-vue-
grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
    data() {
        return {
            data: data,
            toolbarOptions: ['ExcelExport']
        };
    },
    methods: {

```

```

        toolbarClick: function(args) {
            if (args.item.id === 'Grid_excelexport') { // 'Grid_excelexport' ->
Grid component id + _ + toolbar item name
                let excelExportProperties = {
                    includeHiddenColumn: true
                };
                this.$refs.grid.excelExport(excelExportProperties);
            }
        },
        provide: {
            grid: [Toolbar, ExcelExport]
        }
    }
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/excel/default-cs5" %}

#### Show or hide columns

You can show a hidden column or hide a visible column while printing the grid using [toolbarClick](#) and [pdfExportComplete](#) events.

In the [toolbarClick](#) event, based on **args.item.id** as **Grid\_pdfexport**. We can show or hide columns by setting [column.visible](#) property to **true** or **false** respectively.

In the pdfExportComplete event, We have reversed the state back to the previous state.

In the below example, we have **CustomerID** as a hidden column in the grid. While exporting, we have changed **CustomerID** to visible column and **ShipCity** as hidden column.

#### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid ref='grid' id='Grid' :dataSource='data'
:toolbar='toolbarOptions' height='272px' :allowExcelExport='true'
:excelExportComplete='excelExportComplete' :toolbarClick='toolbarClick'>
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
:visible='false' width=150></e-column>
                <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
                <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, ExcelExport } from "@syncfusion/ej2-vue-
grids";

```

```

import { data } from './datasource.js';
Vue.use(GridPlugin);

### [Export the master detail grid](#)

It is possible to export the master-detail grid on the same Excel sheet using the `ExcelExportProperties` class in the grid.

To export the master-detail grid on the same sheet in the following sample, you need to set the `multipleExport.type` to `AppendToSheet` in the `exportProperties`. A promise object is created by exporting the master grid first, and then the detail grid is exported after the master grid has been successfully exported.

#### Export grid as blob

The Grid offers an option to export the data as a Blob instead of downloading it as a file in the browser. To export the grid as a Blob, set the `isBlob` parameter to **true** in the [excelExport](#) method. The grid returns the promise of a blob in the [excelExportComplete](#) event.

The following example demonstrates how to obtain the blob data of the exported grid by executing the promise in the [excelExportComplete](#) event.

#### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid ref='grid' id='Grid' :dataSource='data'

Excel cell style customization in Vue Grid component

#### Conditional cell formatting

Grid cells in the exported Excel can be customized or formatted using [excelQueryCellInfo](#) event. In this event, we can format the grid cells of exported PDF document based on the column cell value.

In the below sample, we have set the background color for **Freight** column in the exported excel by **args.cell** and **backColor** property.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='grid' id='Grid' :dataSource='data'

```

{% previewsample "page.domainurl/code-snippet/grid/excel/default-cs3" %}

By default, material theme is applied to exported excel document.

*Rotate a header text to a certain degree in the exported grid*

The DataGrid has support to customize the column header styles such as changing text orientation, the font color, and so on in the exported Excel file. To achieve this requirement, use the [excelHeaderQueryCellInfo](#) event of the Grid.

The `excelHeaderQueryCellInfo` will be triggered when creating a column header for the excel document to be exported. Customize the column header in this event.

In the following demo, using the `rotation` property of the style argument in the `excelHeaderQueryCellInfo` event, you can rotate the header text of the column header in the excel exported document.

### Exporting hierarchy grid in Vue Grid component

The grid have an option to export the hierarchy grid to excel document. By default, grid will exports the visible child grids in expanded state. you can change the exporting option by using the **ExcelExportProperties.hierarchyExportMode** property. The available options are,

Mode	Behavior
Expanded	Exports the visible child grids in expanded state and remaining child grid in collapsed state when args.isChild property is set to true in <a href="#">beforeExcelExport</a> event.
All	Exports the all the child grids in expanded state.
None	Exports all child grids in collapsed state when args.isChild property is set to true in <a href="#">beforeExcelExport</a> event.

### APP.VUE

### Limitations

- Microsoft Excel permits up to seven nested levels in outlines. So that in the grid we can able to provide only up to seven nested levels and if it exceeds more than seven levels then the document will be exported without outline option.

Please refer the [Microsoft Limitation](#)

### Exporting grid with templates in Vue Grid control

The grid offers the option to export the column, detail, and caption templates to an Excel document. The template contains images, hyperlinks, and customized text.

#### Exporting with column template

The Excel export functionality allows you to export Grid columns that include images, hyperlinks, and custom text to an Excel document.

In the following sample, the hyperlinks and images are exported to Excel using [hyperlink](#) and [image](#) properties in the [excelQueryCellInfo](https://ej2.syncfusion.com/vue/documentation/api/grid/#excelquerycellinfo) event.

Excel Export supports base64 string to export the images.

Excel Export		
Employee Image	Name	Email ID
	Nancy	nancy@domain.com
	Andrew	andrew@domain.com
	Janet	janet@domain.com
	Margaret	margaret@domain.com

#### Exporting with detail template

By default, the grid will export the parent grid with expanded detail rows alone. Change the exporting option by using the `ExcelExportProperties.hierarchyExportMode` property. The available options are:

- | Mode | Behavior |
- |-----|-----|
- | Expanded | Exports the parent grid with expanded detail rows. |
- | All | Exports the parent grid with all the detail rows. |
- | None | Exports the parent grid alone. |

The detail rows in the exported Excel can be customized or formatted using the [exportDetailTemplate](#) event. In this event, the detail rows of the Excel document are formatted in accordance with their parent row details.

In the following sample, the detail row content is formatted by specifying the [columnHeader](#) and [rows](#) properties using its [parentRow](#) details. This allows for the creation of detail rows in the Excel document. Additionally, custom styles can be applied to specific cells using the [style](#) property.

When using [rowSpan](#), it is essential to provide the cell's [index](#) for proper functionality.

### Exporting grid in server in Vue Grid component

The Grid have an option to export the data to Excel in server side using Grid server export library.

#### Server dependencies

The Server side export functionality is shipped in the Syncfusion.EJ2.GridExport package, which is available in Essential Studio and [nuget.org](https://www.nuget.org/packages/Syncfusion.EJ2.GridExport). The following list of dependencies is required for Grid server side Excel exporting action.

- Syncfusion.EJ2
- Syncfusion.EJ2.GridExport

#### Server configuration

The following code snippet shows server configuration using ASP.NET Core Controller Action.

To Export the Grid in server side, You need to call the [serverExcelExport](#) method for passing the Grid properties to server exporting action.

```
`ts
public ActionResult ExcelExport([FromForm] string gridModel)
{
    GridExcelExport exp = new GridExcelExport();
    Grid gridProperty = ConvertGridObject(gridModel);
```

```

return exp.ExcelExport<OrdersDetails>(gridProperty, OrdersDetails.GetAllRecords());
}

private Grid ConvertGridObject(string gridProperty)
{
    Grid GridModel = (Grid)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty, typeof(Grid));
    GridColumnModel cols =
    (GridColumnModel)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
    typeof(GridColumnModel));
    GridModel.Columns = cols.columns;
    return GridModel;
}
`
`

<template>
<div id="app">
<ejs-grid ref='grid' id='Grid' :dataSource='data' :toolbar='toolbarOptions' height='272px'
:toolbarClick='toolbarClick'>
<e-columns>
<e-column field='OrderID' headerText='Order ID' textAlign='Right' width=120></e-column>
<e-column field='CustomerID' headerText='Customer ID' width=150></e-column>
<e-column field='ShipCity' headerText='Ship City' width=150></e-column>
<e-column field='ShipName' headerText='Ship Name' width=150></e-column>
</e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
data() {
return {

```

```

data: data,
toolbarOptions: ['ExcelExport']
};
},
methods: {
toolbarClick: function(args) {
if (args.item.id === 'Gridexcelexport') { // 'Gridexcelexport' -> Grid component id + _ + toolbar item
name
this.$refs.grid.serverExcelExport('Home/ExcelExport');
}
}
},
provide: {
grid: [Toolbar]
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
`

```

Note: Refer to the GitHub sample for quick implementation and testing from [here](#).

#### *CSV export in server side*

You can export the Grid to CSV format by using the [serverCsvExport](#) method which will pass the Grid properties to server.

In the below demo, we have invoked the above method inside the [toolbarClick](#) event. In server side, we have deserialized the Grid properties and passed to the `CsvExport` method which will export the properties to CSV format.

```

`ts
public ActionResult CsvGridExport([FromForm] string gridModel)
{
GridExcelExport exp = new GridExcelExport();
Grid gridProperty = ConvertGridObject(gridModel);
return exp.CsvExport<OrdersDetails>(gridProperty, OrdersDetails.GetAllRecords());
}

```

```

private Grid ConvertGridObject(string gridProperty)
{
    Grid GridModel = (Grid)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty, typeof(Grid));
    GridColumnModel cols =
    (GridColumnModel)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
    typeof(GridColumnModel));
    GridModel.Columns = cols.columns;
    return GridModel;
}
、
、

<template>
<div id="app">
<ejs-grid ref='grid' id='Grid' :dataSource='data' :toolbar='toolbarOptions' height='272px'
:toolbarClick='toolbarClick'>
<e-columns>
<e-column field='OrderID' headerText='Order ID' textAlign='Right' width=120></e-column>
<e-column field='CustomerID' headerText='Customer ID' width=150></e-column>
<e-column field='ShipCity' headerText='Ship City' width=150></e-column>
<e-column field='ShipName' headerText='Ship Name' width=150></e-column>

```

#### *Export grid as memory stream*

The Grid offers an option to export the data as a memory stream instead of downloading it as a file in the browser. To obtain the memory stream of the exported grid, set the `AsMemoryStream` parameter to **true** in the [ExcelExport](#) and [CsvExport](#) methods.

The following code demonstrates how to get the memory stream of exported grid.

```

`ts
public object ExcelExport(string gridModel)
{
  GridExcelExport exp = new GridExcelExport();
  Grid gridProperty = ConvertGridObject(gridModel);
  // pass third parameter as true to get the Memory Stream of exported grid data
  return (MemoryStream)exp.ExcelExport<OrdersDetails>(gridProperty, OrderRepository.GetAllRecords(),
  true);
}
public object CsvExport(string gridModel)
{

```

```

GridExcelExport exp = new GridExcelExport();
Grid gridProperty = ConvertGridObject(gridModel);
return (MemoryStream)exp.CsvExport<OrdersDetails>(gridProperty, OrderRepository.GetAllRecords(),
true);
}

```

#### *Merge grid's memory stream*

The [Essential XlsIO](#) library is used to merge multiple memory streams into a single stream. To learn more about the merge option, please refer to this [documentation](#).

You can merge a memory stream, a file stream, and a local file with the Grid's memory stream in the following ways:

#### *Merging with an existing memory stream*

If you already have a memory stream, you can directly use it to merge with the Grid's memory stream.

In the following code, `ExcelEngine` and `AddCopy` method of `Worksheets` are used to merge the grid's memory stream with an existing memory stream.

```

`ts
using Syncfusion.XlsIO;

public MemoryStream ms1; // defines existing memory stream
public object ExcelExport(string gridModel)
{
    GridExcelExport exp = new GridExcelExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    // get the memory stream of exported grid data
    MemoryStream ms2 = (MemoryStream)exp.ExcelExport<OrdersDetails>(gridProperty,
    OrderRepository.GetAllRecords(), true);

    //New instance of ExcelEngine is created equivalent to launching Microsoft Excel with no workbooks
    open
    ExcelEngine excelEngine = new ExcelEngine();
    //Instantiate the Excel application object
    IApplication application = excelEngine.Excel;
    //Assigns default application version
    application.DefaultVersion = ExcelVersion.Xlsx;
    //open an workbook of existing memory stream and grid's memory stream through Open method of
    IWorkbooks
    IWorkbook sourceWorkbook = application.Workbooks.Open(ms1);
    IWorkbook destinationWorkbook = application.Workbooks.Open(ms2);
}

```

```
//Copy all the worksheet from the Source workbook to the destination workbook
for (int i = 0; i < sourceWorkbook.Worksheets.Count; i++)
{
    destinationWorkbook.Worksheets.AddCopy(sourceWorkbook.Worksheets[i]);
}
destinationWorkbook.ActiveSheetIndex = 1;
//Saving the workbook as stream
MemoryStream ms3 = new MemoryStream();
destinationWorkbook.SaveAs(ms3);
ms3.Position = 0;
//Dispose the instance of ExcelEngine
excelEngine.Dispose();
//Dispose the streams.
ms1.Dispose();
ms2.Dispose();
return ms3;
}
`
```

#### Merging with an existing file stream

If you already have a file stream, you can directly use it to merge with the Grid's memory stream. In the following code, the existing file stream is merged with the Grid's memory stream.

```
`ts
using Syncfusion.XlsIO;

public FileStream fs1; // defines existing file stream
public object ExcelExport(string gridModel)
{
    GridExcelExport exp = new GridExcelExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    MemoryStream ms1 = (MemoryStream)exp.ExcelExport<OrdersDetails>(gridProperty,
    OrderRepository.GetAllRecords(), true);
    ExcelEngine excelEngine = new ExcelEngine();
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Xlsx;
    //fs1 and ms1 represents the existing stream and grid's stream.
```

```

IWorkbook sourceWorkbook = application.Workbooks.Open(fs1);
IWorkbook destinationWorkbook = application.Workbooks.Open(ms1);
for (int i = 0; i < sourceWorkbook.Worksheets.Count; i++)
{
    destinationWorkbook.Worksheets.AddCopy(sourceWorkbook.Worksheets[i]);
}
destinationWorkbook.ActiveSheetIndex = 1;
//Saving the workbook as stream
MemoryStream ms3 = new MemoryStream();
destinationWorkbook.SaveAs(ms3);
ms3.Position = 0;
return ms3;
}
`

```

#### Merging with a local file

To merge a local file with the Grid's memory stream, you need to convert it into a file stream before merging. In the following code, the existing local file is merged with the Grid's memory stream.

```

`ts
using Syncfusion.XlsIO;

// get the file stream of local file
public FileStream fs1 = new FileStream("D:/ExcelDoc.xlsx", FileMode.Open, FileAccess.Read); //
ExcelDoc.xlsx is a local file which is located in local disk D.

public object ExcelExport(string gridModel)
{
    GridExcelExport exp = new GridExcelExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    MemoryStream ms1 = (MemoryStream)exp.ExcelExport<OrdersDetails>(gridProperty,
    OrderRepository.GetAllRecords(), true);
    ExcelEngine excelEngine = new ExcelEngine();
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Xlsx;
    //fs1 and ms1 represents the local file's stream and grid's stream.
    IWorkbook sourceWorkbook = application.Workbooks.Open(fs1);
    IWorkbook destinationWorkbook = application.Workbooks.Open(ms1);

```

```

for (int i = 0; i < sourceWorkbook.Worksheets.Count; i++)
{
    destinationWorkbook.Worksheets.AddCopy(sourceWorkbook.Worksheets[i]);
}
destinationWorkbook.ActiveSheetIndex = 1;
MemoryStream ms3 = new MemoryStream();
destinationWorkbook.SaveAs(ms3);
ms3.Position = 0;
return ms3;
}

```

#### Downloading the merged memory stream

You can download the merged memory stream by converting it into a `FileStreamResult`. In the following code, the merged memory stream is downloaded to the browser.

```

`ts
using Syncfusion.XlsIO;

public ActionResult ExcelExport(string gridModel)
{
    ExcelEngine excelEngine = new ExcelEngine();
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Xlsx;
    //open an workbook of streams through Open method of IWorkbooks
    IWorkbook sourceWorkbook = application.Workbooks.Open(ms1);
    IWorkbook destinationWorkbook = application.Workbooks.Open(ms2);
    for (int i = 0; i < sourceWorkbook.Worksheets.Count; i++)
    {
        destinationWorkbook.Worksheets.AddCopy(sourceWorkbook.Worksheets[i]);
    }
    destinationWorkbook.ActiveSheetIndex = 1;
    MemoryStream ms3 = new MemoryStream();
    destinationWorkbook.SaveAs(ms3);
    ms3.Position = 0;
    // Save the MemoryStream into FileStreamResult
}

```

```

FileStreamResult fileStreamResult = new FileStreamResult(ms3, "Application/vnd.openxmlformats-officedocument.spreadsheetml.sheet");
fileStreamResult.FileName = "Export.xlsx";
//Dispose the instance of ExcelEngine
excelEngine.Dispose();
//Dispose the streams.
ms1.Dispose();
ms2.Dispose();
// return the file
return fileStreamResult;
}

```

*Rotate a header text to a certain degree in the exported grid on the server side*

The DataGrid has support to customize the column header styles such as changing text orientation, the font color, and so on in the exported Excel file. To achieve this requirement, use the `ServerExcelHeaderQueryCellInfo` event of the Grid.

The `ServerExcelHeaderQueryCellInfo` will be triggered when creating a column header for the excel document to be exported in the server side. Customize the column header in this event.

In the following demo, using the `HeaderCellRotate` method of the `GridExcelExport` class in the `ServerExcelHeaderQueryCellInfo` event, you can rotate the header text of the column header in the excel exported document.

```

`ts
public ActionResult ExcelExport(string gridModel)
{
    GridExcelExport exp = new GridExcelExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    gridProperty.ServerExcelHeaderQueryCellInfo = ExcelHeaderQueryCellInfo;
    IEnumerable data = Utils.DataTableToJson(dt);
    var result = exp.ExcelExport<dynamic>(gridProperty, data);
    return result;
}

private void ExcelHeaderQueryCellInfo(object excel)
{
    ServerExcelHeaderQueryCellInfoEventArgs name = (ServerExcelHeaderQueryCellInfoEventArgs)excel;
    headerValues.Add(name.Column.HeaderText);
}

```

```

var longestString = headerValues.Where(s => s.Length == headerValues.Max(m => m.Length)).First();
GridExcelExport exp = new GridExcelExport();
var size = exp.ExcelTextSize(name.Style.Font.FontName, (float)name.Style.Font.Size, longestString);
name.Cell.RowHeight = size.Width;
exp.HeaderCellRotate(name, 45); // Give the rotate degree value by the user.
name.Style.Borders.LineStyle = Syncfusion.XlsIO.ExcelLineStyle.None;
}
`

```

### Limitations

- The export feature for detail and caption templates is not supported in server-side exporting.
- Multiple grids exporting feature is not supported with server side exporting.

## Global local in Vue Grid component

### Localization

The **Localization** library allows you to localize default text content of the Grid. The grid component has static text on some features (like group drop area text, pager information text, etc.) that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [locale](#) value and translation object.

The following list of properties and its values are used in the grid.

Locale key words | Text

EmptyRecord | No records to display

True | true

False | false

InvalidFilterMessage | Invalid Filter Data

GroupDropArea | Drag a column header here to group its column

UnGroup | Click here to ungroup

GroupDisable | Grouping is disabled for this column

FilterbarTitle | \s filter bar cell

EmptyDataSourceError | DataSource must not be empty at initial load since columns are generated from dataSource in AutoGenerate Column Grid

Add | Add

Edit | Edit

Cancel | Cancel

Update | Update

previousPageTooltip | Go to previous page

nextPagerTooltip | Go to next pager items

previousPagerTooltip | Go to previous pager items

pagerDropDown | Items per page

pagerAllDropDown | Items

All | All

### [Loading translations](#)

To load translation object in an application use `load` function of `L10n` class.

The below example demonstrates the Grid in `Deutsch` culture.

### **APP.VUE**

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' locale='de-DE' :allowGrouping='true'
    :allowPaging='true' :pageSettings='pageOptions' height='220px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
        width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
        width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { L10n, setCulture } from '@syncfusion/ej2-base';
import { GridPlugin, Page, Group } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
setCulture('de-DE');
L10n.load({
  'de-DE': {
    'grid': {
```

```

        'EmptyRecord': 'Keine Aufzeichnungen angezeigt',
        'GroupDropArea': 'Ziehen Sie einen Spaltenkopf hier, um die
Gruppe ihre Spalte',
        'UnGroup': 'Klicken Sie hier, um die Gruppierung aufheben',
        'EmptyDataSourceError': 'DataSource darf bei der Erstaustauslastung
nicht leer sein, da Spalten aus der dataSource im AutoGenerate
Spaltenraster',
        'Item': 'Artikel',
        'Items': 'Artikel'
    },
    'pager': {
        'currentPageInfo': '{0} von {1} Seiten',
        'totalItemsInfo': '({0} Beiträge)',
        'firstPageTooltip': 'Zur ersten Seite',
        'lastPageTooltip': 'Zur letzten Seite',
        'nextPageTooltip': 'Zur nächsten Seite',
        'previousPageTooltip': 'Zurück zur letzten Seit',
        'nextPagerTooltip': 'Gehen Sie zu den nächsten Pager-Elementen',
        'previousPagerTooltip': 'Gehen Sie zu vorherigen Pager-
Elementen'
    }
    });
Vue.use(GridPlugin);
export default {
    data() {
        return {
            data: data,
            pageOptions: { pageSize: 7 }
        };
    },
    provide: {
        grid: [Page, Group]
    }
}
</script>
<style>
    @import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/databind/default-cs5" %}

### Internationalization

The **Internationalization** library is used to globalize number, date, and time values in grid component using format strings in the [columns.format](#).

### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid :dataSource='data' locale='de-DE' height='315px'>
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>

```

```

        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='Freight' headerText='Freight'
:format='formatOptions' textAlign='Right' width=150></e-column>
        <e-column field='OrderDate' headerText='Order Date'
:format='dateFormatOptions' textAlign='Right' width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { L10n, loadCldr, setCulture, setCurrencyCode } from
"@syncfusion/ej2-base";
import * as currencies from './currencies.json';
import * as cagregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';
import * as timeZoneNames from './timeZoneNames.json';
import * as numberingSystems from './numberingSystems.json';
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
setCulture('de-DE');
setCurrencyCode('EUR');
L10n.load({
    'de-DE': {
        'grid': {
            'EmptyRecord': 'Keine Aufzeichnungen angezeigt',
            'GroupDropArea': 'Ziehen Sie einen Spaltenkopf hier, um die
Gruppe ihre Spalte',
            'UnGroup': 'Klicken Sie hier, um die Gruppierung aufheben',
            'EmptyDataSourceError': 'DataSource darf bei der Erstaustlastung
nicht leer sein, da Spalten aus der dataSource im AutoGenerate
Spaltenraster',
            'Item': 'Artikel',
            'Items': 'Artikel'
        },
        'pager': {
            'currentPageInfo': '{0} von {1} Seiten',
            'totalItemsInfo': '({0} Beiträge)',
            'firstPageTooltip': 'Zur ersten Seite',
            'lastPageTooltip': 'Zur letzten Seite',
            'nextPageTooltip': 'Zur nächsten Seite',
            'previousPageTooltip': 'Zurück zur letzten Seit',
            'nextPagerTooltip': 'Gehen Sie zu den nächsten Pager-Elementen',
            'previousPagerTooltip': 'Gehen Sie zu vorherigen Pager-
Elementen'
        }
    }
});
Vue.use(GridPlugin);
export default {
    data() {
        return {
            data: data,

```

```

        formatOptions: { format: 'C2' , useGrouping: false,
        minimumSignificantDigits:1, maximumSignificantDigits:3, currency: 'EUR' },
        dateFormatOptions: {type: 'date', format: 'dd.MM.yy'}
    };
}
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/databind/default-cs6" %}

\* In the above sample, **Freight** column is formatted by **NumberFormatOptions**.

\* By default, [locale](#) value is **en-US**. If you want to change **en-US** culture, then set the [locale](#).

### Right to Left - RTL

RTL provides an option to switch the text direction and layout of Grid component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc). To enable RTL in the Grid, set the [enableRtl](#) to true.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid :dataSource='data' :enableRtl='true' locale='ar-AE'
        :allowPaging='true' :pageSettings='pageOptions'>
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
                textAlign='Right' width=120></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
                width=150></e-column>
                <e-column field='ShipCity' headerText='Ship City'
                width=150></e-column>
                <e-column field='ShipName' headerText='Ship Name'
                width=150></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { L10n, setCulture } from '@syncfusion/ej2-base';
import { GridPlugin, Page } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
setCulture('ar-AE');
L10n.load({
    'ar-AE': {
        'grid': {
            'EmptyRecord': 'لا سجلات لعرضها',
            'EmptyDataSourceError': 'يجب أن يكون مصدر البيانات فارغة في التحميل الأولي منذ يتم إنشاء الأعمدة من مصدر البيانات في أوتوجينيراتد عمود الشبكة'
        },
        'pager': {

```

```

        'currentPageInfo': '{0} صفحة 1 {من}',
        'totalItemsInfo': '({0} العناصر)',
        'firstPageTooltip': 'انتقل إلى الصفحة الأولى',
        'lastPageTooltip': 'انتقل إلى الصفحة الأخيرة',
        'nextPageTooltip': 'انتقل إلى الصفحة التالية',
        'previousPageTooltip': 'انتقل إلى الصفحة السابقة',
        'nextPagerTooltip': 'انتقل إلى عناصر بيكر التالية',
        'previousPagerTooltip': 'للذهاب إلى عناصر بيكر السابقة'
    }
  }
});
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      pageOptions: { pageSize: 7 }
    };
  },
  provide: {
    grid: [Page]
  }
}
</script>
<style>

## Accessibility in Vue Grid component

The Grid component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

### WAI-ARIA attributes

The Grid component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Grid component:

Attributes	Purpose
---	---
<code>role=grid</code>	To represent the element containing the grid component.
<code>role=row</code>	To represent the element containing the cells of the row in the grid.
<code>role=rowgroup</code>	To represent the group of rows in the grid.

| **role=columnheader** | To represent the cell in a row contains header information for a column in the grid. |

| **role=gridcell** | To represent a cell in the grid component. |

| **role=button** | To represent the element that acts as a button in the grid. |

| **role=search** | To represent the element that acts as a search region in the grid. |

| **role=presentation** | To represent the element to be not available for accessibility concerns. |

| **role=navigation** | To represent the element containing pager elements to navigate from one page to another. |

| **aria-colindex** | Defines the column index of the column with respect to the total number of columns within the grid. |

| **aria-rowindex** | Defines row index of the row with respect to the total number of rows within the grid. |

| **aria-rowspan** | Defines the number of rows spanned by a cell within the grid. |

| **aria-colspan** | Defines the number of columns spanned by a cell within the grid. |

| **aria-rowcount** | Defines the total number of rows in the grid. |

| **aria-colcount** | Defines the total number of columns in the grid. |

| **aria-selected** | Indicates the current "selected" state of the rows and cells in the grid. |

| **aria-expanded** | Indicate if the expand icon in the hierarchy grid or grouped grid or detail grid is expanded or collapsed |

| **aria-sort** | Indicates whether the data in the grid are sorted in ascending or descending order. |

| **aria-busy** | Indicates an element is being modified and that assistive technologies may want to wait until the changes are complete before informing the user about the update. |

| **aria-owns** | Identifies an element in order to define a visual, functional, or contextual relationship between a parent and its child elements. |

| **aria-hidden** | Hides the element from accessibility concerns. |

| **aria-labelledby** | Provides an accessible name for the checkbox labels in excel filter, checkbox filter and column chooser dialog. |

| **aria-describedby** | Provides an description about the features enabled in the header when the grid header cell is focused. |

### Keyboard interaction

The Grid component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Grid component.

<b>Pager</b>

**Windows | MAC | To do this**

**Home | Fn + Left Arrow | Moves the focus to the first cell of the focused row.**

**End | Fn + Right Arrow | Moves the focus to the last cell of the focused row.**

**Ctrl + Home | Command + Fn + Left Arrow | Moves the focus to the first Cell of the first row in the grid.**

**Ctrl + End | Command + Fn + Right Arrow | Moves the focus to the last Cell of the last row in the grid.**

**Up Arrow | Up Arrow | Moves the cell focus upward from the focused cell.**

**Down Arrow | Down Arrow | Moves the cell focus downward from the focused cell.**

**Right Arrow | Right Arrow | Moves the cell focus right side from the focused cell.**

**Left Arrow | Left Arrow | Moves the cell focus left side from the focused cell.**

**Alt + J | Alt + J | Moves the focus to the entire grid.**

**Alt + W | Alt + W | Move the focus to the grid content element.**

**<b>Selection</b>**

**Windows | MAC | To do this**

**Ctrl + Up Arrow | Command + Up Arrow | Collapses all the visible groups.**

**Ctrl + Down Arrow | Command + Down Arrow | Expands all the visible groups.**

**Ctrl + Space | Ctrl + Space | Performs grouping when focused on a header element.**

**Enter | Enter | If the current cell is an expand/collapse cell then expands/collapses the current group/detailrow/childgrid.**

**<b>Print</b>**

**Windows | MAC | To do this**

**Ctrl + C | Command + C | Copies selected rows or cells data into the clipboard.**

**Ctrl + Shift + H | Ctrl + Shift + H | Copies selected rows or cells data with header into clipboard**

**<b>Editing</b>**

**Windows | MAC | To do this**

**Alt + Down arrow | Alt + Down arrow | Opens the filter menu(excel, menu and checkbox filter) when its header element is in focused state.**

**<b>Column Menu</b>**

**Windows | MAC | To do this**

**Ctrl + left arrow or right arrow | Command + left arrow or right arrow | Reorders the focused header column to the left or right side.**

**<b>Sorting</b>**

**Windows | MAC | To do this**

**Enter | Enter | Performs sorting(ascending/descending) on a column when its header element is in focused state.**

**Ctrl + Enter | Command + Enter | Performs multi-sorting on a column when its header element is in focused state.**

**Shift + Enter | Shift + Enter | Clears sorting for the focused header column.**

<br>

**\* The Command and Control keys on Mac devices can be interchanged. When this switch occurs, use the Command key in place of the Control key and the Control key in place of the Command key for the above listed key interactions with Mac devices.**

**\* For example, after switching the keys to group the columns when the header element is focused use Command + Space and for expanding the visible groups use Ctrl + Down Arrow.**

### Ensuring accessibility

The Grid component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Grid component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Grid component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/grid.html" %}

### Clipboard in Vue Grid component

The clipboard provides an option to copy selected rows or cells data into the clipboard.

The following list of keyboard shortcuts is supported in the Grid to copy selected rows or cells data into clipboard.

Interaction keys | Description

**Ctrl + C | Copy selected rows or cells data into clipboard.**

**Ctrl + Shift + H | Copy selected rows or cells data with header into clipboard.**

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' height='315px'
      :selectionSettings='selectionOptions'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
          textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
          width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'

### Copy to clipboard by external buttons

To copy selected rows or cells data into clipboard with help of external buttons, you need to invoke the [copy](#) method.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-button id='copy' @click.native='copy'>Copy</ejs-button>
        <ejs-button id='copyHeader'
@click.native='copyHeader'>CopyHeader</ejs-button>
        <ejs-grid ref='grid' :dataSource='data' height='280px'
:selectionSettings='selectionOptions'>
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
                <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
                <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";

```

```

import { data } from './datasource.js';
Vue.use(GridPlugin);
Vue.use(ButtonPlugin);
export default {
  data() {
    return {
      data: data,
      selectionOptions: { type: 'Multiple' }
    };
  },
  methods: {
    copy: function() {
      this.$refs.grid.copy();
    },
    copyHeader: function() {
      this.$refs.grid.copy(true);
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/print/default-cs1" %}

### AutoFill

AutoFill Feature allows you to copy the data of selected cells and paste it to another cells by just dragging the autofill icon of the selected cells up to required cells. This feature is enabled by defining [enableAutoFill](#) property as true.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :enableAutoFill= "true"
      :selectionSettings='selectionOptions' :editSettings='editSettings'
      :toolbar='toolbar' height='273px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
          textAlign='Right' :isPrimaryKey='true' :visible='false' width=120></e-
          column>
        <e-column field='CustomerID' headerText='Customer ID'
          width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
          width=150></e-column>
        <e-column field='ShipCountry' headerText='ShipCountry'
          width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
          width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";

```

```

import { GridPlugin, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Batch' },
      toolbar: ['Add', 'Update', 'Cancel'],
      selectionOptions: { type: 'Multiple', mode: 'Cell', cellSelectionMode:
'Box' }
    };
  },
  provide: {
    grid: [Edit, Toolbar]
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/databind/default-cs2" %}

\* If [enableAutoFill](#) is set to true, then the autofill icon will be displayed on cell selection to copy cells.

\* It requires the selection [mode](#) to be **Cell**, [cellSelectionMode](#) to be **Box** and also Batch Editing should be enabled.

#### Limitations of AutoFill

- Since the string values are not parsed to number and date type, so when the selected string type cells are dragged to number type cells then it will display as **NaN**. For date type cells, when the selected string type cells are dragged to date type cells then it will display as an **empty cell**.
- Linear series and the sequential data generations are not supported in this autofill feature.

#### Paste

You can able to copy the content of a cell or a group of cells by selecting the cells and pressing Ctrl + C shortcut key and paste it to another set of cells by selecting the cells and pressing Ctrl + V shortcut key.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :selectionSettings='selectionOptions'
:editSettings='editSettings' :toolbar='toolbar' height='273px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' :isPrimaryKey='true' :visible='false' width=120></e-
column>

```

```

        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipCountry' headerText='ShipCountry'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Batch' },
      toolbar: ['Add', 'Update', 'Cancel'],
      selectionOptions: { type: 'Multiple', mode: 'Cell', cellSelectionMode:
'Box' }
    };
  },
  provide: {
    grid: [Edit, Toolbar]
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/databind/default-cs3" %}

To perform paste functionality, it requires the selection [mode](#) to be **Cell**, [cellSelectionMode](#) to be **Box** and also Batch Editing should be enabled.

#### *Limitations of Paste Functionality*

- Since the string values are not parsed to number and date type, so when the copied string type cells are pasted to number type cells then it will display as **NaN**. For date type cells, when the copied string format cells are pasted to date type cells then it will display as an **empty cell**.

### Context menu in Vue Grid component

The Grid has options to show the context menu when right clicked on it. To enable this feature, you need to define either default or custom item in the [contextMenuItems](#).

To use the context menu, inject the **ContextMenu** module in the **provide** section.

The default items are in the following table.

Items | Description

**AutoFit** | Auto fit the current column.

**AutoFitAll** | Auto fit all columns.

**Edit** | Edit the current record.

**Delete** | Delete the current record.

**Save** | Save the edited record.

**Cancel** | Cancel the edited state.

**Copy** | Copy the selected records.

**PdfExport** | Export the grid data as Pdf document.

**ExcelExport** | Export the grid data as Excel document.

**CsvExport** | Export the grid data as CSV document.

**Group** | Group the current column.

**Ungroup** | Ungroup the current column.

**SortAscending** | Sort the current column in ascending order.

**SortDescending** | Sort the current column in descending order.

**FirstPage** | Go to the first page.

**PrevPage** | Go to the previous page.

**LastPage** | Go to the last page.

**NextPage** | Go to the next page.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid :dataSource='data' id="gridcomp" :allowPaging='true'
:allowExcelExport='true' :allowPdfExport='true' height='215px'
:allowSorting='true'
      :contextMenuItems="contextMenuItems" :editSettings='editing'
:allowGrouping='true'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID' width='120'
textAlign="Right" isPrimaryKey='true'></e-column>
        <e-column field='CustomerID' headerText='Customer Name'></e-
column>
        <e-column field='Freight' headerText='Freight' format='C2'
textAlign="Right" editType='numericedit'></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width='150'></e-column>
      </e-columns>
    </div>
  </template>
```

```

    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, ContextMenu, Page, Resize, Sort, Group, Edit,
PdfExport, ExcelExport } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      contextMenuItems: ['AutoFit', 'AutoFitAll', 'SortAscending',
'SortDescending',
'Copy', 'Edit', 'Delete', 'Save', 'Cancel',
'PdfExport', 'ExcelExport', 'CsvExport', 'FirstPage',
'PrevPage',
'LastPage', 'NextPage', 'Group', 'Ungroup'],
      editing: {allowEditing: true, allowDeleting: true}
    };
  },
  provide : {
    grid: [ContextMenu, Page, Resize, Sort, Group, Edit, PdfExport,
ExcelExport]
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/contextMenu/default-cs1" %}

### Custom context menu items

The custom context menu items can be added by defining the [contextMenuItems](#) as a collection of [contextMenuItemModel](#). Actions for this customized items can be defined in the [contextMenuClick](#) event.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='grid' id='gridcomp' :dataSource='data'
:allowSelection='true' :allowPaging='true' height='265px'
:contextMenuItems='contextMenuItems' :contextMenuClick='contextMenuClick'>
      <e-columns>
        <e-column field='EmployeeID' :isPrimaryKey='true'
headerText='Employee ID' textAlign='Right' width=120></e-column>
        <e-column field='FirstName' headerText='First Name'
width=150></e-column>
        <e-column field='LastName' headerText='Last Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>

```

```

        <e-column field='City' headerText='City' width=150></e-
column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, ContextMenu, Page } from "@syncfusion/ej2-vue-grids";
import { employeeData } from './datasource.js';
Vue.use(GridPlugin);
export default {
    data() {
        return {
            data: employeeData,
            contextMenuItems: [{text: 'Copy with headers', target: '.e-content',
id: 'copywithheader'}]
        };
    },
    methods: {
        contextMenuClick: function(args) {
            if(args.item.id === 'copywithheader') {
                this.$refs.grid.copy(true);
            }
        }
    },
    provide: {
        grid: [ContextMenu, Page]
    }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/contextMenu/default-cs2" %}

### Show context menu on left click

By default, the context menu items will be shown in the Grid using the right mouse click action. Show the context menu items during the left mouse click action using the [created](#) and context menu's `beforeOpen` events of the Grid.

Using the `onclick` eventlistener of Grid , you can get the clicked position values and send them to the `open` method of the context menu in the `onclick` event of the Grid. Also, we have prevented the default right click action to open the context menu items using the [created](#) event of the Grid.

This is demonstrated in the following sample.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid ref='grid' :dataSource='data' :allowPaging='true'
            height='265px'

```

```

        :contextMenuItems='contextMenuItems'
        :editSettings = 'editOptions'
        :created = 'created' v-on:click.native="clicked">
            <e-columns>
                <e-column field='EmployeeID' :isPrimaryKey='true'
headerText='Employee ID'
                textAlign='Right' width=120></e-column>
                <e-column field='FirstName' headerText='FirstName'
width=150></e-column>
                <e-column field='LastName' headerText='Last Name'
width=150></e-column>
                <e-column field='City' headerText='City' width=150></e-
column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, ContextMenu, Page, Edit } from "@syncfusion/ej2-vue-
grids";
import { employeeData } from './datasource.js';
Vue.use(GridPlugin);
export default {
    data() {
        return {
            values: "",
            data: employeeData,
            contextMenuItems: ['Copy', 'Edit', 'Delete', 'Save', 'Cancel'],
            editOptions: {
                allowDeleting: true,
                allowEditing: true,
                allowAdding: true,
            },
        };
    },
    methods: {
        created: function(args) {
            this.$refs.grid.ej2Instances.contextMenuModule.contextMenu.beforeOpen
= (
                args
            ) => {
                if (args.event && args.event.which === 3) args.cancel = true;
                args.event = this.values;

            this.$refs.grid.ej2Instances.contextMenuModule.contextMenuBeforeOpen(
                args
            );
        };
    },
    clicked: function(event) {
        this.values = event;
        this.$refs.grid.ej2Instances.contextMenuModule.contextMenu.open(
            this.values.pageY + pageYOffset,
            this.values.pageX + pageXOffset
        );
    }
}

```

```

    },
    provide: {
      grid: [ContextMenu, Page, Edit]
    }
  }
</script>
<style>
  @import
  "https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
  vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/contextMenu/default-cs3" %}

You can hide or show an item in context menu for specific area inside of grid by defining the [target](#) property.

### Enable or disable context menu items

It is possible to enable or disable the default and custom context menu items in the Grid component. This is achieved by using the [enableItems](#) method of the ContextMenu. To enable or disable menu items, set the **enable** parameter in the **enableItems** method to true, and vice versa.

In the following sample, the Copy item is enabled or disabled based on some condition (as per the needs of the application) in the [rowSelected](#) event of the Grid.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' id="gridcomp"
    :allowPaging='true' height='215px'
    :contextMenuItems="contextMenuItems" :editSettings='editSettings'
    :rowSelected='rowSelected'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID' width='120'
        textAlign="Right" isPrimaryKey='true'></e-column>
        <e-column field='CustomerID' headerText='Customer Name'></e-
        column>
        <e-column field='Freight' headerText='Freight' format='C2'
        textAlign="Right" editType='numericedit'></e-column>
        <e-column field='ShipCity' headerText='Ship City'
        width='150'></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, ContextMenu, Page, Edit } from "@syncfusion/ej2-vue-
grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,

```

```

        contextMenuItems: ['Copy', 'Edit', 'Delete'],
        editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true }
    };
    },
    methods: {
        rowSelected: function (args) {
            if (args.data.OrderID % 2 === 0) {

this.$refs.grid.ej2Instances.contextMenuModule.contextMenu.enableItems(['Cop
y'], false);
            } else {

this.$refs.grid.ej2Instances.contextMenuModule.contextMenu.enableItems(['Cop
y'], true);
            }
        },
        provide : {
            grid: [ContextMenu, Page, Edit]
        }
    }
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/contextMenu/default-cs4" %}

### Loading animation in Vue Grid component

The grid has an option to show a loading indicator in-between the time of fetching the data and binding it to the grid during initial rendering or refreshing or after performing any grid action like sorting, filtering, grouping, and more. The grid supports two indicator types, which is achieved by setting the `loadingIndicator.indicatorType` property to `Spinner` or `Shimmer`. The default value of the indicator type is "Spinner."

In the following sample, the Shimmer indicator is displayed while the grid is loading and refreshing when using the remote data.

#### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid :dataSource="data" :allowSorting='true'
:allowFiltering='true' :allowPaging="true" :pageSettings='pageSettings'
:loadingIndicator='loadingIndicator'>
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
                <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
                <e-column field='OrderDate' headerText='Order Date'
textAlign='Right' format='yMd' type='date' width=120></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>

```

```

        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Sort, Filter } from "@syncfusion/ej2-vue-grids";
import { DataManager, ODataAdaptor } from "@syncfusion/ej2-data";
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: new DataManager({
        url: 'https://services.syncfusion.com/js/production/api/Orders/',
        adaptor: new ODataAdaptor()
      }),
      pageSettings: { pageCount: 3 },
      loadingIndicator: { indicatorType: 'Shimmer' },
    };
  },
  provide: {
    grid: [Page, Sort, Filter]
  }
}

## Style And Appearance

### Style and appearance in Vue Grid component

To modify the Grid appearance, you need to override the default CSS of grid. Please find the CSS structure that can be used to modify the Grid appearance. Also, you have an option to create your own custom theme for all the JavaScript controls using our [Theme Studio](#).

#### Customizing the Grid root element

Use the below CSS to customize the Grid root element.

```

,

.e-grid {
font-family: cursive;
}
,

```

You can modify the grid styling appearance by overriding the default CSS style of the Grid.

In the following sample, the font family of grid content is changed to **cursive**, and the background color of rows, selected rows, alternate rows, and row hovering color is modified using the below CSS styles.

#### APP.VUE

```

<template>

```

```

    <div id="app">
      <ejs-grid ref='grid' :dataSource='data' :allowPaging="true"
:pageSettings='pageSettings' :selectionSettings='selectionOptions'
height='272px'>
        <e-columns>
          <e-column field='OrderID' headerText='Order ID'
type='number' textAlign='Right' :isPrimaryKey='true' width=100></e-column>
          <e-column field='CustomerID' headerText='Customer ID'
type='string' width=120></e-column>
          <e-column field='Freight' headerText='Freight' type='number'
format='C2' textAlign='Right' width=100></e-column>
          <e-column field='ShipName' headerText='Ship Name'
type='string' width=180></e-column>
        </e-columns>
      </ejs-grid>
    </div>
  </template>
  <script>
import Vue from "vue";
import { GridPlugin, Page } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      pageSettings: { pageSize: 8 },
      selectionOptions: { type: 'Multiple' }
    };
  },
  provide: {
    grid: [Page]
  }
}
  </script>
  <style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
    .e-grid {
      font-family: cursive;
    }
    .e-grid .e-row:hover .e-rowcell {
      background-color: rgb(204, 229, 255) !important;
    }
    .e-grid .e-rowcell.e-selectionbackground {
      background-color: rgb(230, 230, 250);
    }
    .e-grid .e-row.e-altrow {
      background-color: rgb(150, 212, 212);
    }
    .e-grid .e-row {
      background-color: rgb(180, 180, 180);
    }
  </style>

```

{% previewsample "page.domainurl/code-snippet/grid/pdf/multiple-cs2" %}

## Header in Vue Grid component

### *Customizing the Grid header*

Use the below CSS to customize the Grid header root element. Using this, you can override the thin line between header and content of the grid.

```
,  
  
.e-grid .e-gridheader {  
border:2px solid green  
}  
,
```

### *Customizing the Grid header cell*

You can customize the Grid header cell elements using this CSS.

```
,  
  
.e-grid .e-headercell {  
color: darkblue;  
}  
,
```

### *Customizing the Grid header cell div element*

Use the below CSS to customize the Grid header cell div element. Using this CSS, you can customize the header text content.

```
,  
  
.e-grid .e-headercelldiv {  
font-size: 15px;  
}  
,
```

## Paging in Vue Grid component

### *Customizing the Grid pager root element*

Using this CSS, you can customize the Grid pager root element.

```
,  
  
.e-grid .e-gridpager {  
font-family: cursive;  
background-color: #deecf9;  
}  
,
```

### *Customizing the Grid pager container element*

Use the below CSS to customize the Grid pager container element.

```
,
```

```
.e-grid .e-pagercontainer {  
background-color: #deecf9;  
}  
、
```

#### *Customizing the Grid pager navigation elements*

Customize the Grid pager navigation elements, using the below selector.

```
、  
  
.e-grid .e-gridpager .e-prevpagedisabled,  
.e-grid .e-gridpager .e-prevpage,  
.e-grid .e-gridpager .e-nextpage,  
.e-grid .e-gridpager .e-nextpagedisabled,  
.e-grid .e-gridpager .e-lastpagedisabled,  
.e-grid .e-gridpager .e-lastpage,  
.e-grid .e-gridpager .e-firstpage,  
.e-grid .e-gridpager .e-firstpagedisabled {  
background-color: #deecf9;  
}  
、
```

#### *Customizing the Grid pager page numeric link elements*

Use the below CSS to customize the Grid pager current page numeric link elements.

```
、  
  
.e-grid .e-gridpager .e-numericitem {  
border-radius: initial;  
}  
、
```

#### *Customizing the Grid pager current page numeric element*

Using this CSS, you can customize the Grid pager current page numeric item.

```
、  
  
.e-grid .e-gridpager .e-currentitem {  
background-color: #0078d7;  
}  
、
```

### Sorting in Vue Grid component

#### *Customizing the Grid sorting icon*

Use the below CSS to customize the Grid sorting icon which present in the Grid header. You can use the available Syncfusion [icons](#) based on your theme.

```
,  
  
.e-grid .e-icon-ascending::before {  
content: '\e306';  
}  
  
.e-grid .e-icon-ascending::before {  
content: '\e304';  
}  
,
```

#### *Customizing the Grid multi sorting icon*

Use the below CSS to customize the Grid multi sorting icon which present in the Grid header. You can use the available Syncfusion [icons](#) based on your theme.

```
,  
  
.e-grid .e-sortnumber {  
background-color: #deecf9;  
font-family: cursive;  
}  
,
```

### Filtering in Vue Grid component

#### *Customizing the filterbar cell element*

Use the below CSS to customize the Grid Filterbar cell element present in the Grid header.

```
,  
  
.e-grid .e-filterbarcell {  
background-color: #deecf9;  
}  
,
```

#### *Customizing the filterbar input element*

Customize the Grid Filterbar input element using this CSS.

```
,  
  
.e-grid .e-filterbarcell .e-input-group input.e-input{  
font-family: cursive;  
}
```

,

#### *Customizing the filterbar input focus*

Use the below CSS to customize the Grid Filterbar highlight color of focused filterbar input element.

,

```
.e-grid .e-filterbarcell .e-input-group.e-input-focus::after,  
.e-grid .e-filterbarcell .e-input-group.e-input-focus::before{  
background-color: #0078d7;  
}
```

,

#### *Customizing the filterbar input clear icon*

Use the below CSS to customize the Grid Filterbar input clear icon.

,

```
.e-grid .e-filterbarcell .e-input-group .e-clear-icon::before {  
content: '\e825';  
}
```

,

#### *Customizing the Grid filtering icon*

Below CSS customizes the Grid filter icon which present in the Grid header. You can also use custom icons. Here we have used bootstrap icon for filter icon element.

,

```
.e-grid .e-icon-filter::before{  
content: '\002a';  
}
```

,

#### *Customizing the filter dialog content*

Use the below CSS to customize the Grid filter dialog content element.

,

```
.e-grid .e-filter-popup .e-dlg-content {  
background-color: #deecf9;  
}
```

,

#### *Customizing the filter dialog footer*

Grid filter dialog footer element can be customized by using the below CSS.

,

```
.e-grid .e-filter-popup .e-footer-content {
```

```
background-color: #deecf9;
}
```

#### *Customizing the filter dialog input element*

Use the below CSS to customize the Grid filter dialog input element.

```
.e-grid .e-filter-popup .e-input-group input.e-input{
font-family: cursive;
}
```

#### *Customizing the filter dialog button element*

Use the below CSS to customize the Grid filter dialog button element.

```
.e-grid .e-filter-popup .e-btn{
font-family: cursive;
}
```

#### *Customizing the excel filter dialog number filters element*

Grid Excel filter dialog number filters element can be customized using the below CSS.

```
.e-grid .e-filter-popup .e-contextmenu-wrapper ul{
background-color: #deecf9;
}
```

### Grouping in Vue Grid component

#### *Customizing the group header*

Use the below CSS to customize the group header element.

```
.e-grid .e-groupdroparea {
background-color: #deecf9;
}
```

#### *Customizing the group expand or collapse icons*

Use the below CSS to customize the Grid group expand/collapse icon. You can use the available Syncfusion [icons](#) based on your theme.

```
、  
  
.e-grid .e-icon-gdownarrow::before{  
content:'\e916'  
}  
  
.e-grid .e-icon-grightarrow::before{  
content:'\e913'  
}  
、
```

#### *Customizing the group caption row*

Below CSS customizes the Grid group caption row element.

```
、  
  
.e-grid .e-groupcaption {  
background-color: #deecf9;  
}  
  
.e-grid .e-recordplusexpand,  
.e-grid .e-recordpluscollapse {  
background-color: #deecf9;  
}  
、
```

#### *Customizing the indent cell*

Use the below CSS to customize the Grid grouping indent cell element.

```
、  
  
.e-grid .e-indentcell {  
background-color: #deecf9;  
}  
、
```

#### *Tool bar in Vue Grid component*

##### *Customizing the toolbar root element*

Use the below CSS to customize the Grid toolbar root element.

```
、  
  
.e-grid .e-toolbar-items {  
background-color: #deecf9;  
}  
、
```

*Customizing the toolbar button element*

Use the below CSS to customize the Grid toolbar button element.

`

```
.e-grid .e-toolbar .e-btn {  
background-color: #deecf9;  
}
```

`

*Editing in Vue Grid component**Customizing the edited and added row element*

Use the below CSS to customize the Grid edited and added row table elements

`

```
.e-grid .e-editedrow table,  
.e-grid .e-addedrow table {  
background-color: #deecf9;  
}
```

`

*Customizing the edited row input element*

Grid edited row input elements can be customized using the below CSS.

`

```
.e-grid .e-gridform .e-rowcell .e-input-group .e-input.e-field {  
font-family: cursive;  
}
```

`

*Customizing the edit dialog header element*

Use the below CSS to customize the Grid edit dialog header element

`

```
.e-edit-dialog .e-dlg-header-content {  
background-color: #deecf9;  
}
```

`

*Customizing the edited row input element in dialog edit mode*

Below CSS customizes the Grid edited row input element in Dialog edit mode

`

```
.e-gridform .e-rowcell .e-float-input .e-field {  
font-family: cursive;
```

```
}
,
```

### *Customizing the command column buttons*

Use the below CSS to customize the command column buttons such as edit, delete, update, and cancel.

```
,
```

```
.e-grid .e-edit::before, .e-grid .e-delete::before {
color: #ff8787;
}

.e-grid .e-update::before, .e-grid .e-cancel-icon::before {
color: #0078d7;
}
,
```

Order ID	Customer ID	Freight	Ship Country	Manage Records
10248	VINET	\$2.38	France	 
10249	TOMSP	\$11.61	Germany	 
10250	HANAR	\$65.83	Brazil

### Aggregate in Vue Grid component

#### *Customizing the aggregate root element*

Use the below CSS to customize the Grid aggregate root elements

```
,
```

```
.e-grid .e-gridfooter {
background-color: #deecf9;
}
,
```

,

#### *Customizing the aggregate cell elements*

Using this CSS, you can customize the Grid summary row cell elements.

,

```
.e-grid .e-summaryrow .e-summarycell {  
background-color: #deecf9;  
}
```

,

#### *Selection in Vue Grid component*

##### *Customizing the row selection background*

Row selection background can be customized using below CSS.

,

```
.e-grid td.e-selectionbackground {  
background-color: #deecf9;  
}
```

,

##### *Customizing the cell selection background*

Cell selection background can be customized using below CSS.

,

```
.e-grid td.e-cellselectionbackground {  
background-color: #deecf9;  
}
```

,

##### *Customizing the column selection background*

Column selection background can be customized using below CSS.

,

```
.e-grid .e-columnselection {  
background-color: #deecf9;  
}
```

,

#### *How To*

Register the grid using vue component in Vue Grid component

Import the `GridComponent` from the `@syncfuion/ej2-vue-grids` package, register the same using the `Vue.component()` with name of the grid selector and the `GridComponent` as its arguments.

Refer to the code example given below.

```
`ts
import { GridComponent } from '@syncfusion/ej2-vue-grids';
Vue.component('ejs-grid', GridComponent);
`
```

Using `Vue.component` will register the grid component alone. Child directives such as `Columns` and `Aggregates` need to be registered separately.

Refer to the code example given below to register column directives

```
`ts
import { ColumnsDirective, ColumnDirective } from '@syncfusion/ej2-vue-grids';
Vue.component('e-columns', ColumnsDirective);
Vue.component('e-column', ColumnDirective);
`
```

Refer to the code example given below to register aggregates directives

```
`ts
import { AggregatesDirective, AggregateDirective, AggregateColumnsDirective,
AggregateColumnDirective } from '@syncfusion/ej2-vue-grids';
Vue.component('e-aggregates', AggregatesDirective);
Vue.component('e-aggregate', AggregateDirective);
Vue.component('e-columns', AggregateColumnsDirective);
Vue.component('e-column', AggregateColumnDirective);
`
```

#### [Enable/disable grid and its actions in Vue Grid component](#)

You can enable/disable the Grid and its actions by applying/removing corresponding CSS styles.

To enable/disable the grid and its actions, follow the given steps:

**Step 1:** Create CSS class with custom style to override the default style of Grid.

```
`
.disablegrid {
pointer-events: none;
opacity: 0.4;
}
.wrapper {
cursor: not-allowed;
}
`
```

**Step 2:** Add/Remove the CSS class to the Grid in the click event handler of Button.

```
`ts
btnClick(args) {
  if (this.$refs.Grid.$el.classList.contains('disablegrid')) {
    this.$refs.Grid.$el.classList.remove('disablegrid');
    document.getElementById("GridParent").classList.remove('wrapper');
  }
  else {
    this.$refs.Grid.$el.classList.add('disablegrid');
    document.getElementById("GridParent").classList.add('wrapper');
  }
}
```

In the below demo, the button click will enable/disable the Grid and its actions.

#### **APP.VUE**

```
<template>
  <div id="app">
    <div>
      <ejs-button iconCss="e-icons e-play-icon" cssClass="e-flat"
      :isPrimary="true" :isToggle="true" v-
      on:click.native="btnClick">Enable/Disable Grid</ejs-button>
      <div id="GridParent">
        <ejs-grid ref='Grid' :dataSource='data'
        :editSettings='editSettings' :toolbar='toolbar' height='273px'>
          <e-columns>
            <e-column field='OrderID' headerText='Order ID'
            textAlign='Right' :isPrimaryKey='true' width=100></e-column>
            <e-column field='CustomerID' headerText='Customer ID'
            width=120></e-column>
            <e-column field='Freight' headerText='Freight'
            textAlign= 'Right' editType='numericedit' width=120 format= 'C2'></e-
            column>
            <e-column field='ShipCountry' headerText='Ship
            Country' editType= 'dropdownedit' width=150></e-column>
          </e-columns>
        </ejs-grid>
      </div>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { data } from './datasource.js';
Vue.use(GridPlugin);
```

```

Vue.use(ButtonPlugin);
export default {
  data() {
    return {
      data: data,
      editSettings: { allowAdding:true, allowDeleting:true, allowEditing:
true },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel']
    };
  },
  methods: {
    btnClick(args) {
      if (this.$refs.Grid.$el.classList.contains('disablegrid')) {
        this.$refs.Grid.$el.classList.remove('disablegrid');
        document.getElementById("GridParent").classList.remove('wrapper');
      }
      else {
        this.$refs.Grid.$el.classList.add('disablegrid');
        document.getElementById("GridParent").classList.add('wrapper');
      }
    }
  },
  provide: {
    grid: [Page, Edit, Toolbar]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
  .disablegrid {
    pointer-events: none;
    opacity: 0.4;
  }
  .wrapper {
    cursor: not-allowed;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs45" %}

### Hide sorting in excel filter in Vue Grid component

You can hide the sorting options on the excel filter dialog by setting display as none for the following classes.

```

、

.e-excel-ascending,
.e-excel-descending,
.e-separator.e-excel-separator {
display: none;
}
、

```

**APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' allowFiltering='true'
    :filterSettings='filterOptions' height='273px' >
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City'
        width=100></e-column>
        <e-column field='ShipName' headerText='Ship Name'
        width=100></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Filter } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data: () => {
    return {
      data: data,
      filterOptions: {
        type: 'Excel'
      },
    };
  },
  provide: {
    grid: [Filter],
  },
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
  .e-excel-ascending,
  .e-excel-descending,
  .e-separator.e-excel-separator {
    display: none;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/how-to/default-cs21" %}

### Cascading drop down list with grid editing in Vue Grid component

You can achieve the Cascading DropDownList with grid Editing by using the Cell Edit Template feature.

In the below demo, Cascading DropDownList rendered for **ShipCountry** and **ShipState** column.

**APP.VUE**

```

<template>

```

```

    <div id="app">
      <ejs-grid ref='grid' :dataSource='data' :editSettings='editSettings'
:toolbar='toolbar' height='273px' >
        <e-columns>
          <e-column field='OrderID' headerText='Order ID'
:isPrimaryKey='true' textAlign='Right' width=100></e-column>
          <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
          <e-column field='ShipCountry' headerText='ShipCountry'
editType='dropdownedit' :edit='countryParams' width=150></e-column>
          <e-column field='ShipCity' headerText='Ship City'
editType='dropdownedit' :edit='stateParams' width=150></e-column>
        </e-columns>
      </ejs-grid>
    </div>
  </template>
  <script>
import Vue from "vue";
import { createElement } from '@syncfusion/ej2-base';
import { GridPlugin, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { DropDownList } from "@syncfusion/ej2-dropdowns";
import { Query } from '@syncfusion/ej2-data';
import { cascadeData } from './datasource.js';
let country= [
    { countryName: 'United States', countryId: '1' },
    { countryName: 'Australia', countryId: '2' }
];
let state = [
    { stateName: 'New York', countryId: '1', stateId: '101' },
    { stateName: 'Virginia ', countryId: '1', stateId: '102' },
    { stateName: 'Washington', countryId: '1', stateId: '103' },
    { stateName: 'Queensland', countryId: '2', stateId: '104' },
    { stateName: 'Tasmania ', countryId: '2', stateId: '105' },
    { stateName: 'Victoria', countryId: '2', stateId: '106' }
];
let countryElem, stateElem, countryObj, stateObj;
Vue.use(GridPlugin);
export default {
  data: () => {
    return {
      data: cascadeData,
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
      editSettings: { allowEditing: true, allowAdding: true,
allowDeleting: true },
      countryParams: {
        create: () => {
          countryElem = document.createElement('input');
          return countryElem;
        },
        read: () => {
          return countryObj.text;
        },
        destroy: () => {
          countryObj.destroy();
        },
        write: () => {
          countryObj = new DropDownList({

```

```

        dataSource: country,
        fields: { value: 'countryId', text: 'countryName' },
        change: () => {
            stateObj.enabled = true;
            let tempQuery = new Query().where('countryId', 'equal',
countryObj.value);
            stateObj.query = tempQuery;
            stateObj.text = null;
            stateObj.dataBind();
        },
        placeholder: 'Select a country',
        floatLabelType: 'Never'
    });
    countryObj.appendTo(countryElem);
}
},
stateParams: {
    create: () => {
        stateElem = document.createElement('input');
        return stateElem;
    },
    read: () => {
        return stateObj.text;
    },
    destroy: () => {
        stateObj.destroy();
    },

### Perform grid actions by keyboard short cut keys in Vue Grid component

Using keyboard shortcuts, Grid performs navigation and actions.

In addition, You can also perform grid actions with custom keyboard shortcuts. This operation has to be achieved outside of the grid with the help of `keydown` event.

The following example demonstrates on **Adding** a new row when **Enter** key is pressed in the grid.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' :editSettings='editSettings'
:toolbar='toolbar' height='273px' :load = 'load'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' :isPrimaryKey='true' width=100></e-column>
        <e-column field='CustomerID' :visible = 'false'
headerText='Customer ID' width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign=
'Right' editType= 'numericedit' width=120 format= 'C2'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
editType= 'dropdownedit' width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Normal' },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel']
    };
  },
  methods: {
    load(args) {
      this.$refs.grid.$el.addEventListener('keydown', this.keyDownHandler);
    }
    keyDownHandler(e: any) {
      if(e.keyCode) {
        let gridIns = this.$refs.grid.ej2Instances;
        gridIns.addRecord();
      }
    }
  },
  provide: {
    grid: [Page, Edit, Toolbar]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";

## Exporting grid in cordova application in Vue Grid component

Cordova application does not support direct file download. So we have to use the Blob stream to export the Grid. You can use corresponding exporting methods and exportComplete events to get the Blob stream.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' :toolbar='toolbarOptions'
height='272px' :allowExcelExport='true'
:excelExportComplete='excelExpComplete'
:pdfExportComplete='pdfExportComplete' :allowPdfExport='true'
:toolbarClick='toolbarClick' >
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, PdfExport, ExcelExport } from "@syncfusion/ej2-
vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data: () => {
    return {
      data: data,
      toolbarOptions: ['Add', 'PdfExport', 'ExcelExport'],
    };
  },
  methods: {
    toolbarClick: function (args) {
      if (args['item'].id.indexOf("pdfexport") !== -1) {
        this.$refs.grid.pdfExport(null, null, null, true);
      }
      if (args['item'].id.indexOf("excelexport") !== -1) {
        this.$refs.grid.excelExport(null, null, null, true);
      }
    },
    excelExpComplete: function (args) {
      //This event will be triggered when excel exporting.
      args.promise.then((e) => {
        //In this `then` function, we can get blob data through the
arguments after promise resolved.
        this.exportBlob(e.blobData);
      });
    },
    pdfExportComplete: function (args) {
      //This event will be triggered when pdf exporting.
    }
  }
}
```

```

        args.promise.then((e) => {
            //In this `then` function, we can get blob data through the
            arguments after promise resolved.

### Customize pager drop down in Vue Grid component

To customize default values of pager dropdown, you need to define `pageSizes` as array of strings.

#### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid :dataSource='data' :allowPaging='true'
        :pageSettings='pageSettings' height='280px' >
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
                :isPrimaryKey='true' textAlign='Right' width=100></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
                width=120></e-column>
                <e-column field='Freight' headerText='Freight'
                textAlign='Center' format='C2' width=80></e-column>
                <e-column field='ShipCountry' headerText='Ship Country'
                width=120></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Page } from "@syncfusion/ej2-vue-grids";
import { data } from '../datasource.js';
Vue.use(GridPlugin);

```

```

export default {
  data: () => {
    return {
      data: data,
      pageSettings: {pageSizes: ['5', '10', 'All']}
    };
  },
  provide: {
    grid: [Page]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/how-to/pagerdropdown-cs2" %}

### Hide the expand/collapse icon in parent row in Vue Grid component

By default, the expand/collapse icon will be visible even if the child grid is empty.

You can use [rowDataBound](#) event to hide the icon when there are no records in child grid.

To hide the expand/collapse icon in parent row when no records in child grid, follow the given steps:

**Step 1:** Create CSS class with custom style to override the default style of Grid.

```

.e-row[aria-selected="true"] .e-customizedExpandcell {
background-color: #e0e0e0;
}
.e-grid.e-gridhover tr[role='row']:hover {
background-color: #eee;
}

```

**Step 2:** Add the CSS class to the Grid in the [rowDataBound](#) event handler of Grid.

```

`ts
rowDataBound(args){
let filter:string = args.data.EmployeeID;

let childrecord: any = new DataManager(this.$refs.Grid.childGrid.dataSource).executeLocal(new
Query().where("EmployeeID", "equal", parseInt(filter), true));

if(childrecord.length == 0) {
//here hide which parent row has no child records
args.row.querySelector('td').innerHTML=" ";
args.row.querySelector('td').className = "e-customizedExpandcell";
}
}

```

```

}
}
,

```

In the below demo, the expand/collapse icon in the row with **EmployeeID** as **1** is hidden as it does not have record in child Grid.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='Grid' :dataSource="data" height='315px'
:childGrid='childGrid' :rowDataBound='rowDataBound'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=90></e-column>
        <e-column field='EmployeeID' headerText='Customer ID'
width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
        <e-column field='OrderDate' headerText='Order Date'
textAlign='Right' format='yMd' type='date' width=120></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, DetailRow } from "@syncfusion/ej2-vue-grids";
import { DataManager, Query } from '@syncfusion/ej2-data';
import { employeeData } from './datasource.js';
let dataManger: Object = [{Order:100, ShipName:'Berlin', EmployeeID:2},
                           {Order:101, ShipName:'Capte', EmployeeID:3},
                           {Order:102, ShipName:'Marlon', EmployeeID:4},
                           {Order:103, ShipName:'Black pearl', EmployeeID:5},
                           {Order:104, ShipName:'Pearl', EmployeeID:6},
                           {Order:105, ShipName:'Noth bay', EmployeeID:7},
                           {Order:106, ShipName:'baratna', EmployeeID:8},
                           {Order:107, ShipName:'Charge', EmployeeID:9}];

Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: employeeData,
      childGrid: {
        dataSource: dataManger,
        queryString: 'EmployeeID',
        columns: [
          { field: 'Order', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
          { field: 'EmployeeID', headerText: 'Employee ID', width: 150 },
          { field: 'ShipName', headerText: 'Ship Name', width: 150 }
        ]
      }
    };
  },
},

```

```

methods: {
  rowDataBound(args) {
    let filter:string = args.data.EmployeeID;
    let childrecord: any = new
DataManager(this.$refs.Grid.childGrid.dataSource).executeLocal(new
Query().where("EmployeeID", "equal", parseInt(filter), true));
    if(childrecord.length == 0) {
      //here hide which parent row has no child records
      args.row.querySelector('td').innerHTML=" ";
      args.row.querySelector('td').className = "e-customizedExpandcell";
    }
  },
  provide: {
    grid: [DetailRow]
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
.e-row[aria-selected="true"] .e-customizedExpandcell {
  background-color: #e0e0e0;
}
.e-grid.e-gridhover tr[role='row']:hover {
  background-color: #eee;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs46" %}

### Complex column as foreign key column in Vue Grid component

The following example shows how to set the complex column as foreign key column.

In the following example, `Employee.EmployeeID` is a complex column and also declared as a foreign column which shows `FirstName` column from foreign data.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' height='315'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100></e-column>
        <e-column field='Employee.EmployeeID' headerText='Employee
Name' width=120 foreignKeyValue='FirstName' foreignKeyField='EmployeeID'
:dataSource='employeeData'></e-column>
        <e-column field='Freight' headerText='Freight'
textAlign='Right' width=80></e-column>
        <e-column field='ShipCity' headerText='Ship City' width=130
></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>

```

```

import Vue from "vue";
import { GridPlugin, ForeignKey } from "@syncfusion/ej2-vue-grids";
import { data, employeeData } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data.slice(0, 5),
      employeeData: employeeData.slice(0, 5)
    };
  },
  provide: {
    grid: [ForeignKey]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/foreigncolumn-cs4" %}

\* For remote data, the sorting and grouping is done based on [column.foreignKeyField](#) instead of [column.foreignKeyValue](#).

\* If [column.foreignKeyField](#) is not defined, then the column uses [column.field](#).

List of array of objects in Vue Grid component

The following example shows how to set Complex field for datasource having Array Of Objects.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :height='315'>
      <e-columns>
        <e-column field='EmployeeID' headerText='Employee ID'
textAlign='Right' width=120></e-column>
        <e-column field='Names.0.FirstName' headerText='First Name'
width=120></e-column>
        <e-column field='Names.0.LastName' headerText='Last Name'
width=120></e-column>
        <e-column field='Title' headerText='Title' width=150></e-
column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data.slice(0, 5)
    }
  }
}

```

```

    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/column/complex-cs2" %}

### Add params for filtering in Vue Grid component

You can customize the default settings of the components which are used in Menu filter by using params of filter property in column definition.

In the below sample, OrderID and Freight Columns are numeric columns, while open the filter dialog then you can see that NumericTextBox with spin button is displayed to change/set the filter value. Now using the params option we hide the spin button in NumericTextBox for OrderID Column.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowFiltering='true'
    :filterSettings='filterOptions' height='273px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' :filter='filterParams' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign=
        'Right' width=120 format= 'C2'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
        width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Filter } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js'
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data,
      filterOptions: {
        type: 'Menu'
      },
      filterParams: { params: { showSpinButton: false } }
    };
  },
  provide: {
    grid: [Filter]
  }
}

```

```

</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/filter/default-cs12" %}

### Select grid rows based on certain condition in Vue Grid component

You can select the specific row in the grid based on a certain condition by using the [selectRows](#) method in the [dataBound](#) event of Grid.

In the below demo, we have selected the grid rows only when **EmployeeID** column value greater than 3.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='Grid' :dataSource='data' :allowPaging='true'
height='280px' :rowDataBound='rowDataBound'
:selectionSettings='selectionOptions' :dataBound='dataBound'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
:isPrimaryKey='true' textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='EmployeeID' headerText='Employee ID'
textAlign='Right' width=120></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=80></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
width=120></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Toolbar, Page } from "@syncfusion/ej2-vue-grids";
import { employeeData } from '../datasource.js';
Vue.use(GridPlugin);
export default {
  data: () => {
    return {
      data: employeeData,
      selectionOptions: { type: 'Multiple' },
      selIndex: []
    };
  },
  methods: {
    rowDataBound(args) {
      if (args.data['EmployeeID'] > 3) {
        this.selIndex.push(parseInt(args.row.getAttribute('aria-
rowindex')));
      }
    }
  }
}

```

```

    dataBound(args) {
        if (this.selIndex.length) {
            this.$refs.Grid.selectRows(this.selIndex);
            this.selIndex = [];
        }
    },
    provide: {
        grid: [Page]
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/edit/default-cs48" %}

### Collapse grouped rows at initial render in Vue Grid component

You can collapse all the grouped rows at initial rendering by using `dataBound` event with `collapseAll` method of the grid.

In the below demo, all the grouped rows are collapsed at initial rendering.

#### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid ref='grid' :dataSource='data' :allowGrouping='true'
        :groupSettings='groupOptions' :dataBound='dataBound' height='267px'>
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
                textAlign='Right' width=120></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
                width=150></e-column>
                <e-column field='ShipCity' headerText='Ship City'
                width=150></e-column>
                <e-column field='ShipName' headerText='Ship Name'
                width=150></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Group } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
var initial = true;
export default {
    data() {
        return {
            data: data,
            groupOptions: { columns: ['ShipCity'] }
        };
    },
}

```

```

methods: {
  dataBound: function() {
    if(initial === true) {
      this.$refs.grid.ej2Instances.groupModule.collapseAll();
      initial = false;
    }
  },
  provide: {
    grid: [Group]
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/group/default-cs10" %}

### Grouped row page size in Vue Grid component

By default, we have displayed the no of records based on the `pageSize`. If you want to show grouped column rows based on the `pageSize` then we suggest you to use the below way.

In the below sample, we have overridden the default `generateQuery` to display the grouped rows instead of grid rows based on the `pageSize`.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowGrouping='true'
    :groupSettings='groupOptions' :allowPaging='true'
    :pageSettings='pageOptions' height='273px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
        textAlign='Right' width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
        width=120></e-column>
        <e-column field='Freight' headerText='Freight' textAlign=
        'Right' width=120 format= 'C2'></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
        width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";

### Get row cell index in Vue Grid component

You can get the specific row and cell index of the grid by using `rowSelected` event of the grid. Here, we can get the row and cell index by using `aria-rowindex`(get row Index from `tr` element) and `aria-colindex`(column index from `td` element) attribute.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='grid' :dataSource='data' :rowSelected='rowSelected'
height='267px'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=120></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=150></e-column>
        <e-column field='ShipCity' headerText='Ship City'
width=150></e-column>
        <e-column field='ShipName' headerText='Ship Name'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Group } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: data
    };
  },
  methods: {

```

```

    rowSelected: function(args) {
      alert("row index: "+args.row.getAttribute('aria-rowindex'));
      alert("column index: "+args.target.getAttribute('aria-colindex'));
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/group/default-cs11" %}

### Display null values at bottom in Vue Grid component

By default the null values are displayed at bottom of the Grid row while perform sorting in ascending order. As well as this values are displayed at top of the Grid row while perform sorting with descending order. But you can customize this default order to display the null values at always bottom row of the Grid by using [column.sortComparer](#) method.

In the below demo we have displayed the null date values at bottom of the Grid row while sorting the **OrderDate** column in both ways.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :dataSource='data' :allowSorting='true'
    :actionBegin='actionBegin'>
      <e-columns>
        <e-column field='OrderID' headerText='Order ID'
width=100></e-column>
        <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
        <e-column field='OrderDate' headerText='Order Date'
format='yMd' :sortComparer='sortComparer' width=120></e-column>
        <e-column field='ShipCountry' headerText='Ship Country'
width=150></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Sort } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
let action;
export default {
  data: () => {
    return {
      data: data
    };
  },
  methods: {
    sortComparer: function(reference, comparer) {
      let sortAsc = action === "Ascending" ? true : false;

```

```

        if (sortAsc && reference === null) {
            return 1;
        }
        else if (sortAsc && comparer === null) {
            return -1;
        }
        else if (!sortAsc && reference === null) {
            return -1;
        }
        else if (!sortAsc && comparer === null) {
            return 1;
        }
        else {
            return reference - comparer;
        }
    },
    actionBegin: function(args) {
        if (args.requestType == "sorting") {
            action = args.direction;
        }
    }
},
provide: {
    grid: [Sort]
}
}
</script>
<style>

Enable editing in single click in Vue Grid component

#### Normal Editing

You can make a row editable on a single click with **Normal** mode of editing in Grid, by using the [startEdit](#) and [endEdit](#) methods.

Bind the **mouseup** event for Grid and in the event handler call the [startEdit](#) and [endEdit](#), based on the clicked target element.

#### APP.VUE

```

<template>
    <div id="app">
        <ejs-grid ref='grid' id='grid' :dataSource='data' :load='load'
        :editSettings='editSettings' :toolbar='toolbar' :allowPaging="true">
            <e-columns>
                <e-column field='OrderID' headerText='Order ID'
                textAlign='Right' width=100 :isPrimaryKey='true'></e-column>
                <e-column field='CustomerID' headerText='Customer ID'
                width=120></e-column>
                <e-column field='Freight' headerText='Freight'
                textAlign='Right' width=120 format='C2'></e-column>
                <e-column field='ShipCountry' headerText='Ship Country'
                width=150></e-column>
            </e-columns>
        </ejs-grid>
    </div>
</template>

```

```

        </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
  data: function() {
    return {
      data: data,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Normal' },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel']
    };
  },
  methods: {
    load: function() {
      this.$refs.grid.ej2Instances.element.addEventListener('mouseup',
function(e) {
        var instance = this.ej2_instances[0];
        if (e.target.classList.contains("e-rowcell")) {
          if (instance.isEdit)
            instance.endEdit();
          let index = parseInt(e.target.getAttribute("Index"));
          instance.selectRow(index);
          instance.startEdit();
        }
      });
    },
    provide: {
      grid: [Edit]
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/edit/single-click-cs1" %}

#### Open dropdown edit popup on single click

You can open the default dropdown edit popup with single click edit by focusing the dropdown element and calling the EJ2 dropdown list's [showPopup](#) method in the Grid's [actionComplete](#) event. In this demo we have used a global flag variable in the **mouseup** event to ensure if the dropdown column is the clicked edit target.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref='grid' id='grid' :dataSource='data' :load='load'
:actionComplete='onActionComplete' :editSettings='editSettings'
:toolbar='toolbar' :allowPaging="true">

```

```

        <e-columns>
            <e-column field='OrderID' headerText='Order ID'
textAlign='Right' width=100 :isPrimaryKey='true'></e-column>
            <e-column field='CustomerID' headerText='Customer ID'
width=120></e-column>
            <e-column field='Freight' headerText='Freight'
textAlign='Right' width=120 format='C2'></e-column>
            <e-column field='ShipCountry' headerText='Ship Country'
editType='dropdownedit' width=150></e-column>
        </e-columns>
    </ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
Vue.use(GridPlugin);
export default {
    data: function() {
        return {
            data: data,
            editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Normal' },
            toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
            isDropdown: false
        };
    },
    methods: {
        load: function() {
            this.$refs.grid.ej2Instances.element.addEventListener('mouseup',
function(e) {
                if (e.target.classList.contains("e-rowcell")) {
                    if (this.$refs.grid.ej2Instances.isEdit)
                        this.$refs.grid.ej2Instances.endEdit();
                    let rowInfo =
this.$refs.grid.ej2Instances.getRowInfo(e.target);
                    if (rowInfo.column.field === "ShipCountry")
                        this.isDropdown = true;
                    this.$refs.grid.ej2Instances.selectRow(rowInfo.rowIndex);
                    this.$refs.grid.ej2Instances.startEdit();
                }.bind(this));
        },
        onActionComplete: function(args) {
            if (args.requestType === "beginEdit" && this.isDropdown) {
                this.isDropdown = false;
                let dropdownObj = args.form.querySelector('.e-
dropdownlist').ej2_instances[0];
                dropdownObj.element.focus();
                dropdownObj.showPopup();
            }
        }
    },
    provide: {
        grid: [Edit]
    }
}

```

```

</script>

### Render date picker in frozen columns in Vue Grid component

You can render the custom component in frozen columns using edit params.

In the following example, we have rendered the **Datepicker** component to the **OrderDate** column. Here the datepicker object is appended to the corresponding input element in the editing row.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid :frozenColumns="2" :dataSource="data"
    :editSettings="editSettings" :toolbar="toolbar"
    height="273px">
      <e-columns>
        <e-column field="OrderID" headerText="Order ID" :isPrimaryKey="true"
width="100"></e-column>
        <e-column field="CustomerID" headerText="Customer ID"
width="120"></e-column>
        <e-column field="ShipCity" headerText="Ship City" textAlign="Right"
width="120"></e-column>
        <e-column field="OrderDate" headerText="Order Date" type="date"
format="yMd"
:edit="dpParams" width="150"></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import {
  GridPlugin,
  Page,
  Freeze,
  Toolbar,
  Edit
} from "@syncfusion/ej2-vue-grids";
import { DatePicker } from "@syncfusion/ej2-calendars";
import { data } from "../datasource.js";
Vue.use(GridPlugin);
let elem;
let datePickerObj;
export default {
  data() {
    return {
      data: data,
      editSettings: {
        allowEditing: true,
        allowAdding: true,
        allowDeleting: true

```

```

    },
    toolbar: ["Add", "Edit", "Delete", "Update", "Cancel"],
    dpParams: {
      create: function() {
        elem = document.createElement("input");
        return elem;
      },
      read: () => {
        return datePickerObj.value;
      },
      destroy: () => {
        datePickerObj.destroy();
      },
      write: args => {
        datePickerObj = new DatePicker({
          value: new Date(args.rowData[args.column.field]),
          floatLabelType: "Never"
        });
        datePickerObj.appendTo(args.element);
      }
    }
  };
},
provide: {
  grid: [Page, Edit, Toolbar, Freeze]
}
};
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

[Edit template from another vue in Vue Grid component](#)

You can achieve the dialog template editing using another vue page.

,

<template>

<div id="app">

<ejs-grid :dataSource="data" :editSettings="editSettings" :actionBegin="actionBegin"  
:actionComplete="actionComplete" :toolbar="toolbar" height="273px">

<e-columns>

<e-column field="OrderID" headerText="Order ID" textAlign="Right" :isPrimaryKey="true"  
width="100"></e-column>

<e-column field="CustomerID" headerText="Customer ID" width="120"></e-column>

<e-column field="ShipCountry" headerText="Ship Country" width="150"></e-column>

</e-columns>

</ejs-grid>

```
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js';
import DialogTemplate from "./dialogtemp.vue";
import { DatePickerPlugin } from "@syncfusion/ej2-vue-calendars";
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
import { NumericTextBox } from "@syncfusion/ej2-inputs";
import { NumericTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
import { DataUtil } from '@syncfusion/ej2-data';
Vue.use(GridPlugin);
Vue.use(DropDownListPlugin);
Vue.use(DatePickerPlugin);
Vue.use(NumericTextBoxPlugin)
export default {
  data() {
    return {
      data: data,
      editSettings: {
        allowEditing: true,
        allowAdding: true,
        allowDeleting: true,
        mode: "Dialog",
        template: function() {
          return { template: DialogTemplate };
        }
      },
      toolbar: ["Add", "Edit", "Delete", "Update", "Cancel"]
    };
  },
  provide: {
```

```
grid: [Page, Edit, Toolbar]
},
methods: {
  actionBegin(args) {
    if (args.requestType === "save") {
      // cast string to integer value.
      args.data["Freight"] = parseFloat(args.form.querySelector("#Freight").value);
    }
  },
  actionComplete(args) {
    // Set initail Focus
    if (args.requestType === "beginEdit") {
      args.form.elements.namedItem("OrderID").focus();
    }

} else {
this.$refs.CustomerID.focus();
}
}
};
</script>
`

```

#### Access grid instance in Vue Grid component

You can access the instance of the Vue Grid in the following way.

```

`ts
dataBound: function (args) {
var gridObj = this.$refs.grid1.$el.ej2_instances[0]; // get the instance of the Grid.
Object.assign(gridObj.filterModule.filterOperators, {
startsWith: "contains", // change the default operator as contains for string type column.
});
}
`

```

In the following sample, the filter operation is performed by getting the instance of the Vue Grid component.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-grid ref="grid1" :dataSource="data" :allowPaging="true"
:allowFiltering="true" :filterSettings="filterOptions"
:dataBound="dataBound">
      <e-columns>
        <e-column field="InternalDocumentNo"
headerText="InternalDocumentNo" width="180" isPrimaryKey="true"
headerTextAlign="center">
          </e-column>
        <e-column field="DocumentNumber" headerText="DocumentNumber"
width="180" headerTextAlign="center" :filter="filterOptions">
          </e-column>
        <e-column field="CustomerCode" headerText="CustomerCode"
width="180" headerTextAlign="center">
          </e-column>
      </e-columns>
    </div>
  </template>

```

```

        <e-column field="WarehouseName" headerText="WarehouseName"
width="180" isPrimaryKey="true" headerTextAlign="center">
        </e-column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, Page, Filter } from "@syncfusion/ej2-vue-grids";
Vue.use(GridPlugin);
export default {
    data() {
        return {
            data: [
                {
                    InternalDocumentNo: 84374,
                    DocumentNumber: "SOV-7855",
                    CustomerCode: "0500733131",
                    WarehouseName: "Main Warehouse"
                },
                {
                    InternalDocumentNo: 84372,

                {
                    InternalDocumentNo: 84357,
                    DocumentNumber: "SOV-7849",
                    CustomerCode: "0500733131",
                    WarehouseName: "Main Warehouse"
                }
            ],
            filterOptions: {
                operator: "contains",
            }
        };
    },
    methods: {
        dataBound: function (args) {
            var gridObj = this.$refs.grid1.$el.ej2_instances[0];
            Object.assign(gridObj.filterModule.filterOperators, {
                startsWith: "contains", // change the default operator as
contains for string type column
            });
        }
    }
};

```

```

    });
  },
  provide: {
    grid: [Page, Filter]
  }
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/how-to/dropdown-cs3" %}

### Get parent column instance in Vue Grid component

Emit values from one component and listen to emitted values in other component by using the **eventHub**. The **eventHub** is a global event bus used to communicate between any components.

In the following example, we have defined a template column in the grid column definition which emits a value and listens the emitted value in the [created](#) event of the Grid component.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid ref="grid" :dataSource="data" height="272px">
      <e-columns>
        <e-column
          field="OrderID" headerText="Order ID" textAlign="Right"
          width="100" isPrimaryKey="true"
        ></e-column>
        <e-column
          field="CustomerID" headerText="Customer ID" width="120"
        ></e-column>
        <e-column
          field="ShipCity" headerText="Ship City" width="100"
        ></e-column>
        <e-column
          field="ShipName" headerText="Ship Name" width="100"
          :template="cTemplate"
        ></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { data } from './datasource.js'
Vue.use(GridPlugin);
Vue.prototype.$eventHub = new Vue();
export default {
  data() {
    return {
      data: data,
      cTemplate: function() {

```

```

        return {
            template: Vue.component("columnTemplate", {
                template: `<button v-
on:click="click(event)">button</button>`,
                data: function () {
                    return {
                        data: {},
                    };
                },
                methods: {
                    click: function (event) {
                        this.$eventHub.$emit("detail",
this.data.index);
                    },
                },
            }),
        };
    },
    created() {
        this.$eventHub.$on("detail", (event) => {
            alert("passed value:" + event);
        });
    },
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/filter/default-cs13" %}

### How to create a routing sample in Vue Grid component

[Vue Router](#) is the official routing library for Vue.js which is widely used for building single-page applications (SPA's). It provides a way to handle navigation and routing within an application. In Vue routing, you can able to configure the different routes for different URL's or paths to navigate between different sections or pages of the application. This approach is particularly advantageous for SPA's since it permits the loading of content dynamically without requiring a complete page refresh.

#### Steps to create a routing sample in Vue Grid component

##### 1. Creating a vue project and integrating the Syncfusion Grid component:

A simple vue project can be created by following the steps under [getting started](#) section of this documentation. Install the Vue Router package by running the following command in your project's directory.

`

```
npm install vue-router
```

`

To use Vue routing in your application, you need to create at least two components that can be navigated from one to another.

## 2. Defining Routes:

To define the routes create a new folder **router** under src directory and create new file named **index.js** inside it (**src\router\index.js**). You can define the routes that correspond to different components in this file. Import the components and define an array of route objects that specifies the path and the component to be rendered for each route.

```
,  
  
import Vue from 'vue'  
import Router from 'vue-router'  
import About from '../components/About'  
import Home from '../components/Home'  
import Contact from '../components/Contact'  
Vue.use(Router);  
const router = new Router({  
  mode: 'history',  
  routes: [  
    {  
      path: '/',  
      name: 'Home',  
      component: Home  
    },  
    {  
      path: '/about',  
      name: 'About',  
      component: About  
    },  
    {  
      path: '/contact',  
      name: 'Contact',  
      component: Contact  
    },  
  ]  
});  
export default router;  
,
```

### 3. Configuring the router module:

Open the **src/main.js** file and import the router.js.

```
,  
  
import router from './router'
```

### 4. Setting up navigation:

Include the below code lines in **App.vue** file to set up the navigation.

```
,  
  
<template>  
<div id="app">  
<nav>  
<ul>  
<li><router-link to="/">Home</router-link></li>  
<li><router-link to="/about">About</router-link></li>  
<li><router-link to="/contact">Contact</router-link></li>  
</ul>  
</nav>  
<router-view></router-view>  
</div>  
</template>  
,
```

The `<router-link>` components are used for navigation, the `to` attribute specifies the path to navigate.

The `<router-view>` component is responsible for rendering the content of each route. It acts as a placeholder that will be replaced with the component corresponding to the active route.

[Here](#), you can find the Vue Routing sample with Syncfusion DataGrid.

### Testing the Vue application using Jest

Vue [Jest](#) testing is a popular approach to test Vue applications using the Jest testing framework. This approach involves the creation and execution of unit tests specifically designed for Vue components. By conducting unit testing, which focuses on testing isolated units of code like functions, methods, and components to ensure that they behave as expected. This approach validates the individual units of your Vue components, catch potential bugs early in the development process, and maintains the reliability and stability of your Vue application. To create a Jest test case for the Grid component, follow the below steps:

#### Step 1: Set up the Jest testing environment

##### I. Check and install the node version:

You need to verify if the installed version of Node is 14 or higher. If it is below version 14, you must install a version of Node above 14. You can refer the following link to install the [node version](#). You can select the any node version is 14 or above and installed.

## II. Create an Vue application and install the Syncfusion Grid package:

To create an Vue application and install the Syncfusion Grid package, you can refer to the [Getting started](#) documentation.

## III. Install the Jest:

Run the following command to install the Jest dependency using npm.

```
,
npm install --save-dev jest
,
```

## IV. How to add the unit jest test case environment:

Run the following command to add the unit jest test case environment.

```
,
vue add unit-jest
npm install jest-environment-jsdom --save-dev
,
```

## V. How to add the test command in the script section:

You should check that the **test** command is specified in the **script** section of the **package.json** file. If the **script** section is not specify the **test** command, you must define the **test** command in the **script** section of the **package.json** file.

```
,
"test": "jest"
,
```

## Step 2: Adding a Grid component

Refer to the [documentation](#) to add the styling for the Grid component. The following code is used in this demonstration to create a Grid component. For further information on creating the Grid component, refer to the detailed [documentation](#).

### App.vue:

```
`typescript
<template>
<div id="app">
<ejs-grid id='Grid' :dataSource='data.slice(0,5)' height='315'>
<e-columns>
<e-column field='CustomerID' headerText='CustomerID' textAlign='Right' width=90></e-column>
```

```

<e-column field='ContactName' headerText='ContactName' width=120></e-column>
<e-column field='Address' headerText='Address' width=150></e-column>
<e-column field='Country' headerText='Country' width=150></e-column>
</e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
// import the your datasource instead of this
import { customerData } from './datasource';
Vue.use(GridPlugin);
export default {
  data() {
    return {
      data: customerData
    };
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
`

```

### Step 3: To implement the Jest test case

You can write the Jest test case in the spec.js extension file. You need to import the below required files in your component. You need to import the `shallowMount` function from the **@vue/test-utils** package. This function is used to render the component for vue testing. To test a specific component, you need to import it into your testing environment. In this demo, we have written the grid component in the **App** file. So, you need to import the **App** file in the Jest test case.

```

`typescript
import { shallowMount } from '@vue/test-utils'
import App from '@App.vue'

```

`

### I. Define test suite:

The `describe` function is utilized to define the test suite. Within the `describe` function, use the `it` function to specify the individual test cases.

```
`typescript
describe('App component', () => {
  it('Length of the record', () => {
  });
});
```

`

### II. Types of testing:

You need to add the different types of test cases in a `it` block.

#### 1. Snapshot Testing:

The Snapshot testing involves capturing a snapshot of the rendered output of a component and comparing it against a previously stored snapshot. If the current output matches the stored snapshot, the test case will be passed successfully.

##### Example:

In the below example, the `it` block is utilized to define a test case for the **Snapshot testing**. Within the test case, the `shallowMount` function from the `@vue/test-utils` package is used to create a shallow wrapper for the **App** component. After, the `expect` statement verifies that the rendered output matches the stored snapshot, utilizing the `toMatchSnapshot` matcher provided by Jest.

```
`typescript
it('Snapshot testing', () => {
  const wrapper = shallowMount(App);
  expect(wrapper).toMatchSnapshot();
});
```

`

```

PASS tests/unit/App.spec.js (6.806 s)
  App component
    ✓ Snapshot testing (26 ms)

    > 1 snapshot written.
  Snapshot Summary
    > 1 snapshot written from 1 test suite.

Test Suites: 1 passed, 1 total
Tests:       1 passed, 1 total
Snapshots:  1 written, 1 total
Time:        29.541 s
Ran all test suites.

```

## 2. DOM Testing:

The DOM testing involves testing the behavior and interact of Vue component. This goal is to ensure that the component function correctly and produce the expected output when interacting with the DOM. You can utilize libraries like **@vue/test-utils** or **@testing-library/vue** to manipulate the rendered component in the DOM testing.

### Example:

The `it` block is used to define a test case for the "Length of the record". Within the test case, the `shallowMount` function from the **@vue/test-utils** package is used to create a shallow wrapper for the **App** component. After, you need to create the instance of grid component. We check that the data grid in the data source has the appropriate number of data records. The `dataSource` property is employed to retrieve the record of the data. By utilizing this property, we can verify the accurate population of data in the grid component.

```

`typescript
it('Length of the record', () => {
  const wrapper = shallowMount(App);
  var gridElement = wrapper.find('#Grid');
  const gridInstance = gridElement.vm;
  expect(gridInstance.$props.dataSource).toHaveLength(5);
});
`

```

The following example illustrates how to create the grid sample and how to write the Jest test case.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-grid id='Grid' :dataSource='data.slice(0,5)' height='315'>
      <e-columns>
        <e-column field='CustomerID' headerText='CustomerID'
textAlign='Right' width=90></e-column>
        <e-column field='ContactName' headerText='ContactName'
width=120></e-column>
      </e-columns>
    </ejs-grid>
  </div>
</template>

```

```

        <e-column field='Address' headerText='Address' width=150></e-
column>
        <e-column field='Country' headerText='Country' width=150></e-
column>
    </e-columns>
</ejs-grid>
</div>
</template>
<script>
import Vue from "vue";
import { GridPlugin } from "@syncfusion/ej2-vue-grids";
import { customerData } from '../datasource';
Vue.use(GridPlugin);
export default {
    data() {
        return {
            data: customerData
        };
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>

```

### APP.SPEC.JS

```

import { shallowMount } from '@vue/test-utils'
import App from '@app.vue'
describe('App component', () => {
    it('Length of the record', () => {
        const wrapper = shallowMount(App);
        var gridElement = wrapper.find('#Grid');
        const gridInstance = gridElement.vm;
        expect(gridInstance.$props.dataSource).toHaveLength(5);
    })
})

```

### SNAP.SPEC.JS

```

import { shallowMount } from '@vue/test-utils'
import App from '@App.vue'
describe('App component', () => {
    it('Snapshot testing', () => {
        const wrapper = shallowMount(App);
        expect(wrapper).toMatchSnapshot();
    });
})

```

### Run the Jest test case:

Run the following command to execute the Jest test case.

,

npm run test

- \* This is only for local data. You can use the [currentViewData](#) property by rendering the remote data.
- \* You can find the sample of the Unit Jest testing in DataGrid [here](#)

### Customize the Empty Record Template in Vue Grid component

The empty record template feature in the Grid allows you to use custom content such as images, text, or other components, when the grid doesn't contain any records to display. This feature replaces the default message of 'No records to display' typically shown in the grid.

To activate this feature, set the `emptyRecordTemplate` property of the Grid. The `emptyRecordTemplate` property expects the HTML element or a function that returns the HTML element.

In the following example, an image and text have been rendered as a template to indicate that the grid has no data to display.

#### APP.VUE

```
<template>
  <div class="col-lg-12 control-section">
    <div>
      <ejs-grid :dataSource='data'
      :emptyRecordTemplate='emptyRecordTemplate' :editSettings='editSettings'
      :toolbar='toolbar' :allowPaging='true'
      :pageSettings='pageSettings'>
        <e-columns>
          <e-column field='OrderID' headerText='Order ID'
            width='120' textAlign='Right' :isPrimaryKey='true'
            :validationRules='orderidrules'></e-column>
          <e-column field='CustomerID' headerText='Customer ID'
            width='120' :validationRules='customeridrules'></e-column>
          <e-column field='Freight' headerText='Freight' width='180'
            format='C2' textAlign='Right' editType='numericedit'
            :validationRules='freightrules'></e-column>
          <e-column field='OrderDate' headerText='Order Date'
            width='130' editType='datetimepickeredit' :format='formatoptions'
            textAlign='Right'></e-column>
          <e-column field='ShipCountry' headerText='Ship Country'
            width='150' editType='dropdownedit' :edit='editparams'></e-column>
        </e-columns>
      </ejs-grid>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin, GridComponent, ColumnDirective, ColumnsDirective, Edit,
Page, Toolbar } from "@syncfusion/ej2-vue-grids";
import { cascadeData } from "../datasource";
Vue.use(GridPlugin);
export default {
  components: {
    'ejs-grid': GridComponent,
    'e-column': ColumnDirective,
    'e-columns': ColumnsDirective
  }
}
```

```

    },
    data: () => {
      return {
        data: [],
        pageSettings: { pageCount: 5 },
        editSettings: { allowEditing: true, allowAdding: true,
allowDeleting: true },
        toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
        orderidrules: { required: true, number: true },
        formatoptions: { type: 'dateTime', format: 'M/d/y hh:mm a' },
        freightrules: { required: true, number: true },
        editparams: { params: { dataSource: cascadeData, fields:
{text:"ShipCountry",value:"ShipCountry"}}},
        customeridrules: { required: true },
        emptyRecordTemplate: `
          <div class='emptyRecordTemplate'>
            <img src='./emptyRecordTemplate.svg' class='e-emptyRecord'
alt="No record">
            <span>There is no data available to display at the
moment.</span>
          </div>`,
      };
    },
    provide: {
      grid: [Edit, Page, Toolbar]
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
  .emptyRecordTemplate {
    text-align: center;
  }
  .e-emptyRecord {
    display: block;
    margin: 10px auto;
  }
</style>

```

{% previewsample "page.domainurl/code-snippet/grid/how-to/empty-record-template-cs1" %}

## HeatMap Chart

### Getting Started with the Vue HeatMap Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLI](#) and integrating the Syncfusion Vue HeatMap component

#### Prerequisites

[System requirements for Syncfusion Vue UI components](#)

#### Dependencies

For using heat map, the following minimum requirements are needed.

`javascript

```
|-- @syncfusion/ej2-vue-heatmap  
|-- @syncfusion/ej2-base  
|-- @syncfusion/ej2-data  
|-- @syncfusion/ej2-heatmap  
|-- @syncfusion/ej2-vue-base  
|-- @syncfusion/ej2-svg-base  
`
```

### Setting up the Vue 2 project

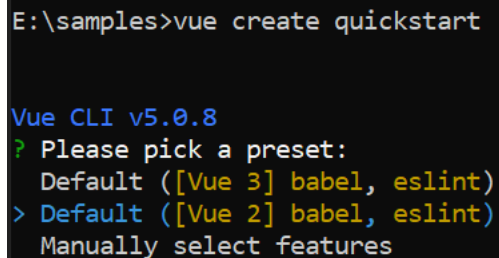

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```
`bash  
npm install -g @vue/cli  
vue create quickstart  
cd quickstart  
npm run serve  
`
```

or

```
`bash  
yarn global add @vue/cli  
vue create quickstart  
cd quickstart  
yarn run serve  
`
```

When creating a new project, choose the option **Default ([Vue 2] babel, eslint)** from the menu.

```
E:\samples>vue create quickstart  
  
Vue CLI v5.0.8  
? Please pick a preset:  
  Default ([Vue 3] babel, eslint)  
> Default ([Vue 2] babel, eslint)  
  Manually select features
```

Once the **quickstart** project is set up with default settings, proceed to add Syncfusion components to the project.

### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.npmjs.com). To use Vue components, install the required npm package.

This article uses the [Vue HeatMap component](#) as an example. Install the `@syncfusion/ej2-vue-heatmap` package by running the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-heatmap --save
```

```
,
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-heatmap
```

```
,
```

### Adding Syncfusion Vue HeatMap component

Follow the below steps to add the Vue HeatMap component:

1\ First, import and register the HeatMap component in the `script` section of the `src/App.vue` file.

#### ~/SRC/APP.VUE

```
<script>
import { HeatMapComponent } from '@syncfusion/ej2-vue-heatmap';
export default {
  components: {
    'ejs-heatmap' : HeatMapComponent
  },
  data: function() {
    return {
      dataSource: [
        [73, 39, 26, 39, 94, 0],
        [93, 58, 53, 38, 26, 68],
        [99, 28, 22, 4, 66, 90],
        [14, 26, 97, 69, 69, 3],
        [7, 46, 47, 47, 88, 6],
        [41, 55, 73, 23, 3, 79],
        [56, 69, 21, 86, 3, 33],
        [45, 7, 53, 81, 95, 79],
        [60, 77, 74, 68, 88, 51],
        [25, 25, 10, 12, 78, 14],
        [25, 56, 55, 58, 12, 82],
        [74, 33, 88, 23, 86, 59]
      ]
    }
  }
}
</script>
```

2\ In the `template` section, define the HeatMap component.

#### ~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-heatmap id="heatmap" :dataSource='dataSource'></ejs-heatmap>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

#### ~/SRC/APP.VUE

```
<template>
  <ejs-heatmap id="heatmap" :dataSource='dataSource'></ejs-heatmap>
</template>
<script>
import { HeatMapComponent } from "@syncfusion/ej2-vue-heatmap";
export default {
  components: {
    'ejs-heatmap' : HeatMapComponent
  },
  data: function() {
    return {
      dataSource: [
        [73, 39, 26, 39, 94, 0],
        [93, 58, 53, 38, 26, 68],
        [99, 28, 22, 4, 66, 90],
        [14, 26, 97, 69, 69, 3],
        [7, 46, 47, 47, 88, 6],
        [41, 55, 73, 23, 3, 79],
        [56, 69, 21, 86, 3, 33],
        [45, 7, 53, 81, 95, 79],
        [60, 77, 74, 68, 88, 51],
        [25, 25, 10, 12, 78, 14],
        [25, 56, 55, 58, 12, 82],
        [74, 33, 88, 23, 86, 59]
      ]
    }
  }
}
</script>
```

#### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run serve
```

```
,
```

or

```
`bash
```

```
yarn run serve
```

```
,
```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/getting-started-cs8" %}

### Module injection

The heat map components are segregated into individual feature-wise modules. To use its feature, you need to inject its feature service in the AppModule. In the current application, the basic heat map is modified to visualize sales revenue data for week, and the tooltip and legend features of the heat map are used. Find the relevant feature modules and descriptions as follows.

- Legend - Provides the legend feature by injecting it.
- Tooltip - Provides the tooltip feature by injecting it.

Now, import the above-mentioned modules from the heat map package and inject them into **provide**.

#### ~/SRC/APP.VUE

```
<script>
import Vue from "vue";
import { HeatMapComponent, Legend, Tooltip } from "@syncfusion/ej2-vue-heatmap";
export default {
  components: {
    'ejs-heatmap': HeatMapComponent
  },
  provide: {
    heatmap: [Legend, Tooltip]
  }
};
</script>
```

### Populate heat map with data

This section explains how to populate the following two-dimensional array data to the heat map.

#### ~/SRC/APP.VUE

```
<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :dataSource='dataSource'></ejs-heatmap>
  </div>
</template>
<script>
import { HeatMapComponent } from '@syncfusion/ej2-vue-heatmap';
export default {
  components: {
    'ejs-heatmap': HeatMapComponent
  },
  data: function() {
    return {
      dataSource: [
        [73, 39, 26, 39, 94, 0],
        [93, 58, 53, 38, 26, 68],
        [99, 28, 22, 4, 66, 90],
        [14, 26, 97, 69, 69, 3],
        [7, 46, 47, 47, 88, 6],
        [41, 55, 73, 23, 3, 79],
        [56, 69, 21, 86, 3, 33],
      ]
    }
  }
};
```

```

        [45, 7, 53, 81, 95, 79],
        [60, 77, 74, 68, 88, 51],
        [25, 25, 10, 12, 78, 14],
        [25, 56, 55, 58, 12, 82],
        [74, 33, 88, 23, 86, 59]
    ]
}
}
}
</script>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/getting-started-cs1" %}

### Enable axis labels

You can add axis labels to the heat map and format those labels using the [xAxis](#) and [yAxis](#) properties. Axis labels provide additional information about the data points populated in the heat map.

### ~/SRC/APP.VUE

```

<template>
  <div class="control_wrapper">
    <ejs-heatmap id="heatmap" :dataSource='dataSource' :xAxis='xAxis'
    :yAxis='yAxis'></ejs-heatmap>
  </div>
</template>
<script>
import { HeatMapComponent, Tooltip, Legend } from '@syncfusion/ej2-vue-heatmap';
export default {
  components: {
    'ejs-heatmap': HeatMapComponent
  },
  data: function() {
    return {
      xAxis: {
        labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven',
          'Michael', 'Robert', 'Laura', 'Anne', 'Paul',
          'Karin', 'Mario'],
      },
      yAxis: {
        labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat'],
      },
      dataSource: [
        [73, 39, 26, 39, 94, 0],
        [93, 58, 53, 38, 26, 68],
        [99, 28, 22, 4, 66, 90],
        [14, 26, 97, 69, 69, 3],
        [7, 46, 47, 47, 88, 6],
        [41, 55, 73, 23, 3, 79],
        [56, 69, 21, 86, 3, 33],
        [45, 7, 53, 81, 95, 79],
        [60, 77, 74, 68, 88, 51],
        [25, 25, 10, 12, 78, 14],
        [25, 56, 55, 58, 12, 82],
        [74, 33, 88, 23, 86, 59]
      ]
    }
  }
}

```

```

    }
  },
  provide: {
    heatmap: [Tooltip, Legend]
  },
}
</script>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/getting-started-cs2" %}

### Add heat map title

Add a title using the [titleSettings](#) property to the heat map to provide quick information to the user about the data populated in the heat map.

### ~/SRC/APP.VUE

```

<template>
  <div class="control_wrapper">
    <ejs-heatmap id="heatmap" :dataSource='dataSource' :xAxis='xAxis'
    :yAxis='yAxis' :titleSettings='titleSettings'></ejs-heatmap>
  </div>
</template>
<script>
import { HeatMapComponent, Tooltip, Legend } from '@syncfusion/ej2-vue-heatmap';
export default {
  components: {
    'ejs-heatmap': HeatMapComponent
  },
  data: function() {
    return {
      xAxis: {
        labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven',
          'Michael', 'Robert', 'Laura', 'Anne', 'Paul',
          'Karin', 'Mario'],
      },
      yAxis: {
        labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat'],
      },
      titleSettings: {
        text: 'Sales Revenue per Employee (in 1000 US$)',
        textStyle: {
          size: '15px',
          fontWeight: '500',
          fontStyle: 'Normal',
          fontFamily: 'Segoe UI'
        }
      },
    },
    dataSource: [
      [73, 39, 26, 39, 94, 0],
      [93, 58, 53, 38, 26, 68],
      [99, 28, 22, 4, 66, 90],
      [14, 26, 97, 69, 69, 3],
      [7, 46, 47, 47, 88, 6],
      [41, 55, 73, 23, 3, 79],
      [56, 69, 21, 86, 3, 33],
    ]
  }
}

```

```

        [45, 7, 53, 81, 95, 79],
        [60, 77, 74, 68, 88, 51],
        [25, 25, 10, 12, 78, 14],
        [25, 56, 55, 58, 12, 82],
        [74, 33, 88, 23, 86, 59]
    ]
}
},
provide:{
    heatmap:[Tooltip, Legend]
},
}
</script>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/getting-started-cs3" %}

### Enable legend

Use a legend for the heat map in the [legendSettings](#) object by setting the [visible](#) property to **true** and injecting the **Legend** module into the **provide**.

### ~/SRC/APP.VUE

```

<template>
    <div class="control_wrapper">
        <ejs-heatmap id="heatmap" :dataSource='dataSource' :xAxis='xAxis'
        :yAxis='yAxis' :titleSettings='titleSettings'
        :legendSettings='legendSettings'></ejs-heatmap>
    </div>
</template>
<script>
import { HeatMapComponent, Tooltip, Legend } from '@syncfusion/ej2-vue-heatmap';
export default {
    components: {
        'ejs-heatmap': HeatMapComponent
    },
    data: function() {
        return {
            xAxis: {
                labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven',
                    'Michael', 'Robert', 'Laura', 'Anne', 'Paul',
                    'Karin', 'Mario'],
            },
            yAxis:{
                labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat'],
            },
            titleSettings: {
                text: 'Sales Revenue per Employee (in 1000 US$)',
                textStyle: {
                    size: '15px',
                    fontWeight: '500',
                    fontStyle: 'Normal',
                    fontFamily: 'Segoe UI'
                }
            },
            dataSource: [

```

```

        [73, 39, 26, 39, 94, 0],
        [93, 58, 53, 38, 26, 68],
        [99, 28, 22, 4, 66, 90],
        [14, 26, 97, 69, 69, 3],
        [7, 46, 47, 47, 88, 6],
        [41, 55, 73, 23, 3, 79],
        [56, 69, 21, 86, 3, 33],
        [45, 7, 53, 81, 95, 79],
        [60, 77, 74, 68, 88, 51],
        [25, 25, 10, 12, 78, 14],
        [25, 56, 55, 58, 12, 82],
        [74, 33, 88, 23, 86, 59]
    ],
    legendSettings: {
        visible: true,
        position: 'Right',
        showLabel: true,
        height: "150"
    }
},
provide: {
    heatmap: [Tooltip, Legend]
},
}
</script>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/getting-started-cs4" %}

#### Add data label

Add data labels to improve the readability of the heat map. This can be achieved by setting the [showLabel](#) property to **true** in the [cellSettings](#) object.

#### ~/SRC/APP.VUE

```

<template>
  <div class="control_wrapper">
    <ejs-heatmap id="heatmap" :dataSource='dataSource' :xAxis='xAxis'
    :yAxis='yAxis' :titleSettings='titleSettings'
    :legendSettings='legendSettings' :cellSettings='cellSettings'>
    </ejs-heatmap>
  </div>
</template>
<script>
import { HeatMapComponent, Tooltip, Legend } from '@syncfusion/ej2-vue-heatmap';
export default {
  components: {
    'ejs-heatmap': HeatMapComponent
  },
  data: function() {
    return {
      xAxis: {
        labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven',
          'Michael', 'Robert', 'Laura', 'Anne', 'Paul',
          'Karin', 'Mario'],

```

```

    },
    yAxis: {
      labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat'],
    },
    cellSettings: {
      showLabel: true,
    },
    titleSettings: {
      text: 'Sales Revenue per Employee (in 1000 US$)',
      textStyle: {
        size: '15px',
        fontWeight: '500',
        fontStyle: 'Normal',
        fontFamily: 'Segoe UI'
      }
    },
  },
  dataSource: [
    [73, 39, 26, 39, 94, 0],
    [93, 58, 53, 38, 26, 68],
    [99, 28, 22, 4, 66, 90],
    [14, 26, 97, 69, 69, 3],
    [7, 46, 47, 47, 88, 6],
    [41, 55, 73, 23, 3, 79],
    [56, 69, 21, 86, 3, 33],
    [45, 7, 53, 81, 95, 79],
    [60, 77, 74, 68, 88, 51],
    [25, 25, 10, 12, 78, 14],
    [25, 56, 55, 58, 12, 82],
    [74, 33, 88, 23, 86, 59]
  ],
  legendSettings: {
    visible: true,
    position: 'Right',
    showLabel: true,
    height: "150"
  }
}
},
provide: {
  heatmap: [Tooltip, Legend]
},
}
</script>

```

```
{% previewsample "page.domainurl/code-snippet/heatmap-chart/getting-started-cs5" %}
```

### Add custom cell palette

The default palette settings of the heat map cells can be customized by using the [paletteSettings](#) property. Using the [palette](#) property in `paletteSettings` object, you can change the color set for the cells. You can change the color mode of the cells to fixed or gradient mode using the [type](#) property.

### ~/SRC/APP.VUE

```

<template>
  <ejs-heatmap id="heatmap" :dataSource='dataSource' :xAxis='xAxis'
  :yAxis='yAxis' :titleSettings='titleSettings'

```

```

:legendSettings='legendSettings' :cellSettings='cellSettings'
:paletteSettings='paletteSettings'></ejs-heatmap>
</template>
<script>
import { HeatMapComponent, Tooltip, Legend } from '@syncfusion/ej2-vue-heatmap';
export default {
  components: {
    'ejs-heatmap': HeatMapComponent
  },
  data: function() {
    return {
      xAxis: {
        labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven',
          'Michael', 'Robert', 'Laura', 'Anne', 'Paul',
          'Karin', 'Mario'],
      },
      yAxis: {
        labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat'],
      },
      cellSettings: {
        showLabel: true,
      },
      titleSettings: {
        text: 'Sales Revenue per Employee (in 1000 US$)',
        textStyle: {
          size: '15px',
          fontWeight: '500',
          fontStyle: 'Normal',
          fontFamily: 'Segoe UI'
        }
      },
      dataSource: [
        [73, 39, 26, 39, 94, 0],
        [93, 58, 53, 38, 26, 68],
        [99, 28, 22, 4, 66, 90],
        [14, 26, 97, 69, 69, 3],
        [7, 46, 47, 47, 88, 6],
        [41, 55, 73, 23, 3, 79],
        [56, 69, 21, 86, 3, 33],
        [45, 7, 53, 81, 95, 79],
        [60, 77, 74, 68, 88, 51],
        [25, 25, 10, 12, 78, 14],
        [25, 56, 55, 58, 12, 82],
        [74, 33, 88, 23, 86, 59]
      ],
      legendSettings: {
        visible: true,
        position: 'Right',
        showLabel: true,
        height: "150"
      },
      paletteSettings: {
        palette: [
          { value: 0, color: '#C06C84' },
          { value: 50, color: '#6C5B7B' },
          { value: 100, color: '#355C7D' }
        ]
      }
    }
  }
}

```

```

        ],
        type: "Gradient"
    }
}
},
provide:{
    heatmap:[Tooltip, Legend]
},
}
</script>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/getting-started-cs6" %}

### Enable tooltip

The tooltip is used when you cannot display information by using the data labels due to space constraints. You can enable the tooltip by setting the [showTooltip](#) property to **true** and injecting the **Tooltip** module into the **provide**.

### ~/SRC/APP.VUE

```

<template>
    <ejs-heatmap id="heatmap" :dataSource='dataSource' :xAxis='xAxis'
    :yAxis='yAxis' :titleSettings='titleSettings'
    :legendSettings='legendSettings' :cellSettings='cellSettings'
    :showTooltip='showTooltip'></ejs-heatmap>
</template>
<script>
import { HeatMapComponent, Tooltip, Legend } from '@syncfusion/ej2-vue-heatmap';
export default {
    components: {
        'ejs-heatmap': HeatMapComponent
    },
    data: function() {
        return {
            xAxis: {
                labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven',
                    'Michael', 'Robert', 'Laura', 'Anne', 'Paul',
                    'Karin', 'Mario'],
            },
            yAxis: {
                labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat'],
            },
            cellSettings: {
                showLabel: true,
            },
            titleSettings: {
                text: 'Sales Revenue per Employee (in 1000 US$)',
                textStyle: {
                    size: '15px',
                    fontWeight: '500',
                    fontStyle: 'Normal',
                    fontFamily: 'Segoe UI'
                }
            }
        },
        dataSource: [

```

```

        [73, 39, 26, 39, 94, 0],
        [93, 58, 53, 38, 26, 68],
        [99, 28, 22, 4, 66, 90],
        [14, 26, 97, 69, 69, 3],
        [7, 46, 47, 47, 88, 6],

        [56, 69, 21, 86, 3, 33],
        [45, 7, 53, 81, 95, 79],
        [60, 77, 74, 68, 88, 51],
        [25, 25, 10, 12, 78, 14],
        [25, 56, 55, 58, 12, 82],
        [74, 33, 88, 23, 86, 59]
    ],
    legendSettings: {
        visible: true,
        position: 'Right',
        showLabel: true,
        height: "150"
    },
    showTooltip: true
}
},
provide: {
    heatmap: [Tooltip, Legend]
},
}
</script>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/getting-started-cs7" %}

## Getting Started with the Vue HeatMap Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue HeatMap component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

### Prerequisites

#### [System requirements for Syncfusion Vue UI components](#)

#### Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm create vite@latest
```

```
,
```

or

```
`bash
yarn create vite
`
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as `my-project` for this article.

```
`bash
? Project name: » my-project
`
```

2. Select `Vue` as the framework. It will create a Vue 3 project.

```
`bash
? Select a framework: » - Use arrow-keys. Return to submit.
Vanilla
Vue
React
Preact
Lit
Svelte
Others
`
```

3. Choose `JavaScript` as the framework variant to build this Vite project using JavaScript and Vue.

```
`bash
? Select a variant: » - Use arrow-keys. Return to submit.
JavaScript
TypeScript
Customize with create-vue ↗
Nuxt ↗
`
```

4. Upon completing the aforementioned steps to create the `my-project`, run the following command to install its dependencies:

```
`bash
cd my-project
npm install
```

```
,  
  
or  
  
`bash  
cd my-project  
yarn install  
,
```

Now that `my-project` is ready to run with default settings, let's add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue HeatMap component](#) as an example. To use the Vue HeatMap component in the project, the `@syncfusion/ej2-vue-heatmap` package needs to be installed using the following command:

```
`bash  
npm install @syncfusion/ej2-vue-heatmap --save  
,  
  
or  
  
`bash  
yarn add @syncfusion/ej2-vue-heatmap  
,
```

#### Add Syncfusion Vue component

Follow the below steps to add the Vue HeatMap component using `Composition API` or `Options API`:

1.First, import and register the HeatMap component and its child directives in the `script` section of the `src/App.vue` file. If you are using the `Composition API`, you should add the `setup` attribute to the `script` tag to indicate that Vue will be using the `Composition API`.

##### COMPOSITION API (~SRC/APP.VUE)

```
<script setup>  
import { HeatMapComponent as EjsHeatmap, Tooltip, Legend } from  
"@syncfusion/ej2-vue-heatmap";  
import { HeatMap } from '@syncfusion/ej2-heatmap';  
HeatMap.Inject(Legend, Tooltip);  
</script>
```

##### OPTIONS API (~SRC/APP.VUE)

```
<script>  
import { HeatMapComponent, Tooltip, Legend } from "@syncfusion/ej2-vue-  
heatmap";  
//Component registration
```

```
export default {
  name: "App",
  components: {
    'ejs-heatmap': HeatMapComponent
  }
}
</script>
```

2. In the **template** section, define the HeatMap component with the [dataSource](#), [xAxis](#), [yAxis](#) and other property definitions.

#### ~/SRC/APP.VUE

```
<template>
<ejs-heatmap id="heatmap" :dataSource='dataSource' :xAxis='xAxis'
:yAxis='yAxis' :titleSettings='titleSettings'
:legendSettings='legendSettings' :cellSettings='cellSettings'
:showTooltip='showTooltip'></ejs-heatmap>
</template>
```

3. In the **script** section, declare the values for the properties defined in the **template** section.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const xAxis = {
  labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven', 'Michael',
    'Robert', 'Laura', 'Anne', 'Paul', 'Karin', 'Mario'],
};
const yAxis = {
  labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat'],
};
const cellSettings = {
  showLabel: true,
};
const titleSettings = {
  text: 'Sales Revenue per Employee (in 1000 US$)',
  textStyle: {
    size: '15px',
    fontWeight: '500',
    fontStyle: 'Normal',
    fontFamily: 'Segoe UI'
  }
};
const dataSource = [
  [73, 39, 26, 39, 94, 0],
  [93, 58, 53, 38, 26, 68],
  [99, 28, 22, 4, 66, 90],
  [14, 26, 97, 69, 69, 3],
  [7, 46, 47, 47, 88, 6],
  [41, 55, 73, 23, 3, 79],
  [56, 69, 21, 86, 3, 33],
  [45, 7, 53, 81, 95, 79],
  [60, 77, 74, 68, 88, 51],
  [25, 25, 10, 12, 78, 14],
  [25, 56, 55, 58, 12, 82],
```

```
[74, 33, 88, 23, 86, 59]
];
const legendSettings = {
  visible:true,
  position: 'Right',
  showLabel: true,
  height: "150"
};
const showTooltip = true;
</script>
```

### OPTIONS API (~SRC/APP.VUE)

```
<script>
data() {
  return {
    xAxis: {
      labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven', 'Michael',
        'Robert', 'Laura', 'Anne', 'Paul', 'Karin', 'Mario'],
    },
    yAxis:{
      labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat'],
    },
    cellSettings: {
      showLabel: true,
    },
    titleSettings: {
      text: 'Sales Revenue per Employee (in 1000 US$)',
      textStyle: {
        size: '15px',
        fontWeight: '500',
        fontStyle: 'Normal',
        fontFamily: 'Segoe UI'
      }
    },
    dataSource: [
      [73, 39, 26, 39, 94, 0],
      [93, 58, 53, 38, 26, 68],
      [99, 28, 22, 4, 66, 90],
      [14, 26, 97, 69, 69, 3],
      [7, 46, 47, 47, 88, 6],
      [41, 55, 73, 23, 3, 79],
      [56, 69, 21, 86, 3, 33],
      [45, 7, 53, 81, 95, 79],
      [60, 77, 74, 68, 88, 51],
      [25, 25, 10, 12, 78, 14],
      [25, 56, 55, 58, 12, 82],
      [74, 33, 88, 23, 86, 59]
    ],
    legendSettings: {
      visible:true,
      position: 'Right',
      showLabel: true,
      height: "150"
    },
    showTooltip:true
  }
}
```

```
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

### COMPOSITION API (~SRC/APP.VUE)

```
<template>
<ejs-heatmap id="heatmap" :dataSource='dataSource' :xAxis='xAxis'
: yAxis='yAxis' :titleSettings='titleSettings'
: legendSettings='legendSettings' :cellSettings='cellSettings'
: showTooltip='showTooltip'></ejs-heatmap>
</template>
<script setup>
import { HeatMapComponent as EjsHeatmap, Tooltip, Legend } from
"@syncfusion/ej2-vue-heatmap";
import { HeatMap } from "@syncfusion/ej2-heatmap";
HeatMap.Inject(Legend, Tooltip);
const xAxis = {
labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven', 'Michael',
'Robert', 'Laura', 'Anne', 'Paul', 'Karin', 'Mario'],
};
const yAxis = {
labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat'],
};
const cellSettings = {
showLabel: true,
};
const titleSettings = {
text: 'Sales Revenue per Employee (in 1000 US$)',
textStyle: {
size: '15px',
fontWeight: '500',
fontStyle: 'Normal',
fontFamily: 'Segoe UI'
}
};
const dataSource = [
[73, 39, 26, 39, 94, 0],
[93, 58, 53, 38, 26, 68],
[99, 28, 22, 4, 66, 90],
[14, 26, 97, 69, 69, 3],
[7, 46, 47, 47, 88, 6],
[41, 55, 73, 23, 3, 79],
[56, 69, 21, 86, 3, 33],
[45, 7, 53, 81, 95, 79],
[60, 77, 74, 68, 88, 51],
[25, 25, 10, 12, 78, 14],
[25, 56, 55, 58, 12, 82],
[74, 33, 88, 23, 86, 59]
];
const legendSettings = {
visible: true,
position: 'Right',
showLabel: true,
```

```
height: "150"
};
const showTooltip = true;
</script>
```

### OPTIONS API (~SRC/APP.VUE)

```
<template>
<ejs-heatmap id="heatmap" :dataSource='dataSource' :xAxis='xAxis'
:yAxis='yAxis' :titleSettings='titleSettings'
:legendSettings='legendSettings' :cellSettings='cellSettings'
:showTooltip='showTooltip'></ejs-heatmap>
</template>
<script>
import { HeatMapComponent, Tooltip, Legend } from "@syncfusion/ej2-vue-heatmap";
// Component registration
export default {
name: "App",
// Declaring component and its directives
components: {
'ejs-heatmap': HeatMapComponent
},
// Bound properties declarations
data() {
return {
xAxis: {
labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven', 'Michael',
'Robert', 'Laura', 'Anne', 'Paul', 'Karin', 'Mario'],
},
yAxis: {
labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat'],
},
cellSettings: {
showLabel: true,
},
titleSettings: {
text: 'Sales Revenue per Employee (in 1000 US$)',
textStyle: {
size: '15px',
fontWeight: '500',
fontStyle: 'Normal',
fontFamily: 'Segoe UI'
}
},
},
dataSource: [
[73, 39, 26, 39, 94, 0],
[93, 58, 53, 38, 26, 68],
[99, 28, 22, 4, 66, 90],
[14, 26, 97, 69, 69, 3],
[7, 46, 47, 47, 88, 6],
[41, 55, 73, 23, 3, 79],
[56, 69, 21, 86, 3, 33],
[45, 7, 53, 81, 95, 79],
[60, 77, 74, 68, 88, 51],
[25, 25, 10, 12, 78, 14],
```

```
[25, 56, 55, 58, 12, 82],
[74, 33, 88, 23, 86, 59]
],
legendSettings: {
  visible: true,
  position: 'Right',
  showLabel: true,
  height: "150"
},
showTooltip: true
};
},
provide: {
  heatmap: [Tooltip, Legend]
}
};
</script>
```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
`
```

or

```
`bash
```

```
yarn run dev
```

```
`
```

The output will appear as follows:

For migrating from Vue 2 to Vue 3, refer to the [migration](#) documentation.

### Working with data in Vue Heatmap chart component

Heat map visualizes the JSON data and two-dimensional array data. Using the data adaptor support, data can be bound to the heat map.

#### Data adaptor

Heat map supports the following types of data binding with the adaptor support.

- Array
- Table Binding
- Cell Binding
- JSON data
- Table Binding
- Cell Binding

#### Array - table binding

This data type is a collection of one dimensional array objects, at which each inner array contains data points for an X-axis data label. This is the default data binding type for heat map. You can also directly bind the array object to the [dataSource](#) property.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :titleSettings='titleSettings'
    :xAxis='xAxis' :yAxis='yAxis' :paletteSettings='paletteSettings'
    :legendSettings='legendSettings' :tooltipRender='tooltipRender'
    :dataSource='dataSource'></ejs-heatmap>
  </div>
</template>
<script>
import Vue from 'vue';
import { HeatMapPlugin, Tooltip, Legend } from '@syncfusion/ej2-vue-heatmap';
Vue.use(HeatMapPlugin);
export default {
  data: function() {
    return {
      dataSource: [
        [9.5, 2.2, 4.2, 8.2, -0.5, 3.2, 5.4, 7.4, 6.2, 1.4],
        [4.3, 8.9, 10.8, 6.5, 5.1, 6.2, 7.6, 7.5, 6.1, 7.6],
        [3.9, 2.7, 2.5, 3.7, 2.6, 5.1, 5.8, 2.9, 4.5, 5.1],
        [2.4, -3.7, 4.1, 6.0, 5.0, 2.4, 3.3, 4.6, 4.3, 2.7],
        [2.0, 7.0, -4.1, 8.9, 2.7, 5.9, 5.6, 1.9, -1.7, 2.9],
        [5.4, 1.1, 6.9, 4.5, 2.9, 3.4, 1.5, -2.8, -4.6, 1.2],
        [-1.3, 3.9, 3.5, 6.6, 5.2, 7.7, 1.4, -3.6, 6.6, 4.3],
        [-1.6, 2.3, 2.9, -2.5, 1.3, 4.9, 10.1, 3.2, 4.8, 2.0],

        labelRotation: 45,
        labelIntersectAction: 'None'
    },
    yAxis: {
        labels: ['2008', '2009', '2010', '2011', '2012', '2013',
        '2014', '2015', '2016', '2017']
    },
    paletteSettings: {
        palette: [
            { value: -1, color: '#F0D6AD' },
            { value: 0, color: '#9da49a' },
            { value: 3.5, color: '#d7c7a7' },
            { value: 6.0, color: '#6e888f' },
            { value: 7.5, color: '#466f86' },
            { value: 10, color: '#19547B' },
        ]
    },
    legendSettings: {
        visible: false
    }
},
provide: {
    heatmap: [Tooltip, Legend]
},
methods: {
    tooltipRender: function(args)
    {
        args.content = [args.yLabel + ' | ' + args.xLabel + ' : ' +
args.value + ' %'];
    }
}
}
</script>
<style>
@import
'https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-heatmap/styles/material.css';
</style>

```

```
{% previewsample "page.domainurl/code-snippet/heatmap-chart/working-with-data-cs1" %}
```

### Array - cell binding

This data type is a collection of array objects that contain information about the row index, column index, and data value for each cell. You can bind the data to heat map by using the [data](#) property in the [dataSource](#) and setting the [adaptorType](#) property to **Cell**.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :titleSettings='titleSettings'
    :xAxis='xAxis' :yAxis='yAxis' :paletteSettings='paletteSettings'
    :legendSettings='legendSettings' :tooltipRender='tooltipRender'
    :dataSource='dataSource' :cellSettings='cellSettings'></ejs-heatmap>
  </div>
</template>
<script>
import Vue from 'vue';
import { HeatMapPlugin, Tooltip, Legend, Adaptor } from '@syncfusion/ej2-
vue-heatmap';
Vue.use(HeatMapPlugin);
export default {
  data: function() {
    return {
      dataSource: [
        [0, 0, 10.75], [0, 1, 14.5], [0, 2, 25.5], [0, 3, 39.5],
        [0, 4, 59.75], [0, 5, 35.50], [0, 6, 75.5],
        [1, 0, 20.75], [1, 1, 35.5], [1, 2, 29.5], [1, 3, 75.5],

        labels: ['China', 'Australia', 'Mexico', 'Canada',
'Brazil', 'USA',
        'UK', 'Germany', 'Russia', 'France', 'Japan']
    },
    yAxis: {
        labels: ['2000', '2005', '2010', '2011', '2012', '2013',
'2014']
    },
    cellSettings: {
        border: {
            width: 0
        },
        textStyle: {
            color: 'white'
        },
        format: '{value} %'
    },
    legendSettings: {
        visible: false,
    },
    paletteSettings: {
        palette: [
            { color: '#3498DB' },
            { color: '#2C3E50' }
        ]
    },
    legendSettings: {
        visible: false
    }
    },
    provide:{
        heatmap:[Tooltip, Legend, Adaptor]
    },
    methods: {
        tooltipRender: function(args)
        {
            args.content = [args.yLabel + ' | ' + args.xLabel + ' : ' +
args.value + ' %'];
        }
    }
}
</script>
<style>
@import
'https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-heatmap/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/working-with-data-cs2" %}

*JSON data - table binding*

In JSON table data binding, each JSON object contains an X-axis data point as row header and all the corresponding Y-axis data values. You can bind the JSON table data to the heat map using the [data](#) property in [dataSource](#). To achieve this, you should enable the [isJsonData](#) property and define the [adaptorType](#) property as **Table**. The [xDataMapping](#) property is used to map the row header in JSON data.

**APP.VUE**

```
<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :titleSettings='titleSettings'
    :xAxis='xAxis' :yAxis='yAxis' :paletteSettings='paletteSettings'
    :dataSource='dataSource' :dataSourceSettings='dataSourceSettings'
    :cellSettings='cellSettings'></ejs-heatmap>
  </div>
</template>
<script>
import Vue from 'vue';
import { HeatMapPlugin, Tooltip, Legend, Adaptor } from '@syncfusion/ej2-
vue-heatmap';
Vue.use(HeatMapPlugin);
export default {
  data: function() {
    return {
      dataSource: [
        { 'Region': 'USA', '2000': 93, '2004': 101, '2008': 112,

### JSON data - Cell binding

In JSON cell data binding, each JSON object consists a value for each cell along with a mapping value for row and column. You can bind the JSON cell data having information for each cell to the heat map using the [data](#) property in [dataSource](#). To achieve this, you should define the [adaptorType](#) property as **Cell**, and enable the [isJsonData](#) property. Now, map the fields of data by using the [valueMapping](#), [xDataMapping](#) and [yDataMapping](#) properties.

### Empty points

The data points that use the **null** or **undefined** or empty string as value are considered as empty points. Empty data points are ignored and not displayed in the heat map, and these points are rendered with default palette. You can customize the empty data point color value using the [emptyPointColor](#) property.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :xAxis='xAxis' :yAxis='yAxis'
    :dataSource='dataSource' :legendSettings='legendSettings'></ejs-heatmap>
  </div>
</template>

### Binding nested JSON data

In complex data binding, you can bind the nested JSON data to the data points in the heat map.

The nested data can be mapped using the [xDataMapping](#), [yDataMapping](#), [valueMapping](#) and [bubbleDataMapping](#) properties as string value concatenated by a dot.

### APP.VUE

- [To bind data for bubble heat map with size and color attributes](#)

### Bubble heatmap in Vue Heatmap chart component

Data points represent the data source values with **gradient** or **fixed** colors in the HeatMap. You can customize the appearance of these data points by changing the **color** and **size** attributes.

The data points can be represented in color fill or bubble shape by defining the **tileType** property. By default, the data points are color filled with gradient or fixed colors and this depiction of data points is defined as **Rect** in the **tileType** property.

The cell customizations and color mapping for rect tile type is defined in [appearance](#) and [palette](#) sections in detail.

#### Bubble types

The data points can be represented in the bubble along with its attributes by setting the **tileType** property to **Bubble**.

In bubble HeatMap, you can display the data points with bubble size, bubble colors, and sector attributes of the bubble.

#### Bubble size

In this bubble HeatMap type, the size factor of the bubble is used to denote the data variations. The radius of the bubble varies according to data values.

By default, the bubble with small size denotes the data value with small magnitude and the larger bubble size denotes the data value with larger magnitude. This behavior can be inverted by using the [isInversedbubblesize](#) property.

To render a bubble HeatMap with size series, set the [bubbleType](#) property to **Size**.

### *Combining size and color bubble types*

In this bubble HeatMap type, size and color of the bubble represents the data value variation. To render this bubble HeatMap type, set the [bubbleType](#) property to **SizeAndColor**.

The following examples demonstrate different data binding with the **SizeAndColor** bubble type set in the HeatMap.

<!-- markdownlint-disable MD036 -->

### **Array binding**

When an array of numbers is specified as the data source, the bubble HeatMap can be rendered with different sizes and colors depending on the bound data.

<!-- markdownlint-disable MD036 -->

### **Table**

The following example illustrates how to render a bubble HeatMap with different sizes and colors using array table binding.

### **APP.VUE**

```

### JSON binding

When a list of JSON objects are specified as data source, the bubble HeatMap can be rendered with different sizes and colors depending on the bound data.

```
<!-- markdownlint-disable MD036 -->
```

### Table

The following example illustrates how to render a bubble HeatMap with different sizes and colors using JSON table binding.

### APP.VUE

### Binding size and color values from datasource

The size and color of the bubbles in the **SizeAndColor** bubble HeatMap type can be customized by binding the datasource field name that holds the size and color values to the [size](#) and [color](#) properties in the [bubbleDataMapping](#).

The `bubbleDataMapping` supports only for the JSON data with cell adaptor type.

### APP.VUE

```

<template>

### Rendering mode in Vue Heatmap chart component

Heat map can be displayed using **Canvas** or **Scalable Vector Graphics (SVG)** rendering logic to improve the initial load performance and scalability. Heat map can also be automatically switched between **Canvas** and **SVG** modes based on dataset size. You can enable this mode by setting the [renderingMode](#) property to **Auto**.

If the **Auto** mode is enabled in the heat map and there are more than 10,000 data points, then the heat map will be rendered in a **Canvas** mode; Otherwise, the heat map will be rendered in a **SVG** mode.

**APP.VUE**

```

<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :titleSettings='titleSettings'

### Axis in Vue HeatMap chart component

HeatMap consists of two axes namely, X-axis and Y-axis that displays the row headers and column headers to plot the data points respectively. You can define the type, format, and other customizing options for both axes in the HeatMap.

#### Types

There are three different axis types available in the HeatMap, which defines the data type of the axis labels. You can define the axis type by using the [valueType](#) property in the HeatMap.

#### Category axis

Category axis type is used to represent the string values in axis labels.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :xAxis='xAxis' :yAxis='yAxis'
:dataSource='dataSource'></ejs-heatmap>
  </div>
</template>

#### *Date-time axis*

Date-time axis type is used to represent the date-time values in axis labels with a specific format. In date-time axis, you can define the start and end date/time using the [minimum](#) and [maximum](#) properties.

### Axis labels customization

#### *Customizing the text style*

The text style of the axis labels can be customized using the following options available in the [textStyle](#) property.

- [color](#) - It is used to change the text color of the axis labels.
- [fontFamily](#) - It is used to change the font family of the axis labels.
- [fontStyle](#) - It is used to change the font style of the axis labels.
- [fontWeight](#) - It is used to change the font weight of the axis labels.
- [size](#) - It is used to change the font size of the axis labels.
- [textAlignment](#) - It is used to position and align the axis labels. This property allows you to specify values such as **Near**, **Center**, and **Far**.
- [textOverflow](#) - When the axis label exceeds the intended space, this property is used to trim or wrap it. This property takes values such as **None**, **Trim**, and **Wrap**.

{% previewsample "page.domainurl/code-snippet/heatmap-chart/axis-cs11" %}

#### Providing line breaks

Axis labels with line breaks improve the readability of the HeatMap by splitting the text on an axis into multiple lines. The “`<br>`” character is used to add line breaks to the axis labels.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :xAxis='xAxis' :yAxis='yAxis'
    :dataSource='dataSource'></ejs-heatmap>
  </div>
</template>
<script>
import Vue from 'vue';
import { HeatMapPlugin, Legend, Tooltip } from '@syncfusion/ej2-vue-heatmap';
Vue.use(HeatMapPlugin);
export default {
  data: function () {
    return {
      dataSource: [
        [1, 76],
        [19, 3]
      ],
      xAxis: {
        labels: ['Actual<br>Accept', 'Actual<br>Reject'],
        opposedPosition: true
      },
    },
  },

```

```

        yAxis: {
            labels: ['Actual<br>Accept', 'Actual<br>Reject'],
            maxLabelLength: 50
        }
    },
    provide: {
        heatmap: [Tooltip, Legend]
    }
}
</script>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/axis-cs14" %}

#### *Customizing labels when intersecting with other labels*

When the axis labels intersect, [labelIntersectAction](#) property is used to handle the intersection. The [labelIntersectAction](#) property can take the following values.

- **None** - It specifies that no action is taken when the axis labels intersect.
- **Trim** - It specifies to trim the axis labels when they intersect.
- **Rotate45** - When the axis labels intersect, they are rotated to 45 degrees.
- **MultipleRows** - It specifies to show all the axis labels as multiple rows when they intersect.

The below example demonstrates to trim the axis labels by using the [labelIntersectAction](#) property.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :xAxis='xAxis' :yAxis='yAxis'
    :dataSource='dataSource'
    :titleSettings='titleSettings' :paletteSettings='paletteSettings'
    :legendSettings='legendSettings'></ejs-heatmap>
  </div>
</template>
<script>
import Vue from 'vue';
import { HeatMapPlugin, Tooltip } from '@syncfusion/ej2-vue-heatmap';
Vue.use(HeatMapPlugin);

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/axis-cs13" %}

### Label formatting

HeatMap supports formatting the axis labels by using the [labelFormat](#) property. Using this property, you can customize the axis label by global string format ('P', 'C', etc) or customized format like '{value}°C'.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :xAxis='xAxis' :yAxis='yAxis'
    :legendSettings='legendSettings' :dataSource='dataSource'></ejs-heatmap>
  </div>
</template>
<script>
import Vue from 'vue';
import { HeatMapPlugin, Tooltip, Legend } from '@syncfusion/ej2-vue-heatmap';
Vue.use(HeatMapPlugin);
export default {
  data: function() {

```

```

return {
  dataSource: [
    [73, 39, 26, 39, 94, 0],

### Axis intervals

In HeatMap, you can define an interval between the axis labels using the [interval](#) property. In date-time axis, you can change the interval mode by using the [intervalType](#) property. The date-time axis supports the following interval types:

- Years
- Months
- Days
- Hours
- Minutes

**APP.VUE**

```

<template>
  <div id="app">

{% previewsample "page.domainurl/code-snippet/heatmap-chart/axis-cs7" %}

### Axis label increment

Axis label increment in the HeatMap is used to display the axis labels with regular interval values in numeric and date-time axes. The labels will be displayed with tick gaps when you set the label interval. But, to achieve the same behavior without tick gaps, use the label increment. You can set the axis label increment using the [increment](#) property and the default value of this property is 1.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :xAxis='xAxis' :yAxis='yAxis'
      :dataSource='dataSource'></ejs-heatmap>
    </div>
  </template>
<script>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/axis-cs8" %}

### Limiting labels in date-time axis

You can display the axis labels at specific time intervals along with the date-time axis using the [showLabelOn](#) property. This property supports the following types:

- **None**: Displays the axis labels based on the `intervalType` and `interval` property of the axis. This type is default value of the `showLabelOn` property.
- **Years**: Displays the axis labels on every year between given date-time range.
- **Months**: Displays the axis labels on every month between given date-time range.
- **Days**: Displays the axis labels on every day between given date-time range.
- **Minutes**: Displays the axis labels on every minute between given date-time range.

### Multilevel Labels

Multilevel labels are used to classify a group of axis labels as a single category, which is then displayed with a label. By using [multiLevelLabels](#), you can add multiple levels on top of the axis labels.

To divide and group the axis labels, you can use `multiLevelLabels` property. The starting and ending indexes of the axis labels can be set using the `start` and `end` properties in the `categories`. The `text` property can be used to specify a name for the grouped axis labels.

The multilevel labels can be customized by using the following properties.

- [overflow](#) - It is used to trim or wrap the multilevel labels when the label overflows the intended space. NOTE: This property is only for x-axis.
- [alignment](#) - It is used to place and align the multilevel labels.
- [maximumTextWidth](#) - It is used to set the maximum width of the text. When the text length exceeds the maximum text width, the overflow action will be performed.
- [textStyle](#) - It is used to customize the font style of the multilevel labels.
- [border](#) - It is used to customize the border of the multilevel labels displayed in the x-axis and y-axis.

### Palette in Vue Heatmap chart component

In heat map, each data point is displayed as a cell with applied color based on the data value. The palette in the heat map is used to define the color range for cells and gradient type for colors. You can define the colors either in RGB or hex codes using the [color](#) property in the [palette](#). The defined colors are applied to the cell background based on the palette type and cell value.

#### Palette types

You can display the heat map cells either in gradient colors or fixed colors.

##### Gradient

The smooth transition between the given palette colors can be applied for the heat map cells based on value. The heat map calculates all the gradient colors between the start and end colors for all distinct data values. Default start color and end color will be considered for gradient calculation, if the colors are not defined. The palette type must be defined as **Gradient** for the [type](#) property in the [paletteSettings](#) property.

{% previewsample "page.domainurl/code-snippet/heatmap-chart/palette-cs2" %}

### Defining color stops

You can define the colors ranges or color stops for data values in both gradient and fixed palette types. You need to define the data value in the [value](#) property for [palette](#) property to calculate the color stops. The heat map automatically calculates the color stops if the [value](#) property is not defined. The [label](#) property is used to provide the additional information about the color that is to be displayed in the legend. If the label is not provided, the value is displayed in the legend. The labels can be automatically calculated based on data values, if both the values and labels are not defined.

### Color range

The color range support is used to provide a specific color for specific range in heat map. The `startValue` and `endValue` properties are used to define the range start and end value. The `minColor` and `maxColor` properties represent the colors of given range. It's possible to set the cell color for the value not in the given range using the `fillColor` property.

In Fixed type, the `minColor` value is used for cell color.

#### APP.VUE

### Legend in Vue Heatmap chart component

The legend is used to provide the information about the heat map cell. You can enable the legend by setting the [visible](#) property to **true** and injecting the **Legend** module into the **provide**.

#### APP.VUE

```

<template>
  <div id="app">

```

### Legend types

Heat map supports two legend types: Gradient and list type.

- Gradient - This is a continuous color legend with smooth color transition between palette color values.
- List - List is a fixed color legend. Each palette color information is shown separately in the list item.

You can change the legend type by using the [type](#) property in the `paletteSettings` property.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :titleSettings='titleSettings'
    :xAxis='xAxis' :yAxis='yAxis' :dataSource='dataSource'
    :paletteSettings='paletteSettings' :cellSettings='cellSettings'
    :legendSettings='legendSettings'></ejs-heatmap>
  </div>
</template>
<script>
import Vue from 'vue';
import { HeatMapPlugin, Tooltip, Legend } from '@syncfusion/ej2-vue-heatmap';
Vue.use(HeatMapPlugin);
export default {
  data: function() {
    return {
      dataSource: [
        [73, 39, 26, 39, 94, 0],
        [93, 58, 53, 38, 26, 68],
        [99, 28, 22, 4, 66, 90],
        [14, 26, 97, 69, 69, 3],
        [7, 46, 47, 47, 88, 6],
        [41, 55, 73, 23, 3, 79],
        [56, 69, 21, 86, 3, 33],
        [45, 7, 53, 81, 95, 79],
        [60, 77, 74, 68, 88, 51],
        [25, 25, 10, 12, 78, 14],
        [25, 56, 55, 58, 12, 82],
        [74, 33, 88, 23, 86, 59]
      ],
      titleSettings: {
        text: 'Sales Revenue per Employee (in 1000 US$)',
        textStyle: {
          size: '15px',
          fontWeight: '500',
          fontStyle: 'Normal',
          fontFamily: 'Segoe UI'
        }
      },
      xAxis: {
```

```

        labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven',
        'Michael', 'Robert', 'Laura', 'Anne', 'Paul', 'Karin',
        'Mario']
    },
    yAxis: {
        labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat']
    },
    cellSettings: {
        showLabel: false,
    },
    paletteSettings: {
        type: 'Fixed'
    },
    legendSettings: {
        position: 'Right',
    }
    }
    },
    provide: {
        heatmap: [Tooltip, Legend]
    }
    }
</script>
<style>

### Smart Legend

Smart legend is another way of showing list type legend with responsiveness and readability, when the palette has more number of items. You can enable this smart legend by using the [enableSmartLegend](#) property when the palette type is set to **Fixed**.

In smart legend, you can change the display type of legend labels by using the [labelDisplayType](#) property.

The following are the legend label display types:

- All: Displays all labels in the legend.
- Edge: Displays the legend labels only at extreme ends.
- None: None of the labels are displayed. The tooltip will appear for this type of label display when hovering over the legend item.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :titleSettings='titleSettings'
    :xAxis='xAxis' :yAxis='yAxis' :dataSource='dataSource'

{% previewsample "page.domainurl/code-snippet/heatmap-chart/appearance-cs2" %}

#### Color gradient mode

The [colorGradientMode](#) property can be used to set the minimum and maximum values for colors based on row and column.

Three types of color gradient modes are available.

- **Table:** The minimum and maximum value colors calculated for overall data.
- **Row:** The minimum and maximum value colors calculated for each row of data.
- **Column:** The minimum and maximum value colors calculated for each column of data.

Note: The default value of `colorGradientMode` is **Table**.

        labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat']
      },
      cellSettings: {
        format: '${value}'
      }
    }
  },
  provide: {
    heatmap: [Tooltip, Legend]
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-vue-heatmap/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/appearance-cs10" %}

### Template

Any HTML elements can be added as a template in the data labels by using the [labelTemplate](#) property of [cellSettings](#) in the HeatMap.

The following examples show various data binding methods in the HeatMap using the `labelTemplate` property.

#### Array binding

By including `${value}` in the template content, the value from the data source for the corresponding cell can be displayed in the HeatMap cell as data label template content. Additionally, the x-axis and y-axis label values can be displayed by including `${xLabel}` and `${yLabel}` in the template content.

#### Table

The following example demonstrates how to add a data label template for array table binding.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :titleSettings='titleSettings'
      :xAxis='xAxis' :yAxis='yAxis' :dataSource='dataSource'
      :cellSettings='cellSettings'></ejs-heatmap>
  </div>
</template>
<script>
import Vue from 'vue';
import { HeatMapPlugin, Tooltip, Legend } from '@syncfusion/ej2-vue-heatmap';
Vue.use(HeatMapPlugin);
export default {
  data: function () {
    return {
      dataSource: [
        [[4, 39], [3, 8], [1, 3], [1, 10], [4, 4], [2, 15]],
        [[4, 28], [5, 92], [5, 73], [3, 1], [3, 4], [4, 126]],
        [[4, 45], [5, 152], [0, 44], [4, 54], [5, 243], [2, 45]]
      ],
      titleSettings: {
        text: 'Commercial Aviation Accidents and Fatalities by year
2015 - 2017',
        textStyle: {
          size: '15px',
          fontWeight: '500',
          fontStyle: 'Normal',
          fontFamily: 'inherit'
        }
      },
      xAxis: {
        labels: ['2015', '2016', '2017']
      },
      yAxis: {
        labels: ['Jan-Feb', 'Mar-Apr', 'May-Jun', 'Jul-Aug', 'Sep-
Oct', 'Nov-Dec']
      },
      cellSettings: {
        labelTemplate:
          '<div style="width:25px;height:20px;text-align:center;padding-top:2px;background-color:#5BBB9C; border: 1px solid #000000; border-radius:50%;font-weight:bold;">${value}</div>'
      }
    }
  }
}
```

```

    }
  },
  provide: {
    heatmap: [Tooltip, Legend]
  }
}
</script>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/appearance-cs11" %}

## Cell

The following example demonstrates how to add a data label template for array cell binding.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :titleSettings='titleSettings'
      :dataSourceSettings='dataSourceSettings' :xAxis='xAxis' :yAxis='yAxis'
      :dataSource='dataSource'
      :cellSettings='cellSettings'></ejs-heatmap>
  </div>
</template>
<script>
import Vue from 'vue';
import { HeatMapPlugin, Adaptor, Tooltip, Legend } from '@syncfusion/ej2-
vue-heatmap';
Vue.use(HeatMapPlugin);
export default {
  data: function () {
    return {
      dataSource: [
        [0, 0, [4, 39]], [0, 1, [3, 8]], [0, 2, [1, 3]], [0, 3, [1,
10]], [0, 4, [4, 4]], [0, 5, [2, 15]],
        [1, 0, [4, 28]], [1, 1, [5, 92]], [1, 2, [5, 73]], [1, 3,
[3, 1]], [1, 4, [3, 4]], [1, 5, [4, 126]],
        [2, 0, [4, 45]], [2, 1, [5, 152]], [2, 2, [0, 44]], [2, 3,
[4, 54]], [2, 4, [5, 243]], [2, 5, [2, 45]]
      ],
      titleSettings: {
        text: 'Commercial Aviation Accidents and Fatalities by year
2015 - 2017',
        textStyle: {
          size: '15px',
          fontWeight: '500',
          fontStyle: 'Normal',
          fontFamily: 'inherit',
        },
      },
      xAxis: {
        labels: ['2015', '2016', '2017']
      },
      yAxis: {
        labels: ['Jan-Feb', 'Mar-Apr', 'May-Jun', 'Jul-Aug', 'Sep-
Oct', 'Nov-Dec']
      },
    },
  },

```

```

        cellSettings: {
            labelTemplate:
                '<div style="width:25px;height:20px;text-align:center;padding-top:2px;background-color:#5BBB9C; border: 1px solid #000000; border-radius:50%;font-weight:bold;">${value}</div>'
        },
        dataSourceSettings: {
            isJsonData: false,
            adaptorType: 'Cell'
        }
    },
    provide: {
        heatmap: [Tooltip, Legend, Adaptor]
    }
}
</script>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/appearance-cs12" %}

### JSON binding

By including the desired field name in the template content, such as **\${value}**, the value from the data source for the corresponding cell can be displayed in the HeatMap cell as data label template content.

### Table

The following example demonstrates how to add a data label template for JSON table binding.

### APP.VUE

```

<template>
    <div id="app">
        <ejs-heatmap id="heatmap" :titleSettings='titleSettings'
        :dataSourceSettings='dataSourceSettings' :xAxis='xAxis'
        :yAxis='yAxis' :dataSource='dataSource'
        :cellSettings='cellSettings'></ejs-heatmap>
    </div>
</template>
<script>
import Vue from 'vue';
import { HeatMapPlugin, Adaptor, Tooltip, Legend } from '@syncfusion/ej2-vue-heatmap';
Vue.use(HeatMapPlugin);
export default {
    data: function () {
        return {
            dataSource: [
                {
                    Year: '2017',
                    image:
                        'https://ej2.syncfusion.com/vue/demos/src/circular-gauge/images/golf-ball.png',
                    'Jan-Feb': [4, 39],
                    'Mar-Apr': [3, 8],
                    'May-Jun': [1, 3],
                    'Jul-Aug': [1, 10],
                    'Sep-Oct': [4, 4],
                }
            ]
        }
    }
}

```

```

        'Nov-Dec': [2, 15]
      },
      {
        Year: '2016',
        image:
          'https://ej2.syncfusion.com/vue/demos/src/circular-
          gauge/images/basket-ball.png',
        'Jan-Feb': [4, 28],
        'Mar-Apr': [5, 92],
        'May-Jun': [5, 73],
        'Jul-Aug': [3, 1],
        'Sep-Oct': [3, 4],
        'Nov-Dec': [4, 126]
      },
      {
        Year: '2015',
        image:
          'https://ej2.syncfusion.com/vue/demos/src/circular-
          gauge/images/foot-ball.png',
        'Jan-Feb': [4, 45],
        'Mar-Apr': [5, 152],
        'May-Jun': [0, 44],
        'Jul-Aug': [4, 54],
        'Sep-Oct': [5, 243],
        'Nov-Dec': [2, 45]
      }
    ],
    titleSettings: {
      text: 'Commercial Aviation Accidents and Fatalities by year
2015 - 2017',
      textStyle: {
        size: '15px',
        fontWeight: '500',
        fontStyle: 'Normal',
        fontFamily: 'inherit',
      },
    },
    xAxis: {
      labels: ['2015', '2016', '2017']
    },
    yAxis: {
      labels: ['Jan-Feb', 'Mar-Apr', 'May-Jun', 'Jul-Aug', 'Sep-
Oct', 'Nov-Dec']
    },
    cellSettings: {
      labelTemplate:
        "<div><img style='width:20px;height:20px;'
src='${image}' /> </div>"
    },
    dataSourceSettings: {
      isJsonData: true,
      adaptorType: 'Table',
      xDataMapping: 'Year'
    }
  },
  provide: {

```

```

        heatmap: [Tooltip, Legend, Adaptor]
    }
}
</script>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/appearance-cs13" %}

## Cell

The following example demonstrates how to add a data label template for JSON cell binding.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :titleSettings='titleSettings'
:dataSourceSettings='dataSourceSettings' :xAxis='xAxis'
      :yAxis='yAxis' :dataSource='dataSource'
:cellSettings='cellSettings'></ejs-heatmap>
  </div>
</template>
<script>
import Vue from 'vue';
import { HeatMapPlugin, Adaptor, Tooltip, Legend } from '@syncfusion/ej2-
vue-heatmap';
Vue.use(HeatMapPlugin);
export default {
  data: function () {
    return {
      dataSource: [
        { Year: '2017', Months: 'Jan-Feb', Accidents: 4, Fatalities:

## Dimensions in Vue Heatmap chart component

### Size for container

Heat map can be rendered to its container size. You can set the size through inline or CSS.

```
`javascript
<div id='container'>

<div id='element' style="width:650px; height:350px;"></div>

</div>
`
```

### Size for heat map

You can set the size of heat map directly by using the [width](#) and [height](#) properties.

### In pixel

You can set the size for heat map in a pixel.

## APP.VUE

```
<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :titleSettings='titleSettings'
      :xAxis='xAxis' :yAxis='yAxis' :dataSource='dataSource' height='350px'
      width='650px'></ejs-heatmap>
  </div>
</template>
<script>
import Vue from 'vue';
import { HeatMapPlugin, Tooltip, Legend } from '@syncfusion/ej2-vue-heatmap';
Vue.use(HeatMapPlugin);
export default {
  data: function() {
    return {
      dataSource: [
        [73, 39, 26, 39, 94, 0],
        [93, 58, 53, 38, 26, 68],
        [99, 28, 22, 4, 66, 90],
        [14, 26, 97, 69, 69, 3],
        [7, 46, 47, 47, 88, 6],
        [41, 55, 73, 23, 3, 79],
        [56, 69, 21, 86, 3, 33],
        [45, 7, 53, 81, 95, 79],
        [60, 77, 74, 68, 88, 51],
        [25, 25, 10, 12, 78, 14],
        [25, 56, 55, 58, 12, 82],
        [74, 33, 88, 23, 86, 59]
      ],
      titleSettings: {
        text: 'Sales Revenue per Employee (in 1000 US$)',
        textStyle: {
          size: '15px',
          fontWeight: '500',
          fontStyle: 'Normal',
          fontFamily: 'Segoe UI'
        }
      }
    }
  }
}
```

```

    },
    xAxis: {
      labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven',
        'Michael', 'Robert', 'Laura', 'Anne', 'Paul', 'Karin',
        'Mario'],
    },
    yAxis: {
      labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat'],
    }
  },
  provide: {
    heatmap: [Tooltip, Legend]
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-vue-heatmap/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/dimensions-cs1" %}

### In percentage

By setting value in percentage, heat map gets its dimension with respect to its container. For example, when the height is '50%', heat map rendered to half of the container height.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :titleSettings='titleSettings'
      :xAxis='xAxis' :yAxis='yAxis' :dataSource='dataSource' height='90%'
      width='80%'></ejs-heatmap>
    </div>
  </template>
<script>
import Vue from 'vue';
import { HeatMapPlugin, Tooltip, Legend } from '@syncfusion/ej2-vue-heatmap';
Vue.use(HeatMapPlugin);
export default {
  data: function() {
    return {
      dataSource: [
        [73, 39, 26, 39, 94, 0],
        [93, 58, 53, 38, 26, 68],
        [99, 28, 22, 4, 66, 90],
        [14, 26, 97, 69, 69, 3],
        [7, 46, 47, 47, 88, 6],
        [41, 55, 73, 23, 3, 79],
        [56, 69, 21, 86, 3, 33],
        [45, 7, 53, 81, 95, 79],
        [60, 77, 74, 68, 88, 51],
        [25, 25, 10, 12, 78, 14],
        [25, 56, 55, 58, 12, 82],
      ]
    }
  }
}

```

```

        [74, 33, 88, 23, 86, 59]
    ],
    titleSettings: {
        text: 'Sales Revenue per Employee (in 1000 US$)',
        textStyle: {
            size: '15px',
            fontWeight: '500',
            fontStyle: 'Normal',
            fontFamily: 'Segoe UI'
        }
    },
    xAxis: {
        labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven',
            'Michael', 'Robert', 'Laura', 'Anne', 'Paul', 'Karin',
            'Mario'],
    },
    yAxis: {
        labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat'],
    }
},
provide:{
    heatmap:[Tooltip, Legend]
}
}
</script>
<style>

</style>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/dimensions-cs2" %}

### Tooltip in Vue Heatmap chart component

Tooltip is used to provide the details of the heatmap cell, and this can be displayed, while hovering the cursor over the cell or performing tap action in touch devices.

#### Default tooltip

You can enable the tooltip by setting the [showTooltip](#) property to **true** and injecting the **Tooltip** module into the **provide**.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :titleSettings='titleSettings'
    :xAxis='xAxis' :yAxis='yAxis' :dataSource='dataSource'
    :cellSettings='cellSettings' :showTooltip='showTooltip'></ejs-heatmap>
  </div>
</template>
<script>
import Vue from 'vue';
import { HeatMapPlugin, Tooltip, Legend } from '@syncfusion/ej2-vue-heatmap';
Vue.use(HeatMapPlugin);
export default {
  data: function() {

```

```

    return {
      dataSource: [
        [0.72, 0.71, 0.71, 0.67, 0.72, 0.53, 0.53, 0.56, 0.58, 0.56],
        [2.28, 2.29, 2.09, 1.84, 1.64, 1.49, 1.49, 1.39, 1.32, 1.23],
        [2.02, 2.17, 2.30, 2.39, 2.36, 2.52, 2.62, 2.57, 2.57, 2.74],
        [3.21, 3.26, 3.45, 3.47, 3.42, 3.34, 3.14, 2.83, 2.64, 2.61],
        [3.22, 3.13, 3.04, 2.95, 2.69, 2.49, 2.27, 2.18, 2.06, 1.87],
        [3.30, 3.39, 3.40, 3.48, 3.60, 3.67, 3.73, 3.79, 3.79, 4.07],
        [5.80, 5.74, 5.64, 5.44, 5.18, 5.08, 5.07, 5.00, 5.35, 5.47],
        [6.91, 7.40, 8.13, 8.80, 9.04, 9.24, 9.43, 9.35, 9.49, 9.69]
      ],
      titleSettings: {
        text: 'Crude Oil Production of Non-OPEC Countries (in Million barrels per day)',
        textStyle: {
          size: '15px',
          fontWeight: '500',

</style>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/tooltip-cs3" %}

Note: To use tooltip feature, we need to inject **Tooltip** module into the **provide**.

### Selection in Vue HeatMap chart component

In the HeatMap, the cell selection is used to select single or multiple HeatMap cells at runtime and get the selected cell details using the [cellSelected](#) event. You can enable the cell selection using the [allowSelection](#) property.

The HeatMap cells can be selected using the following interactions, as shown in the table below.

Modes of Interactions	Description
Mouse	HeatMap cells can be selected by clicking or dragging and dropping over them.
Touch	HeatMap cells can be selected by tapping or dragging and dropping over them.
Keyboard	The <b>Ctrl</b> key on the keyboard can be used to enable multiple cell selection with mouse and touch interaction. The <b>Ctrl</b> key can only be used if the <code>enableMultiSelect</code> property is set to <b>true</b> in order to enable multiple cell selection.

**APP.VUE**

```

<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :titleSettings='titleSettings'
    :xAxis='xAxis' :yAxis='yAxis' :dataSource='dataSource'
    :allowSelection='allowSelection'></ejs-heatmap>
  </div>
</template>
<script>
import Vue from 'vue';
import { HeatMapPlugin, Tooltip, Legend } from '@syncfusion/ej2-vue-heatmap';
Vue.use(HeatMapPlugin);
export default {
  data: function() {
    return {
      dataSource: [
        [73, 39, 26, 39, 94, 0],
        [93, 58, 53, 38, 26, 68],
        [99, 28, 22, 4, 66, 90],
        [14, 26, 97, 69, 69, 3],
        [7, 46, 47, 47, 88, 6],
        [41, 55, 73, 23, 3, 79],
        [56, 69, 21, 86, 3, 33],
        [45, 7, 53, 81, 95, 79],
        [60, 77, 74, 68, 88, 51],
        [25, 25, 10, 12, 78, 14],
        [25, 56, 55, 58, 12, 82],
        [74, 33, 88, 23, 86, 59]
      ],
      titleSettings: {
        text: 'Sales Revenue per Employee (in 1000 US$)',
        textStyle: {
          size: '15px',
          fontWeight: '500',
          fontStyle: 'Normal',
          fontFamily: 'Segoe UI'
        }
      },
      xAxis: {
        labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven'],

```

```

        'Michael', 'Robert', 'Laura', 'Anne', 'Paul', 'Karin',
'Mario']
    },
    yAxis: {
        labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat']
    },
    allowSelection: true
    }
},
provide:{
    heatmap:[Tooltip, Legend]
},
}
</script>
<style>
@import
'https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-heatmap/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/selection-cs1" %}

### Enable single cell selection

In the HeatMap, the [enableMultiSelect](#) property is used to allow single cell selection. When you set the [enableMultiSelect](#) property to **false**, only one cell is selected. By default, [enableMultiSelect](#) property is set to **true**.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :titleSettings='titleSettings'
:xAxix='xAxix' :yAxis='yAxis' :dataSource='dataSource'
:allowSelection='allowSelection'
:enableMultiSelect='enableMultiSelect'></ejs-heatmap>
  </div>
</template>
<script>
import Vue from 'vue';
import { HeatMapPlugin } from '@syncfusion/ej2-vue-heatmap';
Vue.use(HeatMapPlugin);
export default {
  data: function() {
    return {
      dataSource: [
        [73, 39, 26, 39, 94, 0],
        [93, 58, 53, 38, 26, 68],
        [99, 28, 22, 4, 66, 90],
        [14, 26, 97, 69, 69, 3],
        [7, 46, 47, 47, 88, 6],
        [41, 55, 73, 23, 3, 79],
        [56, 69, 21, 86, 3, 33],
        [45, 7, 53, 81, 95, 79],
        [60, 77, 74, 68, 88, 51],
        [25, 25, 10, 12, 78, 14],
        [25, 56, 55, 58, 12, 82],

```

```

        [74, 33, 88, 23, 86, 59]
    ],
    titleSettings: {
        text: 'Sales Revenue per Employee (in 1000 US$)',
        textStyle: {
            size: '15px',
            fontWeight: '500',
            fontStyle: 'Normal',
            fontFamily: 'Segoe UI'
        }
    },
    xAxis: {
        labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven',
            'Michael', 'Robert', 'Laura', 'Anne', 'Paul', 'Karin',
'Mario']
    },
    yAxis: {
        labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat']
    },
    allowSelection: true,
    enableMultiSelect: false
    }
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-vue-heatmap/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/selection-cs2" %}

#### Clearing cell selection

The [clearSelection](#) method can be used to clear all the selected cells. The below example illustrates the same.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-heatmap id="heatmap" ref="heatmap"
: titleSettings='titleSettings' :xAxis='xAxis' :yAxis='yAxis'
: dataSource='dataSource' :allowSelection='allowSelection'>
    </ejs-heatmap>
    <button id='selection' v-on:click='clearSelection'>Clear
Selection</button>
  </div>
</template>
<script>
import Vue from 'vue';
import { HeatMapPlugin, Tooltip, Legend } from '@syncfusion/ej2-vue-heatmap';
Vue.use(HeatMapPlugin);
export default {
  data: function() {
    return {
      dataSource: [

```

```

        [73, 39, 26, 39, 94, 0],
        [93, 58, 53, 38, 26, 68],
        [99, 28, 22, 4, 66, 90],
        [14, 26, 97, 69, 69, 3],
        [7, 46, 47, 47, 88, 6],
        [41, 55, 73, 23, 3, 79],
        [56, 69, 21, 86, 3, 33],
        [45, 7, 53, 81, 95, 79],
        [60, 77, 74, 68, 88, 51],
        [25, 25, 10, 12, 78, 14],
        [25, 56, 55, 58, 12, 82],
        [74, 33, 88, 23, 86, 59]
    ],
    titleSettings: {
        text: 'Sales Revenue per Employee (in 1000 US$)',
        textStyle: {
            size: '15px',
            fontWeight: '500',
            fontStyle: 'Normal',
            fontFamily: 'Segoe UI'
        }
    },
    xAxis: {
        labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven',
            'Michael', 'Robert', 'Laura', 'Anne', 'Paul', 'Karin',
'Mario']
    },
    yAxis: {
        labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat']
    },
    allowSelection: true
    },
    },
    methods: {
        clearSelection: function (args){
            this.$refs.heatmap.ej2Instances.clearSelection();
        }
    },
    provide:{
        heatmap: [Tooltip, Legend]
    }
}
</script>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/selection-cs3" %}

### Appearance in Vue HeatMap chart component

HeatMap has built-in accessibility features like screen reading. Screen reading in the HeatMap component allows all users, regardless of ability or disability, to use the component. The following HeatMap elements will be read aloud with screen reading software like Narrator for Windows.

Elements	Description
---   ---	
Title	Reads the contents of the HeatMap chart's title.

- | Axis labels | Reads the x and y axis labels of the HeatMap chart. |
- | Multilevel labels | Reads the multilevel labels in the x and y axis of the HeatMap chart. |
- | Cell labels | Reads the labels from the cells in the Heatmap chart. |
- | Legend title | Reads the contents of the legend's title as specified in HeatMap chart. |
- | Legend item label | Reads the label of a legend item in HeatMap chart. |

### Ensuring accessibility

The HeatMap component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the HeatMap component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the HeatMap component with accessibility tools.

```
{% previewsample "https://ej2.syncfusion.com/accessibility/heat-map.html" %}
```

### Events in Vue HeatMap chart component

This section describes the HeatMap chart event, which occurs when the required actions are performed.

#### cellClick

When you click on a HeatMap cell, the [cellClick](#) event is triggered. To know more about arguments of this event, refer [here](#).

### APP.VUE

```
<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :titleSettings='titleSettings'
    :xAxis='xAxis' :yAxis='yAxis' :cellClick='cellClick'
    :dataSource='dataSource'></ejs-heatmap>
  </div>
</template>
<script>
import Vue from 'vue';
import { HeatMapPlugin, Tooltip, Legend } from '@syncfusion/ej2-vue-heatmap';
Vue.use(HeatMapPlugin);
export default {
  data: function() {
    return {
      dataSource: [
        [73, 39, 26, 39, 94, 0],
        [93, 58, 53, 38, 26, 68],
        [99, 28, 22, 4, 66, 90],
        [14, 26, 97, 69, 69, 3],
        [7, 46, 47, 47, 88, 6],
        [41, 55, 73, 23, 3, 79],
        [56, 69, 21, 86, 3, 33],
        [45, 7, 53, 81, 95, 79],
      ]
    }
  }
}
```

```

        [60, 77, 74, 68, 88, 51],
        [25, 25, 10, 12, 78, 14],
        [25, 56, 55, 58, 12, 82],

## How To

### Tooltip template in Vue Heatmap chart component

You can show a tooltip as a table using the `template` property in `tooltipSettings`.

The following steps describe how to show the table tooltip.

#### Step 1:

Initialize the tooltip template div as shown in the following html page.

#### Step 2:

Set the element id to the `template` property in `tooltipSettings` to show the tooltip template.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :titleSettings='titleSettings'
:xAxIs='xAxIs' :yAxis='yAxis' :dataSource='dataSource'
:cellSettings='cellSettings' :showTooltip='showTooltip'
:tooltipSettings='tooltipSettings' ></ejs-heatmap>
  </div>
</template>
<script>
import Vue from 'vue';
import { HeatMapPlugin, Tooltip, Legend } from '@syncfusion/ej2-vue-heatmap';
Vue.use(HeatMapPlugin);
let template = '<div>'+
               '<table>'+

```

```

        '<tr bgcolor="#00FFFF"><td
align="right">${xValue}</td><td>${yValue}</td><td >${value}</td></tr>' +
        '</table>'+
        '</div>'
export default {
  data: function() {
    return {
      dataSource: [
        [0.72, 0.71, 0.71, 0.67, 0.72, 0.53, 0.53, 0.56, 0.58, 0.56],
        [2.28, 2.29, 2.09, 1.84, 1.64, 1.49, 1.49, 1.39, 1.32, 1.23],
        [2.02, 2.17, 2.30, 2.39, 2.36, 2.52, 2.62, 2.57, 2.57, 2.74],
        [3.21, 3.26, 3.45, 3.47, 3.42, 3.34, 3.14, 2.83, 2.64, 2.61],
        [3.22, 3.13, 3.04, 2.95, 2.69, 2.49, 2.27, 2.18, 2.06, 1.87],
        [3.30, 3.39, 3.40, 3.48, 3.60, 3.67, 3.73, 3.79, 3.79, 4.07],
        [5.80, 5.74, 5.64, 5.44, 5.18, 5.08, 5.07, 5.00, 5.35, 5.47],
        [6.91, 7.40, 8.13, 8.80, 9.04, 9.24, 9.43, 9.35, 9.49, 9.69]
      ],
      titleSettings: {
        text: 'Crude Oil Production of Non-OPEC Countries (in Million
barrels per day)',
        textStyle: {
          size: '15px',
          fontWeight: '500',
          fontStyle: 'Normal',
          fontFamily: 'Segoe UI'
        }
      },
      xAxis: {
        labels: ['Canada', 'China', 'Egypt', 'Mexico', 'Norway',
'Russia', 'UK', 'USA']
      },
      yAxis: {
        labels: ['2000', '2001', '2002', '2003', '2004', '2005', '2006',
'2007', '2008', '2009', '2010']
      },
      cellSettings: {
        showLabel: false,
      },
      tooltipSettings: {
        fill: '#696295',
        textStyle: {
          color: 'FFFFFF',
          size: '12px'
        },
        border: {
          width: 2,
          color: '#F0C27B'
        },
        template: template
      },
      showTooltip: true
    }
  },
  provide: {
    heatmap: [Tooltip, Legend]
  },
}

```

```

</script>
<style>
  table,
  th,
  td {
    border: 1px solid rgb(105, 105, 105);
    border-collapse: collapse;
  }
</style>
<style>
@import '../node_modules/@syncfusion/ej2-vue-heatmap/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/how-to-cs2" %}

### Legend label customization in Vue Heatmap chart component

You can change the legend label using the 'legendRender' client-side event. You can also hide the legend label using this client-side event.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-heatmap id="heatmap" :titleSettings='titleSettings'
    :xAxis='xAxis' :yAxis='yAxis' :dataSource='dataSource'
    :cellSettings='cellSettings' :legendRender='legendRender'
    :paletteSettings='paletteSettings'></ejs-heatmap>
  </div>
</template>
<script>
import Vue from 'vue';
import { HeatMapPlugin, Tooltip, Legend } from '@syncfusion/ej2-vue-heatmap';
Vue.use(HeatMapPlugin);
export default {
  data: function() {
    return {
      dataSource: [
        [73000, 39000, 26000, 39000, 94000, 0],
        [93000, 58000, 53000, 38000, 26000, 68000],
        [99000, 28000, 22000, 4000, 66000, 9000],
        [14000, 26000, 97000, 69000, 69000, 3000],
        [7000, 46000, 47000, 47000, 88000, 6000],
        [41000, 55000, 73000, 23000, 30000, 79000],
        [56000, 69000, 21000, 86000, 3000, 33000],
        [45000, 7000, 53000, 81000, 95000, 79000],
        [60000, 77000, 74000, 68000, 88000, 51000],
        [25000, 25000, 10000, 12000, 78000, 14000],
        [25000, 56000, 55000, 58000, 12000, 82000],
        [74000, 33000, 88000, 23000, 86000, 59000]
      ],
      titleSettings: {
        text: 'Sales Revenue per Employee (in 1000 US$)',
        textStyle: {
          size: '15px',
          fontWeight: '500',

```

```

        fontStyle: 'Normal',
        fontFamily: 'Segoe UI'
    },
    },
    xAxis: {
        labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven',
        'Michael', 'Robert', 'Laura', 'Anne', 'Paul', 'Karin',
'Mario'],
    },
    yAxis: {
        labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat']
    },
    cellSettings: {
        showLabel: false,
    },
    paletteSettings: {
        palette: [
            { value: 0, color: '#C2E7EC' },
            { value: 25000, color: '#AEDFE6' },
            { value: 50000, color: '#9AD7E0' },
            { value: 75000, color: '#72C7D4' },
            { value: 99000, color: '#5EBFCE' },
        ],
        type: "Gradient"
    },
    },
    },
    provide:{
        heatmap:[Tooltip, Legend]
    },
    methods :{
        legendRender: function(args)
        {
            if(args.text=='25,000' || args.text=='50,000' ||
args.text=='99,000'){
                args.text = args.text.replace(/,/ , "");
                args.text = ` ${parseInt(args.text/1000)} ` + "k "+"$";
            } else {
                args.cancel=true;
            }
        }
    }
}
}
</script>

@import '../node_modules/@syncfusion/ej2-vue-heatmap/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/heatmap-chart/how-to-cs1" %}

## ImageEditor

### Getting Started with the Vue Image Editor Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLI](#) and integrating the Syncfusion Vue Image editor component using the [Composition API](#) / [Options API](#).

#### Dependencies

The following list of dependencies are required to use the Image Editor component in your application.

```
`js
|-- @syncfusion/ej2-vue-image-editor
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-splitbuttons
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-dropdowns
`
```

#### Prerequisites

##### [System requirements for Syncfusion Vue UI components](#)

##### Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```
`bash
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
`
```

or

```
`bash
yarn global add @vue/cli
vue create quickstart
cd quickstart
yarn run serve
```

When creating a new project, choose the option `Default ([Vue 2] babel, eslint)` from the menu.

```
E:\samples>vue create quickstart

Vue CLI v5.0.8
? Please pick a preset:
  Default ([Vue 3] babel, eslint)
> Default ([Vue 2] babel, eslint)
  Manually select features
```

Once the `quickstart` project is set up with default settings, proceed to add Syncfusion components to the project.

### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.npmjs.com). To use Vue components, install the required npm package.

This article uses the [Vue Image Editor component](#) as an example. Install the `@syncfusion/ej2-vue-image-editor` package by running the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-image-editor --save
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-image-editor
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the `Material` theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Image Editor component and its dependents were imported into the `<style>` section of `src/App.vue` file.

#### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
```

```
@import "../node_modules/@syncfusion/ej2-image-editor/styles/material.css";  
</style>
```

### Add Syncfusion Vue component

Follow the below steps to add the Vue Image Editor component using **Composition API** or **Options API**:

1\ First, import and register the Image Editor component in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<script setup>  
import { ImageEditorComponent as EjsImageeditor } from "@syncfusion/ej2-vue-image-editor";  
</script>
```

#### **OPTIONS API (~SRC/APP.VUE)**

```
<script>  
import { ImageEditorComponent } from "@syncfusion/ej2-vue-image-editor";  
export default {  
  components: {  
    'ejs-imageeditor': ImageEditorComponent  
  }  
}  
</script>
```

2\ In the **template** section, define the Image Editor component with the [height](#) and [width](#) property.

#### **~/SRC/APP.VUE**

```
<template>  
<div>  
<ejs-imageeditor id="image-editor" height="350px" width="550px"></ejs-imageeditor>  
</div>  
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<template>  
<div>  
<ejs-imageeditor id="image-editor" height="350px" width="550px"></ejs-imageeditor>  
</div>  
</template>  
<script setup>  
import { ImageEditorComponent as EjsImageeditor } from "@syncfusion/ej2-vue-image-editor";  
</script>
```

```

<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-image-editor/styles/material.css";
#image-editor {
    width: 550px !important;
    height: 350px !important;
}
</style>

```

### OPTIONS API (~SRC/APP.VUE)

```

<template>
<div>
<ejs-imageeditor id="image-editor" height="350px" width="550px"></ejs-
imageeditor>
</div>
</template>
<script>
import { ImageEditorComponent } from "@syncfusion/ej2-vue-image-editor";
export default {
    components: {
        'ejs-imageeditor': ImageEditorComponent
    },
    data: function() {
        return {};
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-image-editor/styles/material.css";
#image-editor {
    width: 550px !important;
    height: 350px !important;
}
</style>

```

### Run the project

To run the project, use the following command:

```
`bash`
```

```
npm run serve
```

```
,
```

```
or
```

```
`bash
```

```
yarn run serve
```

```
,
```

```
{% previewsample "page.domainurl/code-snippet/image-editor/getting-started-cs6" %}
```

### End-user capabilities in the Image Editor component

The following operations are available for end-users and the same is explained briefly in these sections.

#### Open an image

To open an image in the image editor, do the following steps.

- Click the Open icon from the left side of the toolbar.
- The file explorer lists only JPEG, PNG, JPG format files.
- Select the image from the list of the images from the file explorer window.

#### Zooming

Image zooming can be performed in the following ways.

- Using toolbar.
- Using pinch zoom in touch enabled devices.
- Using mouse wheel.
- Using keyboard.

#### *Using toolbar*

To zoom in or out the image in the image editor, do the following steps.

- The Zoom In/ Out option only enabled after opening the image.

#### *Using pinch*

To zoom in or out the image in the image editor, do the following steps.

- Touch with two fingers to perform zooming.
- Zoom in and out controlled by touch gestures.

#### *Using Mouse wheel*

To zoom in or out the image in the image editor, do the following steps.

- Press the ctrl key and scroll the mouse wheel to perform zooming.
- The zoom in and out controlled by the mouse wheel.

### Using keyboard

To zoom in or out the image in the image editor, do the following steps.

- Press the ctrl key with '+' button from the keyboard to zoom in an image.
- Press the ctrl key with '-' button from the keyboard to zoom out an image.

### Panning

To pan an image in the image editor, do the following steps.

- Click on the image and do dragging to move or pan the image.
- Panning option will be enabled in the following two cases.
- If the selection is applied for cropping an image.
- If the image size exceeds the canvas size while zooming an image.

### Cropping and image transformation

To crop an image in the image editor, do the following steps.

- Cropping can be performed based on the selection in an image editor.
- To perform selection, click the crop button in the toolbar which opens the contextual toolbar that shows crop selection options, rotate options, and flip options.
- Click the crop selection button and select the type of selection such as custom, circle, square, and ratio selection from the popup.
- Once selection is completed, do panning to move the image to get the cropped region.

- Utilize the rotate or flip buttons to execute the image transformation, including any inserted annotations.
- Once the cropping region is finalized in the image click the tick icon at the top right of the toolbar to crop the image.

### Annotations

To add annotations to an image in the image editor, do the following steps.

- To add annotation, click the annotation button in the toolbar and select the type of annotations such as Line, Rectangle, Ellipse, Path, Arrow, Text, or Freehand drawing to be inserted to the image editor.
- Once the annotation is added to the image, that can be repositioned by clicking and dragging the annotations using mouse as well as resized by clicking and resizing the selection circle to be placed around the annotations.
- To rotate annotations, you can simply grab the circle located at the bottom of the annotation. The rotation can be applicable to all the annotations except text annotation.
- Customize the annotations by changing their color, stroke width, font family, and font size through the contextual toolbar. The contextual toolbar will be enabled whenever the annotations are selected.
- When annotations are selected in the Image Editor, the quick access toolbar becomes active, providing convenient access to various actions such as duplicating, deleting, or editing text associated with the selected annotation. This toolbar enables users to perform these common

operations quickly and efficiently, streamlining their workflow and enhancing the overall editing experience.

#### Filtering and fine-tune

To perform fine-tuning on an image in the image editor, do the following steps.

- Click the fine-tune button which displays the list of fine-tuning available in the image editor.
- Click one of the fine-tune options from the list of options which shows a slider to adjust the corresponding filter.
- Click on the canvas or tick icon at the right corner of the toolbar in the image editor to apply the modifications.

To apply filters on an image in the image editor, do the following steps.

- Click the filter button which displays the list of filters available in the image editor.
- Click the filter from list of options to apply the corresponding filter to an image.
- Click on the canvas or tick icon at the right corner of the toolbar in the image editor to apply the modifications.

Note:

The Filters and Fine-tunes feature are not accessible within Safari due to compatibility limitations.

#### [Undo and redo the operations](#)

To undo and redo the actions performed in an image editor, do the following steps.

- The undo button will be enabled once the action is performed in an image editor.
- The redo button will be enabled once the undo action is performed in an image editor.
- Click the undo or redo button at the left side of the toolbar to perform undo and redo operation.
- Ctrl + Z and Ctrl + Y facilitates this process by allowing users to undo and redo actions, respectively.

### Reset an image

To revert all the changes done in an image editor, do the following steps.

- Click the reset button which is located on the right side of the toolbar.
- This will revert all the changes performed in the image editor.

### Export an image

To save the modified image in an image editor, do the following steps.

- Click the save button which is located on the right side of the toolbar.
- Ctrl + S facilitates this process by providing users with the ability to save the image.
- Select the type of file to be saved from the popup to save with current modification done in an image.

### Open and save in the Vue Image Editor component

To import an image into the canvas, it must first be converted into a blob object. The Uploader component can be used to facilitate the process of uploading an image from the user interface. Once the image has been uploaded, it can then be converted into a blob and drawn onto the canvas.

To save an edited image in the Image Editor component, use the `toBlob` method to convert it to a blob object. This will save the image with any annotations or filters that have been applied during the editing process. The saved image can be stored as raw image data or as an image file.

### Open

The [open](#) method in the Image Editor component offers the capability to open an image by providing it in different formats. This method accepts various types of arguments, such as a base64-encoded string, raw image data, or a hosted/online URL. You can pass either the file name or the actual image data as an argument to the [open](#) method, and it will load the specified image into the image editor component. This flexibility allows you to work with images from different sources and formats, making it easier to integrate and manipulate images within the Image Editor component.

### APP.VUE

```
<template>
<div>
<ejs-imageeditor id="image-editor" ref="imageEditorObj" height="350px"
width="550px"></ejs-imageeditor>
</div>
</template>
<script>
import Vue from 'vue';
import { ImageEditorPlugin } from "@syncfusion/ej2-vue-image-editor";
import { Browser } from "@syncfusion/ej2-base";
```

```

Vue.use(ImageEditorPlugin);
export default {
  data: function() {
    return {
      toolbar: []
    };
  },
  methods: {
    created: function() {
      if (Browser.isDevice) {
        this.$refs.imageEditorObj.open('flower.png');
      } else {
        this.$refs.imageEditorObj.open('bridge.png');
      }
    }
  }
}
</script>
<style>

### Supported image formats

The Image Editor component supports three common image formats: PNG, JPEG, and SVG. These formats allow you to work with a wide range of image files within the Image Editor.

When it comes to saving the edited image, the default file type is set as PNG. This means that when you save the edited image without specifying a different file type, it will be saved as a PNG file. However, it's important to note that the Image Editor typically provides options or methods to specify a different file type if desired. This allows you to save the edited image in formats other than the default PNG, such as JPEG or SVG, based on your specific requirements or preferences.

### Save

The Image Editor component saves the edited image as Image Data or images like PNG, JPEG, and SVG.

#### Save as ImageData

The [getImageData](#) method is used to get the image as ImageData and this can be loaded to our Image Editor component using the open method.

*Save as image*

The [export](#) method in the Image Editor component enables you to save the modified image as a file on the local device. This method accepts two parameters: the file name and the file type.

By providing a file name, you can specify the desired name for the saved image file. Additionally, you can also specify the file type to determine the format in which the image should be saved. This allows you to save the image according to your specific requirements or preferences, such as PNG, JPEG, or SVG.

By utilizing the [export](#) method with the appropriate file name and file type, you can conveniently save the modified image as a file on the local device, ensuring that it is easily accessible and shareable

In the following example, the [export](#) method is used in the button click event.

{% previewsample "page.domainurl/code-snippet/image-editor/getting-started-cs10" %}

### File opened event

The [fileOpened](#) event is triggered in the Image Editor component after an image is successfully loaded. It provides the [OpenEventArgs](#) as the event argument, which contains two specific arguments:

- **FileName:** This argument is a string that contains the file name of the opened image. It represents the name of the file that was selected or provided when loading the image into the Image Editor.
- **FileType:** This argument is a string that contains the type of the opened image. It specifies the format or file type of the image that was loaded, such as PNG, JPEG, or SVG.

By accessing these arguments within the [fileOpened](#) event handler, you can retrieve information about the loaded image, such as its file name and file type. This can be useful for performing additional actions or implementing logic based on the specific image that was opened in the Image Editor component.

### Saving event

The [saving](#) event is triggered in the Image Editor component when an image is being saved to the local disk. It provides the [SaveEventArgs](#) as the event argument, which includes the following specific arguments:

- **FileName:** This argument is a string that holds the file name of the saved image. It represents the name of the file that will be used when saving the image to the local disk.
- **FileType:** This argument is a string indicating the type or format of the saved image. It specifies the desired file type in which the image will be saved, such as PNG, JPEG, or SVG.
- **Cancel:** This argument is a boolean value that can be set to true in order to cancel the saving action. By default, it is set to false, allowing the saving process to proceed. However, if you want to prevent the saving action from occurring, you can set Cancel to true within the event handler.

By accessing these arguments within the Saving event handler, you can retrieve information about the file name and file type of the image being saved. Additionally, you have the option to cancel the saving action if necessary.

### Created event

The [created](#) event is triggered once the Image Editor component is created. This event serves as a notification that the component has been fully initialized and is ready to be used. It provides a convenient opportunity to render the Image Editor with a predefined set of initial settings, including the image, annotations, and transformations.

### Destroyed event

The [destroyed](#) event is triggered once the Image Editor component is destroyed or removed from the application. This event serves as a notification that the component and its associated resources have been successfully cleaned up and are no longer active.

### Reset an image

The [reset](#) method in the Image Editor component provides the capability to undo all the changes made to an image and revert it back to its original state. This method is particularly useful when multiple adjustments, annotations, or transformations have been applied to an image and you want to start over with the original, unmodified version of the image.

By invoking the [reset](#) method, any modifications or edits made to the image will be undone, and the image will be restored to its initial state. This allows you to easily discard any changes and begin again with the fresh, unaltered image.

### Selection cropping in the Vue Image Editor component

The cropping feature in the Image Editor allows you to select and crop specific regions of an image. It offers different selection options, including custom shapes, squares, circles, and various aspect ratios such as 3:2, 4:3, 5:4, 7:5, and 16:9.

To perform a selection, you can use the [select](#) method, which allows you to define the desired selection area within the image. Once the selection is made, you can then use the [crop](#) method to crop the image based on the selected region. This enables you to extract and focus on specific parts of the image while discarding the rest.

### Insert custom / square / circle region

The [select](#) method allows to perform selection based on the type of selection. Here, the [select](#) method is used to perform the selection as custom, circle, or square. The selection region can also be customized using the select method based on the parameters below.

type - Specify the type of selection

startX - Specify the x-coordinate of the selection region's starting point

startY - Specify the y-coordinate of the selection region's starting point

width - Specify the width of the selection region

height - Specify the height of the selection region

Here is an example of square selection using the [select](#) method.

### APP.VUE

```
<template>
<div>
<ejs-imageeditor id="image-editor" ref="imageEditorObj" height="350px"
width="550px"></ejs-imageeditor>
  <ejs-button cssClass="e-img-button" :isPrimary="true" v-
on:click.native="btnClick">Square selection</ejs-button>
</div>

  height: 350px !important;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/image-editor/getting-started-cs12" %}

#### Insert selection based on aspect ratio

The [select](#) method is used to perform the selection with the various aspect ratios such as 3:2, 4:3, 5:4, 7:5, and 16:9. The selection region can also be customized using the [select](#) method based on the parameters below.

type - Specify the type of selection

startX - Specify the x-coordinate of the selection region's starting point

startY - Specify the y-coordinate of the selection region's starting point

Here is an example of ratio selection using the [select](#) method.

</style>

```

{% previewsample "page.domainurl/code-snippet/image-editor/getting-started-cs14" %}

### Resize selections

The selection region can be changed programmatically by using [selectionChanging](#) event. This event is activated during resizing the selection using mouse, and it allows for alterations to the selection region by adjusting the specified properties.

The [SelectionChangeEventArgs](#) is used in this event to customize the selection and it has the following parameters.

SelectionChangeEventArgs.action - The type of action such as inserting or resizing

SelectionChangeEventArgs.cancel - Specifies to cancel the selection.

SelectionChangeEventArgs.currentSelectionPoint - Represents all the details of the selection including its type, position, width, and height after the current action as CropSelectionSettings.

SelectionChangeEventArgs.previousSelectionPoint - Represents all the details of the selection including its type, position, width, and height before this current action as CropSelectionSettings

Here is an example of changing the selection region using the [SelectionChangeEventArgs](#) event.

### Crop an image

The [crop](#) method allows cropping based on the selected region. Here is an example of cropping the selection region using the [crop](#) method.

Here is an example of circle cropping using the [select](#) and [crop](#) method.

### APP.VUE

    width: 550px !important;
    height: 350px !important;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/image-editor/getting-started-cs15" %}

### Cropping event

The [cropping](#) event is triggered when performing cropping on the image. This event is passed an object that contains information about the cropping event, such as the start and end point of the selection region. And this event uses [CropEventArgs](#) to handle the cropping action in the image.

The parameter available in the [cropping](#) event is,

CroppingEventArgs.startPoint – The x and y coordinates of a start point as ImageEditorPoint of the selection region.

CroppingEventArgs.endPoint - The x and y coordinates of an end point as ImageEditorPoint of the selection region.

CroppingEventArgs.cancel - To cancel the cropping action.

### Annotation in the Vue Image Editor component

The Vue Image Editor allows adding annotations to the image, including text, freehand drawings, and shapes like rectangles, ellipses, arrows, paths, and lines. This gives the flexibility to mark up the image with notes, sketches, and other visual elements as needed. These annotation tools can help to communicate and share ideas more effectively.

#### Text annotation

The text annotation feature in the Image Editor provides the capability to add and customize labels, captions, and other text elements directly onto the image. With this feature, you can easily insert text at specific locations within the image and customize various aspects of the text to meet your requirements.

You have control over the customization options including text content, font family, font style and font size for the text annotation.

### Add a text

The [drawText](#) method in the Vue Image Editor allows you to insert a text annotation into the image with specific customization options. This method accepts the following parameters:

- x: Specifies the x-coordinate of the text, determining its horizontal position within the image.
- y: Specifies the y-coordinate of the text, determining its vertical position within the image.
- text: Specifies the actual text content to be added to the image.
- fontFamily: Specifies the font family of the text, allowing you to choose a specific typeface or style for the text.
- fontSize: Specifies the font size of the text, determining its relative size within the image.
- bold: Specifies whether the text should be displayed in bold style. Set to true for bold text, and false for regular text.
- italic: Specifies whether the text should be displayed in italic style. Set to true for italic text, and false for regular text.
- color: Specifies the font color of the text, allowing you to define the desired color using appropriate color values or names.

By utilizing the [drawText](#) method with these parameters, you can precisely position and customize text annotations within the image. This provides the flexibility to add labels, captions, or other text elements with specific font styles, sizes, and colors, enhancing the visual presentation and clarity of the image.

Here is an example of adding a text in a button click using [drawText](#) method.

### APP.VUE

```

}
</style>

```

{% previewsample "page.domainurl/code-snippet/image-editor/getting-started-cs1" %}

#### Multiline text

The [drawText](#) method in the Vue Image Editor component is commonly used to insert text annotations into an image. If the provided text parameter contains a newline character (\n), the text will be automatically split into multiple lines, with each line appearing on a separate line in the annotation.

Here is an example of adding a multiline text in a button click using [drawText](#) method.

#### APP.VUE

```

{% previewsample "page.domainurl/code-snippet/image-editor/getting-started-cs27" %}

### Delete a text

The [deleteShape](#) method in the Vue Image Editor allows you to remove a text annotation from the image editor. To use this method, you need to pass the [shapeld](#) of the annotation as a parameter.

The [shapeld](#) is a unique identifier assigned to each text annotation within the image editor. It serves as a reference to a specific annotation, enabling targeted deletion of the desired text element. By specifying the [shapeld](#) associated with the text annotation you want to remove, you can effectively delete it from the image editor.

To retrieve the inserted text annotations, you can utilize the [getShapeSetting](#) method, which provides a collection of annotations represented by [ShapeSettings](#). This method allows you to access and work with the annotations that have been inserted into the image.

Here is an example of deleting a text in a button click using [deleteShape](#) method.

### *Customize font family and text color*

The [shapeChanging](#) event in the Image Editor component is triggered when a text annotation is being modified or changed through the toolbar interaction. This event provides an opportunity to make alterations to the text's color and font family by adjusting the relevant properties.

By leveraging the [shapeChanging](#) event, you can enhance the customization options for text annotations and provide a more tailored and interactive experience within the Image Editor component.

Here is an example of changing the text's color and its font family using the [shapeChanging](#) event.

### **APP.VUE**

### Freehand drawing

The Freehand Draw annotation tool in the Vue Image Editor component is a versatile feature that allows users to draw and sketch directly on the image using mouse or touch input. This tool provides a flexible and creative way to add freehand drawings or annotations to the image.

The [freehandDraw](#) method is used to enable or disable the freehand drawing option in the Vue Image Editor component.

Here is an example of using the [freeHandDraw](#) method in a button click event.

### APP.VUE

```
<template>
<div>
<ejs-imageeditor id="image-editor" ref="imageEditorObj" height="350px"
width="550px"></ejs-imageeditor>
<ejs-button cssClass="e-img-button" :isPrimary="true" v-
on:click.native="btnClick">Freehand draw</ejs-button>
</div>
</template>
<script>
import Vue from 'vue';

### *Delete a freehand drawing*

The [deleteShape](#) method in the Vue Image Editor allows you to remove a freehand annotation from the image editor. To use this method, you need to pass the [shapeld](#) of the annotation as a parameter.

The [shapeld](#) is a unique identifier assigned to each freehand annotation within the image editor. It serves as a reference to a specific annotation, enabling targeted deletion of the desired annotation. By specifying the [shapeld](#) associated with the freehand annotation you want to remove, you can effectively delete it from the image editor.

To retrieve the inserted freehand annotations, you can utilize the [getShapeSetting](#) method, which provides a collection of annotations represented by [ShapeSettings](#). This method allows you to access and work with the annotations that have been inserted into the image.

Here is an example of deleting a freehand annotation in a button click using [deleteShape](#) method.

### **APP.VUE**

### Shape annotation

The Image Editor component provides the ability to add shape annotations to an image. These shape annotations include rectangles, ellipses, arrows, paths, and lines, allowing you to highlight, emphasize, or mark specific areas or elements within the image.

#### *Add a rectangle / ellipse / line / arrow / path*

The [drawRectangle](#) method is used to insert a rectangle to the Vue Image Editor component. Rectangle annotations are valuable tools for highlighting, emphasizing, or marking specific areas of an image to draw attention or provide additional context.

The [drawRectangle](#) method in the Vue Image Editor component takes seven parameters to define the properties of the rectangle annotation:

- x: Specifies the x-coordinate of the top-left corner of the rectangle.
- y: Specifies the y-coordinate of the top-left corner of the rectangle.
- width: Specifies the width of the rectangle.
- height: Specifies the height of the rectangle.
- strokeWidth: Specifies the stroke width of the rectangle's border.
- strokeColor: Specifies the stroke color of the rectangle's border.
- fillColor: Specifies the fill color of the rectangle.

The [drawEllipse](#) method is used to insert a ellipse to the Vue Image Editor component. Ellipse annotations are valuable for highlighting, emphasizing, or marking specific areas of an image.

The [drawEllipse](#) method in the Vue Image Editor component takes seven parameters to define the properties of the ellipse annotation:

- x: Specifies the x-coordinate of the center of the ellipse.
- y: Specifies the y-coordinate of the center of the ellipse.
- radiusX: Specifies the horizontal radius (radiusX) of the ellipse.
- radiusY: Specifies the vertical radius (radiusY) of the ellipse.
- strokeWidth: Specifies the width of the ellipse's stroke (border).
- strokeColor: Specifies the color of the ellipse's stroke (border).
- fillColor: Specifies the fill color of the ellipse.

The [drawLine](#) method is used to insert a line to the Vue Image Editor component. Line annotations are valuable for highlighting, emphasizing, or marking specific areas of an image.

The [drawLine](#) method in the Vue Image Editor component takes seven parameters to define the properties of the ellipse annotation:

- startX - Specifies the x-coordinate of the start point.
- startY - Specifies the y-coordinate of the start point.
- endX - Specifies the x-coordinate of the end point.
- endY - Specifies the y-coordinate of the end point.
- strokeWidth - Specifies the stroke width of the line.
- strokeColor - Specifies the stroke color of the line.

The [drawArrow](#) method is used to insert a arrow to the Vue Image Editor component. Arrow annotations are valuable for highlighting, emphasizing, or marking specific areas of an image.

The [drawArrow](#) method in the Vue Image Editor component takes seven parameters to define the properties of the ellipse annotation:

- startX - Specifies the x-coordinate of the start point.
- startY - Specifies the y-coordinate of the start point.
- endX - Specifies the x-coordinate of the end point.
- endY - Specifies the y-coordinate of the end point.
- strokeWidth - Specifies the stroke width of the arrow.
- strokeColor - Specifies the stroke color of the arrow.
- arrowStart - Specifies the arrowhead as ImageEditorArrowHeadType at the start of arrow.
- arrowEnd - Specifies the arrowhead as ImageEditorArrowHeadType at the end of the arrow.

The [drawPath](#) method is used to insert a path to the Vue Image Editor component. Path annotations are valuable for highlighting, emphasizing, or marking specific areas of an image.

The [drawPath](#) method in the Vue Image Editor component takes three parameters to define the properties of the ellipse annotation:

- points - Specifies collection of x and y coordinates as ImageEditorPoint to draw a path.
- strokeWidth - Specifies the stroke width of the path.
- strokeColor - Specifies the stroke color of the path.

Here is an example of inserting rectangle, ellipse, arrow, path, and line in a button click event.

### Image annotation

The image annotation feature in the Image Editor provides the capability to add and customize images directly onto the image. With this feature, you can easily insert image or icons at specific locations within the image and customize various aspects of the image to meet your requirements. You have control over the customization options including rotate, flip, transparency for the image annotation.

#### Add an image annotation

The [drawImage](#) method serves the purpose of inserting an image into the Image Editor control, allowing for image annotations to be added. These image annotations can be used for various purposes, such as adding logos, watermarks, or decorative elements to the image.

The [drawImage](#) method in the Image Editor control takes six parameters to define the properties of the image annotation:

- data: Specified the image data or url of the image to be inserted.
- x: Specifies the x-coordinate of the top-left corner of the image.
- y: Specifies the y-coordinate of the top-left corner of the image.
- width: Specifies the width of the image.
- height: Specifies the height of the image.
- isAspectRatio: Specifies whether the image is rendered with aspect ratio or not.

In the following example, you can use the [drawImage](#) method in the button click event.

## Transform in the vue Image Editor component

The Image Editor provides a range of transformation options for manipulating both the image and its annotations. These options include rotation, flipping, zooming, and panning. These transformations offer flexibility in adjusting the image and enhancing its visual appearance.

### Rotate an image

The Image Editor allows to rotate the image and its annotations by a specific number of degrees clockwise or anti-clockwise using [rotate](#) method. This method takes a single parameter: the angle of rotation in degrees. A positive value will rotate the image clockwise, while a negative value will rotate it anti-clockwise.

Here is an example of rotating an image in a button click event.

#### APP.VUE

### Flip an image

The Image Editor provides the [flip](#) method, which allows you to flip both the image and its annotations either horizontally or vertically. This method takes a single parameter of type ImageEditorDirection, which specifies the direction in which the flip operation should be applied.

The [Direction](#) parameter accepts two values: 'Horizontal' and 'Vertical'. When you choose 'Horizontal', the image and annotations will be flipped along the horizontal axis, resulting in a mirror effect. On the other hand, selecting 'Vertical' will flip them along the vertical axis, producing a vertical mirror effect.

Here is an example of flipping an image in a button click event.

### Zoom in or out an image

The Image Editor allows to magnify an image using the [zoom](#) method. This method allows one to zoom in and out of the image and provides a more detailed view of the image's hidden areas. This method takes two parameters to perform zooming.

- zoomFactor - Specifies a value to controlling the level of magnification applied to the image.
- zoomPoint - Specifies x and y coordinates of a point as ImageEditorPoint on image to perform zooming.

Here is an example of zooming an image in a button click event.

#### *Maximum and Minimum zoom level*

The [maxZoomFactor](#) property is a useful feature in the Image Editor that allows you to define the maximum level of zoom permitted for an image. This property sets a limit on how much the image can be magnified, preventing excessive zooming that may result in a loss of image quality or visibility.

By default, the [minZoomFactor](#) value is set to 10, meaning that the image can be zoomed in up to 10 times its original size. This ensures that the zooming functionality remains within reasonable bounds and maintains the integrity of the image.

The [maxZoomFactor](#) property allows you to specify the minimum level of zoom that is allowed for an image. By setting this property, you can prevent the image from being zoomed out beyond a certain point, ensuring that it remains visible and usable even at the smallest zoom level.

By default, the [maxZoomFactor](#) value is set to 0.1, meaning that the image can be zoomed out up to 10 times its original size.

Here is an example of specifying [minZoomFactor](#) and [maxZoomFactor](#) property in [zoomSettings](#) options in an image editor.

#### *Panning an image*

The Image Editor allows to pan an image when the image exceeds the canvas size or selection range. When zooming in on an image or applying a selection for cropping, it is common for the image to exceed the size of the canvas or exceed the selection range. So, the panning is used to view the entire image, by clicking on the canvas and dragging it in the direction they want to move.

#### *Panning event*

The [panning](#) event is activated when the user begins dragging the image within the canvas. This event provide an opportunity to perform specific actions, like adjusting the position of an image, in response to the gesture of panning. And these event uses [panEventArgs](#) to handle the panning action when the user starts dragging the image.

The parameter available in the [panEventArgs](#) events are,

- [PanEventArgs.startPoint](#) - The x and y coordinates as [ImageEditorPoint](#) for the start point.
- [PanEventArgs.endpoint](#) - The x and y coordinates as [ImageEditorPoint](#) for the end point.
- [PanEventArgs.cancel](#) – Specifies the boolean value to cancel the panning action.

### Zooming event

The [zooming](#) event is triggered when performing zooming the image. This event can be used to perform certain actions, such as updating the position of the image. This event is passed an object that contains information about the zooming event, such as the amount of zooming performed. And this event uses [ZoomEventArgs](#) to handle the zooming action in the image.

The parameter available in the Zooming event is,

- `ZoomEventArgs.zoomPoint` - The x and y coordinates as `ImageEditorPoint` for the zoom point.
- `ZoomEventArgs.previousZoomFactor` - The previous zoom factor applied in the image editor.
- `ZoomEventArgs.currentZoomFactor` - The current zoom factor to be applied in the image editor.
- `ZoomEventArgs.cancel` – Specify a boolean value to cancel the zooming action.
- `ZoomEventArgs.zoomTrigger` - The type of zooming performed in the image editor.

### Rotating event

The [rotating](#) event is triggered when performing rotating the image. This event is passed an object that contains information about the rotating event, such as the amount of rotation performed. And this event uses [RotateEventArgs](#) to handle the rotating action in the image.

The parameter available in the Rotating event is,

- `RotateEventArgs.previousDegree`: The degree of rotation before the recent rotation action was applied in the Image Editor.
- `RotateEventArgs.currentDegree`: The current degree of rotation after the rotation action has been performed in the Image Editor.

`RotateEventArgs.cancel` – Specifies a boolean value to cancel the rotating action.

### Flipping event

The [flipping](#) event is triggered when performing flipping the image. This event is passed an object that contains information about the flipping event, such as the amount of flip performed. And this event uses [FlipEventArgs](#) to handle the flipping action in the image.

The parameter available in the [flipping](#) event is,

- `FlipEventArgs.direction` - The flip direction as `ImageEditorDirection` to be applied in the image editor.
- `FlipEventArgs.cancel` - Specifies a boolean value to cancel the flip action.

## Toolbar in the Vue Image Editor component

The toolbars in the Image Editor are a key component for interacting with and editing images. They provide a range of tools and options that can be customized to suit the needs and preferences. Add or remove items from the toolbar to create a personalized set of tools, or they can even create their own custom toolbar from scratch. This flexibility and customization allow them to create a unique image editing experience that is tailored to their specific needs and workflow.

In the Image Editor, the [toolbar](#) property provides the ability to customize the toolbar by adding or removing items, as well as defining a completely custom toolbar. This feature is valuable for creating a personalized image editing experience that aligns with specific requirements and workflows.

### Built-in toolbar items

Specifies the toolbar items to perform UI interactions. Refer to the built-in toolbar items for the default value.

- Crop
- Transform
- Annotate
- ZoomIn

- ZoomOut
- Open
- Reset
- Save
- Pan

### Add a custom toolbar items

Users can define their own toolbars for an image editor by customizing the items or the entire toolbar. Users can achieve this by using the [toolbar](#) property.

The built-in toolbar can be customized using the [toolbar](#) property, so the specified toolbar items can be enabled in the Image Editor toolbar. And the contextual toolbar which is enabled while inserting annotations can also be customized in the [toolbarUpdating](#) event.

### APP.VUE

```
<template>
<div>
<ejs-imageeditor id="image-editor" ref="imageEditorObj" height="350px"
width="550px"></ejs-imageeditor>
</div>
</template>
<script>
import Vue from 'vue';
import { ImageEditorPlugin } from "@syncfusion/ej2-vue-image-editor";
Vue.use(ImageEditorPlugin);
export default {
  data: function() {
    return {
      toolbar: ['Crop', 'ZoomIn', 'ZoomOut', {text: 'Custom'}]
    };
  }
}
</script>
<style>

### Show or hide a toolbar

The [toolbar](#) property controls the visibility of the toolbar in the Image Editor. When the [toolbar](#) property is set to an empty list, the toolbar is hidden. Conversely, if the [toolbar](#) property contains a list of items, the toolbar is shown, displaying the specified items. This feature provides flexibility for users to personalize their image editing experience.

Here is an example of hiding the toolbar of the image editor using [toolbar](#) property.

#### APP.VUE

  height: 350px !important;
}
</style>
```

```
{% previewsample "page.domainurl/code-snippet/image-editor/getting-started-cs35" %}
```

### Enable or disable a toolbar item

The [toolbar](#) property is employed to enable or disable toolbar items in the Image Editor. By default, the [toolbar](#) property includes the default toolbar items, and these items cannot be disabled. However, if you have defined custom toolbar items using the `toolbarItemModel`, you can enable or disable them by configuring their respective properties within the [toolbar](#) property. This provides the flexibility to control the availability and functionality of custom toolbar items based on your specific requirements.

Here is an example of disabling the custom toolbar item using [toolbar](#) property.

### Enable or disable a contextual toolbar item

The `toolbarItems` property in the `toolbarEventArgs` is used to enable or disable contextual toolbar items in the Image Editor. To enable or disable the default toolbar items, you can accomplish this by setting the `Disabled` property to `true` in the `ImageEditorToolbarItemModel` within the `ToolbarItems` property. This allows you to selectively enable or disable specific default toolbar items based on your requirements, providing a customized toolbar experience in the Image Editor.

### Show or hide a toolbar item

The [toolbar](#) property controls the visibility of the toolbar in the Image Editor. When the [toolbar](#) property is set to an empty list, the toolbar is hidden. Conversely, if the [toolbar](#) property contains a list of items, the toolbar is shown, displaying the specified items. This feature provides flexibility for users to personalize their image editing experience.

Here is an example of hiding the toolbar of the image editor using [toolbar](#) property.

{% previewsample "page.domainurl/code-snippet/image-editor/getting-started-cs36" %}

### Toolbar template

The [toolbarTemplate](#) property in the Image Editor provides the capability to fully customize the toolbar by supplying a custom template. This feature is valuable when you want to create a distinct and personalized image editing experience that goes beyond the default toolbar or the customizable toolbar options offered by the Image Editor. By defining a custom template for the toolbar, you have complete control over its layout, appearance, and functionality. This empowers you to design a unique and tailored toolbar that aligns perfectly with your specific requirements and desired user experience.

Here is an example of using [toolbarTemplate](#) to render only the button to toggle the freehand draw option.

The toolbar of the Image Editor can be replaced with the user specific UI using the [toolbarTemplate](#) property.

### Customize contextual toolbar

The [toolbarUpdating](#) event is triggered when inserting or selecting annotations, which opens the contextual toolbar in the Image Editor. Within this event, the [toolbarItems](#) property in the [ToolbarEventArgs](#) is utilized to add or remove contextual toolbar items.

In the following example, the contextual toolbar for rectangle will be rendered with only stroke color by excluding fill color and stroke width using [toolbarUpdating](#) event.

#### APP.VUE

```
<template>
<div>
<ejs-imageeditor id="image-editor" ref="imageEditorObj" height="350px"
width="550px" :toolbarUpdating="toolbarUpdating"></ejs-imageeditor>
</div>
</template>
<script>
import Vue from 'vue';
import { ImageEditorPlugin } from "@syncfusion/ej2-vue-image-editor";
import { Browser } from "@syncfusion/ej2-base";
Vue.use(ImageEditorPlugin);
export default {
  data: function() {
    return {};
  },
  methods: {
    created: function() {
      if (Browser.isDevice) {
        this.$refs.imageEditorObj.open('flower.png');
      } else {
        this.$refs.imageEditorObj.open('bridge.png');
      }
    },
    toolbarUpdating: function(args) {
      if (args.toolbarType === 'shapes') {
        args.toolbarItems = ['strokeColor'];
      }
    }
  }
}

### Toolbar item clicked event

The [toolbarItemClicked](#) event is triggered when a toolbar item is clicked in the Image Editor. This event is particularly useful when you have added custom options to both the main toolbar and contextual toolbar, as it allows you to capture the user's interaction with those custom options. By subscribing to the [toolbarItemClicked](#) event, you can execute specific actions or handle logic based on the toolbar item that was clicked.

### APP.VUE

```
<template>
<div>
<ejs-imageeditor id="image-editor" ref="imageEditorObj" height="350px"
width="550px" :toolbarItemClicked="toolbarItemClicked"></ejs-imageeditor>
</div>
</template>
<script>
import Vue from 'vue';
import { ImageEditorPlugin } from "@syncfusion/ej2-vue-image-editor";
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { Browser } from "@syncfusion/ej2-base";
Vue.use(ImageEditorPlugin);
export default {
  data: function() {
    return {
      toolbar: [{text: 'Custom'}]
    };
  },
  methods: {
    created: function() {
      if (Browser.isDevice) {
        this.$refs.imageEditorObj.open('flower.png');
      } else {
        this.$refs.imageEditorObj.open('bridge.png');
      }
    },
    toolbarItemClicked: function(args) {
      if(args.item.text === 'Custom') {
        this.$refs.imageEditorObj.rotate(90);
      }
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";

</style>
```

{% previewsample "page.domainurl/code-snippet/image-editor/getting-started-cs40" %}

### Toolbar created event

The [toolbarCreated](#) event is triggered after the toolbar is created in the Image Editor. This event can be useful when you need to perform any actions or make modifications to the toolbar once it is fully initialized and ready for interaction. By subscribing to the [toolbarCreated](#) event, you can access the toolbar object and perform tasks such as adding event handlers, customizing the appearance, or configuring additional functionality.

### Add an additional contextual Toolbar item to text shape

The contextual toolbar that appears when inserting annotations in the Image Editor is customizable using the [toolbarUpdating](#) event. This event is triggered when the contextual toolbar is rendered, allowing you to modify its contents. To add additional toolbar items to the contextual toolbar, you can access the [toolbarItems](#) property of the object within the event handler. By adding or removing items from the [toolbarItems](#) property based on the Item property, you can customize the options available in the contextual toolbar according to your needs. This gives you the ability to extend the functionality of the contextual toolbar and provide additional tools and options for working with inserted annotations.

Here is an example of adding the custom toolbar item to the contextual toolbar.

### APP.VUE

```

## Quick access toolbar in the Vue Image Editor component

The quick access toolbars in the Vue Image Editor play a vital role in facilitating interactions with annotations like Rectangle, Ellipse, Line, Arrow, and Path. These toolbars offer a diverse array of tools and options that can be tailored to match the specific requirements and preferences associated with each annotation type. The toolbar is only displayed when an annotation is selected, ensuring a focused and contextual user experience. Users have the flexibility to add or remove items from the toolbar, allowing them to create a personalized set of tools. Additionally, users can also build a completely custom toolbar from the ground up, providing them with complete control over the available options and functionality.

### Add a custom toolbar item

The quick access toolbar that appears when inserting annotations in the Image Editor is customizable using the [quickAccessToolbarOpen](#) event. This event is triggered when the quick access toolbar is opened, allowing you to modify its contents. To add additional toolbar items to the quick access toolbar, you can access the `toolbarItems` property of the `QuickAccessToolbarEventArgs` within the event handler. By adding or removing items from the `toolbarItems` property based on the item property, you can customize the options available in the quick access toolbar according to your needs. This gives you the ability to extend the functionality of the quick access toolbar and provide additional tools and options for working with inserted annotations.

Here is an example of adding the custom toolbar item to the quick access toolbar.

### APP.VUE

```

<template>
<div>
<ejs-imageeditor id="image-editor" ref="imageEditorObj" height="350px"
width="550px" :quickAccessToolbarOpen="quickAccessToolbarOpen"></ejs-
imageeditor>
</div>
</template>
<script>

```

```

import Vue from 'vue';
import { ImageEditorPlugin, ImageFinetuneOption } from "@syncfusion/ej2-vue-image-editor";
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { Browser } from "@syncfusion/ej2-base";
Vue.use(ImageEditorPlugin);
Vue.use(ButtonPlugin);
Vue.use(ImageFinetuneOption);
export default {
  data: function() {
    return {};
  },
  methods: {
    created: function() {
      if (Browser.isDevice) {
        this.$refs.imageEditorObj.open('flower.png');
      } else {
        this.$refs.imageEditorObj.open('bridge.png');
      }
    },
    quickAccessToolbarOpen: function(args) {
      args.toolbarItems = ['Clone'];
    }
  }
}
</script>

## Undo and redo actions in the Vue Image Editor

The undo and redo functionalities provide a way to reverse and repeat editing actions performed on an image. These features are essential for maintaining control and flexibility during the editing process.

In an image editor, the undo and redo history typically have a limited capacity, and the number of steps that can be stored is 16 steps, meaning that the editor keeps track of the most recent 16 actions performed on the image. Once the history reaches its maximum capacity, any new actions beyond the 16th step will result in the removal of the oldest action from the history.

### Undo the action

The undo action in an image editor allows users to revert the most recent editing action or a series of actions back to their previous state. When the undo command is triggered, the image editor undoes the last applied modification, effectively restoring the image to its state before the action was performed. The undo action is useful for correcting mistakes, removing unwanted changes, or exploring different editing options without permanently altering the image.

### Redo the action

The Redo action in an image editor allows users to reapply previously undone actions or modifications to the image. When the redo command is triggered, the image editor reapplies the last action that was undone, bringing the image back to the state it was in after the action was initially applied. The redo is useful when users want to repeat an action that was previously undone or restore changes that were temporarily reversed.

In the following example, the [undo](#) and [redo](#) method is used in the button click event.

#### APP.VUE

```
<template>
<div>
<ejs-imageeditor id="image-editor" ref="imageEditorObj" height="350px"
width="550px"></ejs-imageeditor>
<ejs-button cssClass="e-img-button" :isPrimary="true" v-
on:click.native="btnClick">Text</ejs-button>
<ejs-button cssClass="e-img-button" :isPrimary="true" v-
on:click.native="undoClick">Undo</ejs-button>

{% previewsample "page.domainurl/code-snippet/image-editor/getting-started-cs30" %}

## Filters in the Vue Image Editor component

Filters are pre-defined effects that can be applied to an image to alter its appearance or mood. Image filters can be used to add visual interest or to enhance certain features of the image. Some common types of image filters include cold, warm, chrome, sepia, and invert. This can be done by either using the toolbar or the [applyImageFilter](#) method which takes a single parameter: the filter applied to an image.

### Apply filter effect

The [applyImageFilter](#) method is utilized to apply filters to an image. By passing the desired filter type as the first parameter of the method, specified as [ImageFilterOption](#) the method applies the corresponding filter to the image. This allows for easy and convenient application of various filters to enhance or modify the image based on the chosen filter type.

- filterOption - Specifies the filter options to the image.

In the following example, you can using the applyImageFilter method in the button click event.

### APP.VUE

```

### Image filtering event

The [imageFiltering](#) event is triggered when applying filtering on the image. This event is passed an object that contains information about the filtering event, such as the type of filtering.

The parameter available in the [ImageFilterEventArgs](#) event is,

[ImageFilterEventArgs.Filter](#) - The type of filtering as [ImageFilterOption](#) to be applied in the image editor.

[ImageFilterEventArgs.Cancel](#) – Specifies to cancel the filtering action.

### Finetune in the Vue Image Editor component

Fine-tuning involves making precise adjustments to the settings of an image filter in order to achieve a specific desired effect. It provides control over the intensity and specific aspects of the filter's impact on the image. For example, fine-tuning allows you to modify parameters like brightness, saturation, or other relevant properties to fine-tune the level or quality of the filter's effect. This level of control enables you to achieve the exact look or outcome you want for your image.

#### Adjust the brightness, contrast, or sharpness

The [finetuneImage](#) method is designed to facilitate fine-tuning operations on an image. It accepts two parameters: the first parameter is [ImageFinetuneOption](#) which determines the type of fine-tuning to be applied (brightness, contrast, or sharpness), and the second parameter represents the fine-tuning value, indicating the degree or intensity of the adjustment. This method allows for convenient adjustment of brightness, contrast, or sharpness by specifying the desired type and corresponding value.

The [finetuneImage](#) method is used to perform brightness, contrast, or sharpness fine-tuning by specifying this type as a first parameter and specifying the fine-tuning value as the second parameter of the method.

Here is an example of brightness, contrast, and sharpness fine-tuning using the [finetuneImage](#) method.

@import "../node_modules/@syncfusion/ej2-image-editor/styles/material.css";
#image-editor {
  width: 550px !important;
  height: 350px !important;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/image-editor/getting-started-cs25" %}

### Finetune value changing event

The [FinetuneValueChanging](#) event is triggered when performing fine-tuning on the image. This event is passed an object that contains information about the fine-tuning event, such as the type of fine-tuning and the value of fine-tuning performed.

The parameter available in the [FinetuneEventArgs](#) event is,

- `FinetuneEventArgs.finetune` - The type of fine-tuning as [ImageFinetuneOption](#) to be applied in the image editor.
- `FinetuneEventArgs.value` - The fine-tuning value to be applied in the image editor.
- `FinetuneEventArgs.cancel` – Specifies a boolean value to cancel the fine-tuning action.

### Frames

The frame feature in an Image Editor provides users with the capability to add decorative borders or frames around their images. Frames are a visual design element that can enhance the overall appearance and appeal of an image.

#### Apply frame to the Image

The [drawFrame](#) method is a function designed to enable the application of various frame options to an image. This method simplifies the process of adding decorative frames, such as mat, bevel, line, hook, and inset, to an image by allowing users to specify their desired frame type.

Depending on the frame type selected, users may have additional customization options, such as adjusting the frame's thickness, color, texture, or other attributes. This allows for fine-tuning the appearance of the frame to match the image's theme or the user's preferences

The [drawFrame](#) method in the Image Editor control takes nine parameters to define the properties of the frame to the image:

- `frameType` - Specified the image data or url of the image to be inserted.
- `Color` - Specifies the color for the frame.
- `gradientColor` - Specifies the gradient color for the frame.
- `size` - Specifies the size of the frame.
- `inset` - Specifies the inset value for line, hook, and inset type frames.
- `offset` - Specifies the offset value for line and inset type frames.
- `borderRadius` - Specifies the border radius for line type frame.
- `frameLineStyle` - Specifies the frame line style for line type frame.
- `lineCount` - Specifies the line count for the line type frame.

In the following example, you can use the `drawFrame` method in the button click event.

#### APP.VUE

```
<template>
<div>
<ejs-imageeditor id="image-editor" ref="imageEditorObj" height="350px"
width="550px"></ejs-imageeditor>
<ejs-button cssClass="e-img-button" :isPrimary="true" v-
on:click.native="matClick">Mat</ejs-button>
<ejs-button cssClass="e-img-button" :isPrimary="true" v-
on:click.native="bevelClick">Bevel</ejs-button>
<ejs-button cssClass="e-img-button" :isPrimary="true" v-
on:click.native="lineClick">Line</ejs-button>
<ejs-button cssClass="e-img-button" :isPrimary="true" v-
on:click.native="insetClick">Inset</ejs-button>
<ejs-button cssClass="e-img-button" :isPrimary="true" v-
on:click.native="hookClick">Hook</ejs-button>
</div>
</template>
<script>
import Vue from 'vue';
import { ImageEditorPlugin, FrameType, FrameLineStyle } from
"@syncfusion/ej2-vue-image-editor";
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { Browser } from "@syncfusion/ej2-base";
Vue.use(ImageEditorPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return {
      toolbar: []
    };
  },
  methods: {
    created: function() {
      if (Browser.isDevice) {
        this.$refs.imageEditorObj.open('flower.png');
      } else {
        this.$refs.imageEditorObj.open('bridge.png');
      }
    }
  },
}
```

```

    matClick: function(event) {
        this.$refs.imageEditorObj.ej2Instances.drawFrame(FrameType.Mat, 'red',

### Frame changing event

The [frameChanging](#) event is triggered when applying frame on the image. This event provides information encapsulated within an object, which includes details about the frame applied in an image. This information encompasses:

**Frame Type:** This indicates the specific type of frame being applied, whether it's a mat, bevel, line, or hook.

**Customization Values:** These values contain information about any adjustments or modifications made to the frame. For instance, if the frame can be customized with attributes like color, size, or style, these details are conveyed within the event object.

The parameter available in the [FrameChangeEventArgs](#) is

- [FrameChangeEventArgs.previousFrameSetting](#) - The frame settings including size, color, inset, offset, gradient color which is applied before changing the frame.
- [FrameChangeEventArgs.currentFrameSetting](#) - The frame settings including size, color, inset, offset, gradient color which is going to apply after changing the frame.
- [FrameChangeEventArgs.cancel](#) - Specifies a boolean value to cancel the frame changing action.

## Resize

The resize feature in an Image Editor is a valuable tool that empowers users to modify the size or dimensions of an image to meet their specific requirements. Whether it's for printing, web display, or any other purpose, this feature allows users to tailor images to their desired specifications.

### Apply resize to the image

The Image Editor control includes a [resize](#) method, which allows you to adjust the size of an image. This method takes three parameters that define how the resizing should be carried out:

- width: Specifies the resizing width of the image.
- height: Specifies the resizing height of the image.
- isAspectRatio: Specifies a boolean value indicating whether the image should maintain its original aspect ratio during resizing. When set to true, the image will be resized while preserving its aspect ratio

Here is an example of resizing the image using the [resize](#) method.

### APP.VUE

```
<template>
<div>
<ejs-imageeditor id="image-editor" ref="imageEditorObj" height="350px"
width="550px"></ejs-imageeditor>
<ejs-button cssClass="e-img-button" :isPrimary="true" v-
on:click.native="aspectClick">Aspect Ratio</ejs-button>
<ejs-button cssClass="e-img-button" :isPrimary="true" v-
on:click.native="nonAspectClick">Non Aspect Ratio</ejs-button>
</div>
</template>
<script>
import Vue from 'vue';
import { ImageEditorPlugin } from "@syncfusion/ej2-vue-image-editor";
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { Browser } from "@syncfusion/ej2-base";
Vue.use(ImageEditorPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return {
      toolbar: []
    };
  },
  methods: {
    created: function() {
      if (Browser.isDevice) {
        this.$refs.imageEditorObj.open('flower.png');
      } else {
```

```

        this.$refs.imageEditorObj.open('bridge.png');
    },
    aspectClick: function(event) {
        this.$refs.imageEditorObj.ej2Instances.resize(300, 400, true);
    },
    nonAspectClick: function(event) {
        this.$refs.imageEditorObj.ej2Instances.resize(400, 100, false);
    }
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";

    width: 550px !important;
    height: 350px !important;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/image-editor/getting-started-cs42" %}

### Resizing event

The [resizing](#) event is triggered when resizing the image. This event provides information encapsulated within an object, which includes details about the previous and current height and width of an image.

The parameter available in [ResizeEventArgs](#) is,

- [ResizeEventArgs.previousWidth](#) - The width of the image before resizing is performed.
- [ResizeEventArgs.previousHeight](#) - The height of the image before resizing is performed.
- [ResizeEventArgs.width](#) - The width of the image after resizing is performed.
- [ResizeEventArgs.height](#) - The width of the image after resizing is performed.
- [ResizeEventArgs.isAspectRatio](#) - The type of resizing performed such as aspect ratio or non-aspect ratio.
- [ResizeEventArgs.cancel](#) - Specifies a boolean value to cancel the resizing action.

### Localization in the Vue Image Editor component

The **Localization** library allows you to localize the default text content of the Image Editor. The Image Editor has static text that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the **locale** value and translation object.

The following list of properties and its values are used in the Image Editor.

| Locale key words | Text |

| ----- | ----- |

Browse	Browse
Crop	Crop
ZoomIn	Zoom In
ZoomOut	Zoom Out
Transform	Transform
Annotation	Annotation
Text	Add Text
Pen	Pen
Reset	Reset
Save	Save
Select	Select
RotateLeft	Rotate Left
RotateRight	Rotate Right
HorizontalFlip	Horizontal Flip
VerticalFlip	Vertical Flip
OK	OK
Cancel	Cancel
FillColor	Fill Color
StrokeColor	Stroke Color
StrokeWidth	StrokeWidth
FontFamily	Font Family
FontStyle	Font Style
FontSize	Font Size
FontColor	Font Color
Pan	Pan
Move	Move
Custom	Custom
Square	Square
Circle	Circle
Rectangle	Rectangle
Line	Line
Default	Default
Bold	Bold

| Italic | Italic |

| BoldItalic | Bold Italic |

| XSmall | X-Small |

| Small | Small |

| Medium | Medium |

| Large | Large |

| XLarge | X-Large |

| ABC | ABC |

**APP.VUE**

```
<template>
<div>
<ejs-imageeditor id="image-editor" height="350px" width="550px" locale="de-
DE"></ejs-imageeditor>
</div>
</template>
<script>
import Vue from 'vue';
import { ImageEditorPlugin } from "@syncfusion/ej2-vue-image-editor";
import { L10n, setCulture } from '@syncfusion/ej2-base';

}
</style>

```

{% previewsample "page.domainurl/code-snippet/image-editor/getting-started-cs8" %}

## Accessibility in Vue Image Editor component

The Image Editor component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Image Editor component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast | `` |

| Mobile Device Support | `` |

| Keyboard Navigation Support | `` |

| [Accessibility Checker](#) Validation | `` |

| [Axe-core](#) Accessibility Validation | `` |

`<style>`

`.post .post-content img {`

`display: inline-block;`

`margin: 0.5em 0;`

`}`

`</style>`

`<div>` - All features of the component meet the requirement.`</div>`

`<div>` - Some features of the component do not meet the requirement.`</div>`

`<div>` - The component does not meet the requirement.`</div>`

### Keyboard interaction

The Image Editor component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Image Editor component.

| **Press** | **To do this** |

| --- | --- |

| **Ctrl + Z** | **Undo the last user action.** |

| **Ctrl + Y** | **Redo the last user action.** |

| **Ctrl + S** | **To save the Image.** |

| **Ctrl + O** | **To open the Image.** |

| **Delete** | **To delete the shape once the shape got selected through mouse click .** |

### Ensuring accessibility

The Image Editor component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Image Editor component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Image Editor component with accessibility tools.

```
{% previewsample "page.domainurl/code-snippet/image-editor/getting-started-cs1" %}
```

## InplaceEditor

### Getting Started with the Vue Inplace editor Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLI](#) and integrating the Syncfusion Vue Inplace editor component

#### Prerequisites

[System requirements for Syncfusion Vue UI components](#)

#### Dependencies

The following list of dependencies are required to use the In-place Editor component in your application.

```
`javascript
|-- @syncfusion/ej2-vue-inplace-editor
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-calendars
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-dropdowns
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-richtexteditor
|-- @syncfusion/ej2-splitbuttons
|-- @syncfusion/ej2-vue-base
`,`
```

#### Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```
`bash
npm install -g @vue/cli
```

```
vue create quickstart
```

```
cd quickstart
```

```
npm run serve
```

```
,
```

```
or
```

```
`bash
```

```
yarn global add @vue/cli
```

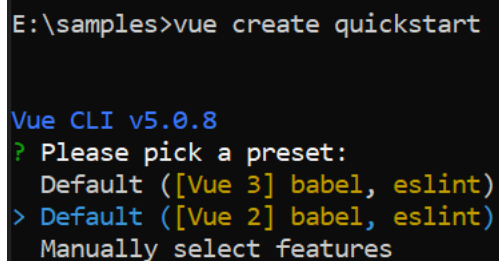

```
vue create quickstart
```

```
cd quickstart
```

```
yarn run serve
```

```
,
```

When creating a new project, choose the option `Default ([Vue 2] babel, eslint)` from the menu.

```
E:\samples>vue create quickstart

Vue CLI v5.0.8
? Please pick a preset:
  Default ([Vue 3] babel, eslint)
> Default ([Vue 2] babel, eslint)
  Manually select features
```

Once the `quickstart` project is set up with default settings, proceed to add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.npmjs.com). To use Vue components, install the required npm package.

This article uses the [Vue Inplace editor component](#) as an example. Install the `@syncfusion/ej2-vue-inplace-editor` package by running the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-inplace-editor --save
```

```
,
```

```
or
```

```
`bash
```

```
yarn add @syncfusion/ej2-vue-inplace-editor
```

```
,
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the **Material** theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Inplace editor component and its dependents were imported into the `<style>` section of **src/App.vue** file.

#### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-richtexteditor/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inplace-editor/styles/material.css";
</style>
```

### Add Syncfusion Vue component

Follow the below steps to add the Vue Inplace editor component:

1\ First, import and register the Inplace editor component in the **script** section of the **src/App.vue** file.

#### ~/SRC/APP.VUE

```
<script>
import { InPlaceEditorComponent } from '@syncfusion/ej2-vue-inplace-editor';
export default {
  components: {
    'ejs-inplaceeditor': InPlaceEditorComponent
  }
}
</script>
```

2\ In the **template** section, define the Inplace editor component with the [model](#) property.

#### ~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-inplaceeditor id="inplace_editor" type="Text" value="Andrew"
:model="model">
</ejs-inplaceeditor>
</div>
</template>
```

3\ Declare the value for the `model` property in the `script` section.

#### ~/SRC/APP.VUE

```
<script>
data () {
  return {
    model: {
      placeholder: 'Enter employee name'
    },
  }
}
</script>
```

#### Add the In-place Editor with Textbox

By default, the TextBox component is rendered in In-place Editor with the `type` property sets as Text.

,

```
<template>
<div id="app">
  <ejs-inplaceeditor id="inplace_editor" type="Text" value="Andrew" :model="model">
  </ejs-inplaceeditor>
</div>
</template>
<script>
import { InPlaceEditorComponent } from '@syncfusion/ej2-vue-inplace-editor';
export default {
  components: {
    'ejs-inplaceeditor': InPlaceEditorComponent
  },
  name: 'app',
  data: function(){
    return {
      model: {
        placeholder: 'Enter employee name'
      },
    }
  }
}
</script>
```

,

### Configure DropDownList

You can render DropDownList by changing the [type](#) property as [DropDownList](#) and configure its properties and methods using the `model` property.

In the following sample, [type](#) and `model` values are configured to render the [DropDownList](#) component.

,

```
<template>
<div id="app">
  <ejs-inplaceeditor id="element" type="DropDownList" mode= "Inline" :model="model">
  </ejs-inplaceeditor>
</div>
</template>
<script>
import { InPlaceEditorComponent } from '@syncfusion/ej2-vue-inplace-editor';
export default {
  components: {
    'ejs-inplaceeditor': InPlaceEditorComponent
  },
  name: 'app',
  data () {
    return {
      model: {
        genderData: ['Male', 'Female'],
        placeholder: 'Select gender'
      },
    }
  }
}
</script>
```

,

### Integrate DatePicker

You can render [DatePicker](#) by changing the [type](#) property as [Date](#) and also configure its properties and methods using [model](#) property.

In the below sample, [type](#) and [model](#) values are configured to render the [DatePicker](#) component.

```
,  
<template>  
<div id="app">  
<ejs-inplaceeditor id="inplace_editor" type="Date" :model="model" :value="value">  
</ejs-inplaceeditor>  
</div>  
</template>  
<script>  
import { InPlaceEditorComponent } from '@syncfusion/ej2-vue-inplace-editor';  
export default {  
  components: {  
    'ejs-inplaceeditor': InPlaceEditorComponent  
  },  
  name: 'app',  
  data () {  
    return {  
      value: new Date('04/12/2018'),  
      model: {  
        showTodayButton: true  
      },  
    }  
  }  
}  
</script>  
,
```

Here is the summarized code for the above steps in the **src/App.vue** file:

#### ~/SRC/APP.VUE

```
<template>  
  <div id="app">  
    <div class="control-group">  
      <h3> Modify Basic Details </h3>  
      <table>  
        <tr>  
          <td>Name</td>  
          <td class='left'>  
            <ejs-inplaceeditor id="element" type="Text" mode="Inline"  
value="Andrew" :model="textModel"></ejs-inplaceeditor>  
          </td>  
        </tr>  
      </table>  
    </div>  
  </div>  
</template>
```

```

        </td>
      </tr>
      <tr>
        <td>Date of Birth</td>
        <td class='left'>
          <ejs-inplaceeditor id="dateofbirth" type="Date"
mode="Inline" :value="dateValue" :model="dateModel"></ejs-inplaceeditor>
        </td>
      </tr>
      <tr>
        <td>Gender</td>
        <td class='left'>
          <ejs-inplaceeditor id="gender" type="DropDownList" mode=
"Inline" value="Male" :model="dropdownModel"></ejs-inplaceeditor>
        </td>
      </tr>
    </table>
  </div>
</div>
</template>
<script>
import { InPlaceEditorComponent } from '@syncfusion/ej2-vue-inplace-editor';
export default {
  components: {
    'ejs-inplaceeditor': InPlaceEditorComponent
  },
  name: 'app',
  data () {
    return {
      dateValue: new Date('04/12/2018'),
      dateModel: {
        showTodayButton: true,
        placeholder: 'Select date of birth'
      },
      textModel: {
        placeholder: 'Enter your name'
      },
      dropdownModel: {
        dataSource: ['Male', 'Female'],
        placeholder: 'Select gender'
      },
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";

```

```
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inplace-editor/styles/material.css";
</style>
<style>
#app {
    visibility: hidden;
}
#app .control-group {
    text-align: center;
    margin-top: 50px;
}
#app .control-group table {
    width: 400px;
    margin:auto;
}
#app .control-group table td {
    height: 70px;
    width: 150px;
}
#app .control-group table td.left {
    text-align: left;
}
</style>
```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run serve
```

```
,
```

or

```
`bash
```

```
yarn run serve
```

```
,
```

```
{% previewsample "page.domainurl/code-snippet/in-place-editor/getting-started-cs11" %}
```

### Two-way binding

In In-place Editor, two-way binding support is achieved using the `v-model` directive in Vue. When you change a value in the first In-place Editor component, the changed value gets updated automatically to the second In-place Editor. The following example demonstrates, how to achieve two-way binding in In-place Editor.

#### ~/SRC/APP.VUE

```
<template>
  <div id="app">
    <div id='container'>
      <div class="control-group">
```

```

        <table>
          <tr>
            <td><b>TextBox :</b></td>
            <ejs-inplaceeditor id="textbox" type="Text" mode="Inline"
:~model="textModel" v-model="value">
            </ejs-inplaceeditor>
            <ejs-inplaceeditor id="textbox2" type="Text" mode="Inline"
:~model="textModel" v-model="value">
            </ejs-inplaceeditor>
          </tr>
          <tr>
            <td><b>Datepicker :</b></td>
            <ejs-inplaceeditor id="dateeditor1" mode="Inline"
type="Date" :model="dateModel" v-model="datePickerValue">
            </ejs-inplaceeditor>
            <ejs-inplaceeditor id="dateeditor2" mode="Inline"
type="Date" :model="dateModel" v-model="datePickerValue">
            </ejs-inplaceeditor>
          </tr>
          <tr>
            <td><b>DropDownList :</b></td>
            <ejs-inplaceeditor id="dropDowneditor1" mode="Inline"
type="DropDownList" :model="dropdownModel" v-model="dropdownValue">
            </ejs-inplaceeditor>
            <ejs-inplaceeditor id="dropDowneditor2" mode="Inline"

  width: 150px;
}
#app .control-group table td.left {
  text-align: left;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/in-place-editor/getting-started-cs12" %}

### Submitting data to the server (save)

You can submit editor value to server by configuring the [url](#), [adaptor](#), and [primaryKey](#) property.

Property	Usage
<b>url</b>	Gets the url for server submit action.
<b>adaptor</b>	Specifies the adaptor type that is used by DataManager to communicate with DataSource.
<b>primaryKey</b>	Defines the unique primary key of editable field which can be used for saving data in the data-base.

The [primaryKey](#) property is mandatory. If it's not set, edited data are not sent to the server.

#### Refresh with modified value

The edited data is submitted to the server and you can see the new values getting reflected in the In-place Editor.

#### ~/SRC/APP.VUE

```
<template>
  <div id="app">
    <div class="container">
      <div class="control-group" style="text-align:center;margin: 100px auto">
        Best Employee of the year: <ejs-inplaceeditor id="element"
type="DropDownList" mode="Inline" value="Andrew Fuller" name="Employee"
:url="serviceUrl" primaryKey="Employee" adaptor="UrlAdaptor"
:model="dropdownModel" :actionSuccess= "actionSuccess"
:created='created'></ejs-inplaceeditor>
      </div>
      <table style="margin:auto;width:50%">

## Getting Started with the Vue In-place Editor Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue In-place Editor component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

#### Prerequisites

##### [System requirements for Syncfusion Vue UI components](#)

#### Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm create vite@latest
```

```
`
```

or

```
`bash
```

```
yarn create vite
```

```
`
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as **my-project** for this article.

```
`bash
```

```
? Project name: » my-project
```

```
`
```

2. Select **Vue** as the framework. It will create a Vue 3 project.

```
`bash
```

```
? Select a framework: » - Use arrow-keys. Return to submit.
```

```
Vanilla
```

```
Vue
```

```
React
```

```
Preact
```

```
Lit
```

```
Svelte
```

```
Others
```

```
`
```

3. Choose **JavaScript** as the framework variant to build this Vite project using JavaScript and Vue.

```
`bash
```

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

,

4. Upon completing the aforementioned steps to create the `my-project`, run the following command to install its dependencies:

```
`bash
```

```
cd my-project
```

```
npm install
```

,

or

```
`bash
```

```
cd my-project
```

```
yarn install
```

,

Now that `my-project` is ready to run with default settings, let's add Syncfusion components to the project.

### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue In-place Editor component](#) as an example. To use the Vue In-place Editor component in the project, the `@syncfusion/ej2-vue-inplace-editor` package needs to be installed using the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-inplace-editor --save
```

,

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-inplace-editor
```

,

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, `Material` theme is applied using CSS styles, which are available in installed packages. The necessary `Material` CSS styles for the In-place Editor component and its dependents were imported into the `<style>` section of `src/App.vue` file.

### ~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-richtexteditor/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inplace-editor/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

### Add Syncfusion Vue component

Follow the below steps to add the Vue In-place Editor component using `Composition API` or `Options API`:

1.First, import and register the In-place Editor component in the `script` section of the `src/App.vue` file. If you are using the `Composition API`, you should add the `setup` attribute to the `script` tag to indicate that Vue will be using the `Composition API`.

### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { InPlaceEditorComponent as EjsInplaceeditor } from "@syncfusion/ej2-vue-inplace-editor";
</script>
```

### OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { InPlaceEditorComponent } from "@syncfusion/ej2-vue-inplace-editor";
//Component registration
export default {
  name: "App",
  components: {
    "ejs-inplaceeditor": InPlaceEditorComponent,
  }
}
</script>
```

2.In the `template` section, define the In-place Editor component with the `dataSource` property and column definitions.

**~/SRC/APP.VUE**

```
<template>
<div id="app">
<ejs-inplaceeditor id="inplace_editor" type="Text" value="Andrew"
:model="model">
</ejs-inplaceeditor>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

**COMPOSITION API (~/SRC/APP.VUE)**

```
<template>
<div id="app">
<ejs-inplaceeditor id="inplace_editor" type="Text" value="Andrew"
:model="data[0].model">
</ejs-inplaceeditor>
</div>
</template>
<script setup>
import { InPlaceEditorComponent as EjsInplaceeditor } from "@syncfusion/ej2-
vue-inplace-editor";
const data = [{ model: {
placeholder: 'Enter employee name'}}]
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-
richtexteditor/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inplace-
editor/styles/material.css";
</style>
```

**OPTIONS API (~/SRC/APP.VUE)**

```
<template>
<div id="app">
<ejs-inplaceeditor id="inplace_editor" type="Text" value="Andrew"
:model="model">
</ejs-inplaceeditor>
</div>
</template>
<script>
import { InPlaceEditorComponent } from "@syncfusion/ej2-vue-inplace-editor";
export default {
name: "App",
```

```
components: {  
  "ejs-inplaceeditor": InPlaceEditorComponent  
},  
data: function () {  
  return {  
    model: {  
      placeholder: 'Enter employee name'  
    },  
  };  
}  
</script>  
<style>  
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-richtexteditor/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";  
@import "../node_modules/@syncfusion/ej2-vue-inplace-editor/styles/material.css";  
</style>
```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
,
```

or

```
`bash
```

```
yarn run dev
```

```
,
```

The output will appear as follows:

### Configure DropDownList in Vue3

You can render DropDownList by changing the type property as DropDownList and configure its properties and methods using the model property.

In the following sample, type and model values are configured to render the DropDownList component.

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<template>
<div id="app">
<ejs-inplaceeditor
id="gender"
type="DropDownList"
mode="Inline"
value="Male"
:model="data[0].dropdownModel"
></ejs-inplaceeditor>
</div>
</template>
<script setup>
import { InPlaceEditorComponent as EjsInplaceeditor } from "@syncfusion/ej2-
vue-inplace-editor";
const data = [{ dropdownModel: {
dataSource: ["Male", "Female"],
placeholder: "Select gender",}}]
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-
richtexteditor/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inplace-
editor/styles/material.css";
</style>
```

#### **OPTIONS API (~SRC/APP.VUE)**

```
<template>
<div id="app">
<ejs-inplaceeditor
id="gender"
type="DropDownList"
mode="Inline"
value="Male"
:model="dropdownModel"
></ejs-inplaceeditor>
</div>
</template>
<script>
```

```

import { InPlaceEditorComponent } from "@syncfusion/ej2-vue-inplace-editor";
export default {
  name: "App",
  components: {
    "ejs-inplaceeditor": InPlaceEditorComponent,
  },
  data: function () {
    return {
      dropdownModel: {
        dataSource: ["Male", "Female"],
        placeholder: "Select gender",
      },
    };
  },
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-richtexteditor/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inplace-editor/styles/material.css";
</style>

```

### Integrate DatePicker in Vue3

You can render DatePicker by changing the type property as Date and also configure its properties and methods using model property.

In the below sample, type and model values are configured to render the DatePicker component.

#### COMPOSITION API (~SRC/APP.VUE)

```

<template>
<div id="app">
<ejs-inplaceeditor
id="inplace_editor"
type="Date"
:model="data[0].model"
:value="data[0].value"
>
</ejs-inplaceeditor>
</div>
</template>
<script setup>
import { InPlaceEditorComponent as EjsInplaceeditor } from "@syncfusion/ej2-vue-inplace-editor";
const data = [{ value: new Date("04/12/2018"),
model: {

```

```

showTodayButton: true}
}]
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";

## Components in Vue Inplace editor component

In-place Editor renders various components based on the [type](#) property and it have built-in and injectable component. To use injectable components, inject the required modules into **In-place Editor**. By default, the [type](#) property set to **Text** and render the **TextBox**.

The following table explains Injectable components module name and built-in components and their types.

Injectable Components		Built in Components	
-----		-----	
<a href="#">AutoComplete</a>	(AutoComplete)	<a href="#">TextBox</a>	(Text)
<a href="#">ComboBox</a>	(ComboBox)	<a href="#">DatePicker</a>	(Date)
<a href="#">MultiSelect</a>	(MultiSelect)	<a href="#">DateTimePicker</a>	(DateTime)
<a href="#">TimePicker</a>	(Time)	<a href="#">DropDownList</a>	(DropDownList)
<a href="#">DateRangePicker</a>	(DateRange)	<a href="#">MaskedTextBox</a>	(Mask)
<a href="#">Slider</a>	(Slider)	<a href="#">NumericTextBox</a>	(Numeric)
<a href="#">Rte</a>	(RTE)		
<a href="#">ColorPicker</a>	(Color)		

In the following sample, built-in and injectable based In-place Editor components are rendered.

### APP.VUE

```
<template>
<div id="app">
  <div id='container'>
    <h3> Built-in Components </h3>

### Model configuration

Components properties and events can be customized using the In-place Editor [model](#) property.

In the following code, the [type](#) defined as the `Date` and `DatePicker` properties are configured through [model](#) property to customize the [DatePicker](#) component at In-place Editor.

```
`ts
```

```
model: {  
  showTodayButton: true,  
  placeholder: 'Select Date'  
}  
,
```

```
[src/app/app.vue]
```

```
,
```

```
<template>
```

```
<div id="app">
```

```
<ejs-inplaceeditor id="inplace_editor" type="Date" :value="datepickerValue" :model="model">
```

```
</ejs-inplaceeditor>
```

```
</div>
```

```
</template>
```

```
<script>
```

```
import Vue from 'vue';
```

```
import { InPlaceEditorPlugin } from '@syncfusion/ej2-vue-inplace-editor';
```

```
Vue.use(InPlaceEditorPlugin);
```

```
export default {
```

```
  name: 'app',
```

```
  data () {
```

```
    return {
```

```
      datepickerValue: new Date('04/12/2018');
```

```
      dateModel: {
```

```
        showTodayButton: true,
```

```
placeholder: 'Select Date'
```

```
},
```

```
}
```

```
}
```

```
}
```

```
</script>
```

```
,
```

## Configuration in Vue Inplace editor component

### Rendering modes

This section explains the supported rendering modes of the In-place Editor. Possible Rendering modes are as follows.

- Popup
- Inline

By default, **Popup** mode will be rendered, when opening an editor.

- For **Popup** mode, editable container displays as like tooltip or popover above the element.
- For **Inline** mode, editable container displays as instead of the element. To render **Inline** mode while opening the editor, specify **mode** as **Inline**.

In the following sample, the In-place Editor renders with **Inline** mode. You can dynamically switch into another mode by changing the drop-down item value.

### **APP.VUE**

```
<template>
  <div id="app">
    <table class="table-section">
      <tr>
        <td>Mode</td>
        <td>
          <ejs-dropdownlist ref="editorMode" id="editorMode"
:dataSource='dataPlace' :change='changeEditorMode' :value='dataValue'
:fields='placeFields'>
          </ejs-dropdownlist>
        </td>
      </tr>
      <tr>
        <td class="sample-td">Enter your Name</td>
        <td class="sample-td">
```

```

        <ejs-inplaceeditor ref="editObj" id="inplace_editor"
mode="Inline" type="Text" value="Andrew" submitOnEnter= "true"
:model="textModel">
        </ejs-inplaceeditor>
    </td>
</tr>
</table>
</div>
</template>
<script>
import Vue from 'vue';

        padding-right: 20px;
    }
    .sample-td {
        padding-top: 10px;
        min-width: 230px;
        height: 100px;
    }
}
</style>

```

{% previewsample "page.domainurl/code-snippet/in-place-editor/getting-started-cs3" %}

### *Pop-up customization*

In-place Editor popup mode can be customized by using the [title](#) and [model](#) properties in [popupSettings](#) API.

Popup mode rendered by using the Essential JS 2 Tooltip component, so you can use tooltip properties and events to customize the behavior of popup via the [model](#) property of [popupSettings](#) API.

For more details, refer the tooltip documentation [section](#).

In the following sample, popup [title](#) and [position](#) customized using the [popupSettings](#) property. All possible tooltip position data configured in the drop-down, if we change drop down item, selected value bound to [model](#) property and applied it to [Tooltip](#) component. **Tooltip** have following position options.

- TopLeft
- TopCenter
- TopRight
- BottomLeft
- BottomCenter
- BottomRight
- LeftTop
- LeftCenter
- LeftBottom
- RightTop
- RightCenter
- RightBottom

### Event actions for editing

The event action of the editor that enable in the edit mode based on the [editableOn](#) property, by default **Click** is assigned, the following options are also supported.

- **Click:** The editor will be opened as single click actions.
- **DbClick:** The editor will be opened as double-click actions and it is not applicable for edit icon.
- **EditIconClick:** Disables the editing of event action of input and allows user to edit only through edit icon.

In-place Editor get focus by pressing the **tab** key from previous focusable DOM element and then by pressing **enter** key, the editor will be opened.

In the following sample, when switching drop-down item, the selected value assigned to the [editableOn](#) property. If you changed to **DbClick**, the editor will open when making a double click on the input.

### APP.VUE

#### Action on focus out

Action to be performed when the user clicks outside the container, that means focusing out of editable content and it can be handled by the [actionOnBlur](#) property, by default **Submit** assigned. It also has the following options.

- **Cancel:** Cancels the editing and resets the old content.
- **Submit:** Submits the edited content to the server.
- **Ignore:** No action is performed with this type and allows to edit multiple editors.

In the following sample, when switching drop-down item, the selected value assigned to the **actionOnBlur** property.

#### APP.VUE

```

<template>
<div id="app">
  <table class="table-section">
    <tr>
      <td>ActionOnBlur</td>
      <td>
        <ejs-dropdownlist ref="actions" id="actions"

### Buttons in Vue Inplace editor component

The In-place Editor had an action for save and cancel using buttons. The [saveButton](#) and [cancelButton](#) properties accept the [ButtonModel](#) objects for customizing the save and cancel button properties.

Buttons can be show or hide by sets a Boolean value to the [showButtons](#) property.

Without buttons value will be processed via the following ways.

- **[actionOnBlur](#)**: By clicking out side the editor component get focus out and do action based on this property value.
- **[submitOnEnter](#)**: Pressing **Enter** key it performs the submit action, if this property set to **true**.

In the following sample, the [content](#) and [cssClass](#) properties of **Button** value assigned to the [saveButton](#) and [cancelButton](#) properties to customize its appearance. Also check or uncheck a checkbox buttons render or removed from the editor.

To restrict either save or cancel button rendering into a DOM, simply pass empty object **{}** in the [saveButton](#) or [cancelButton](#) properties.

For more details about buttons, refer this documentation [section](#).

### APP.VUE

```
<template>
<div id="app">
  <table class="table-section">
    <tr>
      <td>ShowButtons:</td>
      <td>
        <ejs-checkbox ref="checkObj" id="showbuttons" checked=true

### Server actions in Vue Inplace editor component

By passing In-place Editor component value to the server, the [primaryKey](#) property value must require, otherwise action not performed for remote data.

If the [URL](#) property value is empty, data passing will handled at local and also the [actionSuccess](#) event will trigger with `null` as argument value.

The following arguments are passed to the server when submit actions perform.

Arguments	Explanations
value	For processing edited value, like DB value updating.
primaryKey	For value mapping to the server, like selecting DB.
name	For field mapping to the server, like DB column field mapping.

Find the following sample server codes for defining models and controller functions to configure processing data.

`C#

```

public class SubmitModel
{
    public string Name { get; set; }
    public string PrimaryKey { get; set; }
    public string Value { get; set; }
}

```

`C#

```

public IEnumerable<SubmitModel> UpdateData([FromBody]SubmitModel value)
{
    // User can process data
}

```

```
return value;
```

```
}
```

```
,
```

- Server actions successfully done, the [actionSuccess](#) event will be fired with returned server data.
- If the server is not responding, the [actionFailure](#) event will be fired with data, but value not updated in the Editor.

In the following sample, the `actionSuccess` event will trigger once the value submitted successfully into the server. In this sample, both `actionSuccess` and `actionFailure` were configured and resulted value will be converted to chips.

### APP.VUE

```
<template>
<div class="app">

### Data binding in Vue Inplace editor component

The Essential JS 2 components load the data either from local data sources or remote data services using the `dataSource` property and it supports the data type of an array or `DataManager`. Also supports different kind of data services such as OData, OData V4, Web API, and data formats such as XML, JSON, JSONP with the help of `DataManager` adaptors.

#### Local

To bind local data to the Essential JS 2 components, you can assign a JavaScript array of object or string to the `dataSource` property. The local data source can also be provided as an instance of the `DataManager`.

#### APP.VUE

```
<template>
<div class="app">
  <table class="table-section">
    <tr>
      <td>Select customer name: </td>
      <td>
        <ejs-inplaceeditor ref="dropObj" id="dropdownEle" mode="Inline"
type="DropDownList" :model="dropdownModel" value="Maria Anders">
        </ejs-inplaceeditor>
      </td>
    </tr>
  </table>
</div>
</template>
<script>

### Remote

To bind remote data to the Essential JS 2 Vue components, assign service data as an instance of **DataManager** to the **dataSource** property. To interact with remote data source, provide the endpoint URL.

### OData V4

The OData V4 is an improved version of OData protocols, and the [DataManager] can also retrieve and consume OData V4 services. To fetch data from the server by using **DataManager** with the adaptor property configure as [ODataV4Adaptor].

In the following sample, In-place Editor renders a **DropDownList** component and its **dataSource** property configured for fetching a data from the server by using **ODataV4Adaptor** with **DataManager**.

**APP.VUE**

```

<template>
<div id="app">
  <table class="table-section">
    <tr>
      <td>Select customer name:</td>
      <td>
        <ejs-inplaceeditor ref="dropObj" id="dropdownEle" mode="Inline"
type="DropDownList" value='Maria Anders' :model="dropdownModel">
        </ejs-inplaceeditor>
      </td>
    </tr>
  </table>
</div>
</template>
<script>
import Vue from 'vue';
import { InPlaceEditorPlugin } from "@syncfusion/ej2-vue-inplace-editor";
Vue.use(InPlaceEditorPlugin);
import { DataManager, Query, ODataV4Adaptor } from "@syncfusion/ej2-data";
export default {
  data () {
    return {
      dropdownModel: {
        dataSource: new DataManager({
          url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
          adaptor: new ODataV4Adaptor,
          crossDomain: true
        }),
        placeholder: "Select a customer",
        query: new Query().from('Customers').select(['ContactName',
'CustomerID']).take(6),
        fields: { text: 'ContactName', value: 'CustomerID' }
      }
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";

{% previewsample "page.domainurl/code-snippet/in-place-editor/getting-started-cs9" %}

#### Web API

Data can fetch from the server by using [DataManager] with the adaptor property configure as [WebApiAdaptor].

In the following sample, In-place Editor render a DropDownList component and its dataSource property configured for fetching a data from the server by using WebApiAdaptor with DataManager.

#### APP.VUE

```

<template>
<div id="app">
  <table class="table-section">
    <tr>
      <td>select customer name:</td>
      <td>
        <ejs-inplaceeditor ref="dropObj" id="dropdownEle" mode="Inline"
type="DropDownList" value='Maria Anders' :model="dropdownModel">
        </ejs-inplaceeditor>
      </td>
    </tr>
  </table>
</div>
</template>
<script>
import Vue from 'vue';
import { InPlaceEditorPlugin } from "@syncfusion/ej2-vue-inplace-editor";
import { DataManager, ODataV4Adaptor, Query } from '@syncfusion/ej2-data';
Vue.use(InPlaceEditorPlugin);
var dm= new DataManager({
  url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
  adaptor: new ODataV4Adaptor,
  crossDomain: true
});
export default {
  data () {
    return {
      dropdownModel: {
        dataSource: dm,
        placeholder:"Select a customer",
        fields : { text: 'ContactName', value: 'CustomerID' },
        query : new Query().select(['ContactName',
'CustomerID']).take(6),
      }
    }
  },

```

```

    mounted: function() {
      this.dropObj = this.$refs.dropObj.ej2Instances;
    }
  }
</script>

  margin-top: 45px;
}
tr td:first-child {
  text-align: right;
  padding-right: 20px;
}
</style>

```

```
{% previewsample "page.domainurl/code-snippet/in-place-editor/getting-started-cs10" %}
```

### Integration in Vue Inplace editor component

The In-place Editor supports adding HTML5 input components using the [template](#) property. The Template property can be given as either a `string` or a `query selector`.

#### As a string

The HTML element tag can be given as a string for the template property. Here, the input is rendered as an HTML template.

```
`ts
```

```
template: "<div><input type='text' id='name'></input></div>"
```

```
`
```

#### As a selector

The template property also allows getting template content through `query selector`. Here, the input wrapper element 'ID' attribute is specified in the template.

```
`ts
```

```
template: "#date"
```

```
`
```

### As a template

You can render other components inside In-place Editor using Vue template . Follow the below guidelines for using other the components as template in In-place Editor.

Declare a template in the template section of the “.vue” file. An empty object “data” needs to be initialized in the data option of the default export object in script section.

The template function needs to be assigned to the template property of the EJ2 Vue In-place Editor Component.

Template mode, the `value` property not handled by the In-place Editor component. So, before sending a value to the server, you need to modify at [actionBegin](#) event, otherwise, an empty string will pass. In the following template sample, before submitting a data to the server, event argument and `value` property content updated in the `actionBegin` event handler.

### APP.VUE

```
<template>
<div class="app">
  <table class="table-section">
    <tr>
      <td>Select date:</td>
      <td>
        <ejs-inplaceeditor ref="dropObj" id="dropdownEle" mode="Inline"
:template = "Template1" value="1/2/2018" :actionBegin="actionBegin"
actionOnBlur="ignore">
        </ejs-inplaceeditor>
      </td>
    </tr>
  </table>
</div>
</template>
<script>
import Vue from 'vue';
import { InPlaceEditorPlugin } from "@syncfusion/ej2-vue-inplace-editor";
import { DatePickerComponent, DatePickerPlugin } from '@syncfusion/ej2-vue-
calendars';
import { isNullOrUndefined as isNOU } from '@syncfusion/ej2-base';
Vue.component(DatePickerPlugin.name, DatePickerComponent);
Vue.use(InPlaceEditorPlugin);
export default {
  name: 'app',
  data () {
    return {
      Template1: function () {
        return {
          template: Vue.component('DatePickerComponent', {
            template: ' <ejs-datepicker value="1/2/2018"></ejs-
datepicker>',
            data() { return { }; }
          })
        }
      }
    },
    mounted: function() {
```

```

    this.dropObj = this.$refs.dropObj.ej2Instances;
  },
  methods: {
    actionBegin: function(args) {
      var date = (document.getElementsByClassName('e-datepicker')[0]).ej2_instances[0].value;
      if(!(isNOU(date))) {
        this.$refs.dropObj.ej2Instances.value =
date.toLocaleDateString();
        args.data.value = date;
      }
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";

## Validation in Vue Inplace editor component

In-place Editor component supports validation and it can be achieved by adding rules to the [validationRules](#) property, its child property **key** must be same as [name](#) property, otherwise validation not performed. Submitting data to the server or calling the [validate](#) method validation executed.

### Validation Rules

In-place Editor has following validation rules, which are used to perform validation.

Rules	Description	Example
required	The input element must have any input values	a or 1 or -
email	The input element must have valid email format values	<inplace@syncfusion.com>
url	The input element must have valid url format values	<a href="http://syncfusion.com/">http://syncfusion.com/</a>
date	The input element must have valid date format values	12/25/2019
dateIso	The input element must have valid dateIso format values	2019-12-25
number	The input element must have valid number format values	1.0 or 1
maxLength	Input value must have less than or equal to maxLength character length	if maxLength: 5, [check] is valid and [checking] is invalid
minLength	Input value must have less than or equal to minLength character length	if minLength: 5, [testing] is valid and [test] is invalid
rangeLength	Input value must have value between rangeLength character length	if rangeLength: [4,5], [test] is valid and [key] is invalid
range	Input value must have value between range number	if range: [4,5], [4] is valid and [6] is invalid
max	Input value must have less than or equal to max number	if max: 3, [3] is valid and [4] is invalid
min	Input value must have less than or equal to min number	if min: 4, [5] is valid and [2] is invalid

### Style in Vue Inplace editor component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the In-place Editor text

Use the following CSS to customize the default In-place Editor's text content properties like font-family, font-size, color and border bottom.

```
`css
/ To change color, font family and font size /
.e-inplaceeditor .e-editable-value-wrapper .e-editable-value {
border-bottom: 2px dotted green;
color: red;
font-size: 12px;
font-family: Segoe UI
}
```

### Customizing the In-place Editor action buttons

Use the following CSS to customize the default In-place Editor's action buttons.

```
`css
/ To change icon color for save button /
.e-inplaceeditor .e-editable-action-buttons .e-btn-save.e-icon-btn .e-btn-icon.e-icons,
.e-inplaceeditor-tip .e-editable-action-buttons .e-btn-save.e-icon-btn .e-btn-icon.e-icons{
color: green;
}
/ To change icon color for cancel button /
.e-inplaceeditor .e-editable-action-buttons .e-btn-cancel.e-icon-btn .e-btn-icon.e-icons, .e-
inplaceeditor-tip .e-editable-action-buttons .e-btn-cancel.e-icon-btn .e-btn-icon.e-icons {
color: red;
}
/ To change background color for save button /
.e-inplaceeditor .e-editable-action-buttons .e-btn-save.e-icon-btn,
.e-inplaceeditor-tip .e-editable-action-buttons .e-btn-save.e-icon-btn {
background-color: antiquewhite;
}
/ To change background color for cancel button /
.e-inplaceeditor .e-editable-action-buttons .e-btn-cancel.e-icon-btn,
.e-inplaceeditor-tip .e-editable-action-buttons .e-btn-cancel.e-icon-btn {
background-color: antiquewhite;
}
`
```

### Accessibility in Vue Inplace editor component

The Inplace editor component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Inplace editor component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) |  |

| [Section 508 Support](#) |  |

| [Screen Reader Support](#) |  |

| [Right-To-Left Support](#) |  |

| [Color Contrast](#) |  |

| [Mobile Device Support](#) |  |

| [Keyboard Navigation Support](#) |  |

| [Accessibility Checker Validation](#) |  |

| [Axe-core Accessibility Validation](#) |  |

```
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The
component does not meet the requirement.</div>
```

### Keyboard interaction

You can use the following key shortcuts to access the Inplace editor without interruptions:

| **Keyboard shortcuts** | **Actions** |

| --- | --- |

| Tab | Helps in focusing the Inplace editor on the page and switching between the consecutive Inplace editor bars. |

| Shift + Tab | Helps in focusing the previous Inplace editor bar element on the Inplace editor. |

### Ensuring accessibility

The Inplace editor component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Inplace editor component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Inplace editor component with accessibility tools.

```
{% previewsample "https://ej2.syncfusion.com/accessibility/inplace-editor.html" %}
```

## Localization in Vue Inplace editor component

### Localization

Localization library allows you to localize the default text content of the In-place Editor to different cultures using the [locale](#) property. In-place Editor following keys will be localize based on culture.

| Locale key | en-US (default) |

|-----|-----|

| save | Close |

| cancel | Cancel |

| loadingText | Loading... |

| editIcon | Click to edit |

| editAreaClick | Click to edit |

| editAreaDoubleClick | Double click to edit |

To load translation object in an application use `load` function of `L10n` class. In the following sample, French culture is set to In-place Editor and change the tooltip text.

### APP.VUE

```
<template>
  <div id="app">
    <table class="table-section">
      <tr>
        <td>EditableOn:</td>
        <td>
          <ejs-dropdownlist ref="editableOn" id="editableon"
width='90%' :dataSource='editableData' :change='onEditableOn'
:value='editableValue' :fields='editableFields'>
            </ejs-dropdownlist>
        </td>
      </tr>
      <tr>
        <td class="sample-td">Enter your name:</td>
        <td class="sample-td">

    height: 100px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/in-place-editor/getting-started-cs19" %}

### Right to left

Specifies the direction of the In-place Editor component using the [enableRtl](#) property. For writing systems that require it like Arabic, Hebrew, etc., the direction can be switched to right-to-left.

It will not change based on the locale property.

### APP.VUE

```

<template>
  <div id="app">
    <table class="table-section">
      <tr>
        <td>Enter your name:</td>
        <td>
          <ejs-inplaceeditor ref="editObj" id="editor"
mode="Inline" value= 'Andrew' enableRtl=true>
          </ejs-inplaceeditor>
        </td>
      </tr>
    </table>
  </div>
</template>
<script>
import Vue from 'vue';
import { InPlaceEditorPlugin } from '@syncfusion/ej2-vue-inplace-editor';
Vue.use(InPlaceEditorPlugin);
export default {
  name: 'app',
  data () {
    return {};
  },
  mounted: function() {
    this.editObj = this.$refs.editObj.ej2Instances;
  },
}

```

```

}
</script>
<style>

    text-align: right;
    padding-right: 20px;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/in-place-editor/getting-started-cs20" %}

### Format

Formatting is a way of representing the value in different format. You can format the following mentioned components with its `format` property, when it passed through the In-place Editor [model](#) property.

- [DatePicker](#)
- [DateRangePicker](#)
- [DateTimePicker](#)
- [NumericTextBox](#)
- [Slider](#)
- [TimePicker](#)

### APP.VUE

```

<template>
<div id="app">
    <table class="table-section">
        <tr>
            <td>select date: </td>
            <td>
                <ejs-inplaceeditor ref="dateObj" id="datePickerEle"
mode="Inline" type="Date" :value="datePickerValue" :model="datePickerModel">
                    </ejs-inplaceeditor>
                </td>
            </tr>
        </table>
    </div>

```

```

        </table>
    </div>
</template>
<script>
import Vue from 'vue';
import { InPlaceEditorPlugin } from '@syncfusion/ej2-vue-inplace-editor';
Vue.use(InPlaceEditorPlugin);
export default {
  name: 'app',
  data () {
    return {
      datePickerModel: {
        placeholder: 'Select date',
        format: 'yyyy-MM-dd'
      },
      datePickerValue: new Date('11/23/2018'),
    };
  },

## How To

### Dynamic edit mode in Vue Inplace editor component

At component initial load, if you want to open editor state without interacting In-place Editor input element, it can be achieved by configuring the [enableEditMode](#) property to `true`.

In the following sample, editor opened at initial load and when toggling a checkbox, it will remove or open the editor.

### APP.VUE

```
<template>
<div id="app">
<table class="table-section">
  <tr>
    <td>
      <div>EnableEditMode</div>
    </td>
    <td>
      <div>
        <ejs-checkbox ref="checkObj2" id="editorEnable"
label='Enable' checked= true :change="onChange"></ejs-checkbox>
      </div>
    </td>
  </tr>
  <tr>
    <td class="sample-td">
      <div>Enter your name: </div>
    </td class="sample-td">
    <td>
      <ejs-inplaceeditor ref="editObj" id="inplace_editor"
mode="Inline" type="Text" actionOnBlur='Ignore' enableEditMode= true
value="Andrew" submitOnEnter= "true">
      </ejs-inplaceeditor>
    </td>
  </tr>
</table>
</div>
</template>
<script>
import Vue from 'vue';
import { InPlaceEditorPlugin } from "@syncfusion/ej2-vue-inplace-editor";
import { CheckBoxPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(InPlaceEditorPlugin);
Vue.use(CheckBoxPlugin);
export default {
  data () {
    return {
      labelPosition: 'Before',
    };
  },
  mounted: function() {
    this.editObj = this.$refs.editObj.ej2Instances;
  },
  methods: {
    onChange: function(e) {
      this.$refs.editObj.ej2Instances.enableEditMode = e.checked;
    },
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
```

```

@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";

### Disable edit mode in Vue Inplace editor component

The edit mode of In-place Editor can be disabled by setting the [disabled](#) property value to `true`. In the following sample, when check or uncheck the checkbox, In-place Editor component will disable or enable the edit mode.

### APP.VUE

```

<template>
<div id="app">
<table class="table-section">
  <tr>
    <td>
      <div>Disabled</div>
    </td>
    <td>
      <div>

```

### Custom indication in Vue Inplace editor component

You can add custom indication to unsaved input value by using the [actionSuccess](#) event, when data not submitted to the server.

In this sample, the `actionSuccess` event configured and the `URL` property not included. Then submit button clicked, the current editor value saved into input and data sending to server action prevented due to the `URL` property not configured.

But [actionSuccess](#) event will trigger the handler function with `null` argument values. In handler function data property `primaryKey` value checked, whether it empty or not. If it is empty custom class, added in the `e-value-wrapper` element to customize its styles.

To send input value to local, set the `URL` property as empty.

### APP.VUE

```
<template>
<div id="app">
  <table class="table-section">
    <tr>
      <td>Enter your name: </td>
      <td>
        <ejs-inplaceeditor ref="editObj" id="inplace_editor" mode="Inline"
type="Text" value="Andrew" :actionSuccess="actionSuccess" submitOnEnter=
"true">
          </ejs-inplaceeditor>
        </td>
      </tr>
    </table>
  </div>
</template>
<script>
import Vue from 'vue';
import { InPlaceEditorPlugin } from "@syncfusion/ej2-vue-inplace-editor";
import { isNullOrUndefined as isNOU } from '@syncfusion/ej2-base';
Vue.use(InPlaceEditorPlugin);
export default {
  data () {
    return {
    };
  },
  mounted: function() {
    this.editObj = this.$refs.editObj.ej2Instances;
  },
  methods: {
    actionSuccess: function(e) {
      let pk = e.data['PrimaryKey'];
      if (isNOU(pk) || pk === '') {
```

```

        document.querySelector('.e-editable-value').classList.add('e-
send-error');
    }
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";

    color: red;
}
</style>

```

{% previewsample "page.domainurl/code-snippet/in-place-editor/getting-started-cs15" %}

### Custom animation in Vue Inplace editor component

In popup mode, the In-place Editor rendered with the Essential JS 2 **Tooltip** component. You can use tooltip properties and events to customize the popup by configure properties into the [model](#) property inside the [popupSettings](#) API.

In the following sample, popup animation can be customized by passing animation effect using the [model](#) property and the dynamic animation effect changes configured from the Essential JS 2 Vue **DropDownList** component **change** event.

### APP.VUE

```

<template>
<div id="app">
  <table class="table-section">
    <tr>
      <td>Open Animation:</td>
      <td>

```

```

        <ejs-dropdownlist ref="editorMode" id="editorMode" width='90%'
:dataSource='dataPlace' :change='valueChange' :value='dataValue'
:fields='placeFields'>
        </ejs-dropdownlist>
    </td>
</tr>
<tr>
    <td class="sample-td">Enter your name:</td>
    <td class="sample-td">
        <ejs-inplaceeditor ref="editObj" id="inplace_editor"
mode="Popup" type="Text" value="Andrew" submitOnEnter= "true"
:model="textModel" :popupSettings=textPopupSettings>
        </ejs-inplaceeditor>
    </td>
</tr>
</table>
</div>
</template>
<script>
import Vue from 'vue';
import { InPlaceEditorPlugin } from "@syncfusion/ej2-vue-inplace-editor";
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(InPlaceEditorPlugin);
Vue.use(DropDownListPlugin);
export default {
    data () {
        return {
            placeFields: { text: 'data', value: 'id' },
            dataPlace: [{ id: 'None', data: 'None' }, { id: 'FadeIn', data:
'FadeIn' }, { id: 'FadeZoomIn', data: 'FadeZoomIn' }, { id: 'ZoomIn', data:
'ZoomIn' } ],
            dataValue: 'ZoomIn',
            textModel: {
                placeholder: 'Enter some text'
            },
            textPopupSettings: {
                title: 'Enter Employee Name',
                model: {
                    animation: {
                        open: { effect: 'ZoomIn', duration: 1000, delay: 0 }
                    }
                }
            },
        },
    },
    mounted() {
        this.editObj = this.$refs.editObj.ej2Instances;
    },
    methods: {
        valueChange: function(e) {
            this.$refs.editObj.popupSettings.model.animation.open.effect =
e.value;
            this.$refs.editObj.dataBind();
        }
    }
}
</script>

## Kanban

### Getting Started with the Vue Kanban Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using [Vue-CLI](#) and integrating the Syncfusion Vue Kanban component

#### Prerequisites

##### [System requirements for Syncfusion Vue UI components](#)

#### Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the [vue create](#) command. Follow these steps to install Vue CLI and create a new project:

```
`bash
```

```
npm install -g @vue/cli
```

```
vue create quickstart
```

```
cd quickstart
```

```
npm run serve
```

```
`
```

or

```
`bash
```

```
yarn global add @vue/cli
```

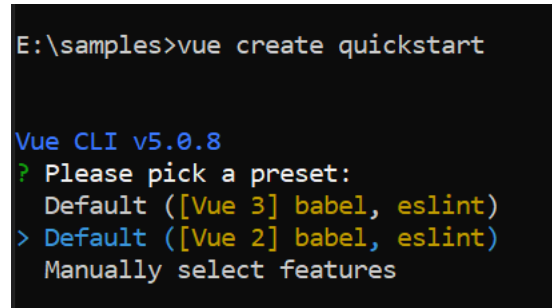

```
vue create quickstart
```

```
cd quickstart
```

```
yarn run serve
```

```
`
```

When creating a new project, choose the option `Default ([Vue 2] babel, eslint)` from the menu.

```
E:\samples>vue create quickstart

Vue CLI v5.0.8
? Please pick a preset:
  Default ([Vue 3] babel, eslint)
> Default ([Vue 2] babel, eslint)
  Manually select features
```

Once the `quickstart` project is set up with default settings, proceed to add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion packages are available at [npmjs.com](https://www.npmjs.com). To use Vue components, install the required npm package.

This article uses the [Vue Kanban component](#) as an example. Install the `@syncfusion/ej2-vue-kanban` package by running the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-kanban --save
```

```
`
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-vue-kanban
```

```
`
```

The `--save` will instruct NPM to include the Kanban package inside of the `dependencies` section of the `package.json`.

#### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the **Material** theme is applied using CSS styles, which are available in installed packages. The necessary **Material** CSS styles for the Kanban component and its dependents were imported into the `<style>` section of `src/App.vue` file.

#### ~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>
```

#### Add Syncfusion Vue component

Follow the below steps to add the Vue Kanban component using **Composition API** or **Options API**:

1\ First, import and register the Kanban component in the `script` section of the `src/App.vue` file.

#### ~/SRC/APP.VUE

```
<script>
import { KanbanComponent, ColumnDirective, ColumnsDirective } from
 '@syncfusion/ej2-vue-kanban';
export default {
  components: {
    'ejs-kanban': KanbanComponent,
    'e-column': ColumnDirective,
    'e-columns': ColumnsDirective
  }
}
</script>
```

2\ In the `template` section, define the Kanban component with [keyField](#) property.

#### ~/SRC/APP.VUE

```
<template>
<div id='app'>
  <ejs-kanban id="kanban" keyField="Status">
    <e-columns>
      <e-column headerText="To Do" keyField="Open"></e-column>
      <e-column headerText="In Progress" keyField="InProgress"></e-column>
      <e-column headerText="Testing" keyField="Testing"></e-column>
      <e-column headerText="Done" keyField="Close"></e-column>
    </e-columns>
  </ejs-kanban>
</div>
</template>
```

### Initialize the Kanban

Add the EJ2 Vue Kanban using `<ejs-kanban>` to the `<template>` section of the `App.vue` file in src directory.

#### ~/SRC/APP.VUE

```
<template>
  <div id='app'>
    <ejs-kanban id="kanban" keyField="Status">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
  import { KanbanComponent, ColumnDirective, ColumnsDirective } from
  '@syncfusion/ej2-vue-kanban';
  export default {
    components: {
      'ejs-kanban': KanbanComponent,
      'e-column': ColumnDirective,
      'e-columns': ColumnsDirective
    }
  }
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/kanban/getting-started-empty-cs1" %}

The output will display the kanban header.

### Populating cards

To populate the empty Kanban with cards, define the local JSON data or remote data using the `dataSource` property. To define `dataSource`, the mandatory fields in JSON object should be relevant to `keyField`. In the following example, you can see the cards defined with default fields such as ID, Summary, and Status.

#### ~/SRC/APP.VUE

```
<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData">
```

```

        :cardSettings="cardSettings">
        <e-columns>
            <e-column headerText="To Do" keyField="Open"></e-column>
            <e-column headerText="In Progress" keyField="InProgress"></e-
column>
            <e-column headerText="Testing" keyField="Testing"></e-column>
            <e-column headerText="Done" keyField="Close"></e-column>
        </e-columns>
    </ejs-kanban>
</div>
</template>
<script>
import { KanbanComponent, ColumnDirective, ColumnsDirective } from
'@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
export default {
    components: {
        'ejs-kanban': KanbanComponent,
        'e-column': ColumnDirective,
        'e-ColumnsDirective': ColumnsDirective
    },
    data: function() {
        return {
            kanbanData: extend([], kanbanData, null, true),
            cardSettings: {
                contentField: "Summary",
                headerField: "Id",
            }
        };
    },
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/kanban/getting-started-key-field-cs2" %}

### Enable swimlane

Swimlane can be enabled by mapping the fields `swimlaneSettings.keyField` to appropriate column name in `dataSource`. This enables the grouping of the cards based on the mapped column values.

### ~/SRC/APP.VUE

```

<template>
    <div id="app">
        <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
            :cardSettings="cardSettings" :swimlaneSettings="swimlaneSettings">

```

```

        <e-columns>
          <e-column headerText="To Do" keyField="Open"></e-column>
          <e-column headerText="In Progress" keyField="InProgress"></e-
column>
          <e-column headerText="Testing" keyField="Testing"></e-column>
          <e-column headerText="Done" keyField="Close"></e-column>
        </e-columns>
      </ejs-kanban>
    </div>
  </template>
  <script>
import { KanbanComponent, ColumnDirective, ColumnsDirective } from
'@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
export default {
  components: {
    'ejs-kanban': KanbanComponent,
    'e-column': ColumnDirective,
    'e-columns': ColumnsDirective
  },
  data: function() {
    return {
      kanbanData: extend([], kanbanData, null, true),
      cardSettings: {
        contentField: "Summary",
        headerField: "Id",
      },
      swimlaneSettings: {
        keyField: "Assignee"
      }
    };
  },
};
  </script>
  <style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';

@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
  </style>

```

{% previewsample "page.domainurl/code-snippet/kanban/getting-started-swimlane-cs1" %}

## Getting Started with the Vue Kanban Component in Vue 3

This article provides a step-by-step guide for setting up a [Vite](#) project with a JavaScript environment and integrating the Syncfusion Vue Kanban component using the [Composition API](#) / [Options API](#).

The **Composition API** is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The **Options API** is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

### Prerequisites

#### [System requirements for Syncfusion Vue UI components](#)

#### Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using [Vite](#). To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm create vite@latest
```

```
,
```

or

```
`bash
```

```
yarn create vite
```

```
,
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as **my-project** for this article.

```
`bash
```

```
? Project name: » my-project
```

```
,
```

2. Select **Vue** as the framework. It will create a Vue 3 project.

```
`bash
```

```
? Select a framework: » - Use arrow-keys. Return to submit.
```

```
Vanilla
```

```
Vue
```

```
React
```

```
Preact
```

```
Lit
```

```
Svelte
```

```
Others
```

```
,
```

3. Choose `JavaScript` as the framework variant to build this Vite project using JavaScript and Vue.

```
`bash
```

? Select a variant: » - Use arrow-keys. Return to submit.

```
JavaScript
```

```
TypeScript
```

```
Customize with create-vue ↗
```

```
Nuxt ↗
```

```
,
```

4. Upon completing the aforementioned steps to create the `my-project`, run the following command to install its dependencies:

```
`bash
```

```
cd my-project
```

```
npm install
```

```
,
```

```
or
```

```
`bash
```

```
cd my-project
```

```
yarn install
```

```
,
```

Now that `my-project` is ready to run with default settings, let's add Syncfusion components to the project.

#### Add Syncfusion Vue packages

Syncfusion Vue component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the [Vue Kanban component](#) as an example. To use the Vue Kanban component in the project, the `@syncfusion/ej2-vue-kanban` package needs to be installed using the following command:

```
`bash
```

```
npm install @syncfusion/ej2-vue-kanban --save
```

```
,
```

```
or
```

```
`bash
```

```
yarn add @syncfusion/ej2-vue-kanban
```

### Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG](#) and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, **Material** theme is applied using CSS styles, which are available in installed packages. The necessary **Material** CSS styles for the Kanban component and its dependents were imported into the `<style>` section of **src/App.vue** file.

#### ~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

### Add Syncfusion Vue component

Follow the below steps to add the Vue Kanban component using **Composition API** or **Options API**:

1. First, import and register the Kanban component and its child directives in the **script** section of the **src/App.vue** file. If you are using the **Composition API**, you should add the **setup** attribute to the **script** tag to indicate that Vue will be using the **Composition API**.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { KanbanComponent as EjsKanban, ColumnsDirective as
EColumns, ColumnDirective as EColumn } from '@syncfusion/ej2-vue-kanban';
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { KanbanComponent, ColumnsDirective, ColumnDirective } from
"@syncfusion/ej2-vue-kanban";
//Component registration
components: {
  "ejs-kanban": KanbanComponent,
  "e-columns": ColumnsDirective,
  "e-column": ColumnDirective,
}
</script>
```

2. In the `template` section, define the Kanban component with the `dataSource` property and column definitions.

#### ~/SRC/APP.VUE

```
<template>
<ejs-kanban :dataSource='data'>
<e-columns>
<e-column headerText="To Do" keyField="Open"></e-column>
<e-column headerText="In Progress" keyField="InProgress"></e-column>
<e-column headerText="Testing" keyField="Testing"></e-column>
<e-column headerText="Done" keyField="Close"></e-column>
</e-columns>
</ejs-kanban>
</template>
```

3. Declare the values for the `dataSource` property in the `script` section.

#### COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const data = [
{
Id: 1,
Status: 'Open',
Summary: 'Analyze the new requirements gathered from the customer.',
Assignee: 'Andrew Fuller'
},
{
Id: 2,
Status: 'InProgress',
Summary: 'Improve application performance',
Assignee: 'Andrew Fuller'
},
{
Id: 3,
Status: 'Close',
Summary: 'Arrange a web meeting with the customer to get new requirements.',
Assignee: 'Janet Leverling'
}]
</script>
```

#### OPTIONS API (~/SRC/APP.VUE)

```
<script>
data: function() {
return {
data: [
{
Id: 1,
Status: 'Open',
Summary: 'Analyze the new requirements gathered from the customer.',
Assignee: 'Andrew Fuller'
},

```

```
{
  Id: 2,
  Status: 'InProgress',
  Summary: 'Improve application performance',
  Assignee: 'Andrew Fuller'
},
{
  Id: 3,
  Status: 'Close',
  Summary: 'Arrange a web meeting with the customer to get new requirements.',
  Assignee: 'Janet Leverling'
}]
}
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

#### **COMPOSITION API (~SRC/APP.VUE)**

```
<template>
<ejs-kanban id="kanban" keyField="Status" :dataSource="data"
:cardSettings="cardSettings">
<e-columns>
<e-column headerText="To Do" keyField="Open" ></e-column>
<e-column headerText="In Progress" keyField="InProgress" ></e-column>
<e-column headerText="Testing" keyField="Testing" ></e-column>
<e-column headerText="Done" keyField="Close" ></e-column>
</e-columns>
</ejs-kanban>
</template>
<script setup>
import { KanbanComponent as EjsKanban , ColumnsDirective as EColumns,
ColumnDirective as EColumn } from '@syncfusion/ej2-vue-kanban';
const data = [
{
  Id: 1,
  Status: 'Open',
  Summary: 'Analyze the new requirements gathered from the customer.',
  Assignee: 'Andrew Fuller'
},
{
  Id: 2,
  Status: 'InProgress',
  Summary: 'Improve application performance',
  Assignee: 'Andrew Fuller'
},
{
  Id: 3,
  Status: 'Close',
  Summary: 'Arrange a web meeting with the customer to get new requirements.',
  Assignee: 'Janet Leverling'
}
];
let cardSettings = {
  contentField: "Summary",
```

```

headerField: "Id",
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>

```

### OPTIONS API (~SRC/APP.VUE)

```

<template>
<ejs-kanban id="kanban" keyField="Status" :dataSource="data"
:cardSettings="cardSettings">
<e-columns>
<e-column headerText="To Do" keyField="Open" ></e-column>
<e-column headerText="In Progress" keyField="InProgress" ></e-column>
<e-column headerText="Testing" keyField="Testing" ></e-column>
<e-column headerText="Done" keyField="Close" ></e-column>
</e-columns>
</ejs-kanban>
</template>
<script>
import { KanbanComponent, ColumnsDirective, ColumnDirective } from
"@syncfusion/ej2-vue-kanban";
export default {
components: {
"ejs-kanban": KanbanComponent,
"e-columns": ColumnsDirective,
"e-column": ColumnDirective,
},
data: function() {
return {
data: [
{
Id: 1,
Status: 'Open',
Summary: 'Analyze the new requirements gathered from the customer.',
Assignee: 'Andrew Fuller'
},
{
Id: 2,
Status: 'InProgress',
Summary: 'Improve application performance',
Assignee: 'Andrew Fuller'
},
{
Id: 3,
Status: 'Close',
Summary: 'Arrange a web meeting with the customer to get new requirements.',
Assignee: 'Janet Leverling'
}
]
}
}

```

```

    }],
    cardSettings: {
      contentField: "Summary",
      headerField: "Id",
    }
  }
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>

```

### Run the project

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
,
```

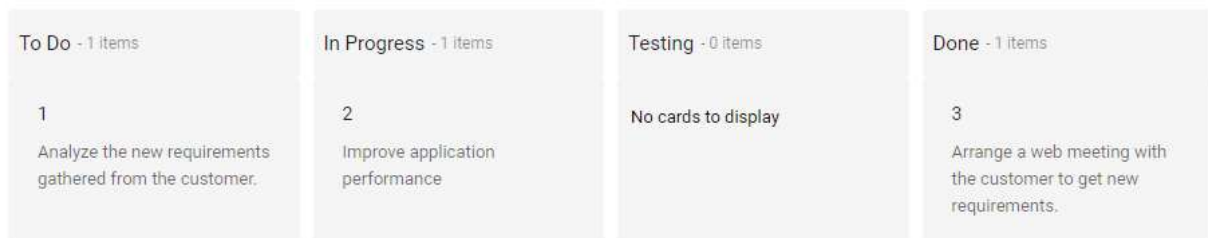

or

```
`bash
```

```
yarn run dev
```

```
,
```

The output will appear as follows:

### Columns in Vue Kanban component

The **Kanban** columns represent the each stage of the process. The column definitions are used as the **dataSource** schema in the Kanban. The Kanban operations such as drag-and-drop, swimlane, and toggle columns are performed based on column definitions.

### Single-key mapping

Kanban columns are categorized by mapping the **key** from the datasource using the **keyField** property. The corresponding **value** in the datasource is mapped inside the columns **keyField**. Based on this categorization, Kanban columns are split on this board.

The **keyField** property is mandatory to render the columns in the Kanban board.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
export default {
  data: function() {
    return {
      kanbanData: extend([], kanbanData, null, true),
      cardSettings: {
        contentField: "Summary",
        headerField: "Id"
      }
    };
  },
};
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/kanban/single-key-cs1" %}

### Multi-key mapping

Kanban board allows to render a single column by mapping multiple keys using `keyField` property. In below sample, specified the multiple keys(Open, Validate) to a single column.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings">
      <e-columns>
        <e-column headerText="To Do" keyField="Open, Validate"></e-
column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
export default {
  data: function() {
    return {
      kanbanData: extend([], kanbanData, null, true),
      cardSettings: {
        contentField: "Summary",
        headerField: "Id"
      }
    };
  },
};
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/kanban/multiple-keys-cs1" %}

### Header text

You can provide the column header text of Kanban columns using the `headerText` property. If you have not specified any header text, it will render the header without any text.

### Header template

You can customize the column header with any HTML or CSS element using the `template` property as shown in the following code.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" cssClass="kanban-header-template">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"
:template="columnsTemplate"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"
:template="columnsTemplate"></e-column>
        <e-column headerText="Testing" keyField="Testing"
:template="columnsTemplate"></e-column>
        <e-column headerText="Done" keyField="Close"
:template="columnsTemplate"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
export default {
  data: function() {
    return {
      kanbanData: extend([], kanbanData, null, true),
      cardSettings: {
        contentField: "Summary",
        headerField: "Id"
      },
      columnsTemplate: function () {
        return {
          template: Vue.component('columnsTemplate', {
            template: `<div class="header-template-wrap">
              <div :class="getClassName(data)"></div>
              <div class="header-text">{{data.headerText}}</div>
            </div>`,
            data() {
              return {
                data: {}
              };
            },
            methods: {
              getClassName: function(data) {
                return "header-icon e-icons " + data.keyField;
              }
            }
          })
        }
      }
    }
  },
}
```

```

    };
  },
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';

### Toggle columns

Kanban allows to expand or collapse its columns using `allowToggle` inside the `columns` property. When enable the property, it will render the expand or collapse icon to the column header.

By default, collapsed column width is set to `50px`.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"

{% previewsample "page.domainurl/code-snippet/kanban/toggle-cs1" %}

#### Initially collapsed column

By default, all columns are on expanded state when loading the Kanban board initially. But, you can render the columns with collapsed state using the `isExpanded` property.

The `isExpanded` property only works when enabling the `allowToggle` property on particular column.

In the following example, the backlog column is collapsed on initialization of Kanban board.

#### APP.VUE

```

<template>
    <div id="app">
        <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
            :cardSettings="cardSettings">
            <e-columns>
                <e-column headerText="To Do" keyField="Open" allowToggle="true"
isExpanded="false"></e-column>
                <e-column headerText="In Progress" keyField="InProgress"
allowToggle="true"></e-column>
                <e-column headerText="Testing" keyField="Testing"
allowToggle="true" isExpanded="false"></e-column>
                <e-column headerText="Done" keyField="Close"
allowToggle="true"></e-column>
            </e-columns>
        </ejs-kanban>
    </div>
</template>

### Stacked headers

Stacked headers are the additional headers to column header that will group the similar columns.

Define the grouping of columns **key** value to the **keyFields** property and provide the custom header text name to grouped columns using the **text** property, which is placed inside the **stackedHeaders** property.

In the following code, the kanban columns 'InProgress, Review' are grouped under 'Development Phase' category.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings">
      <e-columns>
        <e-column headerText="Open" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="In Review" keyField="Review"></e-column>

```

```

        <e-column headerText="Completed" keyField="Close"></e-column>
    </e-columns>
    <e-stackedHeaders>
        <e-stackedHeader text= 'To Do' keyFields= 'Open'></e-
stackedHeader>
        <e-stackedHeader text= 'Development Phase' keyFields=
'InProgress, Review'></e-stackedHeader>
        <e-stackedHeader text= 'Done' keyFields= 'Close'></e-
stackedHeader>
    </e-stackedHeaders>
</ejs-kanban>
</div>
</template>
<script>
import Vue from "vue";

{% previewsample "page.domainurl/code-snippet/kanban/stacked-headers-cs1" %}

### Cards in Vue Kanban component

The cards are main elements in Kanban board, which represent the task information with header and content. The header and content of a card is fetched from the corresponding mapping fields. The card layout can be customized with template also.

### Drag-and-drop

Transit or change the card position using the drag-and-drop functionality. By default, the `allowDragAndDrop` property is enabled on the Kanban board, which is used to change the card position by column-to-column or within the column.

Added dotted border on Kanban cells except the dragged clone cells when dragging, which indicates the possible ways for dropping the cards into the cells.

### Header

The card header is achieved by mapping the `headerField` property, which is placed inside the `cardSettings` property. By default, the `showHeader` property enabled by Kanban board that is used to show the header at the top of the card.

The `headerField` property of `cardSettings` is mandatory to render the cards in the Kanban board. It acts as a unique field that is used to avoid the duplication of card data. You can not change the `headerField` of mapped data value using the `updateCard` public method or server-side update of data.

In the following demo, the `showHeader` property is disabled on Kanban board.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>

### Content

The card's content is fetched from data source using the `contentField` property, which is placed inside the `cardSettings` property. If the `contentField` property is not used, card is rendered with empty content.

### Template

You can customize the default card layout using template as per your application needs. This can be achieved by template of the `cardSettings` property.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings">

```

```

        <e-columns>

{% previewsample "page.domainurl/code-snippet/kanban/card-template-cs1" %}

### Selection

Kanban board allows to select single and multiple selection of cards when mouse or keyboard interactions using `selectionType` property. The property contains following types.

- **None:** No cards are allowed to select from Kanban board.
- **Single:** Only one card allowed to select at a time in the Kanban board.
- **Multiple:** Multiple cards are allowed to select in a board.

### Multiple Selection

Select the multiple cards randomly using Ctrl + mouse click and select the multiple cards continuously using Shift + mouse click action on Kanban board. Set **Multiple** in `selectionType` to enable the multiple selection in a board.

### APP.VUE

```
<template>

{% previewsample "page.domainurl/code-snippet/kanban/multiple-selection-cs1" %}

### Data binding in Vue Kanban component

The Kanban uses **DataManager**, which supports both RESTful data service binding and JavaScript object array binding. The [dataSource](#) property of Kanban can be assigned either with the instance of **DataManager** or JavaScript object array collection, as it supports the following two data binding methods:

- Local data
- Remote data

#### Local data

To bind local JSON data to the Kanban, you can simply assign a JavaScript object array to the [dataSource](#) property. The JSON object dataSource can also be provided as an instance of **DataManager** and assigned to the Kanban **dataSource** property.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>

```

```

</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
export default {
  data: function() {
    return {
      kanbanData: extend([], kanbanData, null, true),
      cardSettings: {
        contentField: "Summary",
        headerField: "Id",
      }
    };
  },
};
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/kanban/local-data-cs1" %}

By default, **DataManager** uses **JsonAdaptor** for binding local data.

#### Remote data

To bind remote data to kanban component, assign service data as an instance of [DataManager](#) to the [dataSource](#) property. To interact with remote data source, provide the endpoint [url](#).

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" allowDragAndDrop="false"
      :dialogOpen="dialogOpen">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>

```

```

import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { DataManager, ODataAdaptor } from "@syncfusion/ej2-data";
import { extend } from '@syncfusion/ej2-base';
Vue.use(KanbanPlugin);
export default {
  data: function() {
    let SERVICE_URI = "https://ej2services.syncfusion.com/production/web-services/api/Kanban";
    return {
      kanbanData: new DataManager({
        url: SERVICE_URI,
        adaptor: new ODataAdaptor(),
        crossDomain: true
      });
      cardSettings: {
        contentField: "Summary",
        headerField: "Id",
      }
    };
  },
  methods: {
    dialogOpen: function (args) {
      args.cancel = true;
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/kanban/remote-data-cs1" %}

By default, [DataManager](#) uses **ODataAdaptor** for remote data-binding.

#### *OData services*

[OData](#) is a standardized protocol for creating and consuming data. You can retrieve data from OData service using the **DataManager**. Refer to the following code example for remote Data binding using OData service.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" allowDragAndDrop="false"
      :dialogOpen="dialogOpen">
      <e-columns>

```

```

        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
    </e-columns>
</ejs-kanban>
</div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { DataManager, ODataAdaptor } from "@syncfusion/ej2-data";
import { extend } from '@syncfusion/ej2-base';
Vue.use(KanbanPlugin);
export default {
    data: function() {
        let SERVICE_URI = "https://ej2services.syncfusion.com/production/web-
services/api/Kanban";
        return {
            kanbanData: new DataManager({
                url: SERVICE_URI,
                adaptor: new ODataAdaptor(),
                crossDomain: true
            });
            cardSettings: {
                contentField: "Summary",
                headerField: "Id",
            }
        };
    },
    methods: {
        dialogOpen: function (args) {
            args.cancel = true;
        }
    }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';

@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/kanban/odata-cs1" %}

#### [OData v4 services](#)

The ODataV4 is an improved version of OData protocols, and the [DataManager](#) can also retrieve and consume OData v4 services. For more details on OData v4 services, refer to the [odata documentation](#). To bind OData v4 service, use the **ODataV4Adaptor**.

**APP.VUE**

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="ContactTitle"
:dataSource="kanbanData"
    :cardSettings="cardSettings" allowDragAndDrop="false"
:dialogOpen="dialogOpen">
      <e-columns>
        <e-column headerText="Order Administrator" keyField="Order
Administrator"></e-column>
        <e-column headerText="Sales Representative" keyField="Sales
Representative"></e-column>
        <e-column headerText="Export Administrator" keyField="Export
Administrator"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { DataManager, ODataV4Adaptor } from "@syncfusion/ej2-data";
import { extend } from '@syncfusion/ej2-base';
Vue.use(KanbanPlugin);
export default {
  data: function() {
    let SERVICE_URI =
"https://services.odata.org/v4/northwind/northwind.svc/Suppliers";
    return {
      kanbanData: new DataManager({
        url: SERVICE_URI,
        adaptor: new ODataV4Adaptor(),
        crossDomain: true
      });
      cardSettings: {
        contentField: "ContactName",
        headerField: "SupplierID",
      }
    };
  },
  methods: {
    dialogOpen: function (args) {
      args.cancel = true;
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';

@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';

```

```
</style>
```

```
{% previewsample "page.domainurl/code-snippet/kanban/odataV4-cs1" %}
```

#### [Web API](#)

You can use **WebApiAdaptor** to bind kanban with Web API created using OData endpoint.

```
`ts
```

```
<template>
```

```
<div id="app">
```

```
<ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
```

```
:cardSettings="cardSettings" allowDragAndDrop="false" :dialogOpen="dialogOpen">
```

```
<e-columns>
```

```
<e-column headerText="To Do" keyField="Open"></e-column>
```

```
<e-column headerText="In Progress" keyField="InProgress"></e-column>
```

```
<e-column headerText="Testing" keyField="Testing"></e-column>
```

```
<e-column headerText="Done" keyField="Close"></e-column>
```

```
</e-columns>
```

```
</ejs-kanban>
```

```
</div>
```

```
</template>
```

```
<script>
```

```
import Vue from "vue";
```

```
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
```

```
import { DataManager, WebApiAdaptor } from "@syncfusion/ej2-data";
```

```
Vue.use(KanbanPlugin);
```

```
export default {
```

```
  data: function() {
```

```
    return {
```

```
      kanbanData: new DataManager({
```

```
        url: '/api/Tasks',
```

```
        adaptor: new WebApiAdaptor(),
```

```
        crossDomain: true
```

```
      });
```

```
      cardSettings: {
```

```
        contentField: "Summary",
```

```
headerField: "Id",
}
};
},
methods: {
  dialogOpen: function (args) {
    args.cancel = true;
  }
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>
`
```

Below server-side controller code to get the Kanban data.

```
`ts
[HttpGet]
public object Get()
{
  var data = OrdersDetails.GetAllRecords().ToList();
  return data;
}
`
```

*URL adaptor*

The CRUD (Create, Read, Update and Delete) actions can be performed easily on Kanban cards using the various adaptors available within the `DataManager`. Most preferably, we will be using `UrlAdaptor` for performing CRUD actions on Kanban.

The CRUD operation in Kanban can be mapped to server-side controller actions using the properties `insertUrl`, `removeUrl`, `updateUrl`, and `crudUrl`.

- `insertUrl` – You can perform a single insertion operation on the server-side.
- `updateUrl` – You can update single data on the server-side.
- `removeUrl` – You can remove single data on the server-side.
- `crudUrl` – You can perform bulk data operation on the server-side.

```
`ts
```

```
<template>
<div id="app">
  <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
    :cardSettings="cardSettings">
    <e-columns>
      <e-column headerText="To Do" keyField="Open"></e-column>
      <e-column headerText="In Progress" keyField="InProgress"></e-column>
      <e-column headerText="Testing" keyField="Testing"></e-column>
      <e-column headerText="Done" keyField="Close"></e-column>
    </e-columns>
  </ejs-kanban>
</div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { DataManager, UrlAdaptor } from "@syncfusion/ej2-data";
Vue.use(KanbanPlugin);
export default {
  data: function() {
    return {
      kanbanData: new DataManager({
        url: 'Home/DataSource',
```

```

updateUrl: 'Home/Update',
insertUrl: 'Home/Insert',
removeUrl: 'Home/Delete',
adaptor: new UrlAdaptor(),
crossDomain: true
});
cardSettings: {
contentField: "Summary",
headerField: "Id",
}
};
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>
`

```

The server-side controller code to handle the CRUD operations are as follows.

```

`ts
private NORTHWNDEntities db = new NORTHWNDEntities();
public ActionResult DataSource() {
var DataSource = db.Tasks.ToList();
return Json(DataSource, JsonRequestBehavior.AllowGet);
}
public ActionResult Insert(Params value) {

```

```
//Insert card data into the database
return Json(value, JsonRequestBehavior.AllowGet);
}

public ActionResult Update(Params value) {
//Update card data into the database
return Json(value, JsonRequestBehavior.AllowGet);
}

public void Delete(Params value) {
//Delete card data from the database
}

public class Params {
public int Id { get; set; }
public string Status { get; set; }
public string Summary { get; set; }
public string Assignee { get; set; }
}
`
```

The `crudUrl` is used to update the bulk data sent to the server-side. Multiple selections and `sortBy` as `Index` properties are used for `crudUrl` properties to update the modified bulk data to the server-side.

#### Custom adaptor

It is possible to create your own custom adaptor by extending the built-in available adaptors. The following example demonstrates the custom adaptor usage and how to add a custom field `TaskId` for the cards by overriding the built-in response processing using the `processResponse` method of the `ODataAdaptor`.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" allowDragAndDrop="false"
      :dialogOpen="dialogOpen">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
```

```

import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { DataManager, ODataAdaptor } from "@syncfusion/ej2-data";
import { extend } from '@syncfusion/ej2-base';
Vue.use(KanbanPlugin);
class TaskIdAdaptor extends ODataAdaptor {
  processResponse() {
    let i = 0;
    // calling base class processResponse function
    let original = super.processResponse.apply(this, arguments);
    // adding Task Id
    original.forEach((item) => item['Id'] = 'Task - ' + ++i);
    return original;
  }
}
export default {
  data: function() {
    let SERVICE_URI = "https://ej2services.syncfusion.com/production/web-services/api/Kanban";
    return {
      kanbanData: new DataManager({
        url: SERVICE_URI,
        adaptor: new TaskIdAdaptor
      });
      cardSettings: {
        contentField: "Summary",
        headerField: "Id",
      }
    };
  },
  methods: {
    dialogOpen: function (args) {
      args.cancel = true;
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/kanban/custom-cs1" %}

#### [Sending additional parameters to the server](#)

To add a custom parameter to the data request, use the **addParams** method of **Query** class. Assign the **Query** object with additional parameters to the kanban [query](#) property.

#### **APP.VUE**

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" allowDragAndDrop="false"
      :dialogOpen="dialogOpen" :query='query'>
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { DataManager, ODataAdaptor, Query } from "@syncfusion/ej2-data";
Vue.use(KanbanPlugin);
export default {
  data: function() {
    let SERVICE_URI = "https://ej2services.syncfusion.com/production/web-
services/api/Kanban";
    return {
      kanbanData: new DataManager({
        url: SERVICE_URI,
        adaptor: new ODataAdaptor(),
        crossDomain: true
      });
      cardSettings: {
        contentField: "Summary",
        headerField: "Id"
      },
      query: new Query().addParams('ej2kanban', 'true');
    };
  },
  methods: {
    dialogOpen: function (args) {
      args.cancel = true;
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/kanban/additional-cs1" %}

The parameters added using the [query](#) property will be sent along with the data request for every kanban action.

#### Handling HTTP error

During server interaction from the kanban, some server-side exceptions may occur, and you can acquire those error messages or exception details

in client-side using the [actionFailure](#) event.

The argument passed to the [actionFailure](#) event contains the error details returned from the server.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-kanban id="kanban" ref="KanbanObj" keyField="Status"
      :dataSource="kanbanData"
      :cardSettings="cardSettings" :actionFailure='actionFailure'>
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { DataManager, ODataAdaptor } from "@syncfusion/ej2-data";
Vue.use(KanbanPlugin);
export default {
  data: function() {
    return {
      kanbanData: new DataManager({
        url: 'http://some.com/invalidUrl',
        adaptor: new ODataAdaptor()
      }),
      cardSettings: {
        contentField: "Summary",
        headerField: "Id"
      },
    },
  },
  methods: {
    actionFailure: function() {
      var span = document.createElement('span');

      this.$refs.KanbanObj.ej2Instances.element.parentNode.insertBefore(span,
      this.$refs.KanbanObj.ej2Instances.element);
      span.style.color = '#FF0000'
      span.innerHTML = 'Server exception: 404 Not found';
    }
  }
}
</script>
```

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';

```

{% previewsample "page.domainurl/code-snippet/kanban/error-cs1" %}

The [actionFailure](#) event will be triggered not only for the server errors, but

also when there is an exception while processing the kanban actions.

#### Loading data via ajax

You can use Kanban [dataSource](#) property to bind the datasource to Kanban from external ajax request. In the following code, we have fetched the datasource from the server using ajax request and provided that to the [dataSource](#) property by using the **onSuccess** event of ajax.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-button v-on:click.native="btnClick">Load Data</ejs-button>
    <ejs-kanban ref="kanbanObj" id="kanban" keyField="ShipCountry"
      :cardSettings="cardSettings">
      <e-columns>
        <e-column headerText="Denmark" keyField="Denmark"></e-column>
        <e-column headerText="Brazil" keyField="Brazil"></e-column>
        <e-column headerText="Switzerland" keyField="Switzerland"></e-
column>
        <e-column headerText="Germany" keyField="Germany"></e-column>
      </e-columns>
    </ejs-kanban>

{% previewsample "page.domainurl/code-snippet/kanban/ajax-cs1" %}

\* If you bind the dataSource from this way, then it acts like a local dataSource. So you cannot perform any server-side crud actions.

### Swimlane in Vue Kanban component

Swimlanes are horizontal categorizations of cards on the Kanban board. It is used for grouping of cards, which brings transparency to the workflow process.

#### Render swimlane row

Cards can be grouped based on **keyField** and displayed in rows, which are separated by columns. It is mandatory to define the **keyField** that is mapped from the datasource for rendering swimlane rows in the Kanban board.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" :swimlaneSettings="swimlaneSettings">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>

```

```

import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
export default {
  data: function() {
    return {
      kanbanData: extend([], kanbanData, null, true),
      cardSettings: {
        contentField: "Summary",
        headerField: "Id",
      },
      swimlaneSettings: {
        keyField: "Assignee"
      }
    };
  },
};
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';

@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/kanban/swimlane-key-cs1" %}

### Custom row text

Customize the swimlane row header text by using the `textField` property mapped from `datasource`.

It is not mandatory to define the `textField` to `swimlaneSettings`. It will automatically consider the `keyField` to swimlane row header text.

If the mapping `textField` key is not present in the `datasource`, it will consider the swimlane `keyField` as swimlane row header text.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" :swimlaneSettings="swimlaneSettings">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>

```

```

</div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
export default {
  data: function() {
    return {
      kanbanData: extend([], kanbanData, null, true),
      cardSettings: {
        contentField: "Summary",
        headerField: "Id",
      },
      swimlaneSettings: {
        keyField: "Assignee",
        textField: 'AssigneeName'
      }
    };
  },
}

{% previewsample "page.domainurl/code-snippet/kanban/swimlane-text-cs1" %}

### Template

You can customize the Kanban swimlane row by using the `template` property, which is specified within the `swimlaneSettings` property. In this demo, the swimlane header is customized with HTML element.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" :swimlaneSettings="swimlaneSettings">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>

```

```

</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
export default {
  data: function() {
    return {
      kanbanData: extend([], kanbanData, null, true),
      cardSettings: {
        contentField: "Summary",
        headerField: "Id",
      },
      swimlaneSettings: {
        template: function() {
          return {
            template: Vue.component('swimlaneTemplate', {
              template: `<div class='swimlane-template e-swimlane-
template-table'>
                                <div class="e-swimlane-row-
text">
<span>{{data.textField}}</span></div>
                                </div>`,
              data() {
                return {
                  data: {}
                };
              },
              methods: {
                image: function(data) {
                  return data.keyField + '.png';
                }
              }
            })
          }
        }
      }
    };
  },
};
</script>

{% previewsample "page.domainurl/code-snippet/kanban/swimlane-sort-cs1" %}

### Drag-and-drop

By default, The Kanban does not allow dragging the cards across the swimlane rows. Enabling the **dragAndDrop** property allows you to drag the cards across the swimlane rows, which is specified inside **swimlaneSettings** property.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" :swimlaneSettings="swimlaneSettings">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
export default {
  data: function() {
    return {
      kanbanData: extend([], kanbanData, null, true),
      cardSettings: {
        contentField: "Summary",
        headerField: "Id",
      },
      swimlaneSettings: {
        keyField: 'Assignee',
        allowDragAndDrop: true
      }
    }
  }
}

```

```

    };
  },
}

### Create empty row

You can render the empty swimlane row by enabling the `showEmptyRow` property. If mapping `keyField` does not have cards, empty swimlane row will be rendered.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" :swimlaneSettings="swimlaneSettings">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
export default {
  data: function() {
    return {
      kanbanData: extend([], kanbanData, null, true),
      cardSettings: {
        contentField: "Summary",
        headerField: "Id",
      },
      swimlaneSettings: {
        keyField: 'Assignee',
        showEmptyRow: true
      }
    };
  },
};

```

```

}
</script>
<style>

```

{% previewsample "page.domainurl/code-snippet/kanban/swimlane-total-cs1" %}

### Enable frozen rows

Frozen rows provide an option to make the current swimlane row header text always visible on top of the content while scrolling the Kanban content. The swimlane header text will be changed dynamically, when you scroll to another swimlane row.

By default, the `enableFrozenRows` property is set as `false`. If you wish to show the swimlane frozen rows, you can enable the `enableFrozenRows` property.

This feature support only when using Kanban content scrolling.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"

## Drag and drop in Vue Kanban component

All cards can be dragged and dropped across the columns or within the columns or swimlane row or kanban to an external source and vice versa.

The following drag and drop types are available in the Kanban board.

- Internal drag and drop
- Column drag and drop
- Swimlane drag and drop
- External drag and drop
- Kanban to Kanban
- Kanban to External source and vice versa.

Dropped card position varies based on the `sortSettings` property.

### Internal drag and drop

Allows the user to drag and drop the cards within the kanban board. Based on this, we can categorize into two ways.

- Column drag and drop
- Swimlane drag and drop

### Column drag and drop

By default, all cards can be dragged and dropped across the columns and within the columns. You cannot drag and drop the cards when disabling the `allowDragAndDrop` property.

You can prevent the drag or drop behavior of the particular column by disabling the `allowDrag` or `allowDrop` property.

You can also control the flow of transition cards between the columns by using the `transitionColumns` property.

In the following example, disable the drag and drop behavior on the Kanban board.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" :allowDragAndDrop="false">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>

#### Swimlane drag and drop

By default, Swimlane allows drag and drop across the columns within the swimlane row. Kanban does not allow dragging the cards across the swimlane rows.

Enabling the `dragAndDrop` property allows you to drag the cards across the swimlane rows, which is specified inside the `swimlaneSettings` property.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" :swimlaneSettings="swimlaneSettings">

### External drag and drop

Allows the user to drag and drop the cards from one kanban to another kanban or Kanban to an external source and vice versa.

#### Kanban to kanban

Drag and drop the card from one kanban to another kanban and vice versa. This can be achieved by specifying the `externalDropId` property which is used to specify the id of the dropped kanban element and the `dragStop` event which is used to delete the card on dragged Kanban and add the card on dropped Kanban using the `deleteCard` and `addCard` public methods.

Before adding a card to dropped kanban, you can manually change the card data `headerField` when the same card data `headerField` is dropped to another Kanban.

In the following example, Drag the card from one Kanban and drop it into another kanban using the `dragStop` event. In this event, remove the card from the dragged Kanban by using the `deleteCard` public method and add the card to the dropped Kanban by using the `addCard` public method.

#### APP.VUE

## Sort in Vue Kanban component

The Kanban provides built-in support to arrange the cards in their columns based on the JSON data order and drop the cards in the columns based on the dropped clone. Initially, users can change the arrangement of cards in the columns and position of the dropped card by using the [sortBy](#) property. The [sortBy](#) property contains three enumeration values as follows.

- Index
- DataSourceOrder
- Custom

### Index

SortBy **Index** property can be used with or without [field](#) mapping.

#### Index without field mapping

By default, SortBy **Index** property support without any [field](#) mapping. In this behavior, cards are loaded based on the JSON data order and cards are dropped based on the dropped clone.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
export default {
  data: function() {
    return {
      kanbanData: extend([], kanbanData, null, true),
      cardSettings: {
        contentField: "Summary",
        headerField: "Id"
      }
    };
  },
};
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/kanban/index-cs1" %}

### *Index with field mapping*

SortBy **Index** property also supports with [field](#) mapping. In this behavior, cards are loaded based on mapping **field** values, and cards are dropped based on the dropped clone.

Cards are placed in a particular position in the columns where you can drop the cards by specifying the [field](#) property, which is mapped from the data source. This property allows the users to drop the cards in the Kanban board where the dropped clone is created exactly. It is also helpful to render the cards based on the [field](#) property value.

The [field](#) property mapping key value must be in **number** format.

The following cases will dynamically change their [field](#) value when dropping the cards.

- If the cell has no cards, the dropped card [field](#) value does not change.
- If the cell has one card and dropped a card to the last position or previous/next cards that do not have continuous order, then the dropped card [field](#) value will be changed based on their previous card value.
- If the cell has one card and dropped a card on the previous position, then it will compare both the values, and the dropped card [field](#) value will be changed if the cards have continuous order otherwise values will not be changed.
- When the previous and next cards do not have continuous order, the dropped card [field](#) value will be changed based on the previous card value.
- When the previous and next cards have continuous order or odd/even value, then the [field](#) value of the dropped card and the cards followed by the dropped card will be changed based on the **previous** card value with continuous order.

For Example,

### **Continuous Order -**

Consider, Column A has Card A with priority value **1**, Card B with priority value **2**, and Card C with priority value **3**. And Column B has Card D with priority value **5**, then the dropped Card D will be placed between Card A and Card B. Now, the Cards D, B, and C will be dynamically changed to the priority values as **2**, **3**, and **4** respectively.

### **Odd/Even order -**

Consider, Column A has Card A with priority value **1**, Card B with priority value **3**, and Card C with priority value **5**.

and Column B has Card D with priority value 5, then the Dropped Card D will be placed between Card A and Card B. Now, the Cards D, B, and C will be dynamically changed to the priority values as 2, 3, and 5 respectively.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" :sortSettings="sortSettings">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
export default {
  data: function() {
    return {
      kanbanData: extend([], kanbanData, null, true),
      cardSettings: {
        contentField: "Summary",
        headerField: "Id"
      },
      sortSettings: {
        sortBy: "Index",
        field: "RankId"
      }
    };
  },
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';

</style>
```

```
{% previewsample "page.domainurl/code-snippet/kanban/index-field-cs1" %}
```

### DataSource Order

The SortBy **DataSourceOrder** property does not require any [field](#) mapping. In this behavior, cards are loaded based on the JSON data order, and also cards are dropped based on the JSON data order.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" :sortSettings="sortSettings">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
export default {
  data: function() {
    return {
      kanbanData: extend([], kanbanData, null, true),
      cardSettings: {
        contentField: "Summary",
        headerField: "Id"
      },
      sortSettings: {
        sortBy: "DataSourceOrder"
      }
    };
  },
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/kanban/data-source-order-cs1" %}

## Custom

*Custom with field mapping*

The SortBy **Custom** property must require datasource [field](#) mapping. In this behavior, cards are loaded based on the [field](#) mapping value and also cards are dropped based on the [field](#) mapping value.

**APP.VUE**

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" :sortSettings="sortSettings">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
export default {
  data: function() {
    return {
      kanbanData: extend([], kanbanData, null, true),
      cardSettings: {
        contentField: "Summary",
        headerField: "Id"
      },
      sortSettings: {
        sortBy: "Custom",
        field: "Summary"
      }
    };
  },
};
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/kanban/custom-mapping-cs1" %}

### Change the direction

Kanban board also provides support for aligning the cards in the columns using the [direction](#) property inside the [sortSettings](#) property. Based on this, cards can be aligned in the columns either in **Ascending** or **Descending** order. Sorting direction will be performed based on [sortBy](#) property.

By default, cards are aligned in the columns based on **Ascending** order.

In the following sample, cards are aligned in **Descending** order.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" :sortSettings="sortSettings">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
export default {
  data: function() {
    return {
      kanbanData: extend([], kanbanData, null, true),
      cardSettings: {
        contentField: "Summary",
        headerField: "Id"
      },
      sortSettings: {
        sortBy: "Custom",
        field: "Summary",
        direction: "Descending"
      }
    };
  },
};
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';

@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
```

```
</style>
```

```
{% previewsample "page.domainurl/code-snippet/kanban/sort-direction-cs1" %}
```

## Dialog in Vue Kanban component

The Kanban provides built-in support to add, edit and delete a card using dialog module. User can edit a card using the following ways.

- Built-in dialog module
- Custom Fields
- Dialog template

### Default Dialog

When double-click on the cards, the dialog is opened with below fields to edit a card. This dialog contains **Delete**, **Save** and **Cancel** buttons.

- To edit a card, modify the card details and click the **Save** button.
- To delete a card, click **Delete** button.
- Click on the **Cancel** button to cancel the editing action.

The dialog displays with the following fields which mapped to dialog fields by default.

Key | Type | Text

cardSettings.headerField | Input | ID

keyField | DropDown | -

cardSettings.contentField | TextArea | -

cardSettings.priority(If applicable) | Numeric | -

swimlaneSettings.keyField(If applicable) | DropDown | -

### APP.VUE

```
<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
```

```

import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
export default {
  data: function() {
    return {
      kanbanData: extend([], kanbanData, null, true),
      cardSettings: {
        contentField: "Summary",
        headerField: "Id",
      }
    };
  },
};
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/kanban/getting-started-key-field-cs1" %}

### Custom Fields

You can change the default fields of dialog using `fields` property inside the `dialogSettings` property. The `key` property used to map the `dataSource` value and rendered the corresponding component based on specified `type` property.

The following types are available in dialog fields.

- String
- Numeric
- TextArea
- DropDown
- TextBox
- Input

If `type` is not defined in the fields, then it renders as the HTML input element in dialog.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" :dialogSettings="dialogSettings">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>

```

```

        <e-column headerText="Done" keyField="Close"></e-column>
    </e-columns>
</ejs-kanban>
</div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
export default {
    data: function() {
        return {
            kanbanData: extend([], kanbanData, null, true),
            cardSettings: {
                contentField: "Summary",
                headerField: "Id",
            },
            dialogSettings: {
                fields: [
                    { text: 'ID', key: 'Id', type: 'Input' },
                    { key: 'Category', type: 'DropDown' },
                    { key: 'Title', type: 'Input' },
                    { key: 'Size', type: 'Input' },
                    { key: 'Description', type: 'TextArea' }
                ]
            }
        };
    },
}
</script>
<style>

@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/kanban/custom-dialog-cs1" %}

#### Custom Fields label

By default, the fields **key** mapping value is considered as a **label** and you can change this label by using **text** property.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" :dialogSettings="dialogSettings">
      <e-columns>

```

```

        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
    </e-columns>
</ejs-kanban>
</div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
export default {
    data: function() {
        return {
            kanbanData: extend([], kanbanData, null, true),
            cardSettings: {
                contentField: "Summary",
                headerField: "Id",
            },
            dialogSettings: {
                fields: [
                    { text: 'ID', key: 'Id', type: 'Input' },
                    { key: 'Status', type: 'DropDown' },
                    { key: 'Estimate', type: 'Numeric' },
                    { key: 'Summary', type: 'TextArea' }
                ]
            }
        };
    },
}
</script>
<style>

Dialog Template

Using the dialog template, you can render your own dialog by defining the `template` property. Initialize the template as SCRIPT element Id or HTML string which holds the template and map it to the template property.

### APP.VUE

```
<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" :dialogSettings="dialogSettings">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
var ContentTemplate = Vue.component("dialogTemplate", {
  template: `<div>
<table>
  <tbody>
    <tr>
      <td class="e-label">ID</td>
      <td>
        <div class="e-float-input e-control-wrapper">

### Prevent Dialog

The Kanban allows to prevent to open a dialog on card double-click by enabling `args.cancel` in `dialogOpen` event.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" :dialogOpen="dialogOpen">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
export default {
  data: function() {
    return {
      kanbanData: extend([], kanbanData, null, true),
      cardSettings: {
        contentField: "Summary",
        headerField: "Id",
      },
      dialogOpen: function (args) {
        args.cancel = true;
      }
    };
  },
};

```

</style>

```

{% previewsample "page.domainurl/code-snippet/kanban/prevent-dialog-cs1" %}

### Persisting data in server

The modified card data can be persisted in the database using the RESTful web services. All the CRUD operations in the Kanban are done through [DataManager](#). The [DataManager](#) has an option to bind all the CRUD related data in server-side.

For your information, the ODataAdaptor persists data in the server as per OData protocol.

In the below section covers how to get the edited data details on the server-side using the [UrlAdaptor](#).

### URL adaptor

You can use the [UrlAdaptor](#) of [DataManager](#) when binding data source for remote data. In the initial load of Kanban, data are fetched from remote data and bound to the Kanban using [url](#) property of [DataManager](#).

You can map the CRUD operation in Kanban can be mapped to server-side controller actions using the properties [insertUrl](#), [removeUrl](#), [updateUrl](#), and [crudUrl](#).

- [insertUrl](#) – You can perform single insertion operation on server-side.
- [updateUrl](#) – You can update single data on server-side.
- [removeUrl](#) – You can remove single data on server-side.
- [crudUrl](#) – You can perform bulk data operation on server-side.

The following code example describes the above behavior.

```

`ts
<template>
<div id="app">
<ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
:cardSettings="cardSettings">
<e-columns>
<e-column headerText="To Do" keyField="Open"></e-column>
<e-column headerText="In Progress" keyField="InProgress"></e-column>
<e-column headerText="Testing" keyField="Testing"></e-column>

```

```
<e-column headerText="Done" keyField="Close"></e-column>
</e-columns>
</ejs-kanban>
</div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { DataManager, UrlAdaptor } from "@syncfusion/ej2-data";
Vue.use(KanbanPlugin);
export default {
  data: function() {
    return {
      kanbanData: new DataManager({
        url: 'Home/DataSource',
        updateUrl: 'Home/Update',
        insertUrl: 'Home/Insert',
        removeUrl: 'Home/Delete',
        adaptor: new UrlAdaptor(),
        crossDomain: true
      });
      cardSettings: {
        contentField: "Summary",
        headerField: "Id",
      }
    };
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
```

```

@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>
`

```

The server-side controller code to handle the CRUD operations are as follows.

```

`ts
private NORTHWNDEntities db = new NORTHWNDEntities();
public ActionResult DataSource() {
    var DataSource = db.Tasks.ToList();
    return Json(DataSource, JsonRequestBehavior.AllowGet);
}
public ActionResult Insert(Params value) {
    //Insert card data into the database
    return Json(value, JsonRequestBehavior.AllowGet);
}
public ActionResult Update(Params value) {
    //Update card data into the database
    return Json(value, JsonRequestBehavior.AllowGet);
}
public void Delete(Params value) {
    //Delete card data from the database
}
public class Params {
    public int Id { get; set; }
    public string Status { get; set; }
    public string Summary { get; set; }
    public string Assignee { get; set; }
}
`

```

### *Insert card*

Using the `insertUrl` property, you can specify the controller action mapping URL to perform insert operation on the server-side.

The following code example describes the above behavior.

```
`ts
public ActionResult Insert(Params value)
{
    //Insert card in the database
}
`
```

The newly added record details are bound to the `value` parameter.

### *Update card*

Using the `updateUrl` property, the controller action mapping URL can be specified to perform save/update operation on the server-side.

The following code example describes the above behavior.

```
`ts
public ActionResult Update(Params value)
{
    //Update card data in the database
}
`
```

The updated record details are bound to the `value` parameter.

### *Delete card*

Using the `removeUrl` property, the controller action mapping URL can be specified to perform delete operation on the server-side.

The following code example describes the above behavior.

```
`ts
public void Delete(int key)
{
    //Delete card in the database
}
`
```

The deleted card primary key value is bound to the `key` parameter.

### CRUD URL

Using the `crudUrl` property, the controller action mapping URL can be specified to perform all the CRUD operations at the server-side using a single method instead of specifying a separate controller action method for CRUD (insert, update and delete) operations.

The action parameter of `crudUrl` is used to get the corresponding CRUD action.

The following code example describes the above behavior.

```
`ts
<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { DataManager, UrlAdaptor } from "@syncfusion/ej2-data";
Vue.use(KanbanPlugin);
export default {
  data: function() {
    return {
      kanbanData: new DataManager({
        url: 'Home/DataSource',
        updateUrl: 'Home/UpdateData',
        insertUrl: 'Home/UpdateData',
        removeUrl: 'Home/UpdateData',
        crudUrl: 'Home/UpdateData',
      })
    }
  }
}
```

```

adaptor: new UrlAdaptor(),
crossDomain: true
});
cardSettings: {
contentField: "Summary",
headerField: "Id",
}
};
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>
`
`ts
private NORTHWNDEntities db = new NORTHWNDEntities();
public ActionResult DataSource() {
var DataSource = db.Tasks.ToList();
return Json(DataSource, JsonRequestBehavior.AllowGet);
}
public ActionResult UpdateData(EditParams param) {
if (param.action == "insert" || (param.action == "batch" && param.added != null)) {
if (param.action == "insert") {
db.Tasks.Add(param.value);
} else {

```

```
foreach (var temp in param.added) {
    db.Tasks.Add(temp);
}
}
}
if (param.action == "update" || (param.action == "batch" && param.changed != null)) {
    if (param.action == "update") {
        Task old = db.Tasks.Where(o => o.Id == param.value.Id).SingleOrDefault();
        if (old != null) {
            db.Entry(old).CurrentValues.SetValues(param.value);
        }
    } else {
        foreach (var temp in param.changed) {
            Task old = db.Tasks.Where(o => o.Id == temp.Id).SingleOrDefault();
            if (old != null) {
                db.Entry(old).CurrentValues.SetValues(temp);
            }
        }
    }
}
if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) {
    if (param.action == "remove") {
        int key = Convert.ToInt32(param.key);
        db.Tasks.Remove(db.Tasks.Where(o => o.Id == key).SingleOrDefault());
    } else {
        foreach (var temp in param.deleted) {
            db.Tasks.Remove(db.Tasks.Where(o => o.Id == temp.Id).SingleOrDefault());
        }
    }
}
db.SaveChanges();
return Json(param, JsonRequestBehavior.AllowGet);
}
```

```

public class EditParams {
public string key { get; set; }
public string action { get; set; }
public List<Tasks> added { get; set; }
public List<Tasks> changed { get; set; }
public List<Tasks> deleted { get; set; }
public Tasks value { get; set; }
}

```

The `crudUrl` is used to update the bulk data sent to the server-side. Multiple selections and `sortBy` as `Index` properties are used for `crudUrl` properties to update the modified bulk data to the server-side.

### Tooltip in Vue Kanban component

The tooltip is used to show the card information when the cursor hover over the card elements using the `enableTooltip` property. Tooltip content is dynamically set based on hovering over the card elements.

If you wish to show tooltip on Kanban board custom elements, you need to add `e-tooltip-text` class name of a particular element.

### Tooltip template

You can customize the tooltip content with any HTML or CSS element and styling using the `tooltipTemplate` property. In the following demo, the tooltip is customized with HTML elements.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" :enableTooltip='true'
      :tooltipTemplate="tooltipTemplate">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
export default {
  data: function() {

```

```

return {
  kanbanData: extend([], kanbanData, null, true),
  cardSettings: {
    contentField: "Summary",
    headerField: "Id",
  },
  tooltipTemplate: function () {
    return {
      template: Vue.component('tooltipTemplate', {
        template: `<div class='e-kanbanTooltipTemp'>
          <table>
            <tr>
              <td class="details">
                <table>
                  <colgroup>
                    <col style="width:30%">
                    <col style="width:70%">

</style>

```

{% previewsample "page.domainurl/code-snippet/kanban/tooltip-template-cs1" %}

### Validation in Vue Kanban component

Validate particular column using the `minCount` or `maxCount` properties. The corresponding columns gets different appearance when validation fails. In default layout, `constraintType` property accept only `Column` type. In swimlane layout, accept both `Column` and `Swimlane` constraint type.

There are two types of constraints:

1. Column
2. Swimlane

By default, the column count validation is performed based on Kanban **columns**.

#### Minimum card limit

The `minCount` property is used to specify the minimum cards hold on particular column or swimlane cell. If the column or swimlane total card count falls short of the minimum count value, it shows the column or cell background colour with validation fails.

#### Maximum card limit

The `maxCount` property is used to specify the maximum cards hold on particular column or swimlane cell. If the column or swimlane cell total card count exceeds the maximum count value, it shows the column or cell background colour with validation fails.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" :enableTooltip=true>
      <e-columns>
        <e-column headerText="To Do" keyField="Open" minCount="6"></e-
column>
        <e-column headerText="In Progress" keyField="InProgress"
maxCount="5"></e-column>

## Virtualization in Vue Kanban component

Kanban allows you to load a large amount of data without any performance degradation. This feature can be enabled by setting the [enableVirtualization](#) property in the Kanban to **true**.

### Virtual scrolling

Virtual scrolling optimizes data rendering within each column when using large datasets. Only a subset of cards that are visible and about to be loaded on the screen are rendered. The number of records displayed in the Kanban is determined implicitly by the height of the Kanban area and the card height. The [cardHeight](#) property of Kanban can be used to set the cards' height in pixel value. By default, the card height will be **auto**.

When the Kanban column is scrolled, the virtual scrolling feature dynamically loads additional data on demand into view and unloads the data that is no longer visible.

### APP.VUE

```

<template>
  <div id="app">

```

```

    <ejs-kanban id="KanbanVirtualScrolling" :enableVirtualization="true"
    keyField="Status"

#### *Configure the remote data service*

When the remote data is configured for the [dataSource](#), the service method will receive an additional **KanbanVirtualization** parameter to handle the initial data load for Kanban Virtualization.

To handle Kanban virtual scrolling, the server-side code needs to handle the **Where** and **Take** queries differently using the **KanbanVirtualization** parameter. The following is the example code for handling Kanban virtualization's initial data load using the **KanbanVirtualization** parameter.

```

`ts
public IActionResult LoadCard([FromBody] ExtendedDataManagerRequest dm)
{
    kanbanData = _context.KanbanCards.ToList();
    IEnumerable<KanbanCard> DataSource = kanbanData.AsEnumerable();
    DataOperations operation = new DataOperations();
    // For normal kanban data load Where query handling.
    if (dm.Where != null && dm.Where.Count > 0 && dm.KanbanVirtualization != "KanbanVirtualization")
    {
        dm.Where[0].value = dm.Where[0].value.ToString();
        DataSource = operation.PerformFiltering(DataSource, dm.Where, dm.Where[0].Operator);
    }
    if (dm.Skip != 0)
    {
        DataSource = operation.PerformSkip(DataSource, dm.Skip);
    }
    // For normal Kanban data load Take query handling.
    if (dm.Take != 0 && dm.KanbanVirtualization != "KanbanVirtualization")

```

```
{
DataSource = operation.PerformTake(DataSource, dm.Take);
}

// For Kanban virtual scrolling data load Where and Take query handling.
var columnCount = new List<KeyValuePair<string, int>>();
if (dm.KanbanVirtualization == "KanbanVirtualization" && dm.Where != null && dm.Where.Count > 0
&& dm.Take != 0)
{
IEnumerable<KanbanCard> currentData = new List<KanbanCard>();
List<WhereFilter> currentFilter = new List<WhereFilter>();
for (int i = 0; i < dm.Where.Count; i++)
{
dm.Where[i].value = dm.Where[i].value.ToString();
currentFilter.Add(dm.Where[i]);
var filterData = operation.PerformFiltering(DataSource, currentFilter, dm.Where[i].Operator);
columnCount.Add(new KeyValuePair<string, int>(dm.Where[i].value.ToString(), filterData.Count()));
filterData = operation.PerformTake(filterData, dm.Take);
currentData = currentData.Concat(filterData);
currentFilter.Clear();
}
DataSource = currentData;
}

// To return the data for Kanban virtual scrolling.
if (dm.KanbanVirtualization == "KanbanVirtualization") {
return Json(new { result = DataSource, count = columnCount });
}

// To return the data for Kanban virtual scrolling.
else
{
return Json(DataSource);
}
}
```

### Limitations for virtual scrolling

- When virtualization is enabled in a Kanban board and the card height is not explicitly set, it will not default to `auto` height. Instead, a fixed height of `100px` will be applied to the cards. It's important to note that the card height should be specified in pixel values, as percentage values are not accepted.
- When a card is dragged and dropped, the index position of the card will not be preserved when scrolling through the column.
- Virtualization is not supported for swimlanes in the Kanban board.

### Localization in Vue Kanban component

The localization library allows you to localize the default text content of the Kanban to different cultures using the `locale` property.

In Kanban, total count and min or max count text alone will be localized based on culture.

Locale key	en-US (default)
-----	-----
items	items
min	Min
max	Max
cardsSelected	Cards Selected
addTitle	Add New Card
editTitle	Edit Card Details
deleteTitle	Delete Card
deleteContent	Are you sure you want to delete this card?
save	Save
delete	Delete
cancel	Cancel
yes	Yes
no	No
close	Close
noCard	No cards to display
unassigned	Unassigned

### Loading translations

To load translation object in an application, use `load` function of `L10n` class.

The following example demonstrates the Kanban in `Deutsch` culture.

#### **APP.VUE**

```
<template>
```

```

<div id="app">
  <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
    :cardSettings="cardSettings" :swimlaneSettings="swimlaneSettings"
    locale='de'>
    <e-columns>
      <e-column headerText="To Do" keyField="Open" minCount= "6"></e-
column>
      <e-column headerText="In Progress" keyField="InProgress"
maxCount= "3"></e-column>
      <e-column headerText="Done" keyField="Close"></e-column>
    </e-columns>
  </ejs-kanban>
</div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend, L10n } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
L10n.load({
  'de': {
    'kanban': {
      'items': 'Artikel',
      'min': 'Min',
      'max': 'Max',
      'cardsSelected': 'Karten ausgewählt',

</style>

```

```
{% previewsample "page.domainurl/code-snippet/kanban/locale-cs1" %}
```

### Right to left (RTL)

The Kanban provides an option to switch its text direction and layout from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable right-to-left mode in Kanban, set the `enableRtl` to true.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" :swimlaneSettings="swimlaneSettings"
      locale='ar' :enableRtl='true'>
      <e-columns>
        <e-column headerText="To Do" keyField="Open" minCount= "2"></e-
column>
        <e-column headerText="In Progress" keyField="InProgress"
maxCount= "3"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>

```

{% previewsample "page.domainurl/code-snippet/kanban/rtl-cs1" %}

## Dimensions in Vue Kanban component

The Kanban dimensions refers to both height and width of the entire layout and it accepts three types of values.

- Auto
- Pixel
- Percentage

### Auto height and width

When height and width of the Kanban are set to `auto`, it will try as hard as possible to keep an element the same width as its parent container. In other words, the parent container that holds Kanban, its width or height will be the sum of its children. By default, Kanban is assigned with `auto` values for both the height and width properties.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"

```

```

        :cardSettings="cardSettings" width="auto" height="auto">
        <e-columns>
            <e-column headerText="To Do" keyField="Open"></e-column>
            <e-column headerText="In Progress" keyField="InProgress"></e-
column>
            <e-column headerText="Testing" keyField="Testing"></e-column>
            <e-column headerText="Done" keyField="Close"></e-column>
        </e-columns>
    </ejs-kanban>
</div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
export default {
    data: function() {
        return {
            kanbanData: extend([], kanbanData, null, true),
            cardSettings: {
                contentField: "Summary",
                headerField: "Id"
            }
        };
    },
}
</script>
<style>

### Persistence in Vue Kanban component

State persistence refers to the Kanban state maintained in the browser's [localStorage](#) even if the browser is refreshed or if you move to the next page within the browser.

State persistence stores Kanban datasource, column and swimlane expand/collapse state in the local storage when the [enablePersistence](#) is defined as true.

### APP.VUE

```

<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" enablePersistence="true"
      :swimlaneSettings="swimlaneSettings">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"
          allowToggle="true"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"
          allowToggle="true"></e-column>
        <e-column headerText="Testing" keyField="Testing"
          allowToggle="true"></e-column>
        <e-column headerText="Done" keyField="Close"
          allowToggle="true"></e-column>
      </e-columns>
    </div>
  </template>

```

```

### Responsive mode in Vue Kanban component

The Kanban component has support for responsive behavior based on the client browser's width and height.

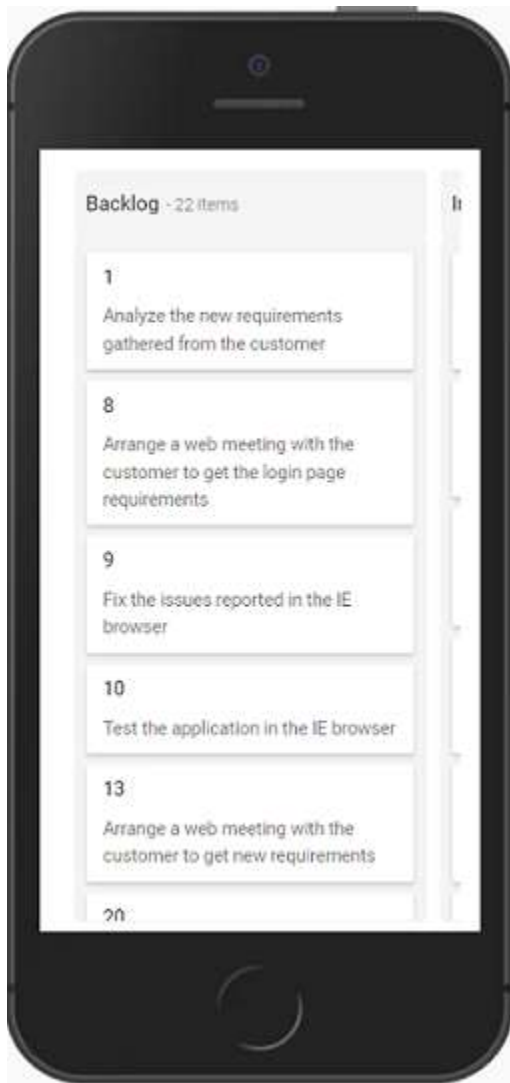

#### Layouts

Possible layouts are:

- Default Layout
- Swimlane Layout

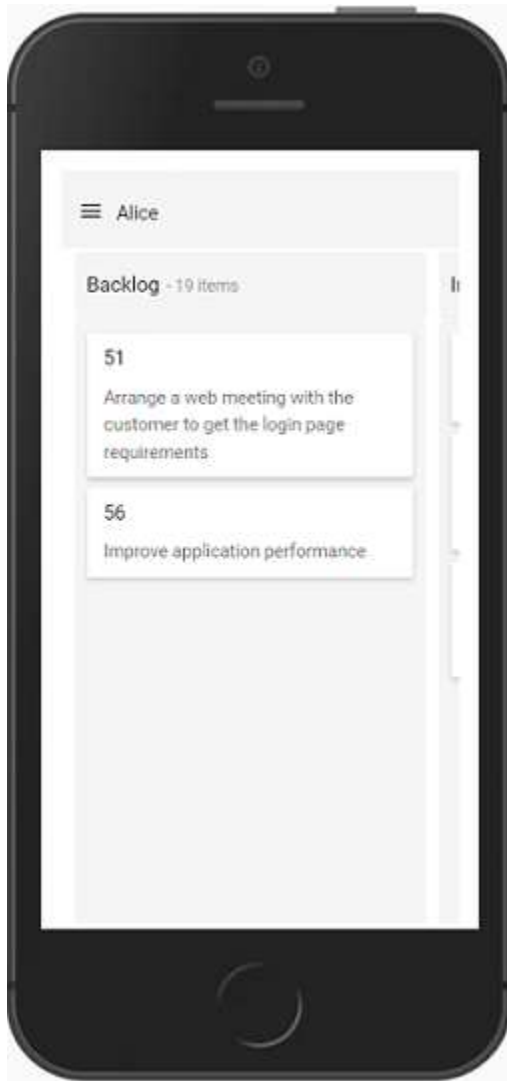

#### Default Layout

Kanban user interface is customized and redesigned for the best view on small screens. In responsive mode, the first column occupies 80% and the second column occupies 20% of the screen layout. Tap and hold the Kanban card to drag and drop it. Swipe left or right to view the columns.

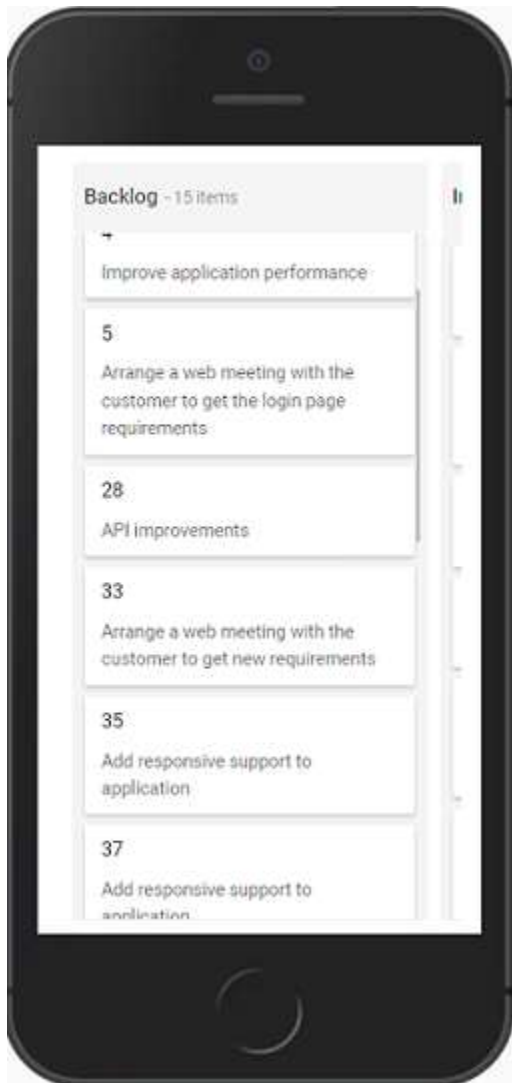

### *Swimlane Layout*

Kanban swimlane header is rendered with menu icon on top of the kanban board. It will show all the available swimlane groups of the header text with a popup when clicking the menu icon. Swimlane selected grouped header text resultant data is rendered on the Kanban board. By default, the first swimlane grouped header text is selected and the resultant data is shown on the Kanban board. The Kanban board data will be changed when changing the swimlane group header text.

### Scrolling

Column scrolling will be shown when exceeding the screen size in the columns.

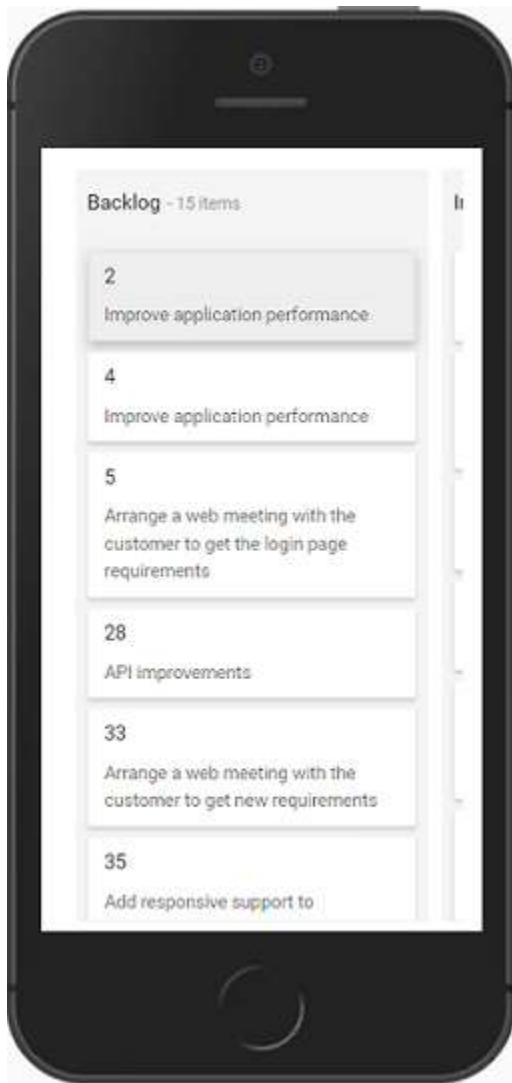

### Selection

Select particular cards in the Kanban board by tapping the card.

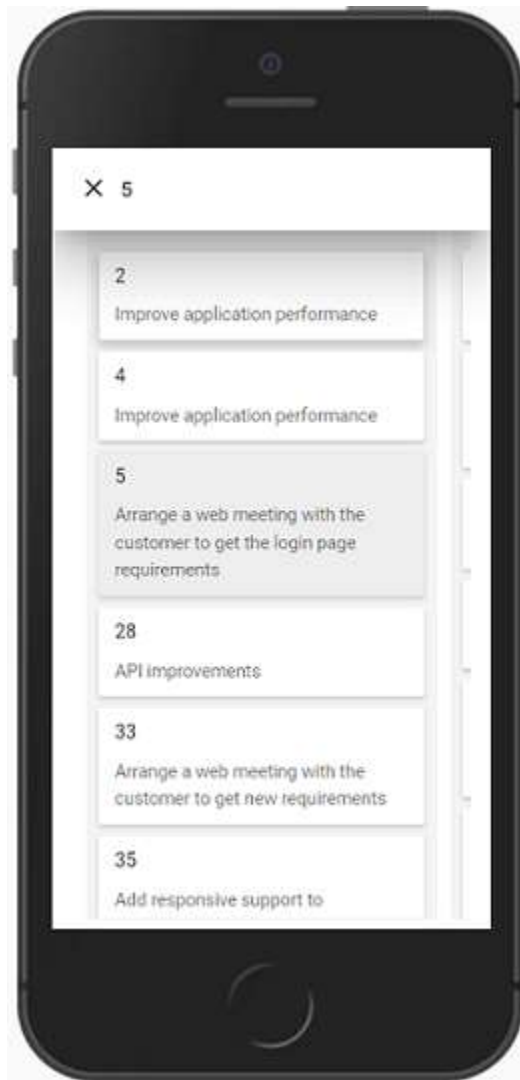

#### Single Selection

Single card will be selected when you tap the card once and selection will be removed when you select another card.

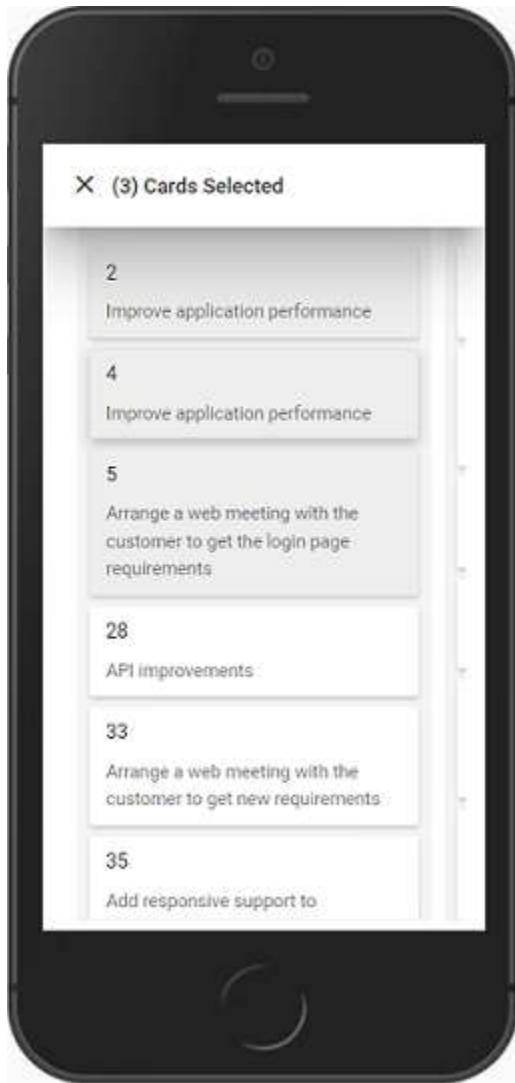

#### *Multiple Selection*

Enable [selectionType](#) as **Multiple** to select multiple cards. It will open the popup on the screen top. Selected card header text will be shown when selecting single card with a tap and hold action. If single card is selected, only tap action is required to select multiple cards. Multiple Selected card count will be shown on the popup when selecting multiple cards.

### Style in Vue Kanban component

To modify the Kanban appearance, you need to override the default CSS of Kanban. Also, you have an option to create your own custom theme using our [Theme Studio](#). Please find the list of CSS classes in Kanban.

Css class	Purpose
<code>.e-kanban</code>	Customize the kanban.
<code>.e-kanban .e-kanban-table</code>	Header cells of kanban.
<code>.e-kanban .e-kanban-header .e-header-cells</code>	Header title of kanban.
<code>.e-kanban .e-kanban-header .e-header-cells .e-header-wrap .e-header-title</code>	Header cells minimum color of kanban.
<code>.e-kanban .e-kanban-header .e-header-cells.e-min-color</code>	Header cells maximum color of kanban.
<code>.e-kanban .e-kanban-header .e-header-cells.e-max-color</code>	Header cells of collapsed column minimum color in column constraint type of kanban.
<code>.e-kanban .e-kanban-header .e-header-cells.e-collapsed.e-min-color</code>	

| .e-kanban .e-kanban-header .e-header-cells.e-collapsed.e-max-color | Header cells of collapsed column maximum color in column constraint type of kanban. |

| .e-kanban .e-kanban-header .e-header-cells .e-header-text | Header text of Kanban. |

| .e-kanban .e-kanban-header .e-header-cells .e-item-count | Header cells Item count of Kanban. |

| .e-kanban .e-kanban-header .e-header-cells .e-limits | Header cells limits in column constraint type of kanban. |

| .e-kanban .e-kanban-header .e-header-cells .e-limits .e-min-count | Header cells minimum count of kanban. |

| .e-kanban .e-kanban-header .e-header-cells .e-limits .e-max-count | Header cells maximum count of kanban. |

| .e-kanban .e-kanban-content | Customize kanban Content. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells .e-limits | Content cells limits in swimlane constraint type of kanban. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells .e-limits .e-min-count | Content cells minimum count of kanban. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells .e-limits .e-max-count | Content cells maximum count of kanban. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells.e-min-color | Content cells minimum color of kanban. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells.e-max-color | Content cells maximum color of kanban. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells.e-collapsed .e-collapse-header-text | Content cells of collapsed header text. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells.e-collapsed .e-collapse-header-text .e-item-count | Content cells of collapsed header text Item count. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells .e-show-add-button | Add button in content cells of kanban. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells .e-show-add-button .e-show-add-icon | Customize content cells add icon of kanban. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells .e-card-wrapper .e-empty-card | Empty content cells of kanban. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells .e-card-wrapper .e-card | Customize cards in kanban. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells .e-card-wrapper .e-card .e-card-header .e-card-header-title | Cards header title of kanban. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells .e-card-wrapper .e-card .e-card-footer | Cards footer of kanban. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells .e-card-wrapper .e-card .e-card-content | Cards content of kanban. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells .e-card-wrapper .e-card.e-card-color |  
Cards color of kanban. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells .e-card-wrapper .e-card .e-card-tags |  
Customize Card tags of kanban. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells .e-card-wrapper .e-card .e-card-tag |  
Card tag of kanban. |

| .e-kanban .e-kanban-content .e-content-row.e-swimlane-row .e-content-cells .e-swimlane-header .e-swimlane-row-expand | Content cells of swimlane row expand of kanban. |

| .e-kanban .e-kanban-content .e-content-row.e-swimlane-row .e-content-cells .e-swimlane-header .e-swimlane-row-collapse | Content cells of swimlane row collapse of kanban. |

| .e-kanban .e-kanban-content .e-content-row.e-swimlane-row .e-content-cells .e-swimlane-header .e-swimlane-text | Content cells of swimlane header text of kanban. |

| .e-kanban .e-kanban-content .e-content-row.e-swimlane-row .e-content-cells .e-swimlane-header .e-item-count | Content cells of swimlane items count of kanban. |

| .e-kanban .e-kanban-content .e-content-row:not(.e-swimlane-row) .e-content-cells | swimlane content cells of kanban. |

| .e-kanban .e-kanban-content .e-content-row:not(.e-swimlane-row) .e-content-cells.e-dropping |  
Customize swimlane content cells card dropping of kanban. |

| .e-kanban .e-kanban-content .e-content-row:not(.e-swimlane-row) .e-content-cells .e-card-wrapper |  
Swimlane content cells of card wrapper. |

| .e-kanban .e-kanban-content .e-content-row:not(.e-swimlane-row) .e-content-cells.e-min-color |  
Swimlane content cells of minimum color of kanban. |

| .e-kanban .e-kanban-content .e-content-row:not(.e-swimlane-row) .e-content-cells.e-max-color |  
Swimlane content cells of maximum color of kanban. |Customize the kanban CSS theme. Please find the list of CSS classes in Kanban. |

| .e-kanban .e-kanban-table .e-header-cells | Header cells of kanban. |

| .e-kanban .e-kanban-table .e-header-cells .e-header-text | Header text of Kanban. |

| .e-kanban .e-kanban-table .e-header-cells .e-item-count | Header cells Item count of Kanban. |

| .e-kanban .e-kanban-table .e-header-cells .e-column-expand | Header cells of toggle icon in column expand. |

| .e-kanban .e-kanban-table .e-header-cells .e-column-collapse | Header cells of toggle icon in column collapse. |

| .e-kanban .e-kanban-table.e-content-table .e-content-row:not(.e-swimlane-row) .e-content-cells |  
swimlane content cells of kanban. |

| .e-kanban .e-kanban-table.e-content-table .e-content-row.e-swimlane-row .e-swimlane-text | Content cells of swimlane header text of kanban. |

| .e-kanban .e-kanban-table.e-content-table .e-content-row.e-swimlane-row .e-item-count | Content cells of swimlane items count of kanban. |

| .e-kanban .e-kanban-table.e-content-table .e-content-row .e-show-add-button .e-show-add-icon | Add icon in content cells of kanban. |

.e-kanban .e-kanban-table.e-content-table .e-card.e-selection	Selected card of kanban.
.e-kanban .e-kanban-table.e-content-table .e-card .e-card-header	Cards header in kanban.
.e-kanban .e-kanban-table.e-content-table .e-card .e-card-content	Cards content in kanban.
.e-kanban .e-kanban-table.e-content-table .e-card .e-card-tag.e-card-label	Cards label in kanban.

#### To set fixed position to the Kanban header

The Fixed header in Kanban control can be customized in following ways,

By setting a fixed height to the Kanban content,

```
`css
.e-kanban .e-kanban-content {
height: 500px;
}
`
```

By customizing the CSS for the Kanban header.

```
`css
.e-kanban-header {
position: -webkit-sticky;
position: sticky;
z-index: 100;
top: 0;
}
`
```

Note: It will not affect the Kanban content's height.

#### Accessibility in Vue Kanban component

The Kanban component has been designed, keeping in mind the WAI-ARIA specifications, and applies the WAI-ARIA roles, states, and properties. This component is characterized by complete ARIA accessibility support that makes it easy for people who use assistive technologies (AT) or those who completely rely on keyboard navigation.

The accessibility compliance for the Kanban component is outlined below.

Accessibility Criteria	Compatibility
[WCAG 2.2 Support](#)	![Yes](https://cdn.syncfusion.com/content/images/landing-page/yes.png)
[Section 508 Support](#)	![Yes](https://cdn.syncfusion.com/content/images/landing-page/yes.png)
[Screen Reader Support](#)	![Yes](https://cdn.syncfusion.com/content/images/landing-page/yes.png)
[Right-To-Left Support](#)	![Yes](https://cdn.syncfusion.com/content/images/landing-page/yes.png)

| [Color Contrast](#) | ![Intermediate](https://cdn.syncfusion.com/content/images/landing-page/intermediate.png) |

| [Mobile Device Support](#) | ![Yes](https://cdn.syncfusion.com/content/images/landing-page/yes.png) |

| [Keyboard Navigation Support](#) | ![Yes](https://cdn.syncfusion.com/content/images/landing-page/yes.png) |

| [Accessibility Checker Validation](#) |

![Intermediate](https://cdn.syncfusion.com/content/images/landing-page/intermediate.png) |

| [Axe-core Accessibility Validation](#) | ![Yes](https://cdn.syncfusion.com/content/images/landing-page/yes.png) |

```
<style>
```

```
.post .post-content img {
```

```
display: inline-block;
```

```
margin: 0.5em 0;
```

```
}
```

```
</style>
```

![Yes](https://cdn.syncfusion.com/content/images/landing-page/yes.png) - All features of the component meet the requirement.

![Intermediate](https://cdn.syncfusion.com/content/images/landing-page/intermediate.png) - Some features of the component do not meet the requirement.

![No](https://cdn.syncfusion.com/content/images/landing-page/no.png) - The component does not meet the requirement.

### WAI-ARIA attributes

The Kanban component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Kanban component:

| Attributes | Purpose |

| --- | --- |

| `aria-label` | It helps to provides information about elements in a kanban component for assistive technology. |

| `aria-expanded` | Attributes indicate the state of a collapsible element. |

| `aria-selected` | This attribute is assigned to the Kanban component for the selection of elements, and its default value is `false`. The value changes to true when the user selects a Kanban card. |

| `aria-grabbed` | Indicates whether the attribute is set to true. It has been selected for dragging. If this attribute is set to false, the element can be grabbed for a drag-and-drop operation but will not be currently grabbed. |

| `aria-describedby` | This attribute contains the ID of the Kanban header column to indicate that the attribute establishes an association between the Kanban header column and the Kanban column body. |

| **aria-roledescription** | This attribute is assigned to the Kanban component and is used to provide alternative descriptions for card elements. |

#### Keyboard interaction

The Kanban component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Kanban component.

| **Press** | **To do this** |

| --- | --- |

| **Home** | To select the first card in the kanban |

| **End** | To select the last card in the kanban |

| **Arrow Up** | Select the card through the up arrow |

| **Arrow Down** | Select the card through the down arrow |

| **Arrow Right** | Move the column selection to the right |

| **Arrow Left** | Move the column selection to the left |

| **Ctrl + Enter** | Used to select the multi cards |

| **Ctrl + Space** | Used to select the multi cards |

| **Shift + Arrow Up** | Used to select the multiple cards towards up |

| **Shift + Arrow Down** | Used to select the multiple cards towards down |

| **Shift + Tab** | Reverse order of the tab action |

| **Enter** | Open the selected cards |

| **Tab** | To navigate the Kanban column |

| **Delete** | To delete the selected cards |

| **ESC** | Escape from the modified details |

| **Space** | Used to open the card edit dialog based on the column selection |

#### Ensuring accessibility

The Kanban component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Kanban component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Kanban component with accessibility tools.

{% previewsample "<https://ej2.syncfusion.com/accessibility/kanban.html>" %}

## How To

### Header double click in Vue Kanban component

You can bind the header double click event by using the [dataBound](#) event at the initial rendering. You can get the column header text when you double click on the headers.

#### APP.VUE

```
<template>
  <div id="app">
    <ejs-kanban id="kanban" keyField="Status" :dataSource="kanbanData"
      :cardSettings="cardSettings" :dataBound="OnDataBound">
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-
column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from '@syncfusion/ej2-vue-kanban';
import { extend } from '@syncfusion/ej2-base';
import { DialogUtility } from '@syncfusion/ej2-popups';
import { kanbanData } from './datasource.js';
Vue.use(KanbanPlugin);
Vue.use(DialogUtility);
export default {
  data: function() {
    return {
      kanbanData: extend([], kanbanData, null, true),
      cardSettings: {
        contentField: "Summary",
        headerField: "Id"
      }
    };
  },
  methods: {
    OnDataBound: function() {
      var headerEle: HTMLElement = document.querySelector('.e-header-
row');
      headerEle.addEventListener("dblclick", function (e: Event) {
        var target = closest(e.target, '.e-header-cells');
        DialogUtility.alert({
          title: 'Header',
          content: "Double clicked on " + target.querySelector('.e-
header-text').innerText + " header",
          showCloseIcon: true,
          closeOnEscape: true,
          animationSettings: { effect: 'Zoom' }
        });
      });
    },
  },
}
```

```

}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';

@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-kanban/styles/material.css';
</style>

```

{% previewsample "page.domainurl/code-snippet/kanban/card-header-cs4" %}

### Dynamically change columns in Vue Kanban component

You can dynamically change the Kanban columns by using the [columns](#) property.

In the below sample, you can dynamically change the [allowToggle](#) property at the particular column when you click on the button. You can also change the initially created columns to the new Kanban columns by using the [columns](#) property when you click on the button.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-button
      id="particular_column"
      class="e-btn"
      v-on:click.native="particularColumnClick"
    >Enable Allow Toggle</ejs-button>
    <ejs-button id="column" class="e-btn" v-on:click.native="columnClick"
    >Change Columns</ejs-button>
    <ejs-kanban
      ref="KanbanObj"
      id="kanban"
      keyField="Status"
      :dataSource="kanbanData"
      :cardSettings="cardSettings"
    >
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
    </ejs-kanban>
  </div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from "@syncfusion/ej2-vue-kanban";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { extend } from "@syncfusion/ej2-base";

```

```

import { kanbanData } from "../datasource.js";
Vue.use(KanbanPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function () {
    return {
      kanbanData: extend([], kanbanData, null, true),
      cardSettings: {
        contentField: "Summary",
        headerField: "Id",
      },
    };
  },
  mounted: function () {
    this.kanbanObj = this.$refs.KanbanObj.ej2Instances;
  },
  methods: {
    particularColumnClick: function () {
      this.kanbanObj.columns[1].allowToggle = true;
    },
    columnClick: function () {
      this.kanbanObj.columns = [
        { headerText: "To Do", keyField: "Open" },
        { headerText: "Done", keyField: "Close" },
      ];
    },
  },
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";

</style>

```

{% previewsample "page.domainurl/code-snippet/kanban/card-header-cs2" %}

### Filter cards in Vue Kanban component

You can filter the collection of cards from the dataSource and display it on the Kanban board by using the [query](#) property.

In the below sample, you can filter the cards based on the 'where' query and display the filtered data to the Kanban board.

#### APP.VUE

```

<template>
  <div id="app">
    <ejs-dropdownlist
      ref="PriorityDrop"
      id="priority_filter"
    >

```

```

        :dataSource="priorityData"
        :change="change"
        value="None"
        placeholder="Select a priority"
    ></ejs-dropdownlist>
    <ejs-kanban
        ref="KanbanObj"
        id="kanban"
        keyField="Status"
        :dataSource="kanbanData"
        :cardSettings="cardSettings"
    >
        <e-columns>
            <e-column headerText="To Do" keyField="Open"></e-column>
            <e-column headerText="In Progress" keyField="InProgress"></e-column>
            <e-column headerText="Testing" keyField="Testing"></e-column>
            <e-column headerText="Done" keyField="Close"></e-column>
        </e-columns>
    </ejs-kanban>
</div>
</template>
<script>
import Vue from "vue";
import { KanbanPlugin } from "@syncfusion/ej2-vue-kanban";
import { DropDownListPlugin } from "@syncfusion/ej2-vue-dropdowns";
import { extend } from "@syncfusion/ej2-base";
import { Query } from "@syncfusion/ej2-data";
import { kanbanData } from "../datasource.js";
Vue.use(KanbanPlugin);
Vue.use(DropDownListPlugin);
export default {
    data: function () {
        return {
            kanbanData: extend([], kanbanData, null, true),

### Search cards in Vue Kanban component

You can search the cards in Kanban by using the `query` property.

In the following sample, the searching operation starts as soon as you start typing characters in the external text box. It will search the cards based on the `Id` and `Summary` using the `search` query with `contains` operator.

### APP.VUE

```
<template>
  <div id="app">
    <table>
      <tbody>
        <td style="width: 200px">
          <ejs-textbox
            ref="SearchText"
            id="search_text"
            placeholder="Enter search text"
            showClearButton="true"
          ></ejs-textbox>
        </td>
        <td>
          <ejs-button
            id="reset_filter"
            class="e-btn"
            v-on:click.native="resetClick"
          >Reset</ejs-button>
        </td>
      </tbody>
    </table>
    <ejs-kanban
      id="kanban"
      ref="kanbanObj"
      keyField="Status"
      :dataSource="kanbanData"
      :cardSettings="cardSettings"
    >
      <e-columns>
        <e-column headerText="To Do" keyField="Open"></e-column>
        <e-column headerText="In Progress" keyField="InProgress"></e-column>
        <e-column headerText="Testing" keyField="Testing"></e-column>
        <e-column headerText="Done" keyField="Close"></e-column>
      </e-columns>
